A. Where pipes pass through a concrete floor slab the pipe shall be covered with high density fiberglass insulation. Pipe insulation shall be 1/2” to 1” thick Johns Manville Microlok HP or Johns Manville Trymer 25-50 for the full thickness of the concrete. After the piping has been installed and the concrete has been poured, the fiberglass insulation shall be cut away or compressed leaving a 1/2” deep space that shall then be filled with a high quality silicone sealant resulting in a flat, water-tight installation.

B. Where pipes pass through fire rated concrete floors or walls install a Schedule 10 galvanized metal sleeve providing between a 1/2 inch and 1 inch clearance around the sides of the pipe and/or pipe insulation for the full thickness of the concrete. After the piping has been installed, fill the annular space in accordance with the applicable UL fire rating system.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering pipe sleeves which may be incorporated in the work include the following, or approved equal:

3M

2.15 SLEEVE SEALS

A. Provide sleeve seals for sleeves located in foundation walls below grade or in exterior walls as follows:

1. Pipe Sleeves through foundations & walls below grade: modular mechanical type, consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing water-tight seal.
2. Available Manufacturers: Subject to compliance with requirement, manufacturers offering mechanical sleeve seals which may be incorporated in the work include the following, or approved equal:

   Thunderline Link-Seal or Calpico

2.16 LOW PRESSURE STRAINERS

A. Provide wye or basket strainers as indicated on the drawings. Strainers shall be full line size of connecting piping, with ends matching the piping system materials, and with cast iron body. Select strainers for 125 psi working pressure, with stainless steel screens, and gasket seal. Provide hose end ball valve on drain fitting. Strainer screens shall have an open area equal to at least twice the cross-sectional area of the pipe in which they are installed (based on IPS) and may be either woven wire or perforated type. Strainer openings shall be .045 inch diameter perforations for strainers up to 3" size and .125 inch diameter perforations for strainers 4" size and larger.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering low pressure strainers which may be incorporated in the work include the following, or approved equal:

Metraflex
Taco
Bell & Gossett
Watts

2.17 PENETRATIONS IN FIRE AND SMOKE RATED PARTITIONS

A. Maintain indicated fire or smoke rating of walls, partitions, ceilings, and floors at pipe, conduit, and duct penetrations. Seal all penetrations with fire-stop and smoke-stop materials complying with the requirements for firestopping and fill materials specified in this section.

B. Schedule and conduct a firestopping pre-installation conference at the job site. Coordinate all firestopping means and methods with other contractors and the general contractor (when applicable) prior to beginning any work.

C. Installer Qualifications: A firm that has been approved by FM Global according to FM Global 4991 (Approval of Firestop Contractors), or been evaluated by UL and found to comply with their 'Qualified Firestop Contractor Program Requirements'.

D. Install all penetration firestopping systems to comply with the manufacturer's written installation instructions and published drawings for products and applications.

E. Do not install penetration firestopping system when ambient or substrate temperatures are outside limits permitted by the penetration firestopping system manufacturer or when substrates are wet because of rain, frost, condensation, or other causes.

F. Install and cure penetration firestopping materials per manufacturer's written instructions using natural means of ventilation, or where this is inadequate, forced-air circulation.

G. The specified firestopping systems are based on a solid sealant only, or combinations of solid sealant, foam sealant, and refractory fibers of thickness required to attain hour ratings.

H. Systems shall comply with the following:

1. Provide a flexible seal to prevent passage of fire, smoke, toxic gases, and water through openings, and prevent transmission of sound and vibration from the penetrating element to the structure.
2. Provide hour ratings indicated and in accordance with ASTM E 814 and/or UL 1479.
3. For projects located in the State of California comply with requirements of CBC Sections 709.6, 709.7, 709.8, 710.2, 710.3 and 710.6, and CBC Standards 7-1 and 7-5.

I. Acceptable Manufacturers: 3M, Hilti, Nelson, Specified Technologies, Tremco, Roxtec, or as otherwise specified. The established standard in most cases is 3M, unless otherwise specified. The listed products are specified to establish standards and the type of materials required. Materials shall be as specified, or approved equal.

J. Sealant: Select among the following materials as appropriate.
   1. Solid (Elastomeric): 3M Fire Barrier Premium Latex CP 25WB+ Caulk, one-component elastomeric water-based latex sealant designed for use as a through-penetration firestop.
   2. Foam: 3M Fire Barrier 2001 Silicone RTV Foam, two-component silicone elastomer foam-in-place sealant designed to fill irregular or complex voids.
   3. Wrap Strip: 3M Fire Barrier FS-195+ Wrap Strip, fire resistive strip designed to be wrapped around the penetrating item and secured in place.
   4. Restricting Collar: 3M Fire Barrier RC-1 Restricting Collar, sheet metal, designed for use with wrap strip in combustible through-wall firestop penetration systems.
   5. Composite Sheet: 3M Fire Barrier CS-195+ Composite Sheet, elastomeric layer reinforced with mesh restraining wire and covered with aluminum foil on one side and bonded to sheet metal, forming a fire resistive sheet.
   6. Putty: 3M Fire Barrier MP Moldable Putty+ Pads and Sticks, one-component elastomeric formable putty, designed for use as a through-penetration firestop system.
   7. Spray: 3M FireDam Spray 100, flexible water-based coating.
   8. Primers: As recommended by the sealant manufacturer.

K. Pillows: Nelson PLW Firestop Pillow, Hilti FS Fire Block, dust proof chemical resistant cloth with heat-reactive expanding solidifying fill, designed for large openings that require frequent cable alterations.

L. Safing Insulation: USG Thermafiber Safing Insulation, 4 lb density mineral wool insulation, unless indicated otherwise.

M. Damming Materials: As recommended by the firestopping manufacturer.

2.18 PIPE ANCHORS AND GUIDES

A. Provide pipe anchors and guides as indicated on the drawings and/or as required to accommodate any thermal expansion, contraction, or seismic movement of the piping system. Pipe anchors and guides shall be Metraflex Model PGIV, or approved equal by Mason Industries.

2.19 FLEXIBLE HOSE EXPANSION LOOPS

A. Provide flexible hose expansion loop(s) as indicated on the drawings and/or as required to accommodate any thermal expansion, contraction, or seismic movement of the piping system. Flexible hose expansion loops shall be Metraloop as manufactured by Metraflex, or approved equal. In cases where space constraints require a smaller footprint, the Contractor may utilize the Metraflex V Loop product upon written approval from the Architect/Engineer.

B. Flexible hose expansion loops shall be manufactured complete with two parallel sections of corrugated metal house, compatible braid, 180 degree return bend, with inlet and outlet connections. Field fabricated loops will not be acceptable.

C. Flexible loops shall be capable of 4 inches of movement in the ±X, ±Y, and ±Z planes.

D. Flexible hose expansion loops shall impart no thrust loads to system supports, anchors, or the building structure.

E. Flexible hose expansion loop return fittings shall be supported to allow movement.

F. Flexible loops for natural gas service shall be CSA/AGA certified.

G. All flexible hose expansion loops shall be manufactured in accordance with the documented manufacturer's weld procedure specifications. The weld procedure qualification record shall be used to document the execution of this procedure and shall follow the general guidelines of ASME Section IX. Each welder shall conform to the in-house procedure qualification record and be qualified prior to each production lot. The testing of each individual welder shall be documented in a welding procedure qualification record.

H. Install loops, guides, and breakaway hangers per the manufacturer's written installation instructions and the Mechanical Contractors Association of America 'Guidelines for Quality Piping Installations'.

2.20 PIPING AND EQUIPMENT IDENTIFICATION

A. Each piping system furnished and installed under this work shall be identified and the direction of flow indicated by means of colored labels and flow arrows, all as specified herein. The labels shall be applied after all painting, priming, and cleaning of the piping and insulation is completed.

B. Provide prefabricated coiled plastic piping labels as manufactured by Marking Services Incorporated (MSI), or approved equal. Labels shall comply with ASME A13.1 with regard to color, letter height, and marker size. The labels shall have black or white lettering and flow arrows on colored backgrounds and shall not require adhesive.

C. The label background colors shall conform to the color schedule in the 'Execution' section of this specification.

1. For pipe labels used indoors use coiled polyester labels, MSI Model MS-975, or equal.
2. For pipe labels used outdoors use coiled polyester labels, MSI Model MS-995, or equal.
3. For piping with an outside diameter, including insulation, greater than 6 inches provide the label manufacturer's nylon straps to secure label to piping. Labels shall lie smoothly against pipe or insulation completely around the pipe.
4. The size of the lettering and label shall be such that the lettering can be easily read from the floor and the colors shall be easily discernible.

D. Provide a white plastic lamacoid plate for each and every piece of equipment installed in this work. Lettering on plate shall be black, with size of lettering to suit equipment. Lettering shall be a minimum of 1/2 inch in height. Plates shall be riveted or bolted to equipment near electrical disconnect or control access panel.

E. Where mechanical or plumbing equipment requiring access is located above a ceiling or behind an access panel, provide an adhesive clear plastic label with 3/8” black lettering on the ceiling grid or access panel identifying the equipment.

F. Available Manufacturers: Subject to compliance with requirements, manufacturers which may be incorporated in the Work include the following:

Marking Services Incorporated (MSI)
LEM Products
Seton
Craftmark

2.21 DETECTABLE UNDERGROUND WARNING TAPE

A. Protect the following underground piping and conduit systems (when shown on the mechanical and/or plumbing drawings) with a detectable underground warning tape, as manufactured by Seton MSI, or approved equal.

1. All gas, fuel oil piping.
2. All heat pump loop piping, including ground loop piping.
3. Temperature control communication conduits.

B. Detectable underground warning tape shall consist of 5 mil foil tape printed with associated pipe service (e.g., ‘Caution Gas Line Below’).

C. Tape shall be buried approximately one half of the pipe buried depth.

1. Tape buried up to 24” deep shall be a minimum of 3” wide.
2. Tape buried greater than 24” deep shall be a minimum of 6” wide.

D. The methodology for locating the detectable underground warning tape shall be demonstrated by the Contractor utilizing an appropriate location device. Location device shall be Ridgid ‘Seetech, Ridgid ‘Navitrack’, or approved equal.

2.22 CONCRETE WORK

A. Where specifically indicated on the drawings or specified as part of the mechanical work, this Contractor shall furnish and install concrete work such as thrust blocks and/or spring isolator bases.

B. Concrete and reinforcing steel shall be equal to that specified for general construction.

C. Except as noted above, concrete work will be furnished and installed by others. This Contractor shall coordinate all requirements accordingly.

2.23 ELECTRIC HEAT TRACING

D. For projects that include electric heat tracing see Specification Section 222300 (Heat Tracing for Plumbing Piping).

2.24 ELECTRIC MOTORS

A. Electric motors larger than 1/2 horsepower (hp) rating shall be, unless otherwise noted, shall be ball bearing, open drip proof, squirrel cage, induction type, normal starting torque, 3 phase, 60 cycle service, 40°C continuous rating, and shall conform in all respects to latest applicable standards of NEMA and AIEE. Motors shall be Century, Louis Allis, Baldor, or equal. Motors located outdoors shall be TEFC type.

B. All motors 1 hp and above shall be high efficiency type, Century E-Plus, or approved equal.

C. Motors utilized with variable frequency drives shall be rated as inverter duty per NEMA standards.

D. Motors shall have nameplate voltage rating of operating voltage specified in subsequent sections of specifications or as shown on drawings and shall have a 1.15 service factor.

E. For normal applications, motors shall be furnished for normal starting torque duty. It shall be this Contractor's responsibility, however, to provide motors and starters (where starters are furnished under this section) having suitable starting torque and current characteristics to allow starting the equipment within the branch circuit protection provided and within the overload protection required by code.

F. Splash-proof or totally enclosed motors having a continuous duty temperature rise rating not exceeding 35°C shall have adequate starting torque, as recommended by the manufacturer, for the service intended.

G. All motors shall be rated at ±10% of the scheduled voltage. If not, provide each motor with a boost transformer sized for the intended use and installed in a rated enclosure.

1. Boost transformers for equipment provided under the mechanical work shall be furnished by the mechanical contractor and turned over to the electrical contractor for installation, unless otherwise noted.

H. Shaft Grounding:

1. All variable frequency drive motors less than 300 hp shall have a single shaft grounding system to protect the bearings from capacitive discharge through the bearings.
2. Available Manufacturers: Subject to compliance with requirements, manufacturers which may be incorporated in the work include the following, or approved equal:

   CR Series by Shaft Grounding Systems
   AEGIS SGR Conductive Microfiber Brush

2.25 ELECTRIC MOTOR STARTERS

A. Magnetic motor starters for equipment provided under the mechanical work shall be furnished by the mechanical contractor and turned over to the electrical contractor for installation, unless otherwise noted. All motor starters shall be by the same manufacturer, Westinghouse, Square D, Cutler-Hammer, General Electric, or approved equal.

B. Magnetic motor starters provided as part of motor control centers shall be provided and installed by the electrical contractor.

C. Unless otherwise noted, magnetic motor starters shall be furnished in a NEMA 1 enclosure for inside installation and in a gasketed NEMA 4 enclosure for outside installation, with three thermal overloads for three phase motors and one overload element for single phase motors. All overloads shall be ambient compensated.

D. Submit schedule to the Architect/Engineer denoting the following:

1. Designation of each motor
2. Name plate rating of each motor
3. Running current of each motor
4. Catalog number and rating of starter overload elements
5. Circuit breaker trip size (when in combination starter)

E. Combination magnetic starters shall be Westinghouse Type A206 with circuit breaker disconnect and trip size of breaker as required for motor size, or as otherwise noted.

F. Magnetic motor starters shall be Westinghouse Type A200, or approved equal.

G. Manual motor starters shall be Westinghouse Type MST01 less enclosure, or approved equal.

H. Magnetic motor starters shall be provided with cover-mounted Hand-Off-Auto ‘Oil-Tight’ type switches as scheduled with integral fused 120 volt single phase control transformers.

PART 3 - EXECUTION

3.1 ACCESS TO PLUMBING WORK

A. Comply with manufacturer's instructions for installation of access doors.

B. Access panels shall be furnished and installed wherever valves, balance valves, damper operating mechanisms, air terminal boxes, fans, and similar items normally requiring adjustment or servicing are installed in concealed or inaccessible spaces. Coordinate with the access doors shown on the architectural drawings.

C. Where access panels are detailed on architectural or mechanical drawings, sizes indicated thereon shall be used.

D. Where access panels are to be located in acoustic tile ceilings, the size of the access panel required shall be increased to properly fit the tile pattern without cutting into the tile.

3.2 EXCAVATION AND BACKFILL

A. Do excavating required for installation of piping and service lines and other work that applies as indicated on drawings. Verify location and elevation of all existing utilities prior to excavation for installation of new piping.

B. Excavations shall be of open vertical construction of sufficient width to provide free working space at both sides of trench and around pipe as required for caulking, joining, backfilling, and compacting.

C. Where invert elevations are not shown, dig trenches to sufficient depth to provide a minimum of 30 inches of fill above top of exterior piping, measured from adjoining finished grade, except as follows:

Outside water lines (36” inches minimum cover); Gas lines (30” minimum cover)

D. Dig trenches straight and true to line and grade with holes for bells for bell-and-spigot pipe. Evenly support piping for its entire length upon outside periphery of lower one third of pipe.

E. Where rock is encountered, undercut trenches by 3 inches, and fill with well tamped clean sand and pea gravel as required to correct pipe elevation.

F. After piping in the excavation has been installed and tested, backfill excavation to a point 6 inches above the piping using sand, fine earth, or other materials free of rocks and large lumps. Proceed evenly on both sides of the pipe and continuously tamp. Except as hereinafter noted, backfill more than 6 inches above the top of the pipe shall be made by using earth from excavation placed in layers of 8 inch maximum depth. Compaction of each successive layer shall be achieved using a mechanical compactor.

G. Special care shall be taken when backfilling over and around wrapped piping to prevent damage to the protective wrapping.

H. Bed sewers under pavements and any wrapped piping in sand prior to backfilling. Backfill to a point 6 inches above the pipe with sand.

I. When pipe or underground conduit with a protective wrapping is to be placed in the trench, sand only shall be used for bedding the pipe or conduit. The sand used shall be certified to have a minimum resistance of 5000 ohms per cubic centimeter when wetted to any moisture content with distilled water and shall consist of clean, natural, washed sand, hard, and durable particles varying from fine particles to particles of such size that all will pass through a 3/8 inch screen, not less than 90 percent will pass through a 1/4 inch screen, and not more than 25 percent will pass through a No. 50 screen.

J. Any backfill placed under this contract which subsides or settles below the adjacent finished grade or paving level during the guarantee period shall be brought to grade by the Contractor by adding compacted backfill or additional paving in paved areas.

3.3 FORMING, CUTTING, AND PATCHING

A. Coordinate with other contractors as necessary to provide any special forming, recesses, chases, etc., and provide wood blocking, backing, and grounds as necessary for proper installation of mechanical work.

B. If this Contractor fails to coordinate with other contractors at the proper time or fails to locate items properly, resulting in extra work, the Contractor is responsible for the additional work, at no cost to the Owner.

C. This Contractor is responsible for proper placement of pipe sleeves, hangers, inserts, and supports for all work.

D. Cutting, patching, and repairing of existing (prior) construction to permit installation of piping, conduit, etc. is the responsibility of the Contractor. Repair or replace any damage that occurs to existing work in a first class manner using skilled mechanics for each trade involved.

E. Cut existing construction in a neat and workmanlike manner by the use of a concrete saw. Use of pneumatic devices is not acceptable.

F. Core openings through existing construction as required for the passage of any new piping and/or conduit. Cut holes of the minimum diameter required to suit the size of the pipe to be installed, including the associated insulation.

3.4 INSTALLATION OF HANGERS AND SUPPORTS

A. See Specification Sections 220530 (Hangers and Supports for Plumbing Systems) and 220540 (Seismic Bracing for Plumbing Systems).

B. Where special hanging or support of piping or equipment is detailed or shown on the drawings, the drawings shall be followed.

3.5 PAINTING

A. In general, painting will be done by others. Exposed piping and unfinished portions of equipment to be painted shall be cleaned by this Contractor of grease, oil, rust, or dirt in preparation for painting. Spot prime all factory primed surfaces as necessary to repair any damage to finish.

3.6 CONCRETE WORK

A. When required or shown on the drawings concrete work for plumbing shall be performed in accordance with Division 1. This Contractor shall coordinate all requirements accordingly.

3.7 INSTALLATION OF EXPANSION ANCHORS

A. Where permitted in other sections of this specification, expansion anchors may be used in hardened concrete.

B. Job Testing: Load test 50 percent of the expansion anchors on each job to twice 80 percent of the ICBO recommended allowable load in tension for that particular anchor, except that if the design load is less than 75 pounds, only one anchor in ten needs be tested. If any anchor fails, then all anchors shall be tested. Perform the load test in the presence of the Building Inspector.

C. Install drilled-in anchors in existing reinforced concrete, using care and caution to avoid cutting or damaging the existing reinforcing bars. Maintain a minimum clearance of one inch between the reinforcement and the drilled-in anchor.

3.8 INSTALLATION OF CATHODIC PROTECTION

A. Install dielectric unions in the following locations:
   1. In all metallic water and gas service connections to the building within 5 feet of the building wall. Install adjacent to the shutoff valve and above ground wherever possible.
   2. At points of connections where copper water lines connect to steel domestic water heater tanks and other equipment.
   3. At points in piping where dissimilar metal pipes are connected together.
   4. Any special applications shown on the drawings.

B. Where steel or cast iron pipe in the ground connects to copper or brass piping above the ground, the transition from steel or cast iron pipe to the copper or brass pipe shall be made above ground in all cases and in an accessible location where practicable.

C. Where copper or brass piping is connected to steel or cast iron piping and the connection is buried in the ground, the connection shall be covered with coal tar protective tape as specified in section 'Pipes And Pipe Fittings' extending outward a minimum of 5 feet on all pipes from the point of connection. The tape shall have a minimum thickness of 10 mils and a maximum thickness of 12 mils and shall be applied so as to provide at least two full thicknesses of tape over the piping. A primer specifically designed for use with the tape, shall be used. The piping shall be thoroughly cleaned before any tape or primer is applied.

3.9 INSTALLATION OF THERMOMETERS

A. Thermometers for piping systems shall be installed so that the liquid flows completely around the sensing well. Pipe sizes at the bulb shall be increased where necessary to allow for full flow without excessive resistance.

B. Where shown on the temperature control diagrams, the temperature control subcontractor shall furnish and install remote panel-mounted thermometers. Duct-mounted thermometers may be omitted at these locations.

C. Thermometers shall be placed at all locations shown on the drawings.

D. In cases where the specified thermometers cannot be located so as to be easily read, a remote reading type thermometer shall be installed, as approved by the Architect/Engineer.

E. Thermometers provided as part of the temperature control work and located on a control panel need not be duplicated by the requirements listed above.

3.10 INSTALLATION OF GAUGES

A. Provide gauge connections at the following locations:
   Suction and discharge of domestic hot water recirculating pumps.
   Elsewhere as shown on the drawings.

B. Gauges shall be provided in convenient locations within approximately 3 feet of the flanges or connections and elsewhere as may be shown on the drawings.

C. Gauge Valves and Siphons
   1. A needle point globe valve, Crane No. 88 or equal, shall be installed at each gauge.
   2. A gauge siphon shall be installed at each hot water gauge.

3.11 INSTALLATION OF FLASHINGS

A. Provide pipe flashings as noted on the drawings.

B. Flue and duct flashings and storm collars shall be securely clamped around flue and/or duct storm collars or counter-flashings.

3.12 INSTALLATION OF PIPING SPECIALTIES

A. Pipe Escutcheons: Install pipe escutcheons on each pipe penetration through floors, walls, partitions, and ceilings where penetration is exposed to view and on exterior of building. Secure escutcheon to pipe or insulation so escutcheon covers penetration hole and is flush with adjoining surface.

B. Sleeves: Secure sleeves to metal or wood forms in such a manner that they will not become displaced during pouring of concrete. Fill sleeves on deck with sand. After forms have been removed from concrete, the sleeves shall be removed from the openings.

C. Core drill properly sized holes in the concrete to replace metal sleeves that are crushed or knocked out of position during pouring of concrete.

D. Provide piping passing through concrete fire walls with sleeves of standard black steel pipe nominally one size larger than pipe enclosed, but in the case of insulated pipe, large enough for insulation to pass through. Caulk space between pipe and sleeve with fire-rated wicking, and provide metal retainer plates at both sides of the wall.

3.13 INSTALLATION OF STRAINERS

A. Install strainers full size of pipeline and in accordance with the manufacturer's installation instructions. Install pipe nipple and shutoff valve in the strainer blow-down connection, full size of the connection, except for strainers 2 inch and smaller installed ahead of control valves feeding individual terminals. Where indicated, provide a drain line from the shutoff valve to the plumbing drain, full size of blow-down connection.

B. Locate strainers in supply line ahead of all pumps, temperature control valves, pressure reducing valves, temperature and pressure regulating valves, and elsewhere as indicated on the drawings if an integral strainer is not included with the equipment:

3.14 INSTALLATION OF VALVES

A. Install valves where required for proper operation of piping and equipment, including valves in branch lines where necessary to isolate sections of piping. Locate valves so as to be accessible and so that separate support can be provided when necessary.

B. Install valves with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane.

C. Provide union at each connection to equipment and downstream of each valve. Provide unions at both ends of valves when valves cannot be turned due to an obstruction.

D. After piping systems have been tested and put into service, but before final testing, adjusting, and balancing inspect each valve for possible leaks. Adjust or replace packing to stop leaks; replace valve if leakage persists.

E. Tag each valve and provide a complete listing of valve locations and functions. In addition, where valves are located above a ceiling or behind an access panel, provide an adhesive clear plastic label with black 3/8” lettering on ceiling grid or access panel identifying valve.

3.15 INSTALLATION OF UNIONS AND FLANGES

A. Install unions and flanges so that piping can be easily disconnected for removal of tanks, equipment, and valves. Provide a minimum of two unions at each three-way valve.

3.16 PIPE IDENTIFICATION

A. Identification shall be applied to all piping, except piping located in furred spaces without access to permit entrance of personnel, and piping buried in the ground or concrete.

B. The legend and flow arrow shall be applied at all valve locations, at all points where piping enters or leaves a wall, partition, cluster of piping, or similar obstruction, and at approximately 20 foot intervals on pipe runs.

C. Practical variations or changes in locations and spacing may be made with the specific approval of the Architect/Engineer to meet specific conditions.

D. Wherever two or more pipes run parallel, the printed legend and other markings shall be applied in the same relative location so that all piping is easily identified.

E. The marking shall be located to be conspicuous from any reasonable vantage point.

F. The legends and flow arrows shall be in the colors as indicated in the pipe marking schedule.

G. Bore field circuit piping in the mechanical room shall be labeled to coincide with the GPS numbering of the bore field.

H. Where different equipment such as fire sprinklers are supplied from a common main, such as a domestic water main, the main should be identified as 'Domestic Water' and each respective branch takeoff as 'Fire Water', etc.

I. The sizes of the stenciled lettering and flow arrows shall be as follows:

Outside Diameter (Inches of Covering)	Size of Stencil Letter	Minimum Length of Flow Arrow
5/8" to 2"	1/2"	3"
2-1/2" to 4"	1"	4"
4"to 7"	2"	5"
Over 7"	3"	6"

J. Pipe Marking Schedule:

Legend	Color
Domestic Cold Water	Green
Domestic Hot Water Supply	Yellow
Domestic Hot Water Return	Yellow
Gas	Yellow
Sanitary Sewer	Brown
Storm Sewer	Brown
Plumbing Vent	Brown
Fire Sprinkler	Red

3.17 DEMOLITION WORK

A. Unless specifically indicated otherwise, demolition work shall include removal of all associated equipment, electrical/controls components, conduit, and wiring, piping/valves and accessories, and supports. The surfaces where the demolition work was performed shall be restored to match the adjacent surfaces to the best extent practical.

3.18 ELECTRICAL DISCONNECTS

A. The short circuit current rating (SSCR) of each integral or factory-furnished disconnect switch provided by Division 23 shall match or exceed the SSCR of the source panel or distribution board. Coordinate with Division 26 for the results of the Short Circuit Studies required in the Division 26 specifications prior to release of order(s) for disconnects. This requirement applies to all electrical disconnects, including but not limited to, disconnects for chillers, boilers, variable frequency drives, air handling units, rooftop units, condensing units, etc.

3.19 ELECTRICAL WORK

A. Adequate working space shall be provided around electrical equipment in compliance with the National Electrical Code and other applicable codes or ordinances. The plumbing work shall be coordinated with the electrical work in order to comply with these requirements. Any work which does not conform to these regulations shall be properly corrected without additional cost to the Owner.

B. Furnish and install all line voltage and low voltage temperature control wiring in the plumbing work (typically performed by the temperature control subcontractor) including all interlock wiring between motor starters, interlock relays, and temperature control equipment. Unless noted otherwise, this does not include primary control wiring between starters and pushbuttons or other manual starter switch or branch power circuits required for temperature control systems.
   1. Starters located in motor control centers will be provided under the electrical work. The Contractor is referred to the electrical drawings for motors served by motor control centers.
   2. All such equipment shall be delivered to the electrical contractor for mounting and connecting to power wiring. Coordinate all motor starter requirements with the electrical contractor.
   3. Temperature control equipment, including relays shown on control diagrams, shall be furnished and installed by the temperature control subcontractor.
   4. Electrical devices with piping connections, such as control valves, insertion thermostats, strap-on aquastats, and similar items which are to be wired under the electrical work or by the temperature control subcontractor, shall be installed by the plumbing contractor.

C. Equipment furnished in this work that is factory wired but requires modification to internal wiring to meet specifications or drawing requirements shall have such internal modifications made at factory before shipment.

D. All electrical work and equipment, including internal wiring, must comply with applicable codes and applicable portions of electrical specifications. Install all line and low voltage control wiring in conduit. Conduit for temperature control wiring shall be responsibility of the plumbing contractor and shall be of type specified in the electrical specifications.

3.20 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. At completion, carefully clean and adjust all equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.21 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.22 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

s

SECTION 22 05 10 - VALVES FOR PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing Systems) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of valves specified in this section include the following:

- Ball Valves
- Butterfly Valves
- Check Valves
- Gas Valves
- Manual Balance Valves
- Automatic Pressure-Compensating Balance Valves
- Motor Operated Valves
- Air Vent Valves
- Pressure Relief Valves
- Temperature and Pressure Relief Valves
- Pressure Reducing Valves
- Emergency Gas Shutoff Valves

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in the manufacture of valves and piping specialties of types and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Valve Types: Provide valves of the same type by the same manufacturer.

C. Identification: Provide valves and piping specialties with the manufacturer's name or trademark and pressure rating clearly marked on the valve body.

1.4 SUBMITTALS

A. Submit manufacturer's technical product data and installation instructions for each type of valve and piping specialty. Include a pressure drop curve or chart for each type and size of isolation valve, balancing valve, and control valve.

B. Operation and Maintenance Data: Submit operation and maintenance data and spare parts lists for each type of manufactured valve and piping specialty. Include this data and product data in the operating and maintenance manual in accordance with all associated requirements.

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide factory-fabricated valves and piping specialties as recommended by the manufacturer for use in the service indicated.

B. All valves, fittings, and accessories located in potable water systems shall be constructed of appropriate materials and conform to the requirements of NSF/ANSI Standards 61 and 372.

C. Unless otherwise indicated, provide valves of same size as the upstream pipe size.

s

D. Provide valves of type and with pressure ratings indicated for each service, or if not indicated, provide proper selection as determined by the Contractor to comply with the installation requirements. Provide sizes and connections which properly mate with piping, tubing, and equipment connections.

2.2 VALVES

A. Provide valves as shown on the drawings and other valves necessary to segregate branches or units. Furnish discs suitable for the intended service. Furnish a brass tag with identification of service controlled for each valve. Properly pack and lubricate valves. Place a union adjacent to each threaded valve. Provide two unions at soldered valves. Provide flanged valves in welded pipe. Provide ball valves in water lines, unless otherwise shown.

B. Valves at connections to appliances shall be Milwaukee BA-300, Nibco 595, or approved equal.

C. Valves shall be full size of pipe, NSF certified, manufactured by Nibco, Milwaukee, Apollo, or approved equal, in accordance with the following schedule and with the remainder of this specification section.

Ball Valves	3" and below	Nibco T-585HP-66-LF	Milwaukee UPBA-400S
Butterfly Valves	4" and above	Nibco LD-2022	Milwaukee ML-233E
Check Valves	2” and below	Nibco T-413-Y-LF	Milwaukee 508
	2-1/2" and above	Nibco F-910-B-LF	Milwaukee F-2970-M
Gas Valves	4” and below	Nibco T-FP-600A	Apollo 94ALF-A
	5" and above	Nordstrom 149	Resun R-1431-WGA

D. Ball Valves: All ball valves shall be two-piece bronze body with stainless steel ball and stem, PTFE packing/seats, and balancing handle. See the preceding table for acceptable manufacturers and models.

E. Butterfly Valves: All butterfly valves shall be lug style with ductile iron body, stainless steel disc and stem, EPDM liner and seals, and balancing handle with memory stop. See the preceding table for acceptable valve manufacturers and models.

F. Lockshield valves shall be lead-free ball type with locking lever, Nibco T-585-80-LF-LL, Crane D171LS, or approved equal.

G. Manual Balance Valves (2” and Below): Fixed port venturi style, IMI Flow Design AccuSetter UA Series, Pro Hydronic CBV Series, Taco Accu-Flo, Bell & Gossett Circuit Setter Plus, Nibco T-1810-LF, or approved equal. Variable orifice balancing valves are not acceptable.

H. Manual Balance Valves (2-1/2” and Above): Fixed port venturi style, IMI Flow Design AccuSetter AF Series, Hays Series CBVF, Nexus Series NVFB, Bell and Gossett Circuit Setter Plus, Nibco F739, or approved equal. Variable orifice balancing valves are not acceptable.

A. Automatic Pressure-Compensating Flow Control Valves: Valves shall include removable stainless steel cartridge, union, and test ports. Valves shall be Pro Hydronic Specialties Model AFLB (No Lead), IMI Flow Design Model ICSS (No Lead), Hays Mesurflo Model 2517 (No Lead), or approved equal. All ball valves shall have stainless steel ball and stem. All butterfly valves shall have stainless steel disc and stem.

I. Motor-Operated Ball Valves: Provide motor-operated ball valves where indicated on the drawings. Motor-operated ball valves shall be Belimo B2 Series, or approved equal.

J. Motor-Operated Butterfly Valves: Provide motor-operated butterfly valves where indicated on the drawings. Motor-operated ball valves shall be Belimo F6 Series, or approved equal.

K. Manual Air Vent Valves: Manual air vents shall be furnished as indicated on the drawings, complete with ball type isolation valve, Hoffman Model 78, or approved equal. Valve pressure rating shall be as required for the system in which installed.

s

L. Automatic Air Vent Valves: Automatic air vents shall be furnished as indicated on the drawings and shall be Hoffman No. 79, Spirotherm Spirotop, or approved equal. Pipe vents to the nearest floor sink. Valve pressure rating shall be as required for the associated system.

M. Pressure Relief Valves

1. Provide ASME rated pressure relief valves and temperature and pressure relief valves as indicated on the drawings. Valve size and capacity shall be as required for proper relieving capacity equal to or greater than the capacity of the associated equipment output rating. Valves shall be sized and rated for compliance with Sections I, IV, and VIII of the ASME Boiler and Pressure Vessel Code, and ANSI Z21.22, as applicable.
2. Pressure Relief Valves: Where indicated on the drawings for boilers, heat exchangers, chillers, etc. provide bronze body relief valves with test lever, complying with listing requirements for temperature and pressure discharge capacity. Relief valves shall be Watts Series 174A, Series 374, Series 740, or approved equal.
3. Combination Temperature and Pressure Relief Valves: When indicated on the drawings for water heaters and/or hot water storage tanks provide bronze body relief valves with test lever and thermal sensor (thermostat), complying with the applicable listing requirements for temperature and pressure discharge capacity. Temperature and pressure valves shall be Watts XL Series, or approved equal.
4. Available Manufacturers: Subject to compliance with requirements, manufacturers offering relief valves which may be incorporated in the Work include the following:

   Watts
   Bell and Gossett
   Spirax Sarco

N. Pressure Reducing Valves

1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include the following, or approved equal:

   Watts Model 223
   Zurn Model 500XL3
2. Pressure reducing valves shall comply with ASSE Standard 1003.
3. Pressure reducing valves shall be provided with an integral bypass capability. Provide upstream and downstream pressure gauges, and a full size valved bypass at each pressure reducing valve location.
4. Pressure reducing valve size shall be as indicated on the drawings, and/or as appropriate for the associated maximum water flow.
5. Pressure reducing valves for closed hot water and chilled water system make-up shall be 1 inch unless indicated otherwise on the drawings. Provide parallel valves for water flows that are beyond the capacity of a 3 inch pressure reducing valve.
6. Valve Body shall be lead free brass or bronze. Valve end connections shall be threaded for valve sizes 2-1/2 inch and smaller, flanged for 3 inch and larger valves.
7. Valves shall be rated for an initial pressure of 150 psi. Valves shall be selected for inlet and outlet pressures as indicated on the drawings.

O. Emergency gas shutoff valves: See specifications section 22 15 00 Facility Natural Gas

P. General Purpose Solenoid Valves: General purpose solenoid valves for air or water shall be Asco Series 8210, or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION OF VALVES

A. Install valves where required for proper operation and isolation of piping and equipment, including valves in branch lines where necessary to isolate sections of piping. Locate valves so as to be accessible and so that separate support can be provided when necessary.

s

B. Install valves with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane.

C. Provide a union at each connection to equipment and downstream of each valve. Provide unions at both ends of valves when valves cannot be turned due to an obstruction.

D. After piping systems have been tested and put into service, but before final testing, adjusting, and balancing inspect each valve for possible leaks. Adjust or replace packing to stop leaks; replace valve if leakage persists.

E. Tag each valve and provide a complete listing of valve locations and functions. In addition, where valves are located above a ceiling or behind an access panel, provide an adhesive clear plastic label with black 3/8” lettering on ceiling grid or access panel identifying valve.

F. Isolation Valves: Install at the inlet of each plumbing equipment item, at the inlet of each plumbing fixture, and elsewhere as indicated on the drawings.

G. Drain Valves: Install at each plumbing equipment item, located to completely drain the equipment for service or repair. Install at base of each riser, at base of each rise or drop in piping systems, and elsewhere as indicated or required to completely drain potable water systems.

H. Check Valves: Install check valves with a minimum of 5 pipe diameters downstream of each pump discharge or change in direction (to avoid excessive turbulence at the check valve).

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. At completion, carefully clean and adjust all equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.3 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.4 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 22 05 20 - OPERATION AND MAINTENANCE OF PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED

A. This section consists of general requirements and standard specifications covering certain parts of the plumbing work and is supplemented by other specification sections covering additional work, requirements, and materials specifically applicable to the work of each section. Requirements of subsequent sections of the specifications, if in conflict with these requirements, shall govern.

1.3 OPERATION AND MAINTENANCE INSTRUCTIONS

A. Furnish the Architect/Engineer with two complete sets of typewritten operating and maintenance instructions, descriptive literature, catalog cuts, and diagrams covering all items of operation and maintenance for each and every plumbing system and piece of equipment furnished under these specifications.

B. In addition to the bound hard copies the Contractor shall provide an electronic copy (pdf file).

C. The Contractor shall commence compiling the above data (including obtaining operating and maintenance instruction data, catalog cuts, and diagrams from the manufacturer of the reviewed equipment) immediately upon review of his list of materials, so as not to delay the final installation and acceptance of the work.

D. Bind and index each set in a durable, hardboard binder. Final observation should not be requested until the operating and maintenance binders are submitted and have been reviewed by the Architect/Engineer.

E. Incorporate complete operating instructions including starting, stopping, and description of emergency manual operation methods for the following:

Plumbing Systems
Piping Systems
Temperature Controls
Test Data and Startup Reports

F. Provide charts and diagrams as required.

G. Provide operating manual for all equipment listed in individual sections of the specification.

H. Provide maintenance instructions for each item of individual equipment covering pertinent maintenance data, such as lubricants to be used, frequency of lubrication, inspections required, adjustments required, etc.

I. Provide parts bulletins containing manufacturer's part numbers, instructions, etc. for each item of equipment. Strip bulletins so that useless bulk is avoided.

J. Post service telephone numbers and/or addresses in an appropriate place as designated by the Architect/Engineer.

END OF SECTION

SECTION 22 05 30 - HANGERS AND SUPPORTS FOR PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. The Conditions of the Contract (General, Supplementary, and other Conditions), Section 220000 (Plumbing), and Section 220540 (Seismic Bracing for Plumbing Systems) are hereby made a part of this section.

1.2 GENERAL

A. The following information is for pipe hanger and support layout and design reference only. The actual design of all hangers, supports, and seismic bracing is the responsibility of the Contractor per the following specification sections:

Specification Section 22 05 30 (Hangers and Supports for Plumbing Systems)
Specification Section 22 05 40 (Seismic Bracing for Plumbing Systems)

B. Piping: Hangers and supports for piping shall be designed in accordance with the latest adopted edition of the standards and codes listed below, and with any other applicable standards. Except in cases where a pipe stress analysis is performed to justify adjusted support and restraint spacing, pipe hangers and supports shall not be placed at intervals that are further apart than the requirements listed in UPC Table 313.3 and in UMC Table 313.3.

Steel Piping	Maximum Spacing	Reference
1-1/4” and smaller	7 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1-1/2”	9 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2”	10 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2-1/2”	11 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3”	12 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3-1/2”	13 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
4”	14 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
5”	16 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
6”	17 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
8”	19 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
10”	22 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
12”	23 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
14”	25 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
Copper Piping	Maximum Spacing	
3/4” and smaller	5 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1”	6 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1-1/4”	7 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1-1/2”	8 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2”	8 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2-1/2”	9 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3”	10 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3-1/2”	11 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
4”	12 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
5”	13 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
6”	14 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
8”	16 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
Gas Piping	Maximum Spacing	
1/2”	6 feet	International Fuel Gas Code
3/4” & 1”	8 feet	International Fuel Gas Code
1-1/4” and larger	10 feet	International Fuel Gas Code

1.3 SUMMARY

A. Section Includes:
   1. Metal pipe hangers and supports
   2. Thermal hanger shield inserts
   3. Fastener systems
   4. Pipe stands
   5. Equipment stands
   6. Equipment supports

B. Related Requirements: All hangers and support systems shall be designed, selected, and installed by the Contractor to comply with the requirements listed in Section 220540 (Seismic Bracing for Plumbing Piping and Equipment).

C. Costs for hanger, support, and seismic bracing systems complying with the requirements listed herein are the responsibility of the Contractor and shall be included in the Contractor's bid. No extra cost will be allowed for failure to include the associated costs in the Contractor's bid.

1.4 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Signed and sealed by a qualified professional engineer**.** Show fabrication and installation details and include calculations for the following (Include product data for all components):
   1. Trapeze Pipe Hangers
   2. Metal Framing (Strut) Systems
   3. Pipe Stands
   4. Equipment Supports

C. Provide comprehensive, all-inclusive, delegated design submittals for all listed items. Submittals shall comply with all performance requirements and design criteria, including analysis data, signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Details for fabrication and assembly of trapeze hangers.
   2. Design calculations utilized for designing the trapeze hangers.

D. The work of this section shall be coordinated with the requirements for the Contractor furnished seismic design submittal for hangers and supports specified in Section 220540 (Seismic Bracing for Plumbing Piping and Equipment). Design and detailing of seismic bracing, hangers, and supports is the responsibility of the Contractor.

E. Submittals shall be fully coordinated with the structural drawings and shall include all applicable structural and seismic attachment details. Locations and the methods of attachment of hangers and supports to the main structural frame shall comply with the limitations specified in the structural drawings. Submittals shall include all support anchorage loads and vectors broken out by discrete load type. Each specific load shall be indicated in the submittals and the structural element that the support is attached to shall be clearly depicted/identified.

F. Shop drawing submittals will be reviewed by both the design mechanical engineer and the design structural engineer.

1.5 QUALITY ASSURANCE

A. Structural Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, 'Structural Welding Code - Steel.'

B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code, Section IX.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, to design trapeze pipe hangers and equipment supports.

B. Structural Performance: Hangers and supports for plumbing piping and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE Standard 7-16.
   1. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
   2. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.
   3. Design seismic restraint hangers and supports for piping and equipment.
   4. Design of connections for hangers, supports, and bracing shall comply with the requirements indicated on the structural drawings

2.2 METAL PIPE HANGERS AND SUPPORTS

A. Carbon Steel Pipe Hangers and Supports:
   1. Description: MSS SP-58, Types 1 through 58, factory fabricated components.
   2. Galvanized Metallic Coatings: Pre-galvanized, hot dip galvanized, or electro-galvanized.
   3. Non-Metallic Coatings: Plastic coated or epoxy powder coated.
   4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support the bearing surface of the piping.
   5. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.

B. Stainless Steel Pipe Hangers and Supports:
   1. Description: MSS SP-58, Types 1 through 58, factory fabricated components.
   2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
   3. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.

C. Copper Pipe and Tube Hangers:
   1. Description: MSS SP-58, Types 1 through 58, copper plated steel, factory fabricated components.
   2. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.

2.3 TRAPEZE PIPE HANGERS

A. Description: MSS SP-58, Type 59, shop or field fabricated pipe support assembly made from structural carbon steel shapes with MSS SP-58 carbon steel hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING (STRUT) SYSTEMS

A. Metal Framing Manufacturers Association (MFMA) Metal Framing Systems:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
      a. B-line
      b. Unistrut
      c. Flex-Strut
      d. G-Strut
      e. Miro Industries

2. Description: Shop or field fabricated, pipe support assembly made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.
3. Standard: Comply with MFMA-4 factory fabricated components for field assembly.
4. Channels: Continuous slotted carbon steel channel with in-turned lips.
5. Channel Width: Selected for applicable load criteria.
6. Channel Nuts: Formed or stamped nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.
7. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.
8. Metallic Coating: Zinc dichromate finish applied over an electro-galvanized zinc plating.

2.5 THERMAL HANGER SHIELD INSERTS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
   1. Pipe Shields
   2. nVent/Caddy
   3. Buckaroos
   4. Carpenter & Paterson
   5. Piping Technology & Products
   6. Rilco Manufacturing
   7. Value Engineered Products

B. Insulation Insert Material for Cold Piping: ASTM C552, Type II cellular glass with 100 psi or ASTM C591, Type VI, Grade 1 polyisocyanurate with 125 psi minimum compressive strength and vapor barrier.

C. Insulation Insert Material for Hot Piping: Water repellent treated, ASTM C533, Type I calcium silicate with 100 psi ASTM C552, Type II cellular glass with 100 psi or ASTM C591, Type VI, Grade 1 polyisocyanurate with 125 psi minimum compressive strength.

D. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

E. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

F. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

G. Structural insert material for hot piping shall be water resistant, high density, calcium silicate with minimum a density of 28 lbs/ft^3 and a minimum compressive strength of 900 psi. Structural inserts shall be used as recommended by the manufacturer to meet load ratings.

H. Structural insert material for cold piping shall be water resistant, high density, polyisocyanurate with a minimum density of 14 lbs/ft^3 and a minimum compressive strength of 900 psi. Structural inserts shall be used as recommended by manufacturer to meet load ratings.

I. Provide a vapor barrier steel jacket around insulation. Insulation jackets shall be galvanized steel conforming to ASTM A653. Hanger bearing surface shall consist of a galvanized sheet metal insulation protection shield or casing.

J. Thermal hanger supports shall be load rated. Load ratings shall be established by the pipe support manufacturer based upon testing and analysis in conformance with the latest edition of the following codes and standards: ASME B31.1, MSS SP-68, MSS SP-69, and MSS SP-89.

K. Unless otherwise indicated, thermal hanger supports shall be as indicated in the following schedule, or approved equal. The listed model numbers are based on Pipe Shields.
   1. Pipe supported on hangers: Models A2000, A4000, A9000, and D3000 series.
   2. Pipe supported on flat surfaces: Models A2000, A4000, A6000, A7000, A7200, and A7400.
   3. Pipe Supported on pipe rolls: Models A4000, A6000, A8200, and A8400.
   4. Pipe supported on slides and guides: Model B series.
   5. Riser pipe supports: Model E series.

L. The selected model(s) shall conform to pipe service, support style, and support spacing.

M. Pipe support spacing shall be in accordance with the manufacturer's recommendations, but in no case shall exceed the maximum spacing required by ASME B31.1.

2.6 FASTENER SYSTEMS

A. Powder Actuated Fasteners: Threaded steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used. Powder actuated fasteners may only be utilized for point loads or 50 lbs or less.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
      a. Hilti
      b. ITW Ramset/Red Head
      c. MKT Fastening
      d. Simpson Strong-Tie

B. Mechanical Expansion Anchors: Insert wedge type anchors for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
   1. Indoor Applications: Zinc-coated stainless steel.
   2. Outdoor Applications: Stainless steel.
   3. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
      a. Hilti
      b. ITW Ramset/Red Head
      c. MKT Fastening
      d. B-line

2.7 PIPE STANDS

A. General Requirements for Pipe Stands: Shop or field fabricated assemblies made of manufactured corrosion resistant components to support roof mounted piping.

B. Compact Pipe Stand
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following, or approved equal:
      a. Miro Industries
      b. PHP Systems/Design
      c. RectorSeal HVAC
      d. Rooftop Support Systems
   2. Description: Single base unit with integral rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.
   3. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate.
   4. Hardware: Galvanized steel or polycarbonate.

5. Accessories: Protection pads.

C. Low Profile, Single Base, Single Pipe Stand:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Miro Industries
      b. PHP Systems/Design
      c. Rooftop Support Systems
   2. Description: Single base with vertical and horizontal members, and pipe support, for roof installation without membrane protection.
   3. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate.
   4. Vertical Members: Two, galvanized stainless steel, continuous thread 1/2 inch rods.
   5. Horizontal Member: Adjustable horizontal, galvanized stainless steel pipe support channels.
   6. Pipe Supports: Roller strut clamps, clevis hanger, or swivel hanger.
   7. Hardware: Galvanized stainless steel.
   8. Accessories: Protection pads.
   9. Height: 12 inches above roof Insert lesser dimension above roof.

D. High Profile, Single Base, Single Pipe Stand:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Miro Industries
      b. PHP Systems/Design
      c. Rooftop Support Systems
   2. Description: Single base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.
   3. Base: Single vulcanized rubber or molded polypropylene.
   4. Vertical Members: Two, galvanized stainless steel, continuous thread 1/2 inch rods.
   5. Horizontal Member: One, adjustable height, galvanized stainless steel pipe support slotted channel or plate.
   6. Pipe Supports: Roller strut clamps, clevis hanger, swivel hanger.
   7. Hardware: Galvanized stainless steel.
   8. Accessories: Protection pads, 1/2 inch continuous thread galvanized steel rod, 1/2 inch continuous thread stainless steel rod.
   9. Height: 36 inches above roof Insert lesser dimension above roof.

E. High Profile, Multiple Pipe Stand:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Miro Industries
      b. PHP Systems/Design
      c. RectorSeal HVAC
      d. Rooftop Support Systems
   2. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
   3. Bases: Two or more; vulcanized rubber molded polypropylene insert material.
   4. Vertical Members: Two or more, galvanized stainless steel channels.
   5. Horizontal Members: One or more, adjustable height, galvanized stainless steel pipe supports.

6. Pipe Supports: Roller strut clamps, clevis hanger, swivel hanger.
7. Hardware: Galvanized stainless steel.
8. Accessories: Protection pads**,** 1/2 inch continuous thread rod.
9. Height: 24 inches above the roof or as indicated on the drawings.

F. Curb Mounted Type Pipe Stands: Shop or field fabricated pipe supports made from structural steel shapes, continuous thread rods, and rollers, for mounting on permanent stationary roof curb.

2.8 EQUIPMENT SUPPORTS

A. Description: Welded, shop or field fabricated equipment support made from structural carbon steel shapes.

2.9 OUTDOOR EQUIPMENT STANDS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. MIRO Industries
2. RectorSeal HVAC
3. Rooftop Support Systems

B. Description
1. Description: Individual foot supports with elevated adjustable channel cross bars and clamps/fasteners/bolts for ground or roof supported outdoor equipment components, without roof membrane penetration, in a pre-fabricated system that can be modularly assembled on site.
2. Foot Material: Rubber or polypropylene.
3. Rails Material: Hot dip galvanized carbon steel.
4. Wind/Sliding Load Resistance: Up to 120 mph, or as indicated on the structural drawings.

2.10 MATERIALS

A. Aluminum: ASTM B221.

B. Carbon Steel: ASTM A1011/A1011M.

C. Structural Steel: ASTM A36/A36M, carbon steel plates, shapes, and bars; galvanized.

D. Stainless Steel: ASTM A240/A240M.

E. Threaded Rods: Continuously threaded. Zinc plated or galvanized steel for indoor applications and stainless steel for outdoor applications. Mating nuts and washers of similar materials as rods.

F. Grout: ASTM C1107/C1107M, factory mixed and packaged, dry, hydraulic cement, non-shrink and non-metallic grout; suitable for interior and exterior applications.
1. Properties: Non-staining, non-corrosive, and non-gaseous.
2. Design Mix: 5,000 psi, 28 day compressive strength.

PART 3 - EXECUTION

3.1 APPLICATION

A. Comply with all requirements in other section of the specifications for firestopping materials and installation for penetrations through fire rated walls, ceilings, and assemblies.

B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lbs.

3.2 HANGER AND SUPPORT INSTALLATION

A. Metal Pipe Hanger Installation: Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.

B. Metal Trapeze Pipe Hanger Installation: Comply with MSS SP-58. Arrange for grouping of parallel runs of horizontal piping, and support together on field fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
   2. Field fabricate from ASTM A36/A36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.

C. Thermal Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

D. Fastener System Installation:
   1. Install powder actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder actuated tool manufacturer. Install fasteners according to powder actuated tool manufacturer's operating manual.
   2. Install mechanical expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

E. Pipe Stand Installation:
   1. Pipe Stand Types Except Curb Mounted Type: Assemble components and mount on smooth roof surface. Do not penetrate the roof membrane.
   2. Curb Mounted Type Pipe Stands: Assemble components or fabricate pipe stands and mounts on a permanent, stationary roof curb.

F. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.

G. Equipment Support Installation: Fabricate from welded structural steel shapes.

H. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

I. Install lateral bracing with pipe hangers and supports to prevent swaying.

J. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, 2-1/2” pipe size and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

K. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

L. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

M. Insulated Piping:
   1. Attach clamps and spacers to piping.
      a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
      b. Piping Operating below Ambient Air Temperature: Use thermal hanger shield insert with clamp sized to match OD of insert.
      c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
   2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.

a. Option: Thermal-hanger shield inserts may be used. Include steel weight distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.

3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
   a. Option: Thermal hanger shield inserts may be used. Include steel weight distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
   a. 1/2” to 3-1/2” pipe: 12 inches long and 0.048 inch thick.
   b. 4” pipe: 12 inches long and 0.06 inch thick.
   c. 4” and 5” pipe: 18 inches long and 0.06 inch thick.
   d. 8” thru 14” pipe: 24 inches long and 0.075 inch thick.
5. Pipes 8” and Larger: Include wood or reinforced calcium silicate insulation inserts of length at least as long as protective shield.
6. Thermal Hanger Shields: Install with insulation same thickness as piping insulation.

3.3 EQUIPMENT SUPPORTS

A. Fabricate structural steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make bearing surface smooth.

C. Provide lateral bracing to prevent swaying for equipment supports.

3.4 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1/D1.1M procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.5 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous thread hanger and support rods to 1-1/2 inches.

3.6 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field painted surfaces.
   1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing repair paint to comply with ASTM A780/A780M.

3.7 HANGER AND SUPPORT SCHEDULE

A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.

B. Comply with MSS SP-58 for pipe hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use carbon steel pipe hangers and supports metal trapeze pipe hangers and metal framing systems and attachments for general service applications.

F. Use copper plated pipe hangers and copper or stainless steel attachments for copper piping and tubing.

G. Use padded hangers for piping that is subject to scratching.

H. Use thermal hanger shield inserts for insulated piping and tubing.

I. Horizontal Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of non-insulated or insulated, stationary pipes 1/2” thru 30” size.
   2. Yoke Type Pipe Clamps (MSS Type 2): For suspension of up to 1050°F, pipes 4” thru 24” size, requiring up to 4 inches of insulation.
   3. Carbon or Alloy Steel, Double Bolt Pipe Clamps (MSS Type 3): For suspension of pipes 3/4” thru 36” size, requiring clamp flexibility and up to 4 inches of insulation.
   4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes 1/2” thru 24” size if little or no insulation is required.
   5. Pipe Hangers (MSS Type 5): For suspension of pipes 1/2” thru 4” size, to allow off center closure for hanger installation before pipe erection.
   6. Adjustable Swivel Split or Solid Ring Hangers (MSS Type 6): For suspension of non-insulated, stationary pipes 3/4” thru 8” size.
   7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of non-insulated, stationary pipes 1/2” thru 8” size.
   8. Adjustable Band Hangers (MSS Type 9): For suspension of non-insulated, stationary pipes 1/2” thru 8” size.
   9. Adjustable, Swivel Ring Band Hangers (MSS Type 10): For suspension of non-insulated, stationary pipes 1/2” thru 8” size.
   10. Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11): For suspension of non-insulated, stationary pipes 3/8” thru 8” size.
   11. Extension Hinged or Two Bolt Split Pipe Clamps (MSS Type 12): For suspension of non-insulated, stationary pipes 3/8” thru 3” size.
   12. U-Bolts (MSS Type 24): For support of heavy pipes 1/2” thru 30” size.
   13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
   14. Pipe Saddle Supports (MSS Type 36): For support of pipes 4” thru 36” size, with steel pipe base stanchion support and cast iron floor flange or carbon steel plate.
   15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes 4” thru 36” size, with steel pipe base stanchion support and cast iron floor flange or carbon steel plate, and with U-bolt to retain pipe.
   16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion type support for pipes 2-1/2” thru 36” size if vertical adjustment is required, with steel pipe base stanchion support and cast iron floor flange.

17. Single Pipe Rolls (MSS Type 41): For suspension of pipes 1” thru 30” size , from two rods if longitudinal movement caused by expansion and contraction might occur.
18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes 2-1/2” thru 24” size, from single rod if horizontal movement caused by expansion and contraction might occur.
19. Complete Pipe Rolls (MSS Type 44): For support of pipes 2” thru 42” size if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is unnecessary.
20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes 2” thru 24” size if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is unnecessary.
21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes 2” thru 30” size if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

J. Vertical Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers 3/4” thru 24”.
   2. Carbon or Alloy Steel Riser Clamps (MSS Type 42): For support of pipe risers 3/4” thru 24” size if longer ends are required for riser clamps.

K. Hanger Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
   2. Steel Clevises (MSS Type 14): For 120 to 450°F piping installations.
   3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
   4. Malleable Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
   5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450°F piping installations.

L. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
   2. Top Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.
   3. Side Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
   4. Center Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
   5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
   6. C-Clamps (MSS Type 23): For structural shapes.
   7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
   8. Side Beam Clamps (MSS Type 27): For bottom of steel I-beams.
   9. Steel Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
   10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
   11. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
   12. Welded Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
      a. Light (MSS Type 31): 750 lbs.
      b. Medium (MSS Type 32): 1500 lbs.
      c. Heavy (MSS Type 33): 3000 lbs.
   13. Side Beam Brackets (MSS Type 34): For sides of steel or wooden beams.

14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

M. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel Pipe Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
   2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
   3. Thermal Hanger Shield Inserts: For supporting insulated pipe.

N. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Restraint Control Devices (MSS Type 47): Where indicated to control piping movement.
   2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
   3. Spring Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.
   4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
   5. Variable Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
   6. Variable Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
   7. Variable Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.
   8. Constant Supports: For critical piping stress and if necessary, to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load adjustment capability. These supports include the following types:
      a. Horizontal (MSS Type 54): Mounted horizontally.
      b. Vertical (MSS Type 55): Mounted vertically.
      c. Trapeze (MSS Type 56): Two vertical type supports and one trapeze member.

O. Comply with MSS SP-58 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

P. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.

Q. Use powder actuated fasteners and mechanical expansion anchors instead of building attachments where required in concrete construction.

END OF SECTION

SECTION 22 05 40 - SEISMIC BRACING FOR PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Section 220000 (Plumbing), Section 220500 (Basic Materials and Methods for Plumbing), and Section 220530 (Hangers and Supports for Plumbing Systems) are hereby made a part of this section.

1.2 GENERAL

A. Seismic bracing for plumbing systems (equipment, piping, and conduit) shall comply with all applicable requirements of the latest adopted edition of the International Building Code (IBC) including all applicable provisions of the latest adopted edition of the American Society of Civil Engineers (ASCE) Minimum Design Loads for Buildings and Other Structures (ASCE Standard 7-16). Basic seismic design criteria for each project shall be as listed on the structural drawings for that project.

B. The anchorage calculations shall show compliance with the latest adopted edition of the American Concrete Institute (ACI) Standards, Handbooks, and Manuals where anchoring to concrete for the project-specific loads and conditions, including project specific calculations for anchors, clips, and fasteners.

C. Compliance with the applicable seismic bracing requirements for equipment, piping, and conduit shall be accomplished utilizing the most current version of one of the following design manuals, or approved equal.

International Seismic Application Technology (ISAT) Design Manual
Mason Industries Seismic Restraint Design Manual
Vibro-Acoustics Seismic Design Manual

D. Component Importance Factors (Ip) for all equipment, ductwork, piping, and conduit shall be determined and assigned in accordance with ASCE Standard 7-16 Section 13.1.3.

E. Design and detailing of seismic bracing, hangers, and supports for equipment, piping, and conduit is the responsibility of the Contractor.

F. Design of connections for hangers, supports, and bracing shall comply with the requirements indicated on the structural drawings.

G. The work of this section shall be coordinated with the requirements for the Contractor furnished delegated design submittal for hangers and supports specified in Section 220530 (Hangers and Supports for Plumbing Systems). Design and detailing of seismic bracing, hangers, and supports is the responsibility of the Contractor.

1.3 SUBMITTALS

A. The Contractor shall provide the required number of seismic shop drawing submittal sets for review and approval by the Engineer. Submittals shall include a comprehensive set of shop drawings clearly depicting the seismic bracing requirements for all equipment, piping, and conduit. Any piping or conduit that does not require seismic bracing shall be specifically identified in the submittal, and the reason for exemption shall be provided. Cite any and all references for the exemption. In cases where seismic bracing is not required due to the supported items being less than 12 inches below the supporting structure, a single note may be provided to cover those locations.

B. Submittals shall be fully coordinated with the structural drawings and shall include all applicable structural attachment details. Seismic bracing shop drawings shall include all vertical support anchorage loads and all seismic bracing anchorage loads. Each specific load shall be indicated and the structural element that the support is attached to shall be clearly depicted/identified. Seismic bracing submittals shall be stamped and signed by a structural or civil engineer with current registration licensed in the State of Nevada (or licensed in the state where the project is located, if the project is located outside the State of Nevada).

C. Seismic shop drawing submittals will be reviewed by both the design mechanical engineer and the design structural engineer.

1.4 SITE VISITS (QUALITY CONTROL)

A. An authorized representative of the seismic bracing system manufacturer shall visit the job site during the construction period to confirm that the seismic bracing installation complies with the shop drawings, with all applicable code requirements, and with the seismic bracing system manufacturer's written installation requirements and associated details. As a minimum, an authorized representative shall visit the site when the seismic bracing installation is complete (and prior to installation of the ceilings).

B. A written report shall be issued within one week the site visit summarizing the observations made during the site visit and listing all required corrective actions and/or deficiencies. The report shall be made available to both the design mechanical engineer and the design structural engineer.

C. After all equipment installation is complete and all seismic bracing has been verified, the authorized representative that conducted the field verification shall issue a letter certifying that the installation is complete and that the installation complies with the specified requirements

D. Site visits shall be coordinated with the Owner and shall be scheduled in writing a minimum of one week prior to the proposed site visit date.

END OF SECTION

SECTION 22 07 00 - PLUMBING INSULATION

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED:

A. Types of plumbing insulation specified in this section include the following:
Domestic Cold Water Piping
Domestic Hot Water Supply and Return Piping
Non-Potable Cold Water Piping (Indoors)
Non Potable Cold Water Piping (Outdoors)
Rainwater Piping and Roof Drain Sumps
ADA Compliant Plumbing Fixtures
Removable Insulation Jackets
Equipment Insulation

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of plumbing insulation products, of types and sizes required, whose products have been in satisfactory use in similar service for not less than 3 years.

B. Installer's Qualifications: A firm with at least 5 years successful installation experience on projects with mechanical insulations similar to that required for this project.

C. Install thermal insulation products on equipment in accordance with manufacturer's written instructions and in accordance with recognized industry practices to ensure that insulation serves its intended purpose.

D. Flame/Smoke Ratings: For insulation installed inside the building provide composite mechanical insulation (insulation, jackets, coverings, sealers, mastics, and adhesives) with a flame spread rating of 25 or less and a smoke developed index of 50 or less, as tested by the ASTM E84 (NFPA 255) method.

1.4 SUBMITTALS:

A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of mechanical insulation. Submit schedule showing manufacturer's product number, k-Value, thickness, density, and furnished accessories for each plumbing system requiring insulation. Include complete description of installation methods with this submittal.

PART 2 - PRODUCTS

2.1 PIPE INSULATION MATERIALS

A. General: All pipe insulation conductivities and thicknesses shall meet or exceed the requirements listed in International Energy Conservation Code Table C403.11.3.

B. Kitchens: For insulated piping exposed in kitchen, hospital, and/or pharmacy areas the aluminum jacketing listed in the following sections shall be replaced with T-304 stainless steel jacketing.

C. Aluminum Jacketing shall be provided on exposed piping and shall be Johns Manville 'JM Aluminum Jacketing' with 'Polyfilm Moisture Barrier' and stucco-embossed finish, or approved equal, and shall be provided where indicated, in the following thicknesses:
   1. For Insulation Outside Diameters under 8 inches: .016 inch thick jacketing
   2. For Insulation Outside Diameters 8 inch and larger: .020 inch thick jacketing

D. Exposed in all piping applications shall mean any exposed pipe in a mechanical room or mezzanine area that is less than 8'-0" above finished floor.

E. Fiberglass Insulation:
   1. Fiberglass insulation shall be Johns Manville Microlok HP, or equal, with factory-applied fire-retardant ASJ jacket, self-sealing laps, and shall be applied per the manufacturer's written recommendations. Conductivity shall be .24 Btu-in/(hr-ft^2-°F) at 100°F.
   2. Insulate and cover all fittings with Johns Manville Zeston Series 2000 pre-molded fitting covers secured with serrated tacks, adhesive, and/or Zeston Z-Tape.
   3. Install a segment of rigid calcium silicate insulation at each pipe hanger for pipe sizes 2-1/2 inches and larger.
   4. Finish all cold fittings with Zeston Z-tape to provide a vapor-tight seal.
   5. Seal all raw ends of insulation with Childers CP-10 weather barrier sealant, or approved equal.
   6. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following, or approved equal:

      Johns Manville
      CertainTeed
      Owens Corning

F. Closed Cell Polyisocyanurate Insulation with Aluminum Jacketing:
   1. Closed cell polyisocyanurate insulation shall be Trymer 25-50, or approved equal. Install per manufacturer's recommendations. Insulation shall have a less than 25/50 flame spread and smoked developed rating in accordance with ASTM E84. Conductivity shall be .190 Btu-in/(hr-ft^2-°F) at 75°F. Insulation shall be rated for applications up to 300°F.
   2. Jacketing: Cover pipe and fitting insulation with .016" thick stucco-embossed aluminum jacketing with 'Polyfilm Moisture Barrier'. Install per manufacturer's recommendations.
   3. Finish all cold fittings as required to provide a vapor-tight seal.
   4. Secure all insulation jacketing with T-304 stainless steel bands at 12" on center.
   5. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:

      Johns Manville ITW Insulation Systems

2.2 DOMESTIC COLD WATER (INDOORS)

A. Insulate exposed domestic cold water piping with fiberglass insulation covered with aluminum jacketing and aluminum fitting covers.

B. Insulate concealed domestic cold water piping with fiberglass insulation. Do not insulate unions, valves, and exposed runouts to fixtures served with domestic cold water piping.
   1. Minimum Insulation Thickness:
      a. Piping 1-1/4 inch and smaller: 1 inch
      b. Piping 1-1/2 inch and larger: 1 inch

2.3 DOMESTIC HOT WATER (INDOORS)

A. Insulate exposed domestic hot water supply and return piping with fiberglass insulation covered with aluminum jacketing and aluminum fitting covers.

B. Insulate concealed domestic hot water supply and return piping with fiberglass insulation. Do not insulate unions, valves, and exposed runouts to fixtures in domestic hot water piping.

1. Minimum Insulation Thickness:

a. Piping 1 inch and smaller: 1 inch

b. Piping 1-1/4 inch and larger: 1-1/2 inches

2.4 NON-POTABLE COLD WATER PIPING (INDOORS)

A. Insulate exposed non-potable cold water piping with fiberglass insulation covered with aluminum jacketing and aluminum fitting covers.

B. Insulate concealed non-potable cold water piping with fiberglass insulation.

1. Minimum Insulation Thickness:

a. Piping 1-1/4 inch and smaller: 1 inch

b. Piping 1-1/2 inch and larger: 1 inch

2.5 NON-POTABLE COLD WATER PIPING (OUTDOORS)

A. Insulate non-potable cold water piping installed outdoors with closed cell polyisocyanurate insulation covered with aluminum jacketing and aluminum fitting covers. Provide heat tracing where indicated on the drawings.

1. Minimum Insulation Thickness (All pipe sizes): 1 inch

2.6 RAINWATER PIPING (INDOORS)

A. Insulate roof drain sumps with one layer of 1/2” thick self-adhesive closed cell elastomeric insulation (AP-ArmaFlex Self-Adhesive Insulation, or approved equal).

B. Insulate rainwater piping with fiberglass insulation, fitting covers, and Zeston Z-tape.

1. Minimum Insulation Thickness (All pipe sizes): 1 inch

2.7 OVERFLOW RAINWATER PIPING (INDOORS)

A. Insulation is not required on overflow roof drain piping located indoors.

2.8 RAINWATER PIPING AND OVERFLOW RAINWATER PIPING (OUTDOORS)

A. Insulate roof drain and overflow roof drain sumps with one layer of 1/2” thick self-adhesive closed cell elastomeric insulation (AP-ArmaFlex Self-Adhesive Insulation, or approved equal).

B. Insulate rainwater piping and overflow rainwater piping that is exposed outdoors in an unheated area with 1” thick closed cell elastomeric insulation, heat tracing, and aluminum jacketing.

C. Provide heat tracing where indicated on the drawings. Piping with heat tracing that is installed inside a soffit or other enclosure does not require aluminum jacketing.

2.9 ADA COMPLIANT PLUMBING FIXTURES

A. Insulate domestic hot water, domestic cold water, and waste piping below ADA compliant plumbing fixtures with Plumberex Pro-Extreme pipe covers, or approved equal. Covers shall be manufactured of 1/8 inch thick PVC with anti-microbial, anti-fungal, and UV-resistant properties. Covers shall have vandal resistant snap fasteners and shall comply with ASME A112.18.9.

2.10 EQUIPMENT INSULATION MATERIALS

A. General: All equipment insulation R-Values and thicknesses shall meet or exceed the requirements listed in International Energy Conservation Code Section C403.11.3.

B. Water Heating Equipment

1. Insulate all water heating equipment operating at increased surface temperatures and which does not have factory-applied insulation, including heating water system air separators. Do not insulate heating water expansion tanks or heating water pumps.
2. Flat insulation shall be 3 lb density fiberglass board with thickness as required for the operating temperature of the associated fluid inside the equipment. Insulation shall be Johns Manville Series 800 Spin-Glas with reinforced FSK jacket, Owens Corning Series 700 fiberglass board insulation with reinforced FSK jacket, or approved equal.
3. Curved insulation shall be 2.5 lb density semi-rigid fiberglass with thickness as required for the operating temperature of the associated fluid inside the equipment. Insulation shall be Johns Manville Micro-Flex large diameter pipe and tank insulation with reinforced FSK jacket, Owens Corning large diameter pipe and tank insulation with reinforced FSK jacket, or approved equal.
4. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:

   Johns Manville
   Owens Corning

C. Removable Insulating Jackets

1. Insulation and jacket material shall be rated for the operating temperature of the equipment and/or fluid being insulated. Insulating jackets shall be removable and reusable, thermal and acoustical insulating jackets, constructed of minimum 18 ounce material, and sewn with Kevlar thread.
2. Jackets for hot water applications shall be fabricated with PTFE-coated fiberglass fabric inner and outer material and minimum 1” thick needled fiberglass insulation (see pipe insulation section for required thickness based on pipe size and temperature).
3. Jackets for cold water applications shall be fabricated with PTFE-coated fiberglass fabric inner and outer material and 1” thick needled fiberglass insulation.
4. Insulating jackets shall be secured with stainless steel d-rings with straps and Velcro fasteners.
5. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:

   Insultech
   MIT International
   Thermal Energy Products
6. Removable insulating jackets shall be provided for the following items.

   Motorized control valves located indoors and/or outdoors.
   Flanged valves located indoors and/or outdoors.

D. Ice Machines: Insulate all ice machine drain piping which does not have factory-applied insulation with fiberglass Insulation. Insulation is not required on ice machine overflow drain piping. Minimum Insulation Thickness for all pipe sizes: 1 inch.

E. Manholes and Handholes: Manholes and handholes shall be made accessible by beveling the insulation around the manhole, and covering the manhole with a removable insulating fiberglass blanket, same thickness as the adjacent equipment insulation. Manhole and handhole covers shall be finished the same as the tank covering.

PART 3 - EXECUTION

3.1 INSTALLATION OF PIPING INSULATION

A. The term ‘piping’ used herein shall include pipe, valves, strainers, and fittings. Apply insulating cements to fittings, valves, and strainers, and trowel smooth to the thickness of adjacent covering. Covering on valves shall extend up to the bonnet. The covering cement shall be of the types herein specified

B. Install insulation products in accordance with manufacturer's written instructions and in accordance with recognized industry practices to ensure that insulation serves its intended purpose.

C. Install insulation on pipe systems subsequent to installation of heat tracing, testing, and acceptance of tests.

D. Install insulation materials with smooth and even surfaces. Insulate each continuous run of piping with full length units of insulation, with single-cut pieces to complete each run. Do not use cut pieces or scraps abutting each other.

E. Clean and dry pipe surfaces prior to insulating. Butt insulation joints firmly together to ensure complete and tight fit over surfaces to be covered.

F. Extend piping insulation without interruption through walls, floors, and similar penetrations, except where otherwise indicated.

G. Install pipe hangers on the outside of the insulation and not in contact with the pipe.

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective insulation. Leave entire work in condition satisfactory to Architect. At completion, carefully clean equipment installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.3 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 22 08 00 - COMMISSIONING OF PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Division 01, Section 01 91 13, General Commissioning Requirements

B. All Division 22 and applicable Division 23 & 26 Sections.

1.3 REFERENCES

A. BCA - Building Commissioning Association.

B. IPC – International Plumbing Code

C. IECC

1. International Energy Conservation Code (IECC) 2018 – Section C408: Maintenance Information and System Commissioning

1.4 DEFINITIONS

A. Basis of Design (BOD): The documentation of design criteria and assumptions for systems, components, and methods chosen to meet the Owner's Project Requirements and applicable regulatory requirements, standards, and guidelines. The document includes narrative descriptions of the systems to be commissioned. The BOD is prepared by the Design Professionals.

B. Building Automation System (BAS): The automated building system providing control and user interaction with select building systems, such as the HVAC, domestic hot water and lighting systems. Also, often referred to as building management system (BMS), energy management system (EMS), or an energy management and control system (EMCS).

C. Commissioning (Cx): A quality-focused process to verify and document that building systems are installed and perform as intended per the OPR, BOD and design documents.

D. Commissioning Authority (CxA): An independent entity hired directly by the Owner to lead, oversee and review the completion of the commissioning process and tasks. The CxA is not responsible for the design or construction of the project. The CxA is the authority on commissioning process, program elements and results, and assists the construction team with coordinating and completing tasks. And reviews and witnesses the completion of the process and tasks using a sampling approach.

E. Functional Performance Test (FPT): A test of the dynamic function, operation and control of the equipment and systems to verify system performance to the fullest extent. Systems are tested

under various operating modes and control sequences including failure modes. The FPTs are performed using manual (direct observation) or monitoring methods. The FPTs can include sequence of operation tests, verification tests, performance tests, integrated systems tests, and trend analysis (monitoring). FPTs are often referred to as acceptance testing.

F. General Contractor (GC): The contractor directly contracted to the Owner with overall responsibility for the project construction and all commissioning activities described herein.

G. HVAC: Heating, ventilation, air conditioning.

H. Installation Verification (IV): Field verification and documentation of proper installation of system equipment, assemblies, and components, per design documents, manufacturer guidelines and industry standards. The IV process is typically complete when systems are ready for startup or operation.

I. Owner's Project Requirements (OPR): A document describing the operational and functional requirements of a project, the expectations of how the facility will be used and operated, and the equipment and system expectations and requirements, as defined by the Owner. This document provides an explanation of the ideas, concepts, goals, success criteria, and supporting information for the project.

J. Pre-Functional Test (PFT): A test or check performed on a piece of equipment, system or controls before, during, or after the initial startup and operation, but prior to the FPT phase. The PFT is performed to confirm, verify and document the system equipment and individual components are working properly, are controlled properly and meeting applicable performance requirements and specifications. A PFT example include verifying and documenting completion of the domestic pipe clean and disinfection.

K. Startup: Initial starting or activating of equipment usually performed by the Trade Contractor or the Manufacturer's authorized representative, including applicable PFTs during the startup process.

L. Systems Manual: A manual that provides the operating staff the information needed to understand and optimally operate the commissioned systems. It expands upon the scope of traditional operating and maintenance documents and is compiled of multiple documents such as the final BOD, single line diagrams, and as-built controls drawings and sequences of operation.

M. TAB: Testing, Adjusting, and Balancing (TAB) work on the HVAC&R air and water systems to ensure design flow, pressure and temperature conditions are met. Performed by the TAB Trade Contractor.

N. Trade Contractor: A subcontractor who provides and installs specific building components and systems and/or provides certain services.

1.5 GENERAL COMMISSIONING DESCRIPTION

A. Commissioning is a quality-focused process for achieving, verifying and documenting that building systems are installed and perform functionally as intended according to the OPR, BOD, and the requirements of the design documents.

B. The work includes the completion and documentation of formal commissioning procedures by the GC, Trade Contractors, and the Manufacturer Representatives.

1. The GC and Trade Contractors shall provide the quality control for the installation, startup, checkout and testing of the systems. The commissioning process provides independent review and witnessing by the CxA (using a sampling approach) throughout the process and during qualitative functional performance testing, to observe and verify the implementation of the process, specific tasks and quality control efforts.
2. Refer to Section 01 91 13, General Commissioning Requirements for summary description of the general commissioning process and requirements.
3. The Trade Contractors and the Manufacturer Representatives shall be responsible for participation in the commissioning process as outlined in this specification and Section 01 91 13 General Commissioning Requirements.

C. Systems and equipment to be commissioned:

1. Domestic cold and hot water systems, including piping, water heaters, re-circulation pumps, thermostatic mixing valves and associated controls.
2. Domestic hot water systems including water heaters, re-circulation pumps, thermostatic mixing valves and associated controls.
3. Pumping systems and controls, including booster, sump, and sewage ejector pumps.
4. Plumbing fixtures with automatic controls.
5. Any BAS controls or monitoring for plumbing systems.

D. Systems and equipment not included in the commissioning are listed below. Commissioning of these systems may fall under the responsibility of the Contractor and/or the Authority Having Jurisdiction (AHJ) as noted in the design specifications.

1. Process systems and equipment.
2. Fire protection, suppression, and sprinkler systems.
3. Waste and vent systems, and storm water systems.
4. Reverse osmosis (RO) and industrial water systems.
5. Water and natural gas meters.
6. Water recovery and reuse systems.
7. Compressed air, vacuum air, and other industrial air systems.
8. Natural gas systems.

1.6 COMMISSIONING TEAM

A. The Commissioning Team is comprised of the following:

1. Owner and Owner’s Representatives
2. Commissioning Authority (CxA).
3. Design Professionals

4. General Contractor (GC)
5. Trade Contractors responsible for systems covered in this section include:
    a. Plumbing Contractor
    b. BAS Contractor
    c. TAB Contractor (if appliable for TAB of plumbing systems).
6. Manufacturer Representatives supplying equipment, materials, components and controls for the systems to be commissioned.

1.7 COMMISSIONING PROCESS

A. Submittal Reviews by the CxA

1. The CxA will review pertinent Trade Contractor submittals for the appropriate systems in the commissioning scope, concurrently with the Design Team and will provide review comments to the Design Team.
2. The GC shall provide a submittal log to the CxA for referencing the requested submittals to be reviewed by the CxA (for which the GC shall issue to the CxA concurrently with the submission to the Design Team). Alternatively, the GC shall include the CxA on the distribution of all Trade Contractor submittals issued to the Design Team, for systems applicable to this specification.
3. The GC shall issue the requested submittals to the CxA for review at the same time they issue the submittals to the Design Team.
4. The CxA will also use the information from the submittals to develop commissioning forms and test procedures.

B. Cx Plan and Form/Procedure Development

1. The CxA prepares a Preliminary Cx Plan either during the project final design phase or early construction phase. The Cx Plan provides guidance in the execution of the commissioning process during construction.
2. Commissioning during construction begins with a kickoff meeting conducted by the CxA where the CxA reviews the commissioning process and responsibilities with the appropriate team members. The CxA presents the Preliminary Cx Plan and discusses the project specific requirements.
3. The GC and Trade Contractors shall submit to the CxA, for review and approval, their "blank" forms and written procedures for completing all of the required Cx pre-functional tasks including IV, Startup, and PFTs s prior to conducting any of these tasks. See Paragraph 1.9 for the submittal requirements for the contractor blank forms and procedures, including the content requirements. The project specific procedures and blank forms will be further described in the Cx Plan.
    a. IV forms are to provide field verification and documentation of proper installation of system equipment, assemblies, and components, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup forms.

i. The IV forms are either supplied by the Trade Contractor and/or the Manufacturer and shall include all checklists and verification requirements from the Manufacturer's installation and operation manual (IOM).

ii. The Trade Contractors are to verify equipment installation per the Manufacturer's guidelines and requirements, and thus are to use and complete any applicable equipment IV checklists contained in the Manufacturer's IOM, in addition to any IV forms used by the Trade Contractors to verify system, equipment and assembly installation per design and industry standards.

iii. The Trade Contractor IV forms may also contain any applicable design or shop drawings, plans, details, or single line diagrams that will be field verified and signed off / checked by the Trade Contractor to document installation verification per design (particularly for piping).

b. The Startup forms and procedures are either supplied by the Manufacturer and/or installing Trade Contractor and shall be used to document the completion of the formal startup procedures and associated checks and verifications during the startup and initial operation. And shall include all required startup and checkout procedures from the Manufacturer's IOM.

i. Where applicable, these forms shall include checks of the equipment internal / factory provided controls including sensors and control devices.

ii. Where required per the design specifications, the startups shall be completed by the authorized Manufacturer's representative.

c. PFT forms and procedures are Trade Contractor provided written procedures and forms used to document the completion and results for the various checks and tests performed before, during, or after startup.

i. Example PFTs include applicable domestic water pipe pressure tests, pipe disinfect and flush checks, and any applicable domestic water system TAB.

4. The CxA may create Checklists to track the contractor submittals and CxA's review of the blank forms and procedures for IV, Startup, and PFTs.

5. The CxA reviews the blank forms and procedures for all IV, Startup and PFT tasks, and will issue any comments, which may include additions or changes to be made by the Trade Contractor to the forms and procedures, and/or supplemental forms may be issued by the CxA, where appropriate, to improve the forms and commissioning process.

6. The CxA will develop FPT procedures and forms and provide the draft forms to the GC and Trade Contractors for review and comment.

C. Pre-Functional Activities and Tasks

1. Meetings will be conducted throughout construction with commissioning team members, as required, to plan, coordinate, and schedule commissioning activities, review documentation, and resolve Cx issues.

2. The Trade Contractors shall perform the IV, Startup and PFT tasks for all systems and equipment (no sampling allowed), unless the contract or design documents allow for sampling of the pre-functional tests.

3. In general, the GC and Trade Contractors are to complete the IV prior to Startups, but where appropriate and approved by the CxA, the IV and Startup can be combined into one task.
4. The Trade Contractors shall document the completion of the IV, Startup and PFT tasks on the IV, Startup, and PFT forms.
5. The GC shall submit all completed IV, Startup, and PFT forms to the CxA, for review prior to conducting the FPTs, in a manner or software program approved by the CxA.
6. The CxA will review the completed IV, Startup, and PFT forms. The CxA will also conduct various field observations and reviews of the installation including reviews of the completed IV forms, and may witness a sample of the Startup and PFT activities. Some witnessing of the PFT activities may be performed as back-checks conducted by the Trade Contractor with the CxA, after PFT forms are complete.
7. The Trade Contractor shall resolve any IV, Startup and PFT issues or results deemed unacceptable by the CxA.
8. The CxA may create System Readiness Checklists to track the status and completion of the IV, IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

D. Functional Performance Testing

1. FPTs are to test the dynamic function, performance and control of the equipment and systems under various modes of operation. These tests verify the correct implementation of the sequences of operation and the system performance meets the design criteria. The FPTs are performed using manual (direct observation) or monitoring methods. FPTs include the following types of tests, where applicable:
    a. Sequence of Operation Tests
        i. Sequence of operation tests are witnessed by the CxA for each unique sequence of operation but may not necessarily be repeated across identical systems, equipment or spaces, if the contractor has verified the same programmed sequence of operation code (as tested) has been programmed across multiple identical systems, equipment or spaces, based sample verification tests witnessed by the CxA.
        ii. Testing certain critical or important sequences with a higher sample rate across identical systems, equipment or spaces, beyond the individual sequence of operation tests may be required and will be determined by the CxA.
    b. Verification Tests.
        i. Verification tests are often less detailed tests than the sequence of operation tests and are typically witnessed by the CxA at a higher sample rate.
        ii. Examples of verification tests include: a) verifying the control settings and alarm points and b) verifying plumbing fixture automatic controls.
    c. Performance Tests.
        i. Performance tests are to be performed after the sequence of operation and verifications tests, and are focused on testing and verifying performance.

ii. Examples include: a) testing and measuring fixture hot water temperature and delivery time per design criteria, and b) testing the DHW heater water flow and temperature performance per design.

d. Integrated Systems Tests.

i. Integrated systems tests verify the operation and performance of multiple systems together operating in a coordinated, stable and efficient manner. Often the integrated systems tests are combined with the performance tests.

ii. Integrated systems tests may also be conducted via analysis of BAS trend data (if applicable).

2. The CxA will develop FPT forms that contain:

a. Specific step-by-step procedures to execute the test in a clear, sequential and repeatable format, including any control system point value or setpoint overrides required to simulate a test condition or sequence mode.

b. The expected system response and acceptance criteria of proper performance with a Yes/No check box to allow for clearly marking whether or not proper performance of each part of the test was achieved.

c. A section for recording actual system response, notes and comments.

3. Execution of the FPTs:

a. Once the IV, Startup and PFT forms are complete, the Trade Contractors shall execute the FPTs, with the FPTs witnessed by the CxA, unless otherwise by the CxA.

b. The GC and Trade Contractors are responsible for ensuring all systems are installed, operating and performing per the requirements of the contract and design documents, and are ready for the FPTs.

c. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

d. A percent sampling approach may be used for executing the FPTs of identical systems and equipment. The approximate system sampling rates for the manual (direct observation) FPTs are defined in Part 3 of this specification and/or in the Cx Plan.

e. The acceptance criteria for the FPT sampling shall be zero, meaning, any FPTs that do not pass shall require the Trade Contractor to resolve the issue for all applicable systems and equipment (even those specifically not in the original sample) and new sample rates selected for a re-test executed by the Trade Contractor and witnessed by the CxA. The CxA shall deem the FPTs acceptable after all FPTs, including re-tests, have passed and resolution of all issues completed.

f. The CxA will document the results of all FPTs on the associated FPT forms created by the CxA, unless indicated otherwise on the FPTs.

g. The Cx Plan will define any required seasonal or deferred testing.

E. Cx Issues and Recommendations

1. Throughout the process, the CxA records Cx issues, observations and recommendations on the Cx Issues Log and distributes the Cx Issues Log to the team.

2. The Cx Issues Log requires contributions and input from each of the Cx team members and as such everyone on the Cx Team has a responsibility to update the log via the agreed upon mechanism.
3. The software program and format for the Cx Issues Log will be provided by the CxA or another software program and format may be used as approved by the CxA.
4. The GC and Trade Contractors shall correct the Cx issues and recheck or retest the system(s) without delay at no additional cost to the Owner.
5. The CxA will verify the completion of the issues and recommendations via onsite reviews or witnessed retests, documentation or photographs provided by the GC and Trade Contractors, or based on information and communications provided by the GC and Trade Contractors.

F. Training Verification

1. The GC shall submit a comprehensive Training Plan with specific training agendas and materials provided by the Trade Contractors, for review by the Design Team, CxA and Owner, prior to conducting any training.
2. The Training Plan shall meet the specific requirements in the contract documents and specifications for each applicable system to be commissioned, and may include both operations and maintenance (O&M) staff training and building occupant training.
3. The GC shall coordinate with the Owner and/or Owner's Representatives, as needed, regarding any specific requirements for occupant training.
4. The CxA will verify completion of the training by receiving a copy of all training class sign-in sheets and any training materials / handouts, to be provided by the GC or Trade Contractors. The CxA may also sample witness some of the training sessions.
5. The Trade Contractors will ensure all O&M manuals have been submitted to the Owner per the contract documents. The CxA may request copies of the O&M manual submittals for verification purposes.

G. Cx Report and Documentation

1. The CxA will develop the Systems Manual, with assistance from the GC and Trade Contractors.
2. The CxA will complete the Commissioning Report and all associated documentation for the Owner with assistance from the GC and Trade Contractors.

H. Post-Occupancy Warranty Phase Commissioning

1. The CxA will report any identified operational or performance issues (identified by the building O&M staff or warranty phase Cx activities) to the GC via a Warranty Phase Cx Log for resolution by the GC and Trade Contractors during or prior to the end of the warranty period.
2. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

3. The CxA may conduct onsite visits to review system operation and performance with the Owner's O&M team and/or may review system trend data during the Warranty Phase and will report any identified issues and recommendations from the trend analysis.

4. No later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy, the CxA will return to the facility to interview facility O&M staff, walk the facility and review systems operation and trend data where applicable. Key representatives from the GC and Trade Contractors shall attend a site walk-through and meeting, as determined by the CxA.

1.8 COMMISSIONING RESPONSIBILITIES

A. General

1. The Commissioning Team and all others involved in the commissioning process shall follow the Commissioning Plan, attend the commissioning kickoff meeting, and attend additional commissioning meetings as necessary.

B. Commissioning Authority (CxA)

1. See Section 01 91 13, General Commissioning Requirements.

C. Owner

1. See Section 01 91 13, General Commissioning Requirements.

D. Design Team

1. See Section 01 91 13, General Commissioning Requirements.

E. General Contractor

1. See Section 01 91 13, General Commissioning Requirements.

F. All Trade Contractors

1. Submit project specific written procedures and blank forms for completing all IV, Startup, and PFT tasks, including manufacturer's installation checks and startup procedures, as a commissioning submittal. See Paragraph 1.9. Electronic files are acceptable.

2. Provide any equipment and construction submittals and shop drawings, control drawings, points lists and detailed sequences of operation (including any local, stand-alone controls independent of the BAS controls), meter lists, system diagrams and riser diagrams, and any other submittals or documentation for systems to be commissioned, as requested by the CxA. The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the design documents. Electronic files are acceptable.

3. Provide a list of any test metering and sensors to be used for sensor and device calibration purposes. All test meter and sensors shall have been calibrated within a year and have calibration documentation.

4. Attend commissioning meetings as directed by the CxA and GC to facilitate the commissioning process.
5. Assign personnel with expertise and authority to act on behalf of the Trade Contractor and schedule them to participate in and perform assigned commissioning tasks.
6. Ensure that any required manufacturer factory tests are performed and provide the factory test data and results where required.
7. Demonstrate and document proper system installation, startup and performance.
    a. Perform IV, Startup and PFT tasks for all systems and equipment (no sampling), unless the contract or design documents allow for sampling of these tasks.
    b. Ensure that any required manufacturer's representative field tests, inspections, startup and checkout of selected equipment are performed per the contract documents. Provide completed manufacturer documentation and commissioning forms for these activities.
    c. Complete all IV, Startup and PFT documentation clearly and legibly.
8. Provide a schedule and access for the CxA to witness any equipment Startup and PFT tasks. Notify the GC and CxA at least 10 days in advance of Startup and PFT tasks.
9. Address applicable Cx issues promptly. All IV, Startup and PFT issues must be resolved before the FPTs can proceed.
10. Assist the CxA in preparing the FPT procedures, clarifying the operation and control of commissioned equipment where the specifications, control drawings or equipment documentation are not sufficient for writing detailed testing procedures.
11. Review the FPT procedures to ensure feasibility, safety and equipment protection, and provide necessary written alarm limits, setpoint changes and overrides to be used during the tests.
12. Setup any control system software points, global commands, overrides of any sensor values or relays, and overrides of any setpoints or schedules, to simulate certain conditions and operating modes, in order to conduct the FPTs.
13. Configure all control settings, schedules, alarms, graphics and programming logic for all control systems and any local equipment or stand-alone controls per the project specific sequence of operations.
14. Prior to conducting the CxA witnessed FPTs, place the systems and controls into the operating modes and test and verify all sequences of operation. Check all control system safety cutouts, alarms, and interlocks with other systems during each mode of operation prior to the FPTs. Ensure all systems are operating and performing per the design requirements, and have been pre-tested per the FPTs, and are ready for the CxA witnessed FPTs.
    a. The Trade Contractors shall determine the appropriate level of pre-testing, to prepare for the CxA witnessed FPTs.
15. Perform the FPTs, with the FPTs witnessed by the CxA. Provide at least 10 days advance notice to the GC and CxA for scheduling the FPTs.
16. Setup any control or monitoring system trends and provide all requested trend data for the FPTs and post-occupancy warranty phase commissioning review to the CxA.

a. As an Owner approved option, the Trade Contractors may provide the CxA remote access to the BAS and any other control system, with the Owner's permission, which will allow the CxA to easily and directly download the trend data files.

17. Prepare a training agenda for each training class for the equipment and systems to be commissioned.

18. Coordinate with the GC and Owner to schedule and plan training. Execute training of Owner's personnel per approved training agenda and schedule. Provide copies of training class sign-in sheets and materials / handouts.

19. Prepare O&M Manuals according to the Contract Documents.

20. Assist the CxA in developing the Systems Manual, including providing as-built drawings, controls sequences, setpoints, single-line diagrams, etc., necessary for the Systems Manual.

21. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Contractors shall participate in the FPTs as required for operation of the inter-related systems.

G. BAS Trade Contractor

1. See Section 23 08 00 for the additional specific BAS Trade Contractor responsibilities and commissioning submittal requirements, applicable for any BAS controls and monitoring for plumbing systems.

H. TAB Trade Contractor

1. See Section 23 08 00 for the additional specific TAB Trade Contractor responsibilities and commissioning submittal requirements, applicable for any TAB work for plumbing systems.

1.9 SUBMITTAL REQUIREMENTS FOR COMMISSIONING

A. Trade Contractor Pre-Functional Procedures/Plans and Blank Forms.

1. The Trade Contractors shall submit to the CxA all applicable project specific written procedures/plans and blank forms for all required IV, Startup and PFT tasks for the project, at least 4 weeks in advance of performing any of these tasks. Provided below are the potential procedures/plans and blank forms required for the applicable plumbing systems. The requirements for the project specific procedures and blank forms will also be further described in the Cx Plan.

a. Domestic Hot Water and Plumbing IV Forms (Equipment, Piping & Local Controls) - including the following.

i. IV forms are to provide verification of the make/model, components, and accessories upon receipt of the equipment and to provide field verification and documentation of proper installation of system equipment, piping, assemblies, and components per design and manufacturer requirements, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup forms.

ii. The IV forms are either supplied by the Trade Contractor and/or the Manufacturer, and shall include all checklists and verification requirements from the manufacturer's installation and operation manual (IOM). The Trade Contractors are to verify equipment installation and access per the manufacturer's guidelines and requirements, and thus are to use and complete any applicable equipment IV checklists contained in the IOM, in addition to any IV forms used by the Trade Contractors to verify system, equipment, piping and assembly installation per design and industry standards.

iii. The IV forms shall also include any applicable design or shop drawings, plans, details, or single line diagrams that will be field verified and signed off / checked, particularly for verification of the system piping.

iv. The IV forms shall also include any local plumbing equipment factory controls or local stand-alone plumbing and DHW controls that are not installed by the BAS Contractor.

b. Domestic Hot Water and Plumbing Startup Procedures and Forms - including the following.

i. The startup procedures and forms are to be supplied by the installing contractor and/or the manufacturer and shall include all required startup and checkout procedures from the manufacturer's IOM.

ii. Where required per the design specifications, the startups shall be completed by the authorized manufacturer's representative. In the submittal for the startup procedures and blank forms, the contractor shall indicate which startups will be completed by the authorized manufacturer's representative.

iii. The startup procedures and forms shall also include the checkout and verification of any local plumbing and DHW equipment factory controls or local stand-alone plumbing controls that are not installed by the BAS Contractor, including any setpoint configuration and programming checks per the project design sequence of operation.

c. Domestic Water Pipe System Pressure / Leak Test Procedures and Forms – including the following.

i. The sections of pipe to be tested and the associated test methods, pressures and durations,

ii. The applicable forms to be used to document the completion of the pressure / leak tests.

d. Domestic Water Pipe Clean / Disinfect & Flush Procedures and Blank Forms – including the following.

i. The intended minimum durations for all pipe cleaning, disinfections, and flushing.

ii. The associated cleaning agents and/or disinfectants to be used.

e. Water & Gas Meter IV and Pre-Functional Test Procedures and Forms – including the following.

i. The IV forms to be used to verify the meter installation and the meter programming / configuration / setup per the Manufacturer IOM and design requirements, including the communication modules for BAS integration.

ii. An outline of the pre-functional tests to verify the meter flow readings of the installed meters.

iii. The applicable forms to be used for the above meter IV and pre-functional checks.

f. Plumbing Fixture Automatic Controls IV and Pre-Functional Test Forms – including the following.

i. Forms that are either floor plan-based checklists or room by room table checklists that indicate completion of the IV and pre-functional tests for each plumbing fixture with automatic controls.

ii. The intent of the forms is to verify the installation of each fixture controls per design documents and manufacturer requirements, to verify any applicable automatic control settings have been adjusted and checked, and to verify the operation and control has been tested.

g. Procedures/Plans for all other applicable plumbing systems IV and PFT tasks, per the project design and specifications or as requested by the CxA.

2. For the requirements for the BAS Controls PFT procedures and blank forms applicable to the plumbing systems, see Section 23 08 00.

3. The CxA will review these submitted commissioning procedures/plans and forms including whether all project specific requirements are included.

4. The CxA may request additional data, changes and/or additions to these forms prior to their use, including forms any supplemental forms provided by CxA, based on the construction documents and specifications, manufacturer installation manuals and procedures, and/or industry standards or guidelines.

B. Training Agenda. The Trade Contractors shall develop a Training Agenda for each training session, per the requirements of the contract documents and specifications, and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and occupant training. The Training Agenda shall be included in the comprehensive Training Plan to be submitted by the GC for review by the CxA, Design Professionals, and/or the Owner (see Section 01 91 13). The GC and Trade Contractors shall coordinate to fully develop the comprehensive Training Plan with input from the Owner.

1. The Training Agenda for each training session shall include the following:

a. equipment and/or systems covered;

b. recommended attendees;

c. proposed location;

d. estimated duration;

e. level of instruction to be provided and an outline of the training topics and subjects to be covered;

f. list of any materials and handouts to be provided (or provided in advance);

g. company to provide the training and the instructor’s name and qualifications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 MEETINGS, SCHEDULING AND COORDINATION

A. See Section 01 91 13.

3.2 DOCUMENTATION

A. The Trade Contractors have specific responsibilities for assisting in the development of equipment check, test and verification procedures and forms, and in performing and documenting commissioning tests, as directed by the GC and as overseen by the CxA.

B. The Trade Contractors shall provide, wherever the Contract Documents require, system checks and testing, test reports, factory test data and reports, checklists, operational verifications and demonstration, etc., whether specified or not in the commissioning sections.

3.3 TEST EQUIPMENT

A. The Trade Contractors shall provide all test equipment in sufficient quantities to execute all Startup, PFT and FPT tasks in an expedient fashion.

B. The test equipment shall be of industrial quality and suitable for testing and calibration with accuracy within the tolerance necessary to demonstrate system performance per the Contract Documents. If not otherwise specified, the following minimum requirements apply:

C. Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5 degree F and a resolution to + or – 0.1 degree F.

D. Pressure sensors shall have an accuracy of + or – 2.0 percent of the value range being measured (not full range of meter) and have been calibrated within the last year.

E. The test equipment shall have calibration certification per equipment manufacturer’s interval level or within one year if not otherwise specified. The calibration tags shall be affixed or certificates readily available for all test equipment.

3.4 COMMISSIONING PRE-FUNCTIONAL TASKS

A. The Trade Contractors shall conduct all IV, startup procedures and pre-functional tests (PFTs) without compromise to human or equipment safety. The GC and Trade Contractors shall be responsible for the liability and safety of conducting all startup, checks and tests.

B. The Trade Contractors shall clearly identify and list any issues and deficiencies resulting from the IV, Startup and PFT tasks on the associated forms and immediately notify the CxA. The CxA will additionally document the issues on the Cx Issues Log. Once issues and deficiencies are corrected and verified, the associated forms shall be updated and resubmitted, and any necessary field review, back-checks or re-tests witnessed by the CxA.

C. The GC and Trade Contractors shall provide a minimum 10 days’ notice to the CxA for witnessing equipment Startup and PFT tasks.

D. The sample rates for the CxA witnessing of plumbing system PFT tasks and equipment startups, will be defined in the Cx Plan.

E. The GC and Trade Contractors shall ensure the completion of the IV, Startup and PFT forms. Review and approval of the completed IV, Startup and PFT forms by the CxA is required prior to conducting the FPTs. The CxA may create System Readiness Checklists to track the status of the IV, IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

3.5 FUNCTIONAL PERFORMANCE TESTS

A. The Trade Contractors shall perform all FPTs per the final FPT forms, for all systems and equipment in the scope of commissioning. The FPTs shall be witnessed by the CxA unless stated otherwise by the CxA. The Trade Contractors may need to complete off hours or weekend work in order to complete the FPTs. The CxA will document all testing results on the FPT forms.

B. As noted in the Part 1, a sampling approach will be used for the FPTs of identical systems and equipment, using the approximate sample rates as defined below and/or in the Cx Plan, with the specific systems and equipment selected by the CxA.

1. FPT Sample Rates for Domestic Hot Water Systems (including water heaters, storage tanks, pumps, recirculation pumps and controls, etc.):
    a. Sequence of Operation, Verification Tests and Performance Tests for *** all of the *** approximately 25% to 50% *** of the DHW systems by type, or at least one for each type, as selected by CxA.
2. FPT Sample Rates for Under Sink Instant-hot Electric Water Heaters
    a. Performance Tests for approximately 10% to 30% of the instant-hot water heaters, as selected by CxA.
3. FPT Sample Rates for Pumping Systems: DCW booster pumps, circulation pumps, sump pumps, sewage ejectors, etc.
    a. Sequence of Operation Tests for each unique pump type / sequence of operation.
    b. Verification Tests for approximately 25% to 50% of the pumps by type, or at least one of each type, as selected by CxA.
    c. The sample is 100% for any critical pumping systems, to be defined in the Cx Plan.
4. FPT Sample Rates for Plumbing Fixture Automatic Controls:
    a. Verification Tests for approximately 10% to 30% of the fixture automatic controls by type, or at least one of each type, as selected by CxA.
5. FPT Sample Rates for Water Recovery and Re-use Systems: all systems (no sampling).

C. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

D. The GC and Trade Contractors shall coordinate all FPTs with the CxA, and provide a minimum of 10 days' notice prior to conducting each test.

E. The GC and Trade Contractors shall have responsibility for the liability and safety of conducting all functional performance tests.

F. The Trade Contractor executing the test shall provide all necessary materials, system modifications, etc. to produce the necessary flows, pressures, temperatures, etc. to execute the test according to the test procedures.

1. The Trade Contractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures. For example, globally adjusting the space temperature setpoints for all terminal units on a floor or AHU or the building. Or as another example, globally overriding the economizer status command for all AHUs.

G. At completion of the test, the Trade Contractor shall return all affected building equipment and systems to their pre-test normal condition.

3.6 TREND ANALYSIS

A. The CxA may conduct trend analysis as part of the FPT process, after completion of the onsite field conducted FPTs and correction of all issues and deficiencies, to verify integrated system operation and performance.

B. The CxA will prepare a BAS trend points list including the trend interval. The BAS Trade Contractor shall set up the trend log definitions prior to the start of the sequence of operation FPTs.

C. The BAS Trade Contractor shall provide the trend to the CxA in an electronic format, either a text file, CSV file or Excel file, with related system parameters grouped together. The estimated duration for the trend data is 1 to 3 weeks (with a minimum of 1 weeks' worth of data).

D. If the CxA discovers any control or performance issues during trend analysis, the Trade Contractors shall correct the issues and provide new trend data for analysis verification by the CxA.

3.7 COMMISSIONING ISSUES, BACK-CHECKS AND RE-TESTS

A. When Cx issues are identified during testing, the CxA will discuss with the executing Trade Contractor and/or GC and determine whether or not testing can proceed. The CxA may allow immediate correction of minor issues and deficiencies identified during testing. The Cx issue and any identified resolution will be documented on the test form in use in addition to the Cx Issues Log.

B. The CxA will maintain and update the Cx Issues Log, and document the issue resolution process. Copies will be distributed to the GC, Owner, and Trade Contractors as appropriate. The Trade Contractors shall provide updates and comments regarding issue status and resolution.

C. The Trade Contractors shall promptly correct all Cx issues. The responsible party shall correct the issue and inform the GC and CxA of the resolution and completion date, and update the Cx Issues Log accordingly (in the fields assigned for contractor updates).

D. The CxA will record completion on the Cx Issues Log after a successful witnessed re-test, field review, back-check, verification obtained through appropriate documentation or photographs, or acceptance by the Design Team or Owner. The GC shall reschedule any applicable re-testing

with the CxA and Trade Contractor. The Trade Contractor shall retest until achievement of passing performance or Owner acceptance of the noted issue.

E. Where sampling is used for the PFTs and FPTs, the results shall be deemed acceptable once all noted issues are resolved and any new sample tests or checks have passed.

F. Additional parties may require input during a dispute regarding a Cx issue. Regardless of the validity or responsibility of the issue, the CxA will have the final interpretive authority on Cx issues and the Owner will have the final approval authority.

G. The CxA may recommend solutions to Cx issues. However, the GC and Trade Contractors ultimately have the burden of responsibility to solve, correct and perform required retests.

H. Back-checks, Verifications and Re-testing:

1. The CxA will witness one (1) re-test or will perform one (1) field back-check or verification of any Cx issue.
2. The CxA's total onsite time for re-test witnessing and field verification or back-check of Cx issues will be limited to no more than 16 hours (2 days) for all applicable mechanical, electrical, and plumbing systems in the commissioning scope.
3. The Owner may back-charge the GC for any additional fees from the CxA, resulting from any additional re-testing or field back-checks or verification beyond this allocated total time.
4. The GC must provide a minimum 48 hours' notice for scheduling any re-testing, though the CxA will attempt to accommodate a shorter timeframe if feasible.
5. Any required re-testing shall not be considered a justified reason for a claim of delay or for a time extension.
6. For any re-testing required, the CxA will determine if the entire test must be re-tested or if it is acceptable to re-test specific portions of the test that had failed.

3.8 DEFERRED & SEASONAL TESTING

A. Before or during the end of the first year warranty period, the Trade Contractor shall complete any seasonal or deferred testing, required per the design specifications and as defined in the Cx Plan. The Trade Contractors shall complete tests in the same manner as all other commissioning tests, including CxA witnessing.

B. The GC and Trade Contractor shall coordinate with CxA and Owner and schedule all deferred and seasonal testing.

3.9 TRAINING VERIFICATION

A. The GC and Trade Contractors shall coordinate and schedule the training for the Owner's facility and operations personnel, and building occupants. The GC shall ensure that training is completed per the requirements of the contract documents and specifications.

B. Trade Contractors responsible for specific equipment and system training shall submit to the GC, a written training agenda for each training class for the equipment and systems to be commissioned. The GC shall submit a comprehensive Training Plan, including the specific

training agendas, to Owner, Design Team and CxA for review and approval. See also Section 01 91 13.

C. The CxA will review the Training Plans for commissioning verification prior to conducting the actual training.

D. For verification of actual training conducted, the GC shall submit to CxA 'attendee signed' attendance sheets for each training session conducted and a copy of any final training presentations or handout materials.

3.10 COMMISSIONING ACCEPTANCE, CLOSE-OUT AND REPORTING

A. Completion of the main commissioning activities (system readiness checks, functional performance testing, and training) shall be accomplished as a prerequisite for substantial completion. Completion of any re-testing shall be completed prior to final acceptance of commissioning.

B. After completion of the main commissioning activities and following review of the completed commissioning documents, test results and the current Cx Issues Log with the Owner, the Owner will indicate whether they accept completion of the project construction phase commissioning or if not, the requirements for acceptance. Upon Owner acceptance, any remaining open Cx issues will be transferred to the warranty phase Cx Issues Log for tracking resolution and completion as part of the warranty phase commissioning.

C. Upon completion of all commissioning activities, the CxA will prepare and submit to the Owner a Cx Report detailing all completed commissioning activities and documentation. The GC shall support this effort by providing all Trade Contractor commissioning documentation.

D. The CxA will complete a Systems Manual for the systems and equipment commissioned, with assistance provided by the GC and Trade Contractors. The Systems Manual will provide the operating staff the information needed to understand and optimally operate the commissioned systems. It will also include the current facility requirements, and an ongoing commissioning plan.

3.11 POST-OCCUPANCY WARRANTY PHASE COMMISSIONING

A. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA, to be witnessed by the CxA, unless stated otherwise by the CxA.

B. The CxA may conduct onsite reviews of the system operation and performance, meet with the O&M Team to discuss system operation and performance, and may also review BAS trend data during the Warranty Phase. The BAS Trade Contractor shall be responsible for providing post-occupancy trend data to the CxA.

C. The CxA will report any identified issues and recommendations to the GC via a Warranty Phase Cx Issues Log for review and resolution by the GC and Trade Contractors prior to the end of the warranty period, for any issues or recommendations identified either by the CxA or the Owner. The GC shall work with the Trade Contractors and O&M staff to make corrections and adjustments as required to address the issues and recommendations.

D. Key representatives from the GC and Trade Contractors shall attend a near end of warranty commissioning review meeting, to be scheduled with the Owner's facility staff and the CxA, no later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy.

1. During this meeting, the operation and performance of the systems will be discussed with the Owner's staff, the results of any commissioning reviews and trend analysis will be discussed and the Warranty Phase Cx Issues Log will be reviewed. If needed, a walk-through of the systems with the Owner's staff will be conducted.

2. Next steps and actions items for any open Cx issues and recommendations will be discussed and documented via meeting minutes or a field report issued by the CxA. The intent is to resolve any open Cx issues prior to the end of the warranty phase.

E. After correcting noted Warranty Phase Cx issues, the GC shall notify the CxA, and the CxA will back-check and verify resolution of the issues and recommendations.

F. Issues identified during the warranty period will remain warranty phase Cx issues until satisfactory completion by Trade Contractors, even if the warranty period expires during the correction and back-check period.

END OF SECTION 220800

SECTION 22 08 10 - COMMISSIONING OF PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Division 01, Section 01 91 13, General Commissioning Requirements

B. All Division 22 and applicable Division 23 & 26 Sections.

1.3 REFERENCES

A. BCA - Building Commissioning Association.

B. IPC – International Plumbing Code

C. IECC

1. International Energy Conservation Code (IECC) 2018 – Section C408: Maintenance Information and System Commissioning

1.4 DEFINITIONS

A. Basis of Design (BOD): The documentation of design criteria and assumptions for systems, components, and methods chosen to meet the Owner's Project Requirements and applicable regulatory requirements, standards, and guidelines. The document includes narrative descriptions of the systems to be commissioned. The BOD is prepared by the Design Professionals.

B. Building Automation System (BAS): The automated building system providing control and user interaction with select building systems, such as the HVAC, domestic hot water and lighting systems. Also, often referred to as building management system (BMS), energy management system (EMS), or an energy management and control system (EMCS).

C. Commissioning (Cx): A quality-focused process to verify and document that building systems are installed and perform as intended per the OPR, BOD and design documents.

D. Commissioning Authority (CxA): An independent entity hired directly by the Owner to lead, oversee and review the completion of the commissioning process and tasks. The CxA is not responsible for the design or construction of the project. The CxA is the authority on commissioning process, program elements and results, and assists the construction team with coordinating and completing tasks. And reviews and witnesses the completion of the process and tasks using a sampling approach.

E. Functional Performance Test (FPT): A test of the dynamic function, operation and control of the equipment and systems to verify system performance to the fullest extent. Systems are tested

under various operating modes and control sequences including failure modes. The FPTs are performed using manual (direct observation) or monitoring methods. The FPTs can include sequence of operation tests, verification tests, performance tests, integrated systems tests, and trend analysis (monitoring). FPTs are often referred to as acceptance testing.

F. General Contractor (GC): The contractor directly contracted to the Owner with overall responsibility for the project construction and all commissioning activities described herein.

G. HVAC: Heating, ventilation, air conditioning.

H. Installation Verification (IV): Field verification and documentation of proper installation of system equipment, assemblies, and components, per design documents, manufacturer guidelines and industry standards. The IV process is typically complete when systems are ready for startup or operation.

I. Owner's Project Requirements (OPR): A document describing the operational and functional requirements of a project, the expectations of how the facility will be used and operated, and the equipment and system expectations and requirements, as defined by the Owner. This document provides an explanation of the ideas, concepts, goals, success criteria, and supporting information for the project.

J. Pre-Functional Test (PFT): A test or check performed on a piece of equipment, system or controls before, during, or after the initial startup and operation, but prior to the FPT phase. The PFT is performed to confirm, verify and document the system equipment and individual components are working properly, are controlled properly and meeting applicable performance requirements and specifications. A PFT example include verifying and documenting completion of the domestic pipe clean and disinfection.

K. Startup: Initial starting or activating of equipment usually performed by the Trade Contractor or the Manufacturer's authorized representative, including applicable PFTs during the startup process.

L. Systems Manual: A manual that provides the operating staff the information needed to understand and optimally operate the commissioned systems. It expands upon the scope of traditional operating and maintenance documents and is compiled of multiple documents such as the final BOD, single line diagrams, and as-built controls drawings and sequences of operation.

M. TAB: Testing, Adjusting, and Balancing (TAB) work on the HVAC&R air and water systems to ensure design flow, pressure and temperature conditions are met. Performed by the TAB Trade Contractor.

N. Trade Contractor: A subcontractor who provides and installs specific building components and systems and/or provides certain services.

1.5 GENERAL COMMISSIONING DESCRIPTION

A. Commissioning is a quality-focused process for achieving, verifying and documenting that building systems are installed and perform functionally as intended according to the OPR, BOD, and the requirements of the design documents.

B. The work includes the completion and documentation of formal commissioning procedures by the GC, Trade Contractors, and the Manufacturer Representatives.

1. The GC and Trade Contractors shall provide the quality control for the installation, startup, checkout and testing of the systems. The commissioning process provides independent review and witnessing by the CxA (using a sampling approach) throughout the process and during qualitative functional performance testing, to observe and verify the implementation of the process, specific tasks and quality control efforts.
2. Refer to Section 01 91 13, General Commissioning Requirements for summary description of the general commissioning process and requirements.
3. The Trade Contractors and the Manufacturer Representatives shall be responsible for participation in the commissioning process as outlined in this specification and Section 01 91 13 General Commissioning Requirements.

C. Systems and equipment to be commissioned:

1. Domestic cold and hot water systems, including piping, water heaters, re-circulation pumps, thermostatic mixing valves and associated controls.
2. Domestic hot water systems including water heaters, re-circulation pumps, thermostatic mixing valves and associated controls.
3. Pumping systems and controls, including booster, sump, and sewage ejector pumps.
4. Plumbing fixtures with automatic controls.
5. Any BAS controls or monitoring for plumbing systems.

D. Systems and equipment not included in the commissioning are listed below. Commissioning of these systems may fall under the responsibility of the Contractor and/or the Authority Having Jurisdiction (AHJ) as noted in the design specifications.

1. Process systems and equipment.
2. Fire protection, suppression, and sprinkler systems.
3. Waste and vent systems, and storm water systems.
4. Reverse osmosis (RO) and industrial water systems.
5. Water and natural gas meters.
6. Water recovery and reuse systems.
7. Compressed air, vacuum air, and other industrial air systems.
8. Natural gas systems.

1.6 COMMISSIONING TEAM

A. The Commissioning Team is comprised of the following:

1. Owner and Owner’s Representatives
2. Commissioning Authority (CxA).
3. Design Professionals

4. General Contractor (GC)
5. Trade Contractors responsible for systems covered in this section include:
   a. Plumbing Contractor
   b. BAS Contractor
   c. TAB Contractor (if appliable for TAB of plumbing systems).
6. Manufacturer Representatives supplying equipment, materials, components and controls for the systems to be commissioned.

1.7 COMMISSIONING PROCESS

A. Submittal Reviews by the CxA

1. The CxA will review pertinent Trade Contractor submittals for the appropriate systems in the commissioning scope, concurrently with the Design Team and will provide review comments to the Design Team.
2. The GC shall provide a submittal log to the CxA for referencing the requested submittals to be reviewed by the CxA (for which the GC shall issue to the CxA concurrently with the submission to the Design Team). Alternatively, the GC shall include the CxA on the distribution of all Trade Contractor submittals issued to the Design Team, for systems applicable to this specification.
3. The GC shall issue the requested submittals to the CxA for review at the same time they issue the submittals to the Design Team.
4. The CxA will also use the information from the submittals to develop commissioning forms and test procedures.

B. Cx Plan and Form/Procedure Development

1. The CxA prepares a Preliminary Cx Plan either during the project final design phase or early construction phase. The Cx Plan provides guidance in the execution of the commissioning process during construction.
2. Commissioning during construction begins with a kickoff meeting conducted by the CxA where the CxA reviews the commissioning process and responsibilities with the appropriate team members. The CxA presents the Preliminary Cx Plan and discusses the project specific requirements.
3. The GC and Trade Contractors shall submit to the CxA, for review and approval, their “blank” forms and written procedures for completing all of the required Cx pre-functional tasks including IV, Startup, and PFTs s prior to conducting any of these tasks. See Paragraph 1.9 for the submittal requirements for the contractor blank forms and procedures, including the content requirements. The project specific procedures and blank forms will be further described in the Cx Plan.
   a. IV forms are to provide field verification and documentation of proper installation of system equipment, assemblies, and components, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup forms.

i. The IV forms are either supplied by the Trade Contractor and/or the Manufacturer and shall include all checklists and verification requirements from the Manufacturer's installation and operation manual (IOM).

ii. The Trade Contractors are to verify equipment installation per the Manufacturer's guidelines and requirements, and thus are to use and complete any applicable equipment IV checklists contained in the Manufacturer's IOM, in addition to any IV forms used by the Trade Contractors to verify system, equipment and assembly installation per design and industry standards.

iii. The Trade Contractor IV forms may also contain any applicable design or shop drawings, plans, details, or single line diagrams that will be field verified and signed off / checked by the Trade Contractor to document installation verification per design (particularly for piping).

b. The Startup forms and procedures are either supplied by the Manufacturer and/or installing Trade Contractor and shall be used to document the completion of the formal startup procedures and associated checks and verifications during the startup and initial operation. And shall include all required startup and checkout procedures from the Manufacturer's IOM.

i. Where applicable, these forms shall include checks of the equipment internal / factory provided controls including sensors and control devices.

ii. Where required per the design specifications, the startups shall be completed by the authorized Manufacturer's representative.

c. PFT forms and procedures are Trade Contractor provided written procedures and forms used to document the completion and results for the various checks and tests performed before, during, or after startup.

i. Example PFTs include applicable domestic water pipe pressure tests, pipe disinfect and flush checks, and any applicable domestic water system TAB.

4. The CxA may create Checklists to track the contractor submittals and CxA's review of the blank forms and procedures for IV, Startup, and PFTs.

5. The CxA reviews the blank forms and procedures for all IV, Startup and PFT tasks, and will issue any comments, which may include additions or changes to be made by the Trade Contractor to the forms and procedures, and/or supplemental forms may be issued by the CxA, where appropriate, to improve the forms and commissioning process.

6. The CxA will develop FPT procedures and forms and provide the draft forms to the GC and Trade Contractors for review and comment.

C. Pre-Functional Activities and Tasks

1. Meetings will be conducted throughout construction with commissioning team members, as required, to plan, coordinate, and schedule commissioning activities, review documentation, and resolve Cx issues.

2. The Trade Contractors shall perform the IV, Startup and PFT tasks for all systems and equipment (no sampling allowed), unless the contract or design documents allow for sampling of the pre-functional tests.

3. In general, the GC and Trade Contractors are to complete the IV prior to Startups, but where appropriate and approved by the CxA, the IV and Startup can be combined into one task.
4. The Trade Contractors shall document the completion of the IV, Startup and PFT tasks on the IV, Startup, and PFT forms.
5. The GC shall submit all completed IV, Startup, and PFT forms to the CxA, for review prior to conducting the FPTs, in a manner or software program approved by the CxA.
6. The CxA will review the completed IV, Startup, and PFT forms. The CxA will also conduct various field observations and reviews of the installation including reviews of the completed IV forms, and may witness a sample of the Startup and PFT activities. Some witnessing of the PFT activities may be performed as back-checks conducted by the Trade Contractor with the CxA, after PFT forms are complete.
7. The Trade Contractor shall resolve any IV, Startup and PFT issues or results deemed unacceptable by the CxA.
8. The CxA may create System Readiness Checklists to track the status and completion of the IV, IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

D. Functional Performance Testing

1. FPTs are to test the dynamic function, performance and control of the equipment and systems under various modes of operation. These tests verify the correct implementation of the sequences of operation and the system performance meets the design criteria. The FPTs are performed using manual (direct observation) or monitoring methods. FPTs include the following types of tests, where applicable:
    a. Sequence of Operation Tests
        i. Sequence of operation tests are witnessed by the CxA for each unique sequence of operation but may not necessarily be repeated across identical systems, equipment or spaces, if the contractor has verified the same programmed sequence of operation code (as tested) has been programmed across multiple identical systems, equipment or spaces, based sample verification tests witnessed by the CxA.
        ii. Testing certain critical or important sequences with a higher sample rate across identical systems, equipment or spaces, beyond the individual sequence of operation tests may be required and will be determined by the CxA.
    b. Verification Tests.
        i. Verification tests are often less detailed tests than the sequence of operation tests and are typically witnessed by the CxA at a higher sample rate.
        ii. Examples of verification tests include: a) verifying the control settings and alarm points and b) verifying plumbing fixture automatic controls.
    c. Performance Tests.
        i. Performance tests are to be performed after the sequence of operation and verifications tests, and are focused on testing and verifying performance.

ii. Examples include: a) testing and measuring fixture hot water temperature and delivery time per design criteria, and b) testing the DHW heater water flow and temperature performance per design.

d. Integrated Systems Tests.

i. Integrated systems tests verify the operation and performance of multiple systems together operating in a coordinated, stable and efficient manner. Often the integrated systems tests are combined with the performance tests.

ii. Integrated systems tests may also be conducted via analysis of BAS trend data (if applicable).

2. The CxA will develop FPT forms that contain:

a. Specific step-by-step procedures to execute the test in a clear, sequential and repeatable format, including any control system point value or setpoint overrides required to simulate a test condition or sequence mode.

b. The expected system response and acceptance criteria of proper performance with a Yes/No check box to allow for clearly marking whether or not proper performance of each part of the test was achieved.

c. A section for recording actual system response, notes and comments.

3. Execution of the FPTs:

a. Once the IV, Startup and PFT forms are complete, the Trade Contractors shall execute the FPTs, with the FPTs witnessed by the CxA, unless otherwise by the CxA.

b. The GC and Trade Contractors are responsible for ensuring all systems are installed, operating and performing per the requirements of the contract and design documents, and are ready for the FPTs.

c. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

d. A percent sampling approach may be used for executing the FPTs of identical systems and equipment. The approximate system sampling rates for the manual (direct observation) FPTs are defined in Part 3 of this specification and/or in the Cx Plan.

e. The acceptance criteria for the FPT sampling shall be zero, meaning, any FPTs that do not pass shall require the Trade Contractor to resolve the issue for all applicable systems and equipment (even those specifically not in the original sample) and new sample rates selected for a re-test executed by the Trade Contractor and witnessed by the CxA. The CxA shall deem the FPTs acceptable after all FPTs, including re-tests, have passed and resolution of all issues completed.

f. The CxA will document the results of all FPTs on the associated FPT forms created by the CxA, unless indicated otherwise on the FPTs.

g. The Cx Plan will define any required seasonal or deferred testing.

E. Cx Issues and Recommendations

1. Throughout the process, the CxA records Cx issues, observations and recommendations on the Cx Issues Log and distributes the Cx Issues Log to the team.

2. The Cx Issues Log requires contributions and input from each of the Cx team members and as such everyone on the Cx Team has a responsibility to update the log via the agreed upon mechanism.
3. The software program and format for the Cx Issues Log will be provided by the CxA or another software program and format may be used as approved by the CxA.
4. The GC and Trade Contractors shall correct the Cx issues and recheck or retest the system(s) without delay at no additional cost to the Owner.
5. The CxA will verify the completion of the issues and recommendations via onsite reviews or witnessed retests, documentation or photographs provided by the GC and Trade Contractors, or based on information and communications provided by the GC and Trade Contractors.

F. Training Verification

1. The GC shall submit a comprehensive Training Plan with specific training agendas and materials provided by the Trade Contractors, for review by the Design Team, CxA and Owner, prior to conducting any training.
2. The Training Plan shall meet the specific requirements in the contract documents and specifications for each applicable system to be commissioned, and may include both operations and maintenance (O&M) staff training and building occupant training.
3. The GC shall coordinate with the Owner and/or Owner's Representatives, as needed, regarding any specific requirements for occupant training.
4. The CxA will verify completion of the training by receiving a copy of all training class sign-in sheets and any training materials / handouts, to be provided by the GC or Trade Contractors. The CxA may also sample witness some of the training sessions.
5. The Trade Contractors will ensure all O&M manuals have been submitted to the Owner per the contract documents. The CxA may request copies of the O&M manual submittals for verification purposes.

G. Cx Report and Documentation

1. The CxA will develop the Systems Manual, with assistance from the GC and Trade Contractors.
2. The CxA will complete the Commissioning Report and all associated documentation for the Owner with assistance from the GC and Trade Contractors.

H. Post-Occupancy Warranty Phase Commissioning

1. The CxA will report any identified operational or performance issues (identified by the building O&M staff or warranty phase Cx activities) to the GC via a Warranty Phase Cx Log for resolution by the GC and Trade Contractors during or prior to the end of the warranty period.
2. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

3. The CxA may conduct onsite visits to review system operation and performance with the Owner's O&M team and/or may review system trend data during the Warranty Phase and will report any identified issues and recommendations from the trend analysis.

4. No later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy, the CxA will return to the facility to interview facility O&M staff, walk the facility and review systems operation and trend data where applicable. Key representatives from the GC and Trade Contractors shall attend a site walk-through and meeting, as determined by the CxA.

1.8 COMMISSIONING RESPONSIBILITIES

A. General

1. The Commissioning Team and all others involved in the commissioning process shall follow the Commissioning Plan, attend the commissioning kickoff meeting, and attend additional commissioning meetings as necessary.

B. Commissioning Authority (CxA)

1. See Section 01 91 13, General Commissioning Requirements.

Commented [EK1]: If not providing a Div 01 spec, copy the responsibilities from the Div 01 spec into each Div specific spec

C. Owner

1. See Section 01 91 13, General Commissioning Requirements.

D. Design Team

1. See Section 01 91 13, General Commissioning Requirements.

E. General Contractor

1. See Section 01 91 13, General Commissioning Requirements.

F. All Trade Contractors

1. Submit project specific written procedures and blank forms for completing all IV, Startup, and PFT tasks, including manufacturer's installation checks and startup procedures, as a commissioning submittal. See Paragraph 1.9. Electronic files are acceptable.

2. Provide any equipment and construction submittals and shop drawings, control drawings, points lists and detailed sequences of operation (including any local, stand-alone controls independent of the BAS controls), meter lists, system diagrams and riser diagrams, and any other submittals or documentation for systems to be commissioned, as requested by the CxA. The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the design documents. Electronic files are acceptable.

3. Provide a list of any test metering and sensors to be used for sensor and device calibration purposes. All test meter and sensors shall have been calibrated within a year and have calibration documentation.

4. Attend commissioning meetings as directed by the CxA and GC to facilitate the commissioning process.
5. Assign personnel with expertise and authority to act on behalf of the Trade Contractor and schedule them to participate in and perform assigned commissioning tasks.
6. Ensure that any required manufacturer factory tests are performed and provide the factory test data and results where required.
7. Demonstrate and document proper system installation, startup and performance.
    a. Perform IV, Startup and PFT tasks for all systems and equipment (no sampling), unless the contract or design documents allow for sampling of these tasks.
    b. Ensure that any required manufacturer's representative field tests, inspections, startup and checkout of selected equipment are performed per the contract documents. Provide completed manufacturer documentation and commissioning forms for these activities.
    c. Complete all IV, Startup and PFT documentation clearly and legibly.
8. Provide a schedule and access for the CxA to witness any equipment Startup and PFT tasks. Notify the GC and CxA at least 10 days in advance of Startup and PFT tasks.
9. Address applicable Cx issues promptly. All IV, Startup and PFT issues must be resolved before the FPTs can proceed.
10. Assist the CxA in preparing the FPT procedures, clarifying the operation and control of commissioned equipment where the specifications, control drawings or equipment documentation are not sufficient for writing detailed testing procedures.
11. Review the FPT procedures to ensure feasibility, safety and equipment protection, and provide necessary written alarm limits, setpoint changes and overrides to be used during the tests.
12. Setup any control system software points, global commands, overrides of any sensor values or relays, and overrides of any setpoints or schedules, to simulate certain conditions and operating modes, in order to conduct the FPTs.
13. Configure all control settings, schedules, alarms, graphics and programming logic for all control systems and any local equipment or stand-alone controls per the project specific sequence of operations.
14. Prior to conducting the CxA witnessed FPTs, place the systems and controls into the operating modes and test and verify all sequences of operation. Check all control system safety cutouts, alarms, and interlocks with other systems during each mode of operation prior to the FPTs. Ensure all systems are operating and performing per the design requirements, and have been pre-tested per the FPTs, and are ready for the CxA witnessed FPTs.
    a. The Trade Contractors shall determine the appropriate level of pre-testing, to prepare for the CxA witnessed FPTs.
15. Perform the FPTs, with the FPTs witnessed by the CxA. Provide at least 10 days advance notice to the GC and CxA for scheduling the FPTs.
16. Setup any control or monitoring system trends and provide all requested trend data for the FPTs and post-occupancy warranty phase commissioning review to the CxA.

a. As an Owner approved option, the Trade Contractors may provide the CxA remote access to the BAS and any other control system, with the Owner's permission, which will allow the CxA to easily and directly download the trend data files.

17. Prepare a training agenda for each training class for the equipment and systems to be commissioned.

18. Coordinate with the GC and Owner to schedule and plan training. Execute training of Owner's personnel per approved training agenda and schedule. Provide copies of training class sign-in sheets and materials / handouts.

19. Prepare O&M Manuals according to the Contract Documents.

20. Assist the CxA in developing the Systems Manual, including providing as-built drawings, controls sequences, setpoints, single-line diagrams, etc., necessary for the Systems Manual.

21. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Contractors shall participate in the FPTs as required for operation of the inter-related systems.

G. BAS Trade Contractor

1. See Section 23 08 00 for the additional specific BAS Trade Contractor responsibilities and commissioning submittal requirements, applicable for any BAS controls and monitoring for plumbing systems.

H. TAB Trade Contractor

1. See Section 23 08 00 for the additional specific TAB Trade Contractor responsibilities and commissioning submittal requirements, applicable for any TAB work for plumbing systems.

1.9 SUBMITTAL REQUIREMENTS FOR COMMISSIONING

A. Trade Contractor Pre-Functional Procedures/Plans and Blank Forms.

1. The Trade Contractors shall submit to the CxA all applicable project specific written procedures/plans and blank forms for all required IV, Startup and PFT tasks for the project, at least 4 weeks in advance of performing any of these tasks. Provided below are the potential procedures/plans and blank forms required for the applicable plumbing systems. The requirements for the project specific procedures and blank forms will also be further described in the Cx Plan.

a. Domestic Hot Water and Plumbing IV Forms (Equipment, Piping & Local Controls) - including the following.

i. IV forms are to provide verification of the make/model, components, and accessories upon receipt of the equipment and to provide field verification and documentation of proper installation of system equipment, piping, assemblies, and components per design and manufacturer requirements, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup forms.

ii. The IV forms are either supplied by the Trade Contractor and/or the Manufacturer, and shall include all checklists and verification requirements from the manufacturer's installation and operation manual (IOM). The Trade Contractors are to verify equipment installation and access per the manufacturer's guidelines and requirements, and thus are to use and complete any applicable equipment IV checklists contained in the IOM, in addition to any IV forms used by the Trade Contractors to verify system, equipment, piping and assembly installation per design and industry standards.

iii. The IV forms shall also include any applicable design or shop drawings, plans, details, or single line diagrams that will be field verified and signed off / checked, particularly for verification of the system piping.

iv. The IV forms shall also include any local plumbing equipment factory controls or local stand-alone plumbing and DHW controls that are not installed by the BAS Contractor.

b. Domestic Hot Water and Plumbing Startup Procedures and Forms - including the following.

i. The startup procedures and forms are to be supplied by the installing contractor and/or the manufacturer and shall include all required startup and checkout procedures from the manufacturer's IOM.

ii. Where required per the design specifications, the startups shall be completed by the authorized manufacturer's representative. In the submittal for the startup procedures and blank forms, the contractor shall indicate which startups will be completed by the authorized manufacturer's representative.

iii. The startup procedures and forms shall also include the checkout and verification of any local plumbing and DHW equipment factory controls or local stand-alone plumbing controls that are not installed by the BAS Contractor, including any setpoint configuration and programming checks per the project design sequence of operation.

c. Domestic Water Pipe System Pressure / Leak Test Procedures and Forms – including the following.

i. The sections of pipe to be tested and the associated test methods, pressures and durations,

ii. The applicable forms to be used to document the completion of the pressure / leak tests.

d. Domestic Water Pipe Clean / Disinfect & Flush Procedures and Blank Forms – including the following.

i. The intended minimum durations for all pipe cleaning, disinfections, and flushing.

ii. The associated cleaning agents and/or disinfectants to be used.

e. Water & Gas Meter IV and Pre-Functional Test Procedures and Forms – including the following.

i. The IV forms to be used to verify the meter installation and the meter programming / configuration / setup per the Manufacturer IOM and design requirements, including the communication modules for BAS integration.

ii. An outline of the pre-functional tests to verify the meter flow readings of the installed meters.

iii. The applicable forms to be used for the above meter IV and pre-functional checks.

f. Plumbing Fixture Automatic Controls IV and Pre-Functional Test Forms – including the following.

i. Forms that are either floor plan-based checklists or room by room table checklists that indicate completion of the IV and pre-functional tests for each plumbing fixture with automatic controls.

ii. The intent of the forms is to verify the installation of each fixture controls per design documents and manufacturer requirements, to verify any applicable automatic control settings have been adjusted and checked, and to verify the operation and control has been tested.

g. Procedures/Plans for all other applicable plumbing systems IV and PFT tasks, per the project design and specifications or as requested by the CxA.

2. For the requirements for the BAS Controls PFT procedures and blank forms applicable to the plumbing systems, see Section 23 08 00.

3. The CxA will review these submitted commissioning procedures/plans and forms including whether all project specific requirements are included.

4. The CxA may request additional data, changes and/or additions to these forms prior to their use, including forms any supplemental forms provided by CxA, based on the construction documents and specifications, manufacturer installation manuals and procedures, and/or industry standards or guidelines.

B. Training Agenda. The Trade Contractors shall develop a Training Agenda for each training session, per the requirements of the contract documents and specifications, and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and occupant training. The Training Agenda shall be included in the comprehensive Training Plan to be submitted by the GC for review by the CxA, Design Professionals, and/or the Owner (see Section 01 91 13). The GC and Trade Contractors shall coordinate to fully develop the comprehensive Training Plan with input from the Owner.

1. The Training Agenda for each training session shall include the following:

a. equipment and/or systems covered;

b. recommended attendees;

c. proposed location;

d. estimated duration;

e. level of instruction to be provided and an outline of the training topics and subjects to be covered;

f. list of any materials and handouts to be provided (or provided in advance);

g. company to provide the training and the instructor’s name and qualifications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 MEETINGS, SCHEDULING AND COORDINATION

A. See Section 01 91 13.

3.2 DOCUMENTATION

A. The Trade Contractors have specific responsibilities for assisting in the development of equipment check, test and verification procedures and forms, and in performing and documenting commissioning tests, as directed by the GC and as overseen by the CxA.

B. The Trade Contractors shall provide, wherever the Contract Documents require, system checks and testing, test reports, factory test data and reports, checklists, operational verifications and demonstration, etc., whether specified or not in the commissioning sections.

3.3 TEST EQUIPMENT

A. The Trade Contractors shall provide all test equipment in sufficient quantities to execute all Startup, PFT and FPT tasks in an expedient fashion.

B. The test equipment shall be of industrial quality and suitable for testing and calibration with accuracy within the tolerance necessary to demonstrate system performance per the Contract Documents. If not otherwise specified, the following minimum requirements apply:

C. Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5 degree F and a resolution to + or – 0.1 degree F.

D. Pressure sensors shall have an accuracy of + or – 2.0 percent of the value range being measured (not full range of meter) and have been calibrated within the last year.

E. The test equipment shall have calibration certification per equipment manufacturer's interval level or within one year if not otherwise specified. The calibration tags shall be affixed or certificates readily available for all test equipment.

3.4 COMMISSIONING PRE-FUNCTIONAL TASKS

A. The Trade Contractors shall conduct all IV, startup procedures and pre-functional tests (PFTs) without compromise to human or equipment safety. The GC and Trade Contractors shall be responsible for the liability and safety of conducting all startup, checks and tests.

B. The Trade Contractors shall clearly identify and list any issues and deficiencies resulting from the IV, Startup and PFT tasks on the associated forms and immediately notify the CxA. The CxA will additionally document the issues on the Cx Issues Log. Once issues and deficiencies are corrected and verified, the associated forms shall be updated and resubmitted, and any necessary field review, back-checks or re-tests witnessed by the CxA.

C. The GC and Trade Contractors shall provide a minimum 10 days' notice to the CxA for witnessing equipment Startup and PFT tasks.

D. The sample rates for the CxA witnessing of plumbing system PFT tasks and equipment startups, will be defined in the Cx Plan.

E. The GC and Trade Contractors shall ensure the completion of the IV, Startup and PFT forms. Review and approval of the completed IV, Startup and PFT forms by the CxA is required prior to conducting the FPTs. The CxA may create System Readiness Checklists to track the status of the IV, IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

3.5 FUNCTIONAL PERFORMANCE TESTS

A. The Trade Contractors shall perform all FPTs per the final FPT forms, for all systems and equipment in the scope of commissioning. The FPTs shall be witnessed by the CxA unless stated otherwise by the CxA. The Trade Contractors may need to complete off hours or weekend work in order to complete the FPTs. The CxA will document all testing results on the FPT forms.

B. As noted in the Part 1, a sampling approach will be used for the FPTs of identical systems and equipment, using the approximate sample rates as defined below and/or in the Cx Plan, with the specific systems and equipment selected by the CxA.

1. FPT Sample Rates for Domestic Hot Water Systems (including water heaters, storage tanks, pumps, recirculation pumps and controls, etc.):
    a. Sequence of Operation, Verification Tests and Performance Tests for *** all of the *** approximately 25% to 50% *** of the DHW systems by type, or at least one for each type, as selected by CxA.
2. FPT Sample Rates for Under Sink Instant-hot Electric Water Heaters
    a. Performance Tests for approximately 10% to 30% of the instant-hot water heaters, as selected by CxA.
3. FPT Sample Rates for Pumping Systems: DCW booster pumps, circulation pumps, sump pumps, sewage ejectors, etc.
    a. Sequence of Operation Tests for each unique pump type / sequence of operation.
    b. Verification Tests for approximately 25% to 50% of the pumps by type, or at least one of each type, as selected by CxA.
    c. The sample is 100% for any critical pumping systems, to be defined in the Cx Plan.
4. FPT Sample Rates for Plumbing Fixture Automatic Controls:
    a. Verification Tests for approximately 10% to 30% of the fixture automatic controls by type, or at least one of each type, as selected by CxA.
5. FPT Sample Rates for Water Recovery and Re-use Systems: all systems (no sampling).

C. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

D. The GC and Trade Contractors shall coordinate all FPTs with the CxA, and provide a minimum of 10 days' notice prior to conducting each test.

E. The GC and Trade Contractors shall have responsibility for the liability and safety of conducting all functional performance tests.

F. The Trade Contractor executing the test shall provide all necessary materials, system modifications, etc. to produce the necessary flows, pressures, temperatures, etc. to execute the test according to the test procedures.

1. The Trade Contractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures. For example, globally adjusting the space temperature setpoints for all terminal units on a floor or AHU or the building. Or as another example, globally overriding the economizer status command for all AHUs.

G. At completion of the test, the Trade Contractor shall return all affected building equipment and systems to their pre-test normal condition.

3.6 TREND ANALYSIS

A. The CxA may conduct trend analysis as part of the FPT process, after completion of the onsite field conducted FPTs and correction of all issues and deficiencies, to verify integrated system operation and performance.

B. The CxA will prepare a BAS trend points list including the trend interval. The BAS Trade Contractor shall set up the trend log definitions prior to the start of the sequence of operation FPTs.

C. The BAS Trade Contractor shall provide the trend to the CxA in an electronic format, either a text file, CSV file or Excel file, with related system parameters grouped together. The estimated duration for the trend data is 1 to 3 weeks (with a minimum of 1 weeks' worth of data).

D. If the CxA discovers any control or performance issues during trend analysis, the Trade Contractors shall correct the issues and provide new trend data for analysis verification by the CxA.

3.7 COMMISSIONING ISSUES, BACK-CHECKS AND RE-TESTS

A. When Cx issues are identified during testing, the CxA will discuss with the executing Trade Contractor and/or GC and determine whether or not testing can proceed. The CxA may allow immediate correction of minor issues and deficiencies identified during testing. The Cx issue and any identified resolution will be documented on the test form in use in addition to the Cx Issues Log.

B. The CxA will maintain and update the Cx Issues Log, and document the issue resolution process. Copies will be distributed to the GC, Owner, and Trade Contractors as appropriate. The Trade Contractors shall provide updates and comments regarding issue status and resolution.

C. The Trade Contractors shall promptly correct all Cx issues. The responsible party shall correct the issue and inform the GC and CxA of the resolution and completion date, and update the Cx Issues Log accordingly (in the fields assigned for contractor updates).

D. The CxA will record completion on the Cx Issues Log after a successful witnessed re-test, field review, back-check, verification obtained through appropriate documentation or photographs, or acceptance by the Design Team or Owner. The GC shall reschedule any applicable re-testing

with the CxA and Trade Contractor. The Trade Contractor shall retest until achievement of passing performance or Owner acceptance of the noted issue.

E. Where sampling is used for the PFTs and FPTs, the results shall be deemed acceptable once all noted issues are resolved and any new sample tests or checks have passed.

F. Additional parties may require input during a dispute regarding a Cx issue. Regardless of the validity or responsibility of the issue, the CxA will have the final interpretive authority on Cx issues and the Owner will have the final approval authority.

G. The CxA may recommend solutions to Cx issues. However, the GC and Trade Contractors ultimately have the burden of responsibility to solve, correct and perform required retests.

H. Back-checks, Verifications and Re-testing:

1. The CxA will witness one (1) re-test or will perform one (1) field back-check or verification of any Cx issue.
2. The CxA's total onsite time for re-test witnessing and field verification or back-check of Cx issues will be limited to no more than 16 hours (2 days) for all applicable mechanical, electrical, and plumbing systems in the commissioning scope.
3. The Owner may back-charge the GC for any additional fees from the CxA, resulting from any additional re-testing or field back-checks or verification beyond this allocated total time.
4. The GC must provide a minimum 48 hours' notice for scheduling any re-testing, though the CxA will attempt to accommodate a shorter timeframe if feasible.
5. Any required re-testing shall not be considered a justified reason for a claim of delay or for a time extension.
6. For any re-testing required, the CxA will determine if the entire test must be re-tested or if it is acceptable to re-test specific portions of the test that had failed.

3.8 DEFERRED & SEASONAL TESTING

A. Before or during the end of the first year warranty period, the Trade Contractor shall complete any seasonal or deferred testing, required per the design specifications and as defined in the Cx Plan. The Trade Contractors shall complete tests in the same manner as all other commissioning tests, including CxA witnessing.

B. The GC and Trade Contractor shall coordinate with CxA and Owner and schedule all deferred and seasonal testing.

3.9 TRAINING VERIFICATION

A. The GC and Trade Contractors shall coordinate and schedule the training for the Owner's facility and operations personnel, and building occupants. The GC shall ensure that training is completed per the requirements of the contract documents and specifications.

B. Trade Contractors responsible for specific equipment and system training shall submit to the GC, a written training agenda for each training class for the equipment and systems to be commissioned. The GC shall submit a comprehensive Training Plan, including the specific

training agendas, to Owner, Design Team and CxA for review and approval. See also Section 01 91 13.

C. The CxA will review the Training Plans for commissioning verification prior to conducting the actual training.

D. For verification of actual training conducted, the GC shall submit to CxA 'attendee signed' attendance sheets for each training session conducted and a copy of any final training presentations or handout materials.

3.10 COMMISSIONING ACCEPTANCE, CLOSE-OUT AND REPORTING

A. Completion of the main commissioning activities (system readiness checks, functional performance testing, and training) shall be accomplished as a prerequisite for substantial completion. Completion of any re-testing shall be completed prior to final acceptance of commissioning.

B. After completion of the main commissioning activities and following review of the completed commissioning documents, test results and the current Cx Issues Log with the Owner, the Owner will indicate whether they accept completion of the project construction phase commissioning or if not, the requirements for acceptance. Upon Owner acceptance, any remaining open Cx issues will be transferred to the warranty phase Cx Issues Log for tracking resolution and completion as part of the warranty phase commissioning.

C. Upon completion of all commissioning activities, the CxA will prepare and submit to the Owner a Cx Report detailing all completed commissioning activities and documentation. The GC shall support this effort by providing all Trade Contractor commissioning documentation.

D. The CxA will complete a Systems Manual for the systems and equipment commissioned, with assistance provided by the GC and Trade Contractors. The Systems Manual will provide the operating staff the information needed to understand and optimally operate the commissioned systems. It will also include the current facility requirements, and an ongoing commissioning plan.

3.11 POST-OCCUPANCY WARRANTY PHASE COMMISSIONING

A. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA, to be witnessed by the CxA, unless stated otherwise by the CxA.

B. The CxA may conduct onsite reviews of the system operation and performance, meet with the O&M Team to discuss system operation and performance, and may also review BAS trend data during the Warranty Phase. The BAS Trade Contractor shall be responsible for providing post-occupancy trend data to the CxA.

C. The CxA will report any identified issues and recommendations to the GC via a Warranty Phase Cx Issues Log for review and resolution by the GC and Trade Contractors prior to the end of the warranty period, for any issues or recommendations identified either by the CxA or the Owner. The GC shall work with the Trade Contractors and O&M staff to make corrections and adjustments as required to address the issues and recommendations.

D. Key representatives from the GC and Trade Contractors shall attend a near end of warranty commissioning review meeting, to be scheduled with the Owner's facility staff and the CxA, no later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy.

1. During this meeting, the operation and performance of the systems will be discussed with the Owner's staff, the results of any commissioning reviews and trend analysis will be discussed and the Warranty Phase Cx Issues Log will be reviewed. If needed, a walk-through of the systems with the Owner's staff will be conducted.
2. Next steps and actions items for any open Cx issues and recommendations will be discussed and documented via meeting minutes or a field report issued by the CxA. The intent is to resolve any open Cx issues prior to the end of the warranty phase.

E. After correcting noted Warranty Phase Cx issues, the GC shall notify the CxA, and the CxA will back-check and verify resolution of the issues and recommendations.

F. Issues identified during the warranty period will remain warranty phase Cx issues until satisfactory completion by Trade Contractors, even if the warranty period expires during the correction and back-check period.

END OF SECTION 22 08 10

SECTION 22 08 20 - PLUMBING SYSTEMS COMMISSIONING – ENGINEER REQUIREMENTS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing Systems) are hereby made a part of this section.

1.2 GENERAL

A. The Contractor shall include an adequate time period and adequate resources for all commissioning tasks in the project schedule. The necessary time period shall be carefully reviewed with all of the appropriate subcontractors to ensure that the subcontractors are in agreement with the time allotted for each scheduled task.

B. Successful completion of the entire plumbing systems commissioning scope of work shall be a condition of Substantial Completion. The building shall be considered ‘ready to utilize for its intended use’ only at such time that the entire plumbing systems commissioning scope of work is successfully completed and accepted by the Owner.

1.3 COMMISSIONING CHECKLIST

Plumbing

1. Verify operation of all toilet and urinal flush valves.
2. Verify operation of all lavatory faucets.
3. Verify adjustment of water flow duration at self-closing lavatory faucets.
4. Verify time delay before domestic hot water is available at lavatory faucets.
5. Verify balancing of domestic hot water re-circulating pumps and balancing valves at each floor.
6. Verify adjustment, calibration, and operation of all tempering valves.
7. Verify the functionality of all backflow preventers.
8. Verify setpoints and operation of all specialty systems (elevator sump pumps, etc.).

END OF SECTION

SECTION 22 08 30 - THIRD PARTY COMMISSIONING OF PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 THIRD PARTY COMMISSIONING AGENT CONTRACT AND PAYMENT

A. The third party commissioning agency will be contracted with and paid by the Owner.

1.3 DESCRIPTION

A. The work of this specification section includes furnishing labor and material to accomplish commissioning of the plumbing systems, including attendance at all third party commissioning meetings.

B. Plumbing systems commissioning work includes but is not limited to:

1. Verifying correct operation and functional performance of plumbing systems for compliance with the ‘Design Intent’ as indicated on the drawings and in the specifications.
2. Documenting all plumbing tests, certifications, and inspections.
3. Verifying the completeness and appropriateness of operation and maintenance manuals, as-built drawings, spare parts lists, special tools lists, and other items as may be specified for support of the plumbing systems and equipment.
4. Verifying the operation and maintenance training sessions with the Owner’s personnel for all plumbing systems and equipment.

1.4 QUALITY ASSURANCE

A. Codes, Regulations and Standards:

ASHRAE Guideline 0 - The Commissioning Process (most current edition)

1.5 COORDINATION

A. Coordinate all work, timing, and completion of work with other specification sections as required to ensure that preliminary commissioning can be completed early enough to allow for final commissioning and reports to be completed prior to the Owner taking occupancy of the building or space.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 PARTICIPATION

A. General: The third party commissioning agency will actively participate in the construction phases of the project to ensure compliance with the drawings and specifications and with all commissioning requirements specified in this and other specification sections as relate to commissioning of the plumbing systems.

B. Pre-Construction Meeting: The third party commissioning agency, the general contractor, mechanical contractor, temperature controls subcontractor, test and balance subcontractor, and all other associated subcontractors shall attend the pre-construction meeting(s) and then coordinate the requirements for plumbing systems commissioning throughout construction of the project.

C. Commissioning Meetings: The third party commissioning agency, the general contractor, mechanical contractor, temperature controls subcontractor, test and balance subcontractor, and all other associated subcontractors shall attend the regularly scheduled commissioning coordination meetings and then coordinate the requirements for plumbing systems commissioning throughout construction of the project

END OF SECTION

SECTION 22 09 00 - PLUMBING FIXTURES AND TRIM

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of plumbing fixtures specified in this section include the following:

Water Closets
Urinals
Lavatories
Mop Sinks
Sinks
Showers
Drinking Fountains

1.3 QUALITY ASSURANCE

A. All plumbing fixtures shall be certified under the United States EPA WaterSense program, as required by Nevada Assembly Bill AB163.

B. Plumbing Fixture Standards: Comply with applicable portions of the following codes and requirements for all work in this section:

American National Standards Institute
Federal Standards
California Plumbing Code (for projects located in California)

C. All plumbing components within the waterways shall comply with the following:

Safe Drinking Water Act
No Lead Restrictions of ANSI/NSF Standard 61 Section 9

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data for plumbing fixtures and trim, including catalog cut of each fixture type and trim item furnished.

B. Operation and Maintenance Data: Submit operation and maintenance data and replacement material lists for each type of material listed in this section. Include this data and product data in the operation and maintenance manual.

1.5 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Handle plumbing fixtures carefully to prevent breakage, chipping, and scoring the fixture finish. Do not install damaged plumbing fixtures; replace and return damaged units to equipment manufacturer.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR PLUMBING FIXTURES

A. All fixtures shall be first class in every respect. Accurately line up finished plumbing. Take special care with the rough-in and finished plumbing where batteries of fixtures occur.

B. Consult architectural drawings, as well as plumbing drawings for locations, dimensions, and mounting heights of plumbing fixtures.

1. Take location and mounting heights for rough-in from architectural drawings.
2. Follow schedule on plumbing drawings for rough-in connections. Set rough-in for all fixtures exactly per measurements furnished by the manufacturers of the fixtures used.
3. Rough-in for lavatories and sinks shall be brought in through the wall under the centerline of the drain from the fixture wherever possible and as close to the fixture as possible.

C. Provide all water supplies to fixtures with compression shutoff stops with IPS inlets, threaded brass nipples at pipe connection, and a lock-shield loose key. Provide combination fixtures with a compression stop on each water supply fitting. Provide loose key handle for each stop. Provide 1/2 inch rigid risers for all fixtures unless otherwise noted.

D. Furnish shutoff valves on hose bibbs directly connected to mains with no intervening valves.

E. Except where otherwise specified, all finish for exposed metal trim on fixture shall be polished chromium plated. This also applies to wall flanges, nuts, and washers. Handles on all faucets and stops shall be all metal chromium plated.

F. Make connection between fixtures and flanges on soil pipe absolutely gas tight and water tight with neoprene type gaskets (wall hung fixtures) or bowl wax (floor outlet fixtures). Rubber gaskets or putty will not be permitted.

G. Provide fixtures not having integral traps with P-traps of chromium plated cast brass body without cleanout connected to concealed waste in wall and sanitary fittings. Provide fixtures with a 17 gauge minimum traps and tailpiece and grid drain unless otherwise noted.

H. Available Manufacturers: Subject to compliance with requirements, manufacturers offering traps which may be incorporated in the work include the following, or approved equal:

McGuire Manufacturing
Dearborn Brass

I. Unions on waste pipes on fixture side of traps may be slip or flange joints with soft rubber or lead gaskets.

2.2 PLUMBING FIXTURE HANGERS AND SUPPORTS

A. Properly install and support plumbing fixtures as required and specified herein.

B. Carriers and supports shall be J.R. Smith, Zurn, Mifab, or equal as recommended by the manufacturer for the particular installation and type of fixture being installed. Residential type fixture supports are not acceptable.

C. Install wall mounted water closets with combination support and waste fittings, with feet of support securely anchored to floor.

D. Install floor mounted water closets with J.R. Smith, Mifab, or equal cast iron closet flanges with brass bolts, nuts, washers, and porcelain caps.

E. Install the following fixtures on concealed support with feet of support securely anchored to floor. Anchor top of support to wall construction in an approved manner.

Wall mounted urinals
Drinking fountains

F. Install wall hung lavatories in stud walls with concealed arms and floor support, with feet of support securely anchored to the floor. In addition, anchor top of support to wall construction.

G. Support multiple faucet wash basins by welding 6” steel plates (minimum 1/8” thick) directly behind the 16 gauge wall studs. Drill pilot holes into the plates, an fasten the sink bracket to the plate using 3/8” self-tapping screws, and then use 6” flat strap for the other attachment locations.

2.3 PLUMBING FIXTURES

A. Fixtures shall be American Standard, Sloan, Kohler, Haws, Elkay, Just, Acorn, or approved equal.

B. Fixture manufacturer and model shall be as scheduled on the drawings, complete with all components and accessories as illustrated and described. Provide stops for all concealed supplies.

C. Flush valves used at handicapped water closets shall be mounted on the wide side of the toilet enclosure.

D. All water coolers, drinking fountains, and hydration stations shall include integral water filters that are accessible from the front of the enclosure.

2.4 WATER CLOSET SEATS

A. Provide seats for standard elongated bowls with self-sustaining check hinges, stainless steel posts, white color.

PART 3 - EXECUTION

3.1 INSPECTION AND PREPARATION

A. Examine rough-in work of domestic water and waste piping systems to verify actual locations of piping connections prior to installing fixtures. Also examine floors, substrates, and conditions under which fixture work is to be accomplished. Correct any incorrect locations of piping and other unsatisfactory conditions for installation of plumbing fixtures. Do not proceed with work until all unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install plumbing fixtures of types indicated where shown and at mounting height indicated on Architectural Drawings in accordance with fixture manufacturer's written instructions, rough-n drawings, and with recognized industry practices. Ensure that plumbing fixtures comply with requirements and serve intended purposes. Comply with applicable requirements of the Uniform Plumbing Code pertaining to installation of plumbing fixtures.

B. In all cases where plumbing fixtures are mounted on or against building walls of concrete or other materials having relatively rough or non-planar surfaces, it shall be the responsibility of this Contractor to provide any necessary grout or backing materials required to facilitate fixture mounting and eliminate void spaces between fixtures and wall to ensure adequate bearing contact.

1. On completion of installation provide silicone sealer at all points of fixture contact with walls or floors.

C. Any fixture broken, cracked, or otherwise damaged during installation shall be replaced by the Contractor at his own expense.

3.3 TRAPPING AND VENTING OF FIXTURES

A. Trap and vent all plumbing fixtures in accordance with the Uniform Plumbing Code, whether or not shown on the drawings. Strictly adhere to any and all local codes. The only exceptions (which require specific written approval) will be those fixtures which are specially noted herein or on the drawings to be provided with special wastes.

B. No vent shall intersect another vent at a point less than 6 inches above the extreme overflow level of highest fixture served.

C. Take vents off the top half of horizontal runs and grade so as to free vents quickly of any water or condensation.

3.4 ADJUSTMENT OF PLUMBING PIPING SYSTEM

A. Test and adjust all flush valves so that each fixture receives the proper amount of water. Regulate all faucets, bibbs, drinking fountains, etc. to the approval of the Architect/Engineer so that the entire system is left in a first class condition.

B. Clean fixtures, equipment, and materials installed under this contract. Remove any/all cement, plaster, paint, rust, etc. Also remove any/all dirt, rubbish, paint spots, or grease on walls or fixtures for which this Contractor is responsible.

3.5 CLEANING AND PROTECTION

A. Clean plumbing fixtures of all dirt and debris upon completion of installation.

B. Protect installed fixtures from dirt and damage during the remainder of the project.

3.6 FIELD QUALITY CONTROL

A. Upon completion of installation of plumbing fixtures and after units are water pressurized, test fixtures to demonstrate capability and compliance with requirements. When possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units and proceed with retesting.

B. Inspect each installed unit for damage to finish. When feasible, restore and match finish to the original at site. Otherwise, remove the fixture and replace with a new unit. Feasibility and match to be judged by the Architect/Engineer. Remove any cracked or dented units and replace with new units.

3.7 EXTRA STOCK

A. Furnish special wrenches and other devices necessary for servicing plumbing fixtures and trim to the Owner with receipt. Furnish one device for every 10 units.

3.8 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.9 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 22 10 00 - FACILITY WATER DISTRIBUTION

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of plumbing piping materials and components specified in this section include the following:

1. Materials and Products
2. Basic Pipes and Fittings
3. Thrust Blocks
4. Basic Valves
5. Hose Bibbs
6. Hydrants
7. Reduced Pressure Backflow Preventers
8. Point-of-Use Mixing Valves
9. Electronic Mixing Valves
10. Emergency Eyewash/Shower Assemblies
11. Water Hammer Arrestors
12. Trap Primers
13. Electronic Trap Primers
14. Expansion Tanks for Potable Water
15. Commercial Clothes Washers

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of plumbing piping systems products, of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Contractor's Qualifications: Firm with at least 5 years of successful installation experience on projects with piping systems work similar to that required for this project.

C. Plumbing Code Compliance: Comply with applicable portions of the Uniform Plumbing Code pertaining to selection and installation of plumbing materials and products.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for plumbing piping systems materials and products.

B. As-Built Drawings: At project closeout, submit as-built drawings of installed piping systems.

C. Operation and Maintenance Data: Submit operation and maintenance data and parts lists for plumbing piping systems materials and products. Include this data, product data, shop drawings, and record drawings in the operation and maintenance manual.

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS

A. Provide piping materials and factory-fabricated piping products of sizes, types, pressure ratings, temperature ratings, and capacities as indicated. Provide materials and products complying with the Uniform Plumbing Code. Where more than one type of material or product is indicated, selection is the Contractor's option.

2.2 BASIC PIPES AND PIPE FITTINGS

A. Provide pipe and pipe fittings complying with Section 220500 (Basic Materials and Methods for Plumbing) and in accordance with the following listing:
   1. Interior Water Piping (and Exterior Water Piping Exposed Above Grade):
      a. Pipe Size 2 inches and Smaller: Copper tube; Type L, hard drawn temper; with wrought copper fittings and solder joints.
      b. Pipe Size 2-1/2 inches and Larger: Copper tube; Type L, hard drawn temper; with wrought copper fittings and brazed joints.
   2. Exterior Water Piping Below Grade:
      a. Below Grade Pipe 3 inch and Smaller: Copper tube; Type K, hard drawn temper; with wrought copper fittings and with brazed joints.
      b. Below Grade Pipe 4 inch through 12 inch: Polyvinyl chloride (PVC) water pipe; Class 150, DR-18, with cast iron or ductile iron fittings, and ring-tite joints. Pipe shall be listed as AWWA C900.
   3. Water Piping Below Building Slab and/or other Concrete Slab:
      a. Below Grade Pipe 2 inch and Smaller: Copper tube; Type K soft copper; with no fittings.
      b. Below Grade Pipe 2-1/2 inch and Larger shall be one of the following:
         1) Copper tube; Type L, hard drawn temper; with wrought copper fittings and brazed joints.
         2) Schedule 80 PVC with socket fittings and solvent cemented joints.
         3) Polypropylene (PP-R) SDR 7.4 pipe, with socket-fusion, butt-fusion, fusion-outlet, or electro-fusion fittings and joints.
   4. Underground Piping Corrosion Protection
      a. All buried copper pipe and fittings shall be wrapped with polyethylene corrosion protection pipe wrap, labeled for the type of pipe and fittings that it covers. Pipe wrap shall be Christy’s Polywrap, or approved equal.

2.3 THRUST BLOCKS

A. All buried piping with friction type joints (bell and spigot, Tyton, etc.) shall have adequate concrete thrust blocks installed at each horizontal and vertical change of direction, at each tee, and at dead ends. Anchor piping at the entrance to the building.

2.4 BASIC VALVES

A. Provide valves complying with Section 220500 (Basic Materials and Methods for Plumbing) and in accordance with the following listing:
   1. Check Valves (All Sizes): Swing check valves
   2. Gas Isolation Valves (All Sizes): Lubricated plug valves
   3. Valves at connections to appliances shall be Milwaukee BA-300, or approved equal.

B. Pressure Reducing Valves:
   1. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include the following, or approved equal:
      Watts Model 223-S-B
      Zurn Model 500XLYSBR
   2. Pressure reducing valves shall comply with ASSE Standard 1003.
   3. Pressure reducing valves shall be provided with the manufacturer's upstream strainer, and with an integral bypass capability. Provide upstream and downstream pressure gauges, and a full size valved bypass at each pressure reducing valve location.
   4. Pressure reducing valve size shall be as indicated on the drawings, and/or as appropriate for the associated maximum water flow. Pressure reducing valves for closed hot water and chilled water system make-up shall be 1 inch unless indicated otherwise on the drawings. Provide parallel valves for water flows that are beyond the capacity of a 3 inch pressure reducing valve.
   5. Valve Body shall be lead free brass or bronze. Valve end connections shall be threaded for valve sizes 2-1/2 inch and smaller, flanged for 3 inch valves.
   6. Valves shall be rated for an initial pressure of 150 psi. Valves shall be selected for inlet and outlet pressures as indicated on the drawings.

C. Pressure Compensating Flow Limiting Valves
   1. Provide pressure compensating flow limiting valves where shown on the drawings. Valves shall provide shutoff, measurement, and flow limiting functions, and shall be NSF-61-G and NSF-372 certified for use in a potable water system.
   2. Valves shall be all brass construction with one male thread end with a brass ball valve, and one union end.
   3. Valves shall include a removable stainless steel flow cartridge and a stainless steel spring.
   4. Valves shall be rated for a minimum of 300 psi at 250°F, shall have a flow control accuracy of plus or minus 5%, and shall have a control range of between 2 and 60 psi.
   5. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      Pro Hydronic Model AFLB (No Lead)
      IMI Flow Design Model ICSS (No Lead)

2.5 INTERIOR HOSE BIBBS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering hose bibbs which may be incorporated in the work include the following, or approved equal:
   Woodford
   Watts

2.6 EXTERIOR HOSE BIBBS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering hydrants which may be incorporated in the work include the following, or approved equal:
   Woodford
   Zurn

2.7 REDUCED PRESSURE BACKFLOW PREVENTERS

A. Provide reduced pressure backflow preventers consisting of a complete assembly, including ball type shutoff valves on inlet and outlet, strainer on the inlet, and an oversized air gap fitting with drain piping routed to the exterior of the building (terminating with a downspout nozzle). Backflow preventers shall include test cocks and a pressure differential relief valve located between two positive seating check valves. Air gap fitting sizes shall be as follows:

1" and 1-1/2" backflow preventer: 3" air gap fitting and drain piping
2" and 2-1/2" backflow preventer: 4" air gap fitting and drain piping
3" and 4" backflow preventer: 6" air gap fitting and drain piping

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering backflow preventers which may be incorporated in the work include the following, or approved equal by Apollo or Watts:

Zurn Wilkins Model 375XL or BF-475 (depending on water line size and flow)

2.8 POINT-OF-USE MIXING VALVES

A. Provide point-of-use mixing valves of type and size as noted on the drawings. Valves shall be thermostatic type, rated for a maximum pressure of 125 psi, UL and ASSE 1070 listed. Provide the valve manufacturer's exposed stainless steel lockable cabinet for each mixing valve.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering point-of-use mixing valves which may be incorporated in the work include the following, or approved equal:

Leonard Model 270-LF
Symmons Model 7-225-CK-MS
Kohler Model K-99799-NA

2.9 ELECTRONIC MIXING VALVES

A. Provide electronic mixing valves of type and size as noted on the drawings. Electronic mixing valves shall be digital electronic type, UL and ASSE 1017 certified. Electronic mixing valves shall be Leonard Model PNV or approved equal, with size as scheduled on the drawings, or based on system flow requirements if not scheduled.

B. Electronic mixing valves shall include an LED display and a plumbing dashboard diagram with status indicating LED's.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering tempered water control valves which may be incorporated in the work include the following, or approved equal:

Leonard Valve Company
Lawler Manufacturing Company
Armstrong International

2.10 EMERGENCY EYEWASH AND/OR SHOWER ASSEMBLIES

A. Provide emergency eyewash and/or shower assemblies, of type, size, and location as indicated on the drawings. Assemblies and installation shall comply in all regards with ANSI Standard Z358.1.

B. Provide mixing valves of type and size as noted on the drawings. Electronic mixing valves shall be thermostatic type complying with ASSE 1071. Mixing valves shall be set to deliver tepid water between 80°F and 90°F.

C. Isolation valves in cold water and hot water piping serving emergency eyewash and/or shower assemblies shall be provided with lockout/tagout devices. Lockout/tagout devices shall be manufactured by Seton, Condor, Brady, or approved equal.

D. Available Manufacturers: Subject to compliance with requirements, manufacturers offering emergency eyewash/shower mixing valves and assemblies which may be incorporated in the work include the following, or approved equal:

Leonard
Haws
Bradley

2.11 WATER HAMMER ARRESTORS

A. Install a manufactured water hammer arrestor in all water branch lines at single fixtures. Water hammer arrestors shall be sized per Plumbing Drainage Institute Standard PDI WH-201 'Water Hammer Arrestors'.

B. Where multiple fixtures are located in a row or battery install single or multiple water hammer arrestors, as appropriate. Water hammer arrestors for multiple fixture installations shall be sized and located per PDI Standard WH-201 and the manufacturer's installation instructions.

C. Water hammer arrestors shall have either threaded or soldered connections.

D. Available Manufacturers: Subject to compliance with requirements, manufacturers offering water hammer arrestors which may be incorporated in the work include the following, or approved equal:

Sioux Chief 650 Series
Mifab CL Series
Precision Plumbing Products SWA or SC Series

2.12 TRAP PRIMERS

A. Trap primer piping located in a concrete floor slab shall be Type 'L' soft copper with no joints, wrapped with corrosion protection tape, Shurtape PW100 Corrosion Protection Tape, or approved equal.

2.13 EXPANSION TANKS FOR POTABLE WATER

A. Provide expansion tanks of size and capacity as listed on the drawings. Expansion tanks shall be replaceable bladder type. Shell and heads shall be of carbon steel welded construction and shall be ASME rated for 125 psi at 240°F. Provide full volume flexible butyl rubber bladder, bottom system connection, air charging fitting, drain connection, lifting eye and base ring for vertical mounting. Tanks shall be factory pre-charged as indicated on drawings. Wetted connections shall be stainless steel and bladder material shall be FDA approved.

B. Install a ball valve with lockshield at all expansion tanks. Ball valves with lockshield shall be Crane Model D171, or approved equal.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering expansion tanks which may be incorporated in the work include the following, or approved equal:

Watts
Elbi
Taco

PART 3 - EXECUTION

3.1 INSTALLATION OF WATER PIPING

A. Run all water piping generally level, free of traps or unnecessary bends, arranged to conform to the building requirements, and to suit clearance for other mechanical work such as ducts, flues, conduits, and other work. No piping shall be installed so as to cause unusual noise from the flow of water therein under normal conditions.

B. Provide water branch lines at single fixtures with a manufactured water hammer arrestor.

1. Water hammer arrestors shall be located as close to the fixture as possible and in conjunction with the manufacturer's installation instructions.
2. Where multiple fixtures are located in a row or battery a single or multiple water hammer arrestors, as required, may be used.
3. Multiple fixture installations shall have the arrestor sized and located per PDI Standard WH-201 and the manufacturer's installation instructions.

C. Install piping on room side of building insulation.

D. Check final location of rubber rings within couplings on PVC water piping with gauge or as recommended by manufacturer. Make connections to valves with cast iron adapters connected to water pipe with cast iron couplings. Furnish and install anchors or thrust blocks.

E. Examine areas and conditions under which plumbing piping systems are to be installed. Do not proceed with any Work until all unsatisfactory conditions have been corrected

3.2 INSTALLATION OF HANGERS AND SUPPORTS

A. Specification Section 220500 (Basic Materials and Methods for Plumbing).

3.3 INSTALLATION OF VALVES

A. Install valves as indicated on Drawings and in the following locations:
1. Shutoff Valves: Install on inlet of each plumbing equipment item, and on inlet of each plumbing fixture, and elsewhere as indicated.
2. Drain Valves: Install on each plumbing equipment item located to completely drain equipment for service or repair. Install at base of each riser, at base of each rise or drop in piping system, and elsewhere indicated or required to completely drain potable water system.

3.4 INSTALLATION OF BACKFLOW PREVENTERS

A. Install backflow preventers where indicated on the drawings. Where drain pans are shown on the drawings, pipe drain pan outlet to the nearest floor drain or floor sink.

3.5 EQUIPMENT CONNECTIONS

A. Piping Runouts to Fixtures: Provide hot and cold water runouts to fixtures of sizes indicated.

B. Mechanical Equipment Connections: Connect hot and cold water piping systems and gas piping systems to mechanical equipment as indicated, and provide a shutoff valve and union at each connection.

3.6 SPARE PARTS

A. Furnish to the Owner, with receipt, one valve key for each key operated hydrant, hose bibb, and faucet installed.

3.7 DOMESTIC WATER SYSTEM STERILIZATION

A. Close open ends of water piping each day to prevent contamination or foreign matter entering pipe during construction. Thoroughly flush out piping to remove any dirt or foreign matter.

B. After flushing of pipe systems, sterilize entire water systems from new point or points of connection before being turned over to Owner for use. Slowly fill system with water and add chlorine chemical agent to produce a minimum of 50 ppm of chlorine in the entering water.

C. Retain treated water in pipe for a minimum of 24 hours. Should chlorine residual at pipe extremities be less than 50 ppm at this time, piping shall be re-chlorinated. As an option, the water systems may be filled with a water and chlorine solution containing a minimum of 200 ppm of chlorine and allowed to stand for four hours.

D. After chlorination, flush lines of chlorinated water and refill from the domestic water supply. Continue flushing until residual chlorine is not greater than the chlorine residual in the flushing water at all pipe extremities. The procedure shall be repeated if it is shown by bacteriological examination made by an approved testing agency that contamination persists in the system.

E. Domestic water sterilization shall be performed in accordance with all requirements of the Nevada Division of Health, Water Supply Regulations (or equivalent authority on projects located in California). Approval of the State Health Division shall be obtained prior to placing the system in service.

F. Submit a written report to the State Health Division as required by State regulations. Provide a copy of the report to the Architect/Engineer prior to placing the system in service and prior to completion of project.

3.8 TESTING OF PIPING

A. Test piping in accordance with the following schedule. Show no loss in pressure or visible leaks after a minimum duration of four hours at the test pressures indicated.

TEST SCHEDULE

SYSTEM TESTED	TEST PRESSURE	TEST WITH
Hot and Cold Water Piping	150 psi at rough-in and 100 psi after equipment connection	Water

B. Testing equipment, materials, and labor shall be furnished by the Contractor.

C. Repair piping systems sections which fail required piping test, by disassembly and reinstallation, using new materials to the extent required to overcome leakage. Chemicals, stop-leak compounds, mastics, or other temporary repair methods are not acceptable.

D. Drain test water from piping systems after all testing and repair work has been completed.

END OF SECTION

SECTION 22 10 10 - COPPER PIPING WITH PRESS FITTINGS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

B. Section 221000 (Facility Water Distribution Systems) is hereby made a part of this section.

1.2 REFERENCE STANDARDS

A. ASME B16.51 - Copper and Copper Alloy Press-Connect Pressure Fittings

B. ASTM B75 - Standard Specification for Seamless Copper Tube

C. ASTM B88 - Standard Specification for Seamless Copper Water Tube

D. ASTM F3226 - Standard Specification for Metallic Press-Connect Fittings for Piping & Tubing

E. IAPMO PS 117 - Press and Nail Connections

F. ASTM E 84 - Standard Test Method for Surface Burning Characteristics of Building Materials

1.3 SEISMIC COMPLIANCE

A. All press fittings shall have seismic certification complying with IBC Section 1705.13.2/3. Certification shall be in accordance with the ICC Evaluation Service Seismic Certification (AC156), or approved equal.

1.4 QUALITY ASSURANCE

A. Installer Qualifications

1. Installers shall attend a manufacturer’s installation training class and be certified as having been trained and qualified to join piping with press-connect fittings. On-site training and credentialing by a manufacturer’s representative is acceptable.
2. Installers shall be qualified, trained, and certified in the installation of press-connect fittings.
3. Press-connect fittings shall be installed using proper tools, actuators, jaws, and rings as approved by the manufacturer.

1.5 WARRANTY

A. The warranty period for Viega ProPress fittings shall be 50 years from the date of installation, and shall cover any labor and material costs caused by failure of a properly installed fitting.

1.6 SUBMITTALS

A. Submittals shall include information indicating all press fittings, all press tools, and copies of the training certifications for all individuals that are planned to install press fittings on the project.

PART 2 - PRODUCTS

2.1 GENERAL

A. Copper piping with press fittings shall be utilized only when and where specifically identified on the drawings and shall be limited to a maximum pipe size of 2 inches.

2.2 VIEGA PROPRESS PIPE AND FITTINGS

A. Viega ProPress Copper and Cast Copper Alloy Press-Connect Fittings
   1. Viega Press-Connect Fittings are approved for use with copper tubing conforming to ASTM B88 or B75. See Specification Section 221000 (Facility Water Distribution) for acceptable pipe materials.
   2. Conform to ASME B16.51, ASTM F3226, IAPMO PS-117, NSF 61, and NSF 372. Copper alloy fittings shall be zero lead silicon bronze alloy C87710 (cast) or C88700 (machined). Bismuth bronze or yellow brass fittings are not acceptable.
   3. Peroxidically cured EPDM elastomeric sealing element rated to 300 psi with a temperature range of 0°F thru 250°F. Sealing element shall be uniform in size/thickness and shall be free from manufactured deformities or indentations.
   4. Press-Connect fittings shall have the 'Viega Smart Connect' feature integral to the fitting body to detect unpressed fittings during the testing process.
   5. Provide color coded markings on exterior of fitting for readily identifying/inspecting sealing element type.
   6. Approved Fitting Manufacturer: Viega, or approved equal.

B. Approved Tool Manufacturers for Installation of Press-Connect Fittings
   1. Viega, Milwaukee, and/or Rigid.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

A. Join copper tube and press-connect fittings with tools recommended by the fitting manufacturer. The manufacturer's installation instructions shall be strictly adhered to.
   1. All connections shall bear full insertion marks on the tubing.
   2. Special attention shall be given to the required two step pressure test.
   3. Perform an initial 'Viega Smart Connect' test for unpressed fitting detection per the manufacturer's installation manual.
   4. The installer shall use an indelible marker to place their initials on the copper pipe immediately adjacent to each completed press fitting, prior to any insulation being installed.
   5. Training certificates for any individual installing press fittings shall be available on site for review by the Engineer and/or Owner.

3.2 TESTING OF PIPING

A. Test piping in accordance with the following schedule. There shall be no loss in pressure and no visible leaks after a minimum duration of four hours at the test pressures indicated.

System Tested	Test Pressure	Test With
Hot and Cold Water Piping	150 psi at rough-in and 100 psi after equipment connection	Water

B. Testing equipment, materials, and labor shall be furnished by the Contractor.

C. Repair piping systems sections which fail required piping test, by disassembly and reinstallation, using new materials to the extent required to overcome leakage. Chemicals, stop-leak compounds, mastics, or other temporary repair methods are not acceptable.

D. Drain test water from piping systems after all testing and repair work has been completed.

3.3 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion carefully clean and adjust all equipment, fixtures, and trim that is installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.4 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.5 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 22 13 00 - FACILITY SANITARY SEWERAGE

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of plumbing piping and accessories specified in this section include the following:

Building Drain and Vent Piping
Grease Waste Piping
Underground Building Drain Piping
Underground Piping Corrosion Protection
Condensate Drain Piping
Trap Primers
Cleanouts
Floor Drains and Floor Sinks
Miscellaneous Drains
Sump Pumps

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of plumbing piping systems products, of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Contractor's Qualifications: Firm with at least 5 years of successful installation experience on projects with piping systems work similar to that required for project.

C. Plumbing Code Compliance: Comply with applicable portions of the Uniform Plumbing Code pertaining to selection and installation of plumbing materials and products.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for plumbing piping system materials and products.

B. As-Built Drawings: At project closeout, submit as-built drawings of installed piping systems in accordance with all associated requirements.

C. Operation and Maintenance Data: Submit operation and maintenance data and parts lists for all plumbing piping system materials and products. Include this data in the operation and maintenance manual in accordance with all associated requirements.

D. Pump Product Data: Submit manufacturer’s pump specifications, installation and start-up instructions, and current accurate pump characteristic performance curves with selection points clearly indicated. Pump efficiency as well as construction will be taken into consideration when assessing the submitted pump.

E. Pump Operation and Maintenance Data: Submit operation and maintenance data and parts lists for each type of pump, control, and accessory, including trouble-shooting maintenance guide. Include this data, product data, and shop drawings in the operation and maintenance manual, in accordance with all associated requirements.

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS

A. Provide piping materials and factory-fabricated piping products of sizes, types, pressure ratings, temperature ratings, and capacities as indicated. Provide materials and products complying with the Uniform Plumbing Code. Where more than one type of material or product is indicated, selection is the Contractor's option.

2.2 BASIC PIPES AND PIPE FITTINGS

A. Above Ground Building Drain Piping

1. Hubless cast iron soil pipe and fittings complying with the latest edition of CISPI Standard 301 and ASTM A888. Pipe and fittings shall be marked with the trademark of the Cast Iron Soil Pipe Institute.
2. Standard No-Hub Couplings: Provide banded couplings with neoprene gasket and Type 304 stainless steel clamp, screw, and shield, all in conformance with ASTM C564 and CISPI 310. Coupling shall be Anaco-Husky Standard No-Hub Coupling, or approved equal. Number of bands shall be as follows:

   Pipe Sizes 1-1/2” thru 4”: 2 Bands
   Pipe Sizes 5” thru 10”: 4 Bands
3. Heavy Duty No-Hub Couplings: Provide banded couplings with neoprene gasket and Type 304 stainless steel clamp, screw, and shield, all in conformance with ASTM C564. Coupling shall be Anaco-Husky Model HD-2000 Heavy Duty No-Hub Coupling, or approved equal. Number of bands shall be as follows:

   Pipe Sizes 1-1/2” thru 4”: 4 Bands
   Pipe Sizes 5” thru 10”: 6 Bands
4. Heavy duty no-hub couplings shall be installed on all exposed piping in mechanical rooms and storage rooms.
5. Heavy duty no-hub couplings shall be installed on all piping located over sensitive areas including kitchens.

B. Below Ground Building Drain Piping

1. Hubless cast iron soil pipe and fittings, complying with the latest edition of CISPI Standards 301 and ASTM A888. Pipe and fittings shall be marked with the trademark of the Cast Iron Soil Pipe Institute.
2. Hubless pipe couplings below grade shall be installed with 4 stainless steel clamps (6 for sizes 5” and above), 0.15” thick Type 304 stainless steel corrugated shield, 3/8” stainless steel bolts and nuts, and neoprene gasket in conformance with the ASTM C564 and ASTM C1540 for heavy duty shielded couplings. Couplings shall be Husky Model SD-4000, Ideal Tridon Heavy Duty, or approved equal.
3. See Specification Section 3.2 for pipe bedding and backfill requirements.

C. Grease Waste Piping

1. Grease waste piping shall be hubless cast iron. For above ground grease waste piping provide two-band or four-band couplings per Section 2.2 (A2 and A3). For below ground grease waste piping provide four-band couplings per Section 2.2 (B3).

D. Vent Piping

1. Vent piping shall be hubless cast iron soil pipe and fittings, same as is specified for above-ground and/or below-ground building drain piping. Provide test tees where required by the Uniform Plumbing Code.

E. Cooling Coil Condensate Drain Piping

1. Type L, hard copper tubing with wrought copper solder joint fittings and 95 percent tin, 5 percent antimony solder. Condensate drain piping 1” and smaller shall use 45 degree wyes and long radius fittings at all changes in direction. Condensate drain piping 1-1/4” and larger shall use DWV fittings.

2.3 TRAP SEALS (TRAP GUARDS)

A. Provide trap seals only where specifically indicated on the drawings. Trap seals shall be IAPMO and ASSE 1072 approved.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering trap seals which may be incorporated in the work include the following, or approved equal:

Provent Systems ProSet Trap Guard
Jay R Smith Quad Close Trap Seal
Zurn Z-Shield Barrier Trap Seal

2.4 CLEANOUTS

A. General: Cleanouts of the same diameter as the pipe shall be installed in all horizontal soil and waste lines where indicated, and at all points of change in direction. Cleanouts shall be located not less than 18 inches from building construction so as to provide sufficient space for rodding. Provide the listed products by Zurn, Mifab, or approved equal.

B. Cleanouts shall have cast iron ferrules and bronze plugs.

C. Cleanouts extending to floor level shall be provided with membrane flange and clamping collar, bronze raised head plug, and nonslip scoriated top.

1. Cleanouts in cast iron soil or waste lines: Zurn Z-1440-BP.
2. Cleanouts in walls: Zurn Z-1446-BP with stainless steel access cover.
3. Cleanouts at exterior of building: Zurn Z-1440-BP.
   a. Provide a stainless steel cover and vandal-proof screws where cleanouts are located in a wall. Zurn Z-1446-A.
   b. Where located at grade, provide an 18x18x6 inch concrete pad and a Zurn Z-1474 heavy duty cover with a Z-1440-A cleanout.
4. Cleanouts in concrete floors: Zurn ZN-1400
5. Cleanouts in terrazzo floors: Zurn Z-1400-T
6. Cleanouts in carpeted floors: Zurn ZN-1400-T-CM
7. Cleanouts in vinyl tile floors: Zurn ZN-1400-TX

2.5 FLOOR DRAINS AND FLOOR SINKS

A. Provide floor drains of size and type as scheduled and shown on the drawings, including the listed options or features. Provide a membrane flashing clamp and frame at floors with a waterproofing membrane.

B. Set the top of each drain as indicated on the plumbing and architectural sheets. Install drains in accordance with the manufacturer's written instructions and in the locations indicated on the drawings. Install a vented P-trap with a 1/2” trap primer connection below each drain.

2.6 MISCELLANEOUS DRAINS

A. Provide drains of size and type as indicated on drawings, including options or features as specified herein. Install vented P-traps below each drain.

1. Fixed Air Gap Drain: Zurn Z-1025 with size as noted on drawings for pipe connection.

2.7 PLASTER INTERCEPTORS

A. Furnish and install Zurn plaster interceptor with minimum capacity indicated on the drawings. Interceptor shall be cast iron with an acid resistant coating on the interior and exterior.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering plaster interceptors which may be incorporated in the work include the following, or approved equal:

Zurn Model Z-1180

2.8 SUMP PUMPS (ELEVATOR)

A. Provide sump pumps where shown and/or scheduled on the drawings.

B. All equipment shall be mounted as detailed on the drawings.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which plumbing piping systems are to be installed. Do not proceed with Work until unsatisfactory conditions have been corrected in a manner acceptable to the Contractor.

3.2 INSTALLATION OF SANITARY DRAINAGE SYSTEMS

A. Run all horizontal sanitary drain piping inside of building on a uniform grade of not less than 1/4 inch per foot. Unless otherwise noted on the drawings piping shall have invert elevations as shown and shall slope uniformly between the given elevations.

B. Run all drainage piping as straight as possible with long radius bends. Make all offsets at an angle of 45 degrees or less.

C. Locate piping runs, except as otherwise indicated on the drawings, vertically and horizontally (pitched to drain), and avoid diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. Locate runs as shown or described by diagrams, details, and notations, or if not otherwise indicated, run piping in the shortest route which does not obstruct usable space or block access for servicing the building and its equipment.

D. Hold piping close to walls, overhead construction, columns, and other structural and/or permanent enclosure elements of the building. Limit clearance to 1/2 inch where furring is shown for enclosure or concealment of piping. Wherever possible in finished and occupied spaces, conceal piping from view by locating piping in column enclosures, in hollow wall construction, or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as indicated on the drawings.

E. Conceal piping in finished portions of building above the floor line, except where otherwise shown or noted. Cutting of walls and floors shall be held to the minimum possible to attain a proper and functional installation.

F. Should structural difficulties or work of other trades prevent the running of pipes or the setting of equipment at the locations shown on the drawings, any necessary deviations determined by the Contractor, shall be submitted for review by the Architect/Engineer, and shall be be installed without additional cost to the Owner.

G. Inspect each piece of pipe and each fitting to see that there is no defective workmanship on the pipe and that there are no obstructions in the pipes and/or fittings.

H. Cap or plug openings in pipes and fittings immediately to prevent dirt entry until fixtures are installed and/or final connections are made.

I. Below grade hubless cast iron drainage piping shall be installed on smooth soil that does not contain rocks that could damage the piping and the area below fittings shall be hand-cleared to allow the pipe and fitting to be properly supported by the soil below. Bedding on sides and top of hubless drainage piping shall be clean crushed gravel (1/2” minus) or sand that is compacted to 85% proctor density.

J. Hubless Cast Iron Joints: Comply with the coupling manufacturer's assembly and installation instructions and with the latest edition of CISPI Standard 310-12.

K. Below grade PVC drainage piping shall be installed using clean, firm, and uniform bedding material. Provide a minimum of 4 inches of bedding below piping, a minimum of 8 inches on the sides, and a minimum of 6 inches above the piping, compacted to 85% proctor density.

L. PVC Joints: Comply with the coupling manufacturer's assembly and installation instructions and with the latest edition of ASTM D2321.

3.3 INSTALLATION OF SANITARY DRAINAGE VENT PIPING

A. Grade all vent piping such that it will free itself quickly of any water or condensation.

B. Where possible join groups of vent risers together to allow one enlarged roof penetration.

3.4 INSTALLATION OF CLEANOUTS

A. Cleanouts: Install in piping as indicated, as required by the Uniform Plumbing Code, at each change in direction of piping greater than 135 degrees, at maximum intervals of 50 feet for piping 4 inches and smaller, at maximum intervals of 100 feet for piping 5 inches and larger, and at the base of each conductor.

B. Flashing Flanges: Install flashing flange and clamping device with each cleanout passing through waterproof membrane.

3.5 INSTALLATION OF TRAP PRIMERS

A. Install trap primers per the manufacturer’s installation instructions, with 1/2 inch Type L hard drawn copper piping to trap primer connection on floor drains and floor sinks where indicated on the drawings.

3.6 INSTALLATION OF PUMPS

A. Install pumps where indicated, in accordance with manufacturer's published instructions, complying with recognized industry practices to ensure that pumps comply with requirements and serve intended purposes.

B. Provide access space around pumps for service as indicated, but in no case less than that recommended by manufacturer.

C. Piping shall be supported from the building structure so as to prevent any strain on the pump casings. A final check for perfect alignment of the piping connections shall be made after pump has been secured to its base. Provide valves, accessories, gauges, flexible connections, and supports as indicated.

D. Install electrical devices furnished by manufacturer but not specified to be factory mounted. Furnish a copy of the manufacturer's wiring diagram to the electrical contractor.

E. Verify that electrical wiring installation is in accordance with manufacturer's submittal and the installation requirements of Division 26. Do not proceed with equipment startup until the wiring installation is complete and correct.

F. Check alignment, and where necessary, realign shafts of motors and pumps within the tolerances recommended by the pump manufacturer.

G. Lubricate pumps before startup. Perform startup in accordance with the manufacturer's written instructions.

H. Pumps shall not be connected to piping before piping is thoroughly flushed and cleaned of all dirt and grit. After piping connections have been made, systems shall be filled before starting pumps. Pumps shall not be run dry under any circumstances.

3.7 TEST OF PIPING

A. Test piping at completion of rough-in, in accordance with the following schedule. Show no loss in pressure or visible leaks after a minimum duration of four hours at the test pressures indicated.

TEST SCHEDULE

SYSTEM TESTED	TEST PROCEDURE	TEST WITH
All Soil, Waste, Drain, & Vent Piping; All Storm Drains within the building. Minimum height of standpipe shall be 10 feet above piping being tested.	Fill with water to top of highest vent and allow to stand 4 hours or longer without a loss of water.	Water

B. At the Contractor's option, piping may be tested with air per UPC Section 712.3.

C. Testing equipment, materials, and labor shall be furnished by this Contractor.

D. Repair piping systems sections which fail required piping test, by disassembly and reinstallation, using new materials to extent required to overcome leakage. Do not use chemicals, stop-leak compounds, mastics, or other temporary repair methods.

E. Drain test water from piping systems after testing and repair work has been completed.

3.8 INSTALLATION OF HANGERS AND SUPPORTS

A. See Specification Section 220500 (Basic Materials and Methods for Plumbing).

3.9 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion carefully clean and adjust all equipment, fixtures, and trim that is installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.10 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.11 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 22 14 00 - FACILITY STORM DRAINAGE

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of plumbing piping and accessories specified in this section include the following:

Building Storm Drain Piping
Cleanouts
Roof Drains

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of plumbing piping systems products, of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Contractor's Qualifications: Firm with at least 5 years of successful installation experience on projects with piping systems work similar to that required for project.

C. Plumbing Code Compliance: Comply with applicable portions of the Uniform Plumbing Code pertaining to selection and installation of plumbing materials and products.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for plumbing piping systems materials and products.

B. As-Built Drawings: At project closeout submit as-built drawings of the installed piping systems in accordance with all associated requirements.

C. Operation and Maintenance Data: Submit operation and maintenance data and parts lists for plumbing piping systems materials and products. Include this data and product data in the operation and maintenance manual, in accordance with all associated requirements.

PART 2 - PRODUCTS

2.1 MATERIALS AND PRODUCTS

A. Provide piping materials and factory-fabricated piping products of sizes, types, and capacities as indicated. Provide materials and products complying with the Uniform Plumbing Code. Where more than one type of material or product is indicated, selection is the Contractor's option.

2.2 BASIC PIPES AND PIPE FITTINGS

A. Above Ground Storm Drain Piping

1. Hubless Cast Iron Soil Pipe and Fittings: Comply with the latest edition of CISPI Standard 301-18, CISPI Standard 301-21, CISPI Standard 310-12, and ASTM A888. Pipe and fittings shall be marked with the trademark of the Cast Iron Soil Pipe Institute. Shield and clamp assembly shall consist of a 300 series stainless steel corrugated shield, stainless steel bands (number of bands as required for pipe size) and sealing sleeve in conformance with ASTM C564.
2. At the Contractor's option vertical piping above the floor from lavatories and sinks may be standard weight galvanized steel pipe with class 125 black cast iron fittings, drainage pattern, with screwed joints.

3. Two-Band Couplings: Provide couplings with 2 stainless steel clamps, stainless steel bolts and nuts, and neoprene gasket in conformance with ASTM C1540 for heavy duty shielded couplings. Couplings shall be Husky Model SD-2000, Ideal Tridon Heavy Duty, or approved equal.
4. Four-Band Couplings: Provide couplings with 4 stainless steel clamps, stainless steel bolts and nuts, and neoprene gasket in conformance with ASTM C1540 for heavy duty shielded couplings. Couplings shall be Husky Model SD-4000, Ideal Tridon Heavy Duty, or approved equal. Four-band couplings shall be installed on all exposed piping in mechanical and storage rooms. Four-band couplings shall also be installed over critical care and other sensitive areas including, but not limited to, kitchens and dining rooms.

B. Underground Storm Drain Piping
1. Hubless cast iron soil pipe and fittings, complying with the latest edition of CISPI Standards 301 and 310, and ASTM A888. Pipe and fittings shall be marked with the trademark of the Cast Iron Soil Pipe Institute. Shield and clamp assembly shall consist of a 300 series stainless steel corrugated shield, stainless steel bands (number of bands as required for pipe size) and sealing sleeve in conformance with ASTM C564.
2. Hubless pipe couplings below grade shall be installed with 4 stainless steel clamps, stainless steel bolts, stainless steel nuts, and neoprene gasket in conformance with CISPI Standard 310 and ASTM C1540 for heavy duty shielded couplings. Couplings shall be Husky Model SD-4000, Ideal Tridon Heavy Duty, or approved equal.
3. See Specification Section 3.2 for pipe bedding and backfill requirements.

2.3 CLEANOUTS

A. General: Cleanouts of same diameter as pipe shall be installed in all horizontal Rainwater leaders where indicated and at all points of change in direction. Cleanouts shall be located not less than 18 inches from building construction so as to provide sufficient space for rodding.

B. Cleanouts shall have cast iron ferrules and bronze plugs.
1. Cleanouts in cast iron drain lines: Zurn Z-1440BP
2. Cleanouts in walls: Zurn Z-1446-A with stainless steel access cover

2.4 ROOF DRAINS

A. Provide roof drains and overflow roof drains of size and type as indicated on the drawings, including options or features as specified herein. Locate roof drains per architectural roof plans. All roof drain domes shall be cast iron.

2.5 ROOF DRAIN TERMINATIONS

A. Provide downspout nozzles of size and type as indicated on the drawings.

PART 3 - EXECUTION

3.1 INSPECTION

A. Install pipes and pipe fittings in accordance with recognized industry practices which will achieve permanently leakproof piping systems, capable of performing each indicated service without piping failure. Install each run with minimum joints and couplings but with adequate and accessible unions for disassembly and maintenance/replacement of valves and equipment. Reduce sizes where indicated by use of reducing fittings. Align piping accurately at connections, within 1/16 inch misalignment tolerance.

3.2 INSTALLATION OF DRAINAGE SYSTEMS

A. Run all horizontal storm drain piping inside of building on a uniform grade of not less than 1/4 inch per foot. Unless otherwise noted on the drawings piping shall have invert elevations as shown and shall slope uniformly between the given elevations.

B. Run all drainage piping as straight as possible with long radius bends. Make all offsets at an angle of 45 degrees or less.

C. Locate piping runs, except as otherwise indicated on the drawings, vertically and horizontally (pitched to drain), and avoid diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. Locate runs as shown or described by diagrams, details, and notations, or if not otherwise indicated, run piping in the shortest route which does not obstruct usable space or block access for servicing the building and its equipment.

D. Hold piping close to walls, overhead construction, columns, and other structural and/or permanent enclosure elements of the building. Limit clearance to 1/2 inch where furring is shown for enclosure or concealment of piping. Wherever possible in finished and occupied spaces, conceal piping from view by locating piping in column enclosures, in hollow wall construction, or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as indicated on the drawings.

E. Conceal piping in finished portions of building above the floor line, except where otherwise shown or noted. Cutting of walls and floors shall be held to the minimum possible to attain a proper and functional installation.

F. Should structural difficulties or work of other trades prevent the running of pipes or the setting of equipment at the locations shown on the drawings, any necessary deviations determined by the Contractor, shall be submitted for review by the Architect/Engineer, and shall be be installed without additional cost to the Owner.

G. Inspect each piece of pipe and each fitting to see that there is no defective workmanship on the pipe and that there are no obstructions in the pipes and/or fittings.

H. Cap or plug openings in pipes and fittings immediately to prevent dirt entry until fixtures are installed and/or final connections are made.

I. Below grade hubless cast iron drainage piping shall be installed on smooth soil that does not contain rocks that could damage the piping and the area below fittings shall be hand-cleared to allow the pipe and fitting to be properly supported by the soil below. Bedding on sides and top of hubless drainage piping shall be clean crushed gravel (1/2” minus) or sand that is compacted to 85% proctor density.

J. Hubless Cast Iron Joints: Comply with the coupling manufacturer's assembly and installation instructions and with the latest edition of CISPI Standard 310-12.

K. Below grade PVC drainage piping shall be installed using clean, firm, and uniform bedding material. Provide a minimum of 4 inches of bedding below piping, a minimum of 8 inches on the sides, and a minimum of 6 inches above the piping, compacted to 85% proctor density.

L. PVC Joints: Comply with the coupling manufacturer's assembly and installation instructions and with the latest edition of ASTM D2321.

3.3 INSTALLATION OF CLEANOUTS

A. Cleanouts: Install in piping as indicated, as required by the Uniform Plumbing Code, at each change in direction of piping greater than 135 degrees, at minimum intervals of 50 feet for piping 4 inches and smaller and 100 feet for larger piping, and at the base of each conductor.

B. Flashing Flanges: Install flashing flange and clamping device with each cleanout passing through a waterproof membrane.

3.4 TEST PROCEDURES

A. Test piping at completion of rough-in, in accordance with the following schedule and show no loss in pressure or visible leaks after a minimum duration of four hours at the test pressures indicated.

SYSTEM TESTED	TEST PROCEDURE	TEST WITH
All Soil, Waste, Drain, & Vent Piping; All Storm Drains within the building. Minimum height of standpipe shall be 10 feet above piping being tested.	Fill with water to top of highest vent. Allow to stand 4 hours without loss of water.	Water

B. At the Contractor's option, piping may be tested with air per UPC Section 712.3.

C. Testing equipment, materials, and labor shall be furnished by this Contractor.

D. Repair any piping system sections that fail the required piping test, by disassembly and reinstallation, using new materials to the extent required to overcome leakage. Do not use chemicals, stop-leak compounds, mastics, or other temporary repair methods.

E. Drain test water from piping systems after the testing and repair work has been completed.

3.5 INSTALLATION OF HANGERS AND SUPPORTS

A. See Specification Section 220500 (Basic Materials and Methods for Plumbing).

3.6 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave the entire work in a condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment that is installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.7 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 22 15 00 - FACILITY NATURAL GAS SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of piping systems and specialties specified in this section include the following:

Steel Gas Pipe
Polyethylene Gas Pipe
Miscellaneous Piping Materials/Products
Gas Pressure Regulating Valves
Flexible Connections
Emergency Fuel Shutoff Valves
Hangers and Supports

1.3 QUALITY ASSURANCE

A. Welders' Qualifications:

1. Welding: Qualify welding procedures, welders and operators in accordance with ASME B31.1, or ASME B31.9, as applicable, for shop and project site welding of piping work.

B. Heat fusion qualifications:

1. Heat Fusion Joining: Qualify procedures and operators in accordance with the requirements of Title 49 of the Code of Federal Regulations as it applies to heat fusion.

C. Manufacturers: Firms regularly engaged in manufacture of supports and anchors of types and sizes required, whose products have been in satisfactory use in similar service for not less than five years.

1. Plumbing Code Compliance: Comply with applicable portions of the Uniform Plumbing Code pertaining to selection and installation of plumbing materials and products.
2. ANSI Compliance: Fabricate and install natural gas piping in accordance with ANSI B31.2 (Fuel Gas Piping).
3. NFPA Compliance: Fabricate and install natural gas systems in accordance with NFPA (National Fuel Gas Code).
4. Utility Compliance: Fabricate and install natural gas systems in accordance with local gas utility company requirements.
5. Comply with applicable codes pertaining to product materials and installation of supports and anchors.
6. UL and FM Compliance: Provide products which are Underwriters Laboratories listed and Factory Mutual approved.

1.4 SUBMITTALS

A. Product Data: Submit catalog cuts, specifications, installation instructions, and dimensioned drawings for each type of pipe, support, anchor, and seal listed in this section.

B. Welding Certifications: Submit certifications and reports for welded piping work.

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide pipe and tube, joint type, grade, size, and weight indicated for each service, and complying with governing regulations and industry standards.

B. All piping, valves, and accessories shall be specifically listed and approved for use with natural gas.

2.2 BELOW GRADE POLYETHYLENE GAS PIPE

A. Polyethylene Pipe, PE2406. Pipe and fittings shall meet the requirements of ASTM D2513.

B. Fittings and accessories shall be as manufactured and furnished by the pipe supplier. Fittings shall meet the requirements of ASTM D2513, as mandated by CFR 49 Part 192.59 and is so marked, according to Part 192.63.

2.3 WELDING MATERIALS

A. Except as otherwise indicated, provide welding materials as determined by the Contractor as required to comply with all installation requirements and to comply with Section II, Part C of the ASME Boiler and Pressure Vessel Code.

2.4 PIPE AND PIPE FITTINGS

A. Gas Piping (Outside the Building Below Grade)

1. All Pipe Sizes: Polyethylene Pipe, PE2406.
2. Polyethylene pipe fittings and accessories shall be manufactured and furnished by the polyethylene pipe supplier. Fittings shall meet the requirements of ASTM D2513, complying with CFR 49 Part 192.59, and shall be marked according to Part 192.63

B. Gas Piping (Outside the Building Above Grade and Building Distribution Piping)

1. Pipe sizes 2 inches and smaller shall be Schedule 40 black steel pipe with threaded fittings.
2. Pipe sizes 2-1/2 inches and larger shall be Schedule 40 black steel pipe with butt and/or socket weld fittings.
3. Gas piping of all sizes routed inside a building at a pressure that exceeds 2 psi shall be welded Schedule 40 black steel pipe with wrought steel butt and/or socket weld fittings.

C. Gas Piping (Below a Concrete Floor Slab)

1. Install gas piping that is located below a concrete floor slab in accordance with UPC Section 1210.1.6. Gas piping that is located below a concrete floor slab shall be flexible stainless steel with a polyethylene sleeve, Omega TracPipe P-II, or approved equal. Fittings connected to the Omega TracPipe P-II flexible gas piping shall be by the same manufacturer as the pipe. Pipe and fittings shall be installed in conformance with the manufacturer’s written instructions. The gas piping sleeve shall be vented to the outdoors in compliance with UPC Section 1210.1.6.1.

2.5 PIPING SPECIALTIES

A. Comply with Section 220500 (Basic Materials and Methods for Plumbing)

Pipe Escutcheons
Pipe Sleeves
Sleeve Seals
Unions and Flanges

2.6 BASIC GAS VALVES

A. Gas Valves: Valves 4 inch and smaller shall be Nibco T-FP-600A, Apollo 94ALF-A, or approved equal. Valves 5 inch and larger shall be worm gear operated, Resun Figure R-1431-WGA, Nordstrom Figure 149, or approved equal. Gas valves shall be CSA/AGA and ASME listed.

B. Appliance Gas Valves: Provide a gas valve at each connection to an appliance. Appliance gas valves shall be Nibco GB1A, Milwaukee BB2 Series, or approved equal. Gas valves shall be CSA/AGA and ASME listed.

2.7 GAS PRESSURE REGULATING VALVES

A. Provide single stage, steel jacketed, corrosion resistant gas pressure regulators with atmospheric vent, elevation compensator with threaded ends for 2 inches and smaller, flanged ends for 2-1/2 inches and larger, for inlet and outlet gas pressures, specific gravity, and volume flow indicated on the drawings. All gas pressure regulators shall be ANSI/CSA approved.

B. Install as indicated and comply with all utility provider requirements. Pipe atmospheric vent to outdoors, full size of outlet. Install a gas shutoff valve upstream of each pressure regulating valve.

C. Gas pressure regulating valves shall be installed such that the pressure regulator vent is a minimum of 3 feet from any doors, openable windows, foundation vents, crawlspaces, electrical panels, phone and/or cable tv conduits, etc. The pressure regulator vent shall also be a minimum of 5 feet from any powered air intakes, evaporative coolers, make-up air louvers, etc.

2.8 EMERGENCY GAS SHUTOFF VALVES

A. Provide emergency gas shutoff valves where shown on the drawings. Valves shall be listed by either UL or FM and by either AGA or CSA, and shall be capable of being installed in either a horizontal or vertical position. Valve sizes 1/2” through 3” shall be Asco Series S261, AGS Model GSV, or approved equal. Valve sizes 4” and 6” shall be AGS Merlin, or approved equal.

B. A strainer shall be installed upstream of each emergency gas shutoff valve. Strainers 3 inch and smaller shall be Titan YS-12-CI, or approved equal, with 40 mesh strainer and Buna gasket. Strainers 4 inch and larger shall be Titan YS-61-CS, or approved equal, with 40 mesh strainer and Buna gasket.

2.9 SEISMIC GAS SHUTOFF VALVES

A. Provide seismic gas shutoff valves where shown on the drawings. Install seismic gas valves immediately outside the gas service entrance to each building. Seismic gas valves shall be California (Koso) Valve manufactured by Pacific Seismic Products, with Model MS monitoring switch, or approved equal. The monitoring switch shall be wired to activate an audible/visible alarm. Audible/visible alarm horn/strobe shall be Amseco Model CSHB-BG with blue light lens, or approved equal by Kele & Associates. The alarm horn/strobe shall be located on the building exterior adjacent to the seismic gas valve, mounted at 7’-6” above finished grade. The gas piping immediately adjacent to the seismic gas shutoff valve shall be secured to the building with Unistrut channel bracing and a Unistrut Series P1100 pipe clamp.

2.10 FLEXIBLE CONNECTIONS

A. Provide flexible connections in gas piping at all equipment, including but not limited to, boilers, water heaters, furnaces, rooftop units, kitchen equipment, and clothes dryers. Flexible connections shall be as Metraflex Model GASC, Mason Industries Model CSAMN, Unisource Series 400, or approved equal. Flexible connections shall be CSA approved.

PART 3 - EXECUTION

3.1 INSTALLATION OF GAS PIPING

A. Install piping and pipe fittings in accordance with recognized industry practices which will achieve permanently leakproof piping systems, capable of performing each indicated service without piping failure. Install each run with minimum joints and couplings but with adequate and accessible unions for disassembly and maintenance/replacement of valves and equipment. Reduce sizes where indicated by use of reducing fittings. Align piping accurately at connections, within 1/16 inch misalignment tolerance.

B. Comply with ANSI B31 Code for Pressure Piping.

C. Use sealants on metal gas piping threads which are chemically resistant to natural gas. Use sealants sparingly and apply to only male threads of metal joints.

D. Remove cutting and threading burrs before assembling piping.

E. Do not install defective piping or fittings. Do not use pipe with threads which are chipped, stripped, or damaged.

F. Plug each gas outlet, including valves, with threaded plug or cap immediately after installation and retain until continuing piping or equipment connections are completed.

G. Ground gas piping electrically and continuously within project, and bond tightly to grounding connection. Provide listed isolation fitting above grade prior to entry into building. Provide independent ground systems for above ground and below grade.

H. Install drip legs in gas piping where indicated and where required by code or regulation.

I. Install tee fitting with bottom outlet plugged or capped at bottom of pipe risers.

J. Install gas piping with 1/64 inch per foot (1/8 percent) downward slope in direction of flow.

K. Maintain minimum of 12 inch clearance between gas piping and steam piping above 200°F.

L. Install magnesium anodes for underground steel pipe, one 5 lb anode for up to 100 feet in length and one 5 lb anode for each additional 100 feet.

M. Locate piping runs, except as otherwise indicated, vertically and horizontally (pitched to drain), and avoid diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. Locate runs as shown or described by diagrams, details and notations, or if not otherwise indicated, run piping in shortest route which does not obstruct usable space or block access for servicing building and its equipment.

N. Hold piping close to walls, overhead construction, columns, and other structural and permanent enclosure elements of the building, limit clearance to ½ inch where furring is shown for enclosure or concealment of piping, locate insulated piping for a 1 inch clearance outside of the insulation. Wherever possible in finished and occupied spaces conceal piping from view by locating in column enclosures, in hollow wall construction, or above suspended ceilings. Do not encase horizontal runs in solid partitions, except as indicated on the drawings.

O. Electrical Equipment Spaces: Do not run piping through transformer vaults and other electrical or electronic equipment spaces and enclosures unless unavoidable. Install drip pans under piping that must be run through electrical spaces and in all other locations indicated on the drawings.

P. Should structural difficulties or work of other contractors prevent the running of pipes or the setting of equipment at the points shown, the necessary deviations therefrom, as determined by the Contractor, with the Architect/Engineer's review, will be allowed but must be made without additional cost to Owner.

Q. Inspect each piece of pipe and each fitting to see that there is no defective workmanship on pipe or obstructions in pipes and fittings.

R. Install exposed polished or enameled connections from fixtures or equipment with special care, showing no tool marks or threads at fittings.

S. Cap or plug openings in piping and fittings immediately to exclude all dirt until fixtures are installed or final connections are made.

T. Use reducing fittings where any change in pipe size occurs. Bushings shall not be used.

U. Couplings shall not be used except where required pipe runs between fittings are longer than a standard length of the type of pipe being used and except where their use is specifically reviewed by the Architect/Engineer.

V. Conceal piping in finished portions of building, above the floor line, except where otherwise shown or noted. Cutting of walls and floors shall be held to the minimum possible to secure the proper installation.

W. Install piping subject to expansion or contraction in a manner permitting strains to be evenly distributed and alleviated by expansion loops installed as required.

X. Sleeves for branches through walls from adjacent mains shall be of sufficient size to allow for free side motion of covered pipe in sleeve.

Y. Install polyethylene pipe where indicated on the drawings in accordance with ASTM D2774 'Standard Recommended Practice for Underground Installation of Thermoplastic Pressure Piping' and as required by the manufacturer's installation instructions.

1. Polyethylene pipe fittings shall be joined in accordance with the pipe manufacturer's instructions.
2. Connection of plastic pipe with metal pipe shall be only outside underground with ASTM D2513 category I transition fittings.
3. Gas pipe risers to above grade, shall be metallic and shall be wrapped or coated to a point at least six inches above grade.
4. When riser connects underground to plastic pipe, the underground horizontal metallic portion of the riser shall extend at least 30 inches before connecting to the plastic pipe.
5. Heat fusion joints shall be made in accordance with qualified procedures that have been established and proven by test to produce gas tight joints at least as strong as the pipe or tubing being joined. Joints shall be made with the joining method recommended by the pipe manufacturer.
6. Plastic pipe shall be buried with an electrically continuous corrosion resistant tracer wire (minimum 14 AWG) and tape to facilitate locating. One end of the wire and tape shall be brought above ground at a riser.

3.2 INSTALLATION OF HANGERS AND SUPPORTS

A. See Specification Section 220500 (Basic Materials and Methods for Plumbing).

3.3 INSTALLATION OF PIPING SYSTEM JOINTS

A. General: Provide joints of type indicated in each piping system.

B. Cut all steel pipe by power hacksaw, a circular cutting machine using an abrasive wheel, or in square end vise by means of hand hacksaw. Wheel cutters may be used for steel pipe provided that the pipe shall have ends reamed to full inside diameter and beveled before being made up into fittings. Pipe shall have round edges or burrs removed such that a smooth and unobstructed flow will be obtained.

C. Thread pipe in accordance with ANSI B2.1, cut threads full and clean using sharp dies. Ream threaded ends to remove burrs and restore full inside diameter. Apply pipe joint compound, RectorSeal No. 5, or approved equal, on male threads at each joint and tighten joint to leave not more than 3 threads exposed. Teflon tape may be used on piping 1-1/2 inches and smaller.

D. Use joint compound, same as specified for threaded pipe joints, on all cleanout plugs.

E. Weld pipe joints in accordance with recognized industry practice and as follows:
   1. Welding shall be done by qualified welders in a first class, workmanlike manner, conforming to the American Standard Code for Pressure Piping ANSI B31.1 and B31.1A.
   2. Bevel pipe ends at a 37.5 degree angle where possible, smooth rough cuts, and clean to remove slag, metal particles, and dirt.
   3. Do not weld out piping system imperfections using tack welding procedures. Re-fabricate piping to comply with requirements.

3.4 INSTALLATION OF FLANGED JOINTS

A. Match flanges within piping system and at connections with valves and equipment. Clean flange faces and install gaskets. Tighten bolts to provide uniform compression of gaskets.

3.5 INSTALLATION OF PROTECTIVE PIPE WRAP

A. Protect all steel pipe buried in ground from corrosion by the application of protective pipe wrap. Clean and prime pipe before application of the wrapping material.

3.6 INSTALLATION OF DETECTABLE UNDERGROUND WARNING TAPE

A. Protect all underground gas and/or fuel oil piping systems (when shown on the mechanical and/or plumbing drawings) with a detectable underground warning tape, as manufactured by Seton, or approved equal. This requirement applies to metallic and non-metallic piping (including polyethylene piping).

B. Detectable underground warning tape shall consist of 5 mil foil tape printed with associated pipe service (e.g., ‘Caution Gas Line Below’).

C. Tape shall be buried approximately one half of the pipe buried depth. Tape buried up to 24” deep shall be a minimum of 3” wide. Tape buried greater than 24” deep shall be a minimum of 6” wide.

3.7 INSTALLATION OF GAS PRESSURE REGULATING VALVES

A. Install as indicated on the drawings and comply with all utility provider requirements. Pipe atmospheric vent to outdoors, full size of outlet. Install a gas shutoff valve upstream of each pressure regulating valve.

B. Gas pressure regulating valves shall be installed such that the pressure regulator vent is a minimum of 3 feet from any doors, openable windows, foundation vents, crawlspaces, electrical panels, phone and/or cable tv conduits, etc. The pressure regulator vent shall also be a minimum of 5 feet from any powered air intakes, evaporative coolers, make-up air louvers, etc.

3.8 INSTALLATION OF GAS PIPING EQUIPMENT CONNECTIONS

A. Connect gas piping to each gas fired equipment item, with drip leg, gas shutoff valve, and flexible connection. Comply with the equipment manufacturer's instructions. Gas shutoff valves shall comply with UPC Section 1212.6 to be within 6 feet of the equipment and shall be installed no higher than 5 feet above finished floor.

3.9 PIPE CLEANING

A. Purge all newly installed natural gas piping with compressed air.

3.10 TEST OF PIPING

A. Test piping at completion of rough-in, in accordance with the following schedule and show no loss in pressure or visible leaks after a minimum duration of four hours at the test pressures indicated.

TEST SCHEDULE

SYSTEM TESTED	TEST PRESSURE	TEST WITH
Gas Piping	100 psi	Air

B. Testing equipment, materials, and labor shall be furnished by this Contractor.

C. Repair piping systems sections which fail required piping test, by disassembly and reinstallation, using new materials to extent required to overcome leakage. Do not use chemicals, stop-leak compounds, mastics, or other temporary repair methods.

3.11 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment, fixtures, and trim that are installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.12 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.13 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 22 23 00 - HEAT TRACING FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 SUMMARY

A. Types of heat tracing specified in this section include the following:

Self-regulating, parallel resistance heat tracing with capacity, design, and accessories as scheduled on the drawings.

1.3 SUBMITTALS

A. Provide the following for each type of product.
   1. Shop drawings for electric heating cable.
   2. Field quality control reports.
   3. Operation and maintenance data.

PART 2 - PRODUCTS

2.1 SELF-REGULATING, PARALLEL RESISTANCE HEATING CABLES

A. Manufacturer shall be as follows, or approved equal:
Raychem/nVent
Chromolox
Thermon

B. Comply with IEEE Standard 515.1 (Standard for the Testing, Design, Installation, and Maintenance of Electrical Resistance Trace Heating for Commercial Applications).

C. Heating Element: Pair of parallel No. 16 AWG, nickel-coated, stranded copper bus wires embedded in cross-linked conductive polymer core, which varies heat output in response to temperature along its length. Terminate with waterproof, factory-assembled, non-heating leads with connectors at one end, and seal the opposite end water-tight. Cable shall be capable of crossing over itself once without overheating.

D. Electrical Insulating Jacket: Flame-retardant polyolefin.

E. Cable Cover: Tinned-copper braid and polyolefin outer jacket with ultraviolet inhibitor.

F. Maximum Operating Temperature (Power On): 150°F.

G. Maximum Exposure Temperature (Power Off): 185°F.

H. Electrical components, devices, and accessories shall be listed and labeled as defined in NFPA 70 by a qualified testing agency, and marked for the intended location and application.

2.2 CONTROLS

A. Provide Raychem ‘ProtoNode’, or approved equal, and C910 485 and ACS 30 controllers, as required for a complete and functional system with a BACnet Interface.

B. Provide an outdoor air temperature sensor with a 40°F setpoint.

C. Provide a remote temperature sensor for applications that require pipe temperature sensing.

2.3 ACCESSORIES

A. Cable Installation Accessories (Provided by Heat Tracing Manufacturer): Fiberglass cloth adhesive tape, Rayclic-PC power connection, RayClic-S splice kits, RayClic-T tee kits, and Rayclic-E end seals. Also provide Rayclic-SB-04 mounting brackets for installations involving fluid temperatures above 150°F, and for all grease waste piping.

B. Warning Labels: Continuously printed 'Electrical Heat Tracing' vinyl labeling, 3 mil minimum thickness, with pressure sensitive, permanent, waterproof, self-adhesive back.

1. Markers on pipes with outside diameter including Insulation of less than 6 Inches shall be 3/4 inch minimum width.
2. Markers on pipes with outside diameter including Insulation of 6 Inches and larger shall be 1-1/2 inch minimum width.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install electric heating cable across expansion joints according to manufacturer's written instructions; use slack cable to allow movement without damage to cable.

B. Install electric heating cables after piping has been tested and before insulation is installed.

C. Install electric heating cables according to IEEE Standard 515.1 (Standard for the Testing, Design, Installation, and Maintenance of Electrical Resistance Trace Heating for Commercial Applications).

D. Install insulation over piping with electric heating cables according to Specification Section 220700 (Plumbing Insulation).

E. Install warning tape on piping insulation where piping is equipped with electric heating cables.

F. Set all field adjustable switches and circuit breaker trip ranges.

G. Ground equipment according to the requirements listed in Division 26.

H. Connect wiring according to the requirements listed in Division 26.

3.2 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Perform tests after cable installation but before application of coverings such as insulation, wall, or ceiling construction, or concrete.
2. Test cables for electrical continuity and insulation integrity before energizing.
3. Test cables to verify rating and power input. Energize and measure voltage and current simultaneously.

B. Repeat tests for continuity, insulation resistance, and input power after applying thermal insulation on pipe mounted cables.

C. Cables will be considered defective if they do not pass the listed tests and inspections.

D. Prepare and submit test and inspection reports.

E. Remove and replace damaged heat tracing cables.

END OF SECTION

SECTION 22 34 00 - GAS FIRED DOMESTIC WATER HEATERS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 220000 (Plumbing) and 220500 (Basic Materials and Methods for Plumbing) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of plumbing equipment specified in this section include the following:

Gas Fired Water Heaters

1.3 QUALITY ASSURANCE

A. Manufacturers: Firms regularly engaged in manufacture of plumbing equipment of type and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Grade or quality of materials desired is indicated by trade names or catalog numbers stated herein.

C. Dimensions, sizes, and capacities shown are minimum and shall not be changed without permission of the Architect/Engineer.

D. UL and NEMA Compliance: Provide electric motors and electrical components required as part of plumbing equipment, which have been listed and labeled by Underwriters Laboratories and comply with NEMA standards.

E. NEC Compliance: Comply with the National Electrical Code (ANSI/NFPA 70) as applicable to installation and electrical connections of ancillary electrical components of plumbing equipment.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's plumbing equipment specifications, installation and startup instructions, capacity and ratings, with selection points clearly indicated.

B. Maintenance Data: Submit maintenance data and parts lists for each item of plumbing equipment. Include troubleshooting maintenance guides. Include this data in maintenance manual.

PART 2 - MATERIALS

2.1 GAS FIRED WATER HEATERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering gas fired water heaters which may be incorporated in the work include the following, or equal:

Lochinvar Shield

B. The water heater shall be capable of full modulation firing down to 20% of rated input with a 5:1 turndown ratio and shall have a minimum 95% thermal efficiency.

C. The water heater shall consist of a direct fired stainless steel heat exchanger mounted on top of a glass lined storage tank in a fashion that will reduce the amount of scale build-up that is known to reduce efficiency. The water heater shall have no visible pipes that connect the heat exchanger to the storage tank. Heat exchangers shall bear the ASME ‘HLW’ stamp and shall be National Board listed. There shall be no banding material, bolts, gaskets or O-rings in the header configuration.

D. The stainless steel combustion chamber shall be designed to drain condensation to the bottom of the heat exchanger assembly. A built in trap shall allow condensation to drain from the heat exchanger assembly. The water heater shall carry a three year warranty against leaks and a one year parts warranty.

E. The water heater shall bear the ASME 'HLW' stamp and shall be National Board listed. The tank shall have a working pressure of 150 psi. The tank shall be glass lined and fired to 1600°F to ensure a molecular fusing of glass and steel. The tank shall be completely encased in high density insulation of sufficient thickness to meet the energy efficiency requirements of the latest edition of the ASHRAE 90.1 Standard. The tank shall be fitted with a brass drain valve.

F. The water heater shall be certified and listed by C.S.A. International under the latest edition of the harmonized ANSI Z21.10.3 test standard for the US and Canada. Water heater shall comply with the energy efficiency requirements of the latest edition of the ASHRAE 90.1 standard. The water heater shall be certified for indoor installation. The water heater efficiency shall be verified through third party testing by AHRI and listed in the AHRI Directory.

G. The water heater shall be constructed with a heavy gauge steel jacket assembly, primed and pre-painted on both sides. The combustion chamber shall be sealed and completely enclosed, independent of the outer jacket assembly, so that integrity of the outer jacket does not affect a proper seal. A burner/flame observation port shall be provided. The burner shall be a premix design and constructed of high temperature stainless steel with a woven metal fiber outer covering to provide modulating firing rates. The water heater shall be supplied with a gas valve designed with negative pressure regulation and be equipped with a variable speed blower system, to precisely control the fuel/air mixture to provide modulating water heater firing rates for maximum efficiency. The water heater shall operate in a safe condition at a de-rated output with gas supply pressures as low as 4 inches of water column.

H. The water heater shall utilize a 24 volt control circuit and components. The control system shall have an electronic display for water heater set-up, water heater status, and water heater diagnostics. All electronic circuitry shall be easily accessed and serviceable from the front of the jacket. The water heater shall be equipped with; an all-bronze circulating pump; high limit temperature control; ASME certified temperature and pressure relief valve; inlet & outlet water temperature sensors; flue temperature sensor; runtime contacts; alarm contacts; low water flow protection, contacts for louvers, security protection, adjustable pump delay, enable/disable contacts and built-in freeze protection. The manufacturer shall verify proper operation of the burner, all controls, and the heat exchanger connecting to water and venting prior to shipping.

I. Provide equal flow manifold for piping entering and leaving multiple water heaters. The manifold shall be provided by the manufacturer as a standard option for the specified water heaters.

J. The water heater shall feature a programmable smart control with an LCD display, soft key pad, pump delay with freeze protection, and pump exercise. The water heater shall be equipped with an eight foot power cord. Supply voltage shall be 120 volt/1 phase.

K. The water heater shall be installed and vented with a vertical or sidewall direct vent system. The vent and combustion air material shall be sealed stainless steel or sealed polypropylene routed separately and terminating with the manufacturer's specified termination fitting for both the vent and combustion air. The vent and combustion air materials shall be UL listed for use with the water heater. Note that polypropylene does not conform to ASTM E84 with regard to a 25/50 flame spread and smoke developed rating and cannot be installed in a return air plenum.

L. The water heater shall be approved for 180°F operation.

M. The water heater shall have an independent laboratory rating for Oxides of Nitrogen (NO_x) of 20 ppm or less, corrected to 3% O_2.

N. The water heater shall operate at altitudes up to 4,500 feet above sea level without additional parts or adjustments.

O. The water heater firing control system shall be direct spark ignition with electronic supervision.

PART 3 - EXECUTION

3.1 INSTALLATION OF GAS FIRED WATER HEATERS

A. Install power gas-fired water heaters as indicated, in accordance with the manufacturer's installation instructions and in compliance with all applicable codes.

B. Furnish wiring diagram to the electrical installer. Refer to Division 26 for wiring requirements.

C. Connect hot and cold water piping to units with shutoff valves and dielectric unions. Connect drain and relief piping as noted on the drawings.

D. Start, test, and adjust water heaters in accordance with the manufacturer's startup instructions. Check and calibrate all controls.

E. All water heaters shall be secured in place with two straps as required by Uniform Plumbing Code Section 507.2.

3.2 TRAINING

A. Provide a minimum of 2 hours of training and orientation of the Owner’s staff in proper care and operation of all equipment.

3.3 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment, fixtures, and trim that are installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.4 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.5 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 00 00 - HEATING, VENTILATING, AND AIR CONDITIONING

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. The Conditions of the Contract (General, Supplementary, and other Conditions) and the General Requirements (Sections of Division 1) are hereby made a part of this section.

B. This section lists general requirements for Heating, Ventilating, and Air Conditioning (HVAC) work and is hereby made a part of each Division 23 specification section.

C. For convenience or reference the Specifications are separated into Divisions and Sections. Such separations shall not operate to make the Engineer an arbitrator to establish subcontract limits between the Prime Contractor and his Subcontractors. In any case, the Prime Contractor is responsible to the owner for a complete job.

D. Wherever the word ‘provide’ is utilized with regard to materials or equipment on the drawings or in the specifications it shall be interpreted to mean ‘furnish and install’.

E. The term ‘exposed’ shall be interpreted to mean any equipment, ductwork, or piping that is not concealed above a continuous ceiling or inside a finished wall.

1.2 WORK INCLUDED

A. This section consists of general requirements and standard specifications covering certain parts of the HVAC work and is supplemented by other Division 23 specification sections covering additional work, requirements, and materials specifically applicable to the HVAC work of each section. Requirements of subsequent sections of the specifications, if in conflict with these general requirements, shall govern.

1.3 REQUIREMENTS OF REGULATORY AGENCIES

A. Provide work and materials in full accordance with the latest rules and regulations of the following:

Nevada
2018 International Building Code
2018 Uniform Mechanical Code
2018 Uniform Plumbing Code
2018 International Energy Conservation Code
2017 National Electrical Code
2018 International Fire Code
2018 NFPA Codes and Standards
Nevada State Fire Marshal
Nevada Occupational Safety and Health
National Fire Protection Association
Underwriters Laboratories
All other applicable state codes, rules, and regulations

B. Nothing in the drawings or specifications shall be construed to permit work not conforming to these codes and regulations.

C. When the Contract Documents differ from governing codes, furnish and install the larger size or higher standards called for at no additional cost to the Owner.

1.4 FEES, PERMITS, AND UTILITY SERVICES

A. Obtain and pay for all permits and service required for installation of this work; arrange for required inspections and secure approvals from the authorities having jurisdiction.

B. Arrange for utility connections and coordinate work with utility company.

C. Arrange required inspections and secure approvals from the authorities having jurisdiction.

1.5 SITE EXAMINATION

A. Examine site, verify dimensions and locations against drawings, and inform self of conditions under which work is to be done before submitting proposal. No allowance will be made for extra expense on account of error.

B. Information shown relative to existing services is based upon available records and data but is approximate only. Make minor deviations found necessary to conform to actual locations and conditions without extra cost. Verify location and elevation of utilities prior to commencement of excavation for new piping or its installation.

C. Exercise extreme care in excavating near existing utilities to avoid any damage thereto. This Contractor is responsible for any damage caused by his operations.

1.6 PLACEMENT OF EQUIPMENT AND WORK

A. The placement of equipment and mechanical work in the locations and spaces shown on the drawings is the Contractor's responsibility.

B. Move equipment and/or work into spaces through openings provided or located in the spaces during construction, as required.

C. Perform disassembling and reassembling of equipment and/or other work necessary to accomplish this requirement without extra cost to the Owner.

1.7 SUBMITTALS AND SUBSTITUTIONS

A. In all cases, there is one basis of design manufacturer or product for each item of equipment or product shown on the drawings and/or specified herein. These products are identified by name and model number on the drawings and/or in the specifications. Alternative manufacturers and products are also listed; however, their inclusion as an alternative manufacturer or product does not cause them to be the basis of design. If an alternative manufacturer and/or product is desired to be used by the Contractor, it will be considered a substitution. Substitutions will be interpreted to be all manufacturers or products other than the basis of design. Only one request for substitution will be considered for each item of material or equipment. No substitutions will be considered thereafter. After a substitution request is reviewed and is found to be unacceptable the Architect/Engineer reserves the right to require the originally specified equipment or product at no additional cost to the Owner.

B. If the Contractor desires to make a substitution, he shall submit complete information or catalog data to show equality of equipment or material offered to that specified. No substitutions will be allowed unless requested and reviewed in writing. The Architect/Engineer will review and take appropriate action on shop drawings, product data, samples, and other submittals as required by the contract documents. Such review shall be only for general conformance with the design concept and general compliance with the information given in the contract documents. The review shall not include review of quantities, dimensions, weights or gauges, fabrication processes, construction methods, coordination with the work of other trades, or construction safety precautions, all of which are the sole responsibility of the Contractor. Review of a specific item shall not indicate acceptance of an assembly of which the item is a component. The Architect/Engineer shall not be required to review and shall not be responsible for any deviations from the Contract Documents not clearly noted by the Contractor, nor shall the Architect/Engineer be required to review partial submissions or those for which submissions for correlated items have not been received. The Architect/Engineer reserves the right to require the originally specified item.

C. Installation of reviewed substitutions is the Contractor's responsibility. Any changes required for installation of reviewed substituted equipment must be made without additional cost to the Owner. Review by the Architect/Engineer of the substituted equipment and/or the dimensioned drawings does not waive the requirements stated herein.

D. In any case where the Contractor intends to utilize a listed or unlisted acceptable equipment manufacturer that is not the basis of design as listed on the drawings and in the specifications it is the Contractor's responsibility to confirm prior to bidding that all ductwork, piping, controls, electrical power, conduit, service clearances, space requirements, and structural requirements match those of the basis of design equipment. Costs for any revisions necessary to accommodate the ductwork, piping, controls, electrical power, conduit, service clearances, space requirements, and structural requirements for the alternative equipment are the responsibility of the Contractor and shall be included in the Contractor's bid. No extra cost will be allowed for failure to allow for accommodations related to the alternative equipment in the Contractor's bid.

E. Submit to the Architect/Engineer for review, within a reasonable time after award of Contract and in ample time to avoid delay of construction, shop drawings or submittals on all items of equipment and materials, including all substitutions. Also see Division 1 for additional related requirements.

F. Partial or incomplete sets of equipment and materials submittals will not be acceptable.

G. Assessment of quantities is solely the Contractor's responsibility and will not be reviewed.

H. All submittal data shall be tailored to suit the specific project, with appropriate model or part numbers, materials, sizes, options, and accessories clearly indicated for each different submittal item and on each submittal page. Submittal pages without this information will be returned and will need to be resubmitted with all of the required information indicated on each sheet.

I. The Contractor shall certify that he has examined all submittal data and that the equipment and materials submitted for review meet or exceed the requirements of the drawings and specifications. Submittals without the required certification will not be acceptable.

J. Should the Contractor neglect to include submittal data for any item of equipment or material it shall be assumed and agreed that the associated equipment or material is the exact item specified as the basis of design on the drawings and in the specifications.

K. Electronic Formatted Submittals

1. Provide submittals in electronic form (.pdf file format).
2. Identify and incorporate submitted information as follows:
   a. Provide complete submittal package including cover sheet with:
      1) Project Name
      2) Submittal Package Number (with Revision Number identified)
      3) Date
      4) Name and Address of Architect/Engineer
      5) Name of Contractor
      6) Name of Subcontractor
   b. Group submitted items by specification section and provide:
      1) Index of submitted products with page numbers
      2) Name of firm or entity that prepared submittal
      3) Name of supplier
      4) Name of manufacturer
      5) Equipment and/or fixture tag, if applicable
      6) Number and title of appropriate specification section
3. Items indicated by the Architect/Engineer to be resubmitted shall be resubmitted as follows:
   a. Retain items marked as 'No Exceptions Taken' or 'Make Corrections Noted' and resubmit with the revised package. Do not provide new sheets for these items.
   b. Provide revised submittal sheets for all other reviewed items. Provide originally submitted sheet with Architect/Engineer comments. Clearly indicate amendments and modifications made in response to previous submittal review comments.

PART 2 - PRODUCTS

2.1 MATERIALS AND EQUIPMENT

A. Mention herein or on the drawings requires that this Contractor provide each item listed of quality noted, or equal. All material shall be new, full weight, standard in all respects, and in first class condition. Provide materials of the same brand or manufacturer throughout for each class of material or equipment wherever possible. Materials shall be tested within the continental United States by an independent, nationally recognized testing agency and shall be listed in accordance with testing agency requirements.

B. The grade or quality of materials desired is indicated by the trade names and/or catalog numbers stated on the drawings and in the specifications.

C. Dimensions, sizes, and capacities shown are a minimum and shall not be changed without the written permission of the Architect/Engineer.

D. All equipment shall comply with the mandatory equipment efficiencies listed in IECC Section C403.3.2.

E. No material installed as part of this work shall contain asbestos in any form.

2.2 MATERIALS FURNISHED

A. Identify all materials and equipment by manufacturer’s name and model number. Remove unidentified materials and equipment from site.

B. Equipment specified by manufacturer’s number shall include all accessories, controls, etc. listed in catalog as standard with equipment. Furnish optional accessories as specified.

C. Equipment or material damaged during transportation, installation, or operation is considered as totally damaged. Replace with new equipment. Variance from this requirement will be permitted only with the written consent of the Architect/Engineer.

D. Provide an authorized representative to constantly supervise the work of this division. Check all materials prior to installation for conformance with drawings and specifications.

PART 3 - EXECUTION

3.1 ACCESS TO HVAC WORK

A. Comply with manufacturer’s written instructions for installation of access doors.

B. Access panels shall be furnished and installed wherever valves, balance valves, damper operating mechanisms, air terminal boxes, fans, and similar items normally requiring adjustment or servicing are installed in concealed or inaccessible spaces. Coordinate with access doors shown on architectural drawings.

3.2 DRAWINGS AND COORDINATION

A. General arrangement and location of piping, ductwork, equipment, etc. are shown on the drawings or herein specified. Carefully examine other work that may conflict with this work. Install this work in harmony with other crafts and at proper time to avoid delay of work.

B. In advance of construction, work out minor changes and relocations to suit actual conditions and work of other trades to avoid any conflicts. This shall not be cause for additional cost.

C. Verify all measurements at the building and be responsible for the correctness of same. No extra compensation will be allowed on account of differences between actual dimensions and those indicated on the drawings.

D. In addition, obtain all necessary information from the other trades regarding centers of partitions, walls, location of plumbing mains, fire sprinkler mains, and electrical conduits, ducts, pipes, etc. in order that pipes, equipment, and ductwork may be placed in their correct positions.

E. Execute any work or apparatus shown on the drawings and not mentioned in the specifications, or vice versa, the same as if specifically mentioned by both. Omission from drawings or specifications of any minor details of construction, installation, materials, or essential specialties does not relieve this Contractor from furnishing same in place complete.

F. Furnish and install any incidental work not shown or specified which can reasonably be inferred as part of the work and necessary to provide a complete and workable system.

G. Furnish materials and work at proper time to avoid delay of the work.

3.3 TEMPORARY UTILITIES, HEATING, AND COOLING

A. Temporary utilities may be connected to the Owner's existing metered utilities only with the Owner's and the utility company's written authorization. Any connection to the Owner's existing utilities shall be separately metered to allow for proper allocation of utility costs unless another arrangement is specifically agreed to and authorized by the Owner in writing. Temporary meters shall be removed upon completion of the Work.

B. The Contractor shall be solely responsible for providing temporary heating, cooling, and/or ventilation as required to prevent degradation or damage to the Work. The permanent heating, cooling, and air handling systems shall not be utilized for the purpose of temporary heating, cooling, or ventilation until the Owner approves of such use in writing. In no case shall the permanent heating, cooling, or air handling systems be operated until they are complete, including formal startup, check out, and testing and balancing.

C. Utilization of any of the permanent heating, cooling, or air handling systems prior to the date of Substantial Completion shall not impact the specified warranty for such equipment, which shall begin on the date of Substantial Completion.

3.4 ACCESS

A. Continuously check architectural drawings for clearance and accessibility of equipment specified herein to be placed. No allowance of any kind will be made for negligence on part of the Contractor to foresee means of installing his equipment into proper position.

3.5 CLOSING IN OF UNINSPECTED WORK

A. Do not allow or cause work installed to be covered up or enclosed before it has been inspected and tested. Should work be enclosed or covered up before it has been inspected and tested, uncover work at own expense. After it has been inspected and tested, make repairs necessary to restore work of other contractors to condition in which it was found at time of cutting.

3.6 PROJECT MODIFICATIONS

A. During the progress of construction, if any conditions arise that necessitate revisions, modifications, or relocation of any mechanical equipment or materials, such revisions shall be immediately brought to the attention of the Architect/Engineer. The Contractor shall then prepare necessary drawings showing the proposed changes. All proposed changes shall be submitted, reviewed, and approved by the Architect/Engineer prior to proceeding with any associated revision work in the field.

B. Maintain copies of all approved changes at the project site for reference by all parties during the remaining work.

C. Incorporate all revisions into the as-built drawings.

3.7 FORMING, CUTTING, AND PATCHING

A. Coordinate with other contractors as necessary to provide any special forming, recesses, chases, etc., and provide wood blocking, backing, and grounds as necessary for proper installation of mechanical work.

B. If this Contractor fails to coordinate with other contractors at proper time or fails to locate items properly, resulting in extra work, then this Contractor is responsible.

C. This Contractor is responsible for proper placement of pipe sleeves, hangers, inserts, and supports for work.

D. Cutting, patching, and repairing of existing (old) construction to permit installation of piping, etc. is responsibility of this Contractor. Repair or replace damage to existing work with skilled mechanics for each trade involved in a first class manner.

3.8 EXISTING SERVICES

A. Provide and install all required connections to existing systems as required by the drawings and specifications.

B. Integrate existing systems with all new work to provide a complete working system.

C. Provide minimum 48 hour notice to Owner of any service interruptions. All service interruptions shall be kept to the minimum possible time. When requested by Owner service interruptions shall occur outside of normal working hours.

D. The Contractor shall be responsible for damage to any part of the premises during the guarantee period that is caused by defects, leaks, or breaks in work furnished and/or installed under this section.

E. The Contractor shall replace refrigerant, lubricants, and/or gases lost as a result of defects, breaks, or leaks in the work.

3.9 AS-BUILT DRAWINGS

A. Upon completion of work submit to the Architect/Engineer as-built drawings showing all changes in equipment, piping, ductwork, etc. installed as part of this project which are not in accordance with the contract drawings. As-built drawing deliverables shall be in accordance with the requirements of Division 1, and shall consist of the following as a minimum.

1. Provide as-built drawings in electronic file format (pdf file). In addition to the electronic file, when field mark-ups have been utilized, provide a complete set of full size neatly and legibly marked as-built drawings on 20 pound white bond paper.
2. As-built drawings shall be full size (same size as the contract documents) and shall be standard engineering scale. The minimum drawing scale shall match those provided in the contract documents.
3. As-built drawings shall include all outside utility connections, piping, etc. installed under this Contract. Locate and dimension all work with reference to permanent landmarks.

B. Match all symbols and designations used in the contract drawings when preparing the as-built drawings.

C. Indicate clearly and correctly all work installed differently from that shown, and maintain records up to date as work progresses. Include invert elevations of pipes below grade of floor, the floor lines, plugged wyes, tees, caps, exact locations and sizing of piping, location of valves, and the like. Dimension locations from structural points.

D. Properly identify all stubs for future connections as to locations and use by setting of concrete markers at finished grade in manner suitable to the Architect/Engineer.

3.10 PROJECT COMPLETION TESTS AND STARTUP

A. Upon completion of the mechanical work, or at such time prior to completion as may be determined by the Architect/Engineer, operate and test all mechanical equipment and systems for a period of at least five consecutive 8 hour days to demonstrate the satisfactory overall operation of the building or project as a complete unit. Include operation of heating and air conditioning equipment and systems for a period of not less than two 8 hour days at not less than 90 percent of full specified heating and cooling capacities in tests.

B. Commence tests after preliminary balancing and adjustments to equipment have been checked. Immediately before starting tests, install air filters and lubricate all running equipment. The Contractor shall notify the Architect/Engineer at least seven calendar days in advance of starting the tests listed above.

C. Provide training and orientation of the Owner's facilities staff in proper care and operation of equipment, systems, and controls.

D. Neatly tabulate and deliver to the Architect/Engineer complete operational data, including air flows, room temperatures, fan speeds, motor currents, plenum and duct static pressures, and other data as required. The Architect/Engineer reserves the right to spot check results, and if discrepancies or errors are noted, Contractor will be required to redo balancing tests and tabulations entirely.

E. During test period, make final adjustments and balancing of equipment, systems, controls, and circuits so that all are placed in first class operating condition.

F. Mark final positions of balancing valves after balancing is complete.

G. All areas of building shall receive proper flow of hot and chilled water to assure adequate and uniform temperatures throughout.

H. Final observation will not be made until all of the above have been completed and balance report has been submitted and reviewed.

3.11 POST CONTRACT COMPLETION TESTS

A. If the required full load operation conditions cannot be conducted at the time of the 'Project Completion Tests and Start-Up' due to outdoor seasonal temperatures, the Contractor shall return to the job site when appropriate weather conditions arise (and/or when requested by the Architect/Engineer) to complete proper loading of equipment and systems as required. The Contractor will be allowed seven calendar days after notification to begin the tests. The Owner will be responsible for providing new air filters for the Contractor to install prior to this testing if necessary.

3.12 PRE-SEASON START UP

A. Within one year of filing of the Notice of Substantial Completion, when all full load tests required under 'Project Completion Tests and Start-Up' and 'Post Contract Completion Tests' have not yet been performed, the Contractor shall perform startup of any equipment or systems required for heating or cooling season operation when such equipment and systems have remained shut down or remain to be tested under full load. The Contractor shall ensure that all equipment and systems are operating properly before being turned over for the first operational use by the Owner. All such testing shall occur within one year of filing the Notice of Substantial Completion. The Owner will be responsible for providing new air filters for the Contractor to install prior to this testing if necessary.

3.13 GUARANTEE

A. The Contractor shall be responsible for all work done and material installed under the plans and specifications. Repair or replace, as may be necessary, any defective work, material, or part which may show itself within one year of filing of the Notice of Substantial Completion and be responsible for damage to other materials, furnishing, equipment, or premises caused by such defects during this period, if in the opinion of the Architect/Engineer said defect is due to imperfection of material or workmanship. Provide all such work and materials at no cost to the Owner.

3.14 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 05 00 - BASIC MATERIALS AND METHODS FOR HVAC

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. The Conditions of the Contract (General, Supplementary, and other Conditions) and Section 230000 (Heating, Ventilating, and Air Conditioning) are hereby made a part of this section.

B. This section provides requirements for basic materials and methods related to all of the HVAC work. This section applies to all other Division 23 specification sections.

1.2 WORK INCLUDED

A. Types of HVAC items specified in this section include the following:

1. Materials
2. Valves
3. Valve Boxes
4. Hangers and Supports for HVAC Systems
5. Seismic Bracing for HVAC Systems
6. Flow Meters
7. Access Doors
8. Roof and Wall Flashings
9. Cathodic Protection
10. Thermometers
11. Pressure Gauges
12. Unions and Flanges
13. Pipe Escutcheons
14. Pipe Sleeves
15. Sleeve Seals
16. Low Pressure Strainers
17. Basket Strainers
18. Penetrations in Fire and Smoke Rated Partitions
19. Pipe Anchors and Guides
20. Flexible Hose Expansion Loops
21. Piping and Equipment Identification
22. Detectable Underground Warning Tape and Tracer Wire
23. Painting
24. Concrete Work
25. Electrical Disconnects
26. Electric Motors
27. Electric Motor Starters
28. Flexible Connections
29. Pre-Fabricated Roof Curbs
30. Welding

B. Types of flow meters specified in this section include the following:

- Heat Pump Loop Flow Meters
- Make-Up Water Flow Meters
- Domestic Water Flow Meters

1.3 PROJECT CONDITIONS

A. Existing Utilities: Locate and protect existing utilities and other underground work in manner which will ensure that no damage or service interruption will result from excavating and backfilling.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of piping specialties and valves, of types and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Valve Types: Provide valves of same type by same manufacturer.

C. Identification: Provide piping specialties and valves with manufacturer's name (or trademark) and pressure rating clearly marked on valve body.

1.5 SUBMITTALS

A. Submit manufacturer's technical product data and installation instructions for each type of manufactured piping specialty and valve. Include pressure drop curve or chart for each type and size of valve, control valve and balancing valve.

B. Operation and Maintenance Data: Submit operation and maintenance data and spare parts lists for each type of manufactured piping specialty and valve. Include this data and product data in the operating and maintenance manual in accordance with all associated requirements.

C. All interface requirements (BACnet or other) shall be coordinated with the temperature control system subcontractor prior to issuing submittals and/or ordering any equipment that is required to have an interface.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide factory-fabricated piping specialties and valves recommended by manufacturer for use in service indicated. Provide piping specialties of types and pressure ratings indicated for each service, or if not indicated, provide proper selection as determined by Contractor to comply with installation requirements. Provide sizes and connections which properly mate with pipe, tube, and equipment connections. Where more than one type is indicated, selection is the Contractor's option. Unless otherwise indicated, valves shall be same size as the upstream pipe size.

2.2 VALVES

A. See Specification Section 230510 (Valves for HVAC Systems).

2.3 VALVE BOXES

A. Provide at each valve in ground a concrete valve box with the cover marked for the applicable service. Furnish an extension handle for valves as required for opening and closing the valve. In areas that are not subject to vehicle traffic concrete valve boxes shall be Christy Model B-09, or approved equal, with a steel checker plate cover. In areas that are subject to vehicle traffic concrete valve boxes shall be Christy Model B-1017, or approved equal, with a steel checker plate cover.

1. Do not locate valve boxes in areas subject to vehicle traffic, in walkways, or in covered passageways unless absolutely necessary.
2. Provide valve box extensions as required to set the bottom of the valve box tight on top of the piping in which the valve is installed.
3. Provide special valve boxes where required to conform to local codes.

2.4 HANGERS AND SUPPORTS FOR HVAC SYSTEMS

A. See Specification Section 230530 (Hangers and Supports for HVAC Systems).

2.5 SEISMIC BRACING FOR HVAC SYSTEMS

A. See Specification Section 230540 (Seismic Bracing for HVAC Systems).

2.6 FLOW METERS

A. See Specification Section 230900 (Temperature Controls).

B. Flow meters shall be installed in strict conformance with the manufacturer's installation instructions, including required straight pipe length upstream and downstream of the flow meter.

2.7 ACCESS DOORS AND PANELS

A. Where floors, walls, or ceilings must be penetrated for access to mechanical equipment, provide access doors, 22 inch by 22 inch minimum size in usable opening. Where entry of service personnel may be required, provide a 22 inch by 30 inch minimum usable opening.

B. Access doors shall match those listed in the architectural documents in all respects, except as noted herein.

C. Where panels are located on ducts or plenums, provide neoprene gaskets to prevent air leakage, and use frames to set door out to flush with insulation.

D. Provide insulated access doors where located in internally insulated ducts or casings.

E. Where specific information or details relating to access panels different from the above is shown or given on the drawings or other divisions of work, then that information shall supersede this specification.

F. Available Manufacturers: Subject to compliance with requirements, manufacturers offering access doors which may be incorporated in the work include Milcor, Best, or approved equal:

Milcor Style M	Drywall and/or Masonry
Milcor Style K	Plaster
Milcor Style UFR	Fire Rated (where required)

2.8 ROOF AND WALL FLASHINGS

A. Flashing for penetrations of the roof for mechanical items such as flues and ducts will be furnished and installed under other sections of these specifications. The work of this section shall include layout, sizing, and coordination of penetrations required for the mechanical work. Furnish and install counter-flashings above each flashing required in the mechanical work. Flues and ducts shall have 24 gauge galvanized sheet metal storm collar securely clamped to the flue or duct above the flashing.

2.9 CATHODIC PROTECTION

A. Furnish and install dielectric unions at all locations described herein, whether shown on drawings or not. Construct couplings and flanges so that the two pipes being connected are completely insulated from each other with no metal-to-metal contact. Couplings shall be lined with a hard, insulating, phenolic plastic threaded in standard pipe sizes.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers which may be incorporated in the work include the following:

Nibco
Legend
Zurn
Watts

2.10 THERMOMETERS

A. Thermometers shall be of the bimetal helix type, Miljoco Model B5099A, or approved equal by Weiss or Weksler. Thermometers shall be accurate to within plus or minus 1% throughout the entire scale range. Scales shall have a minimum of 2 degrees between graduations and a maximum of 20 degrees between figures.

B. Thermometers shall be 5 inch diameter with polycarbonate lens, stainless steel case and ring, stainless steel stem, and stainless steel well. Thermometer stem length for piping shall be 2-1/2 inches, and stem length for tanks shall be 9 inches. Thermometers installed on insulated tanks or piping shall be provided with an extension neck well to compensate for the thickness of the insulation.

C. Thermometer ranges shall be as listed below.

Location	Range
Heat pump well field supply and return mains at each header.	25° to 125°F

D. Thermometers used for air temperature in ductwork, plenums, etc., shall have a perforated guard over the stem suitable for sensing air temperature. Stem length shall be 9 inches minimum.

E. Thermometers shall include an adjustable bracket allowing rotation to any position, and shall be located such that they are easily read from a normal vantage point.

F. Thermometer wells with chain and cap shall be provided as spares wherever spare wells are indicated on the drawings.

2.11 PRESSURE GAUGES

A. Pressure gauges shall be flangeless case type, Miljoco Model P4598L, or approved equal by Weiss or Weksler. Gauges shall be accurate to within plus or minus 1% throughout the entire scale range. Scales shall have a minimum of 2 degrees between graduations and a maximum of 20 degrees between figures.

B. Pressure gauges shall be 4-1/2 inch diameter with acrylic lens, stainless steel case, and stainless steel ring. Gauge movement shall be brass with precision-milled teeth. Gauges shall be selected with a pressure range such that the gauge reads near the middle of the total gauge range at the pressure indicated on the drawings. The most common gauge selections will be for ranges of 0 to 160, 0 to 60, and/or 0 to 30 psi.

2.12 UNIONS AND FLANGES

A. Furnish and install unions at each threaded or soldered connection to all equipment, tanks and valves, of type specified in following schedule:

Type of Pipe	Union
Steel pipe 2" and smaller	150 lb screwed malleable ground joint, brass to iron seat, black for black piping, galvanized for galvanized piping.
Screwed steel, black or galvanized 2-1/2" and larger	125 lb cast iron screwed flanged union, flat faced, gasket, black for black piping, galvanized for galvanized piping.
Copper tubing 2" and smaller	150 lb bronze ground joint, bronze to bronze sweat connection.
Copper tubing 2-1/2" and larger	150 lb cast bronze, flat faced flange with silver brazing threadless ends.

B. Insulating couplings or flanges shall be furnished and installed at all connections of piping with dissimilar materials. Construct couplings so that the two pipes being connected are completely insulated from each other with no metal-to-metal contact. Heavily line the couplings with a hard, insulating, phenolic threaded coupling in standard pipe sizes.

C. Furnish and install flanges at each flanged connection to equipment, tanks, and valves per following schedule:

Type of Pipe	Flanges
Screwed black or galvanized steel pipe 2-1/2" and larger	125 lb cast iron screwed flange flat faced, black or galvanized as required, unless noted otherwise.
Welded steel pipe 2-1/2" and larger	150 lb forged steel welding flanges, 1/16" raised faced, unless noted otherwise.

D. Provide full faced or ring type gasket material to suit facing on flanges. Gasket material shall be 1/16" thick Garlock Blue-Gard, or approved equal. Gasket material shall be suitable for the connected piping system content and temperature.

2.13 PIPE ESCUTCHEONS

A. Provide chrome plated brass pipe escutcheons with inside diameter closely fitting pipe outside diameter or outside of pipe insulation where pipe is insulated. Select outside diameter of escutcheon to completely cover pipe penetration hole in floors, walls, ceilings, or pipe sleeve extension, if any. Furnish pipe escutcheons with nickel or chrome finish and screw or spring clamping device with concealed hinge.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering pipe escutcheons which may be incorporated in the work include the following, or approved equal:

Chicago Specialty Manufacturing Company
Producers Specialty and Manufacturing Corporation
Sanitary Dash Manufacturing Company

2.14 PIPE SLEEVES

A. Where pipes pass through a concrete floor slab the pipe shall be covered with high density fiberglass insulation. Pipe insulation shall be 1/2” to 1” thick Johns Manville Microlok HP or Johns Manville Trymer 25-50 for the full thickness of the concrete. After the piping has been installed and the concrete has been poured, the fiberglass insulation shall be cut away or compressed leaving a 1/2” deep space that shall then be filled with a high quality silicone sealant resulting in a flat, water-tight installation.

B. Where pipes pass through fire rated concrete floors or walls install a Schedule 10 galvanized metal sleeve providing between a 1/2 inch and 1 inch clearance around the sides of the pipe and/or pipe insulation for the full thickness of the concrete. After the piping has been installed, fill the annular space in accordance with the applicable UL fire rating system.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering pipe sleeves which may be incorporated in the work include 3M, or approved equal.

2.15 SLEEVE SEALS

A. Provide sleeve seals for sleeves located in foundation walls below grade or in exterior walls as follows:

1. Pipe Sleeves through foundations & walls below grade: modular mechanical type, consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing water-tight seal.
2. Available Manufacturers: Subject to compliance with requirement, manufacturers offering mechanical sleeve seals which may be incorporated in the work include the following, or approved equal:

Thunderline Link-Seal
Calpico

2.16 LOW PRESSURE STRAINERS

A. Provide wye or basket strainers as indicated on the drawings. Strainers shall be full line size of connecting piping, with ends matching the piping system materials, and with cast iron body. Select strainers for 125 psi working pressure, with stainless steel screens, and gasket seal. Provide hose end ball valve on drain fitting.

B. Strainer screens shall have an open area equal to at least twice the cross-sectional area of the pipe in which they are installed (based on IPS) and may be either woven wire or perforated type. Strainer openings shall be .045 inch diameter perforations for strainers up to 3" size and 0.125 inch diameter perforations for strainer sizes 4" and larger.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering low pressure strainers which may be incorporated in the work include the following, or approved equal:

Metraflex
Taco
Bell & Gossett
Watts

2.17 BASKET STRAINERS

A. Provide basket strainers as indicated on the drawings. Strainers shall be full line size of connecting piping, with ends matching the piping system materials, and with cast iron body. Select strainers for 125 psi working pressure, with stainless steel screens, and gasket seal.

B. Strainer screens shall have an open area equal to at least twice the cross-sectional area of the pipe in which they are installed (based on IPS) and may be either woven wire or perforated type. Strainer openings shall be .045 inch diameter perforations for strainers up to 3" size and .125 inch diameter perforations for strainers 4" size and larger.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering low pressure strainers which may be incorporated in the work include the following, or approved equal:

Watts
Metraflex
Titan

D. When a low pressure drop basket strainer with automatic blowdown is scheduled on the drawings the strainer shall be Miller-Leaman Thompson Model MLS, or approved equal.

2.18 PENETRATIONS IN FIRE AND SMOKE RATED PARTITIONS

A. Maintain indicated fire or smoke rating of walls, partitions, ceilings, and floors at pipe, conduit, and duct penetrations. Seal all penetrations with fire-stop and smoke-stop materials complying with the requirements for firestopping and fill materials specified in this section.

B. Schedule and conduct a firestopping pre-installation conference at the job site. Coordinate all firestopping means and methods with other contractors and the general contractor (when applicable) prior to beginning any work.

C. Installer Qualifications: A firm that has been approved by FM Global according to FM Global 4991 (Approval of Firestop Contractors), or been evaluated by UL and found to comply with their 'Qualified Firestop Contractor Program Requirements'.

D. Install all penetration firestopping systems to comply with the manufacturer's written installation instructions and published drawings for products and applications.

E. Do not install penetration firestopping system when ambient or substrate temperatures are outside limits permitted by the penetration firestopping system manufacturer or when substrates are wet because of rain, frost, condensation, or other causes.

F. Install and cure penetration firestopping materials per manufacturer's written instructions using natural means of ventilation, or where this is inadequate, forced-air circulation.

G. The specified firestopping systems are based on a solid sealant only, or combinations of solid sealant, foam sealant, and refractory fibers of thickness required to attain hour ratings.

H. Systems shall comply with the following:
   1. Provide a flexible seal to prevent passage of fire, smoke, toxic gases, and water through openings, and prevent transmission of sound and vibration from the penetrating element to the structure.
   2. Provide hour ratings indicated and in accordance with ASTM E814 and/or UL 1479.
   3. For projects located in the State of California comply with requirements of CBC Sections 709.6, 709.7, 709.8, 710.2, 710.3 and 710.6, and CBC Standards 7-1 and 7-5.

I. Acceptable Manufacturers: 3M, Hilti, SpecSeal, Nelson, Specified Technologies, Tremco, Roxtec, or as otherwise specified. The established standard in most cases is 3M, unless otherwise specified. The listed products are specified to establish standards and the type of materials required. Materials shall be as specified, or approved equal.

J. Sealant: Select among the following materials as appropriate.
   1. Solid (Elastomeric): 3M Fire Barrier Premium Latex CP 25WB+ Caulk, one-component elastomeric water-based latex sealant designed for use as a through-penetration firestop.
   2. Foam: 3M Fire Barrier 2001 Silicone RTV Foam, two-component silicone elastomer foam-in-place sealant designed to fill irregular or complex voids.
   3. Wrap Strip: 3M Fire Barrier FS-195+ Wrap Strip, fire resistive strip designed to be wrapped around the penetrating item and secured in place.
   4. Restricting Collar: 3M Fire Barrier RC-1 Restricting Collar, sheet metal, designed for use with wrap strip in combustible through-wall firestop penetration systems.
   5. Composite Sheet: 3M Fire Barrier CS-195+ Composite Sheet, elastomeric layer reinforced with mesh restraining wire and covered with aluminum foil on one side and bonded to sheet metal, forming a fire resistive sheet.
   6. Putty: 3M Fire Barrier MP Moldable Putty+ Pads and Sticks, one-component elastomeric formable putty, designed for use as a through-penetration firestop system.
   7. Spray: 3M FireDam Spray 100, flexible water-based coating.
   8. Primers: As recommended by the sealant manufacturer.

K. Pillows: Nelson PLW Firestop Pillow, Hilti FS Fire Block, dust proof chemical resistant cloth with heat-reactive expanding solidifying fill, designed for large openings that require frequent cable alterations.

L. Safing Insulation: USG Thermafiber Safing Insulation, 4 lb density mineral wool insulation, unless indicated otherwise.

M. Damming Materials: As recommended by the firestopping manufacturer.

2.19 PIPE ANCHORS AND GUIDES

A. Provide pipe anchors and guides as indicated on the drawings and/or as required to accommodate any thermal expansion, contraction, or seismic movement of the piping system. Pipe anchors and guides shall be Metraflex Model PGIV, or approved equal by Mason Industries.

2.20 FLEXIBLE HOSE EXPANSION LOOPS

A. Provide flexible hose expansion loop(s) as indicated on the drawings and/or as required to accommodate any thermal expansion, contraction, or seismic movement of the piping system. Flexible hose expansion loops shall be Metraloop as manufactured by Metraflex, or approved equal. In cases where space constraints require a smaller footprint, the Contractor may utilize the Metraflex V-Loop product upon written approval from the Architect/Engineer.

B. Flexible hose expansion loops shall be manufactured complete with two parallel sections of corrugated metal house, compatible braid, 180 degree return bend, with inlet and outlet connections. Field fabricated loops will not be acceptable.

C. Flexible loops shall be capable of 4 inches of movement in the ±X, ±Y, and ±Z planes.

D. Flexible hose expansion loops shall impart no thrust loads to system supports, anchors, or the building structure.

E. Flexible hose expansion loop return fittings shall be supported to allow movement.

F. Flexible loops for natural gas service shall be CSA/AGA certified.

G. All flexible hose expansion loops shall be manufactured in accordance with the documented manufacturer's weld procedure specifications. The weld procedure qualification record shall be used to document the execution of this procedure and shall follow the general guidelines of ASME Section IX. Each welder shall conform to the in-house procedure qualification record and be qualified prior to each production lot. The testing of each individual welder shall be documented in a welding procedure qualification record.

H. Install loops, guides, and breakaway hangers per the manufacturer's written installation instructions and the Mechanical Contractors Association of America 'Guidelines for Quality Piping Installations'.

2.21 PIPING AND EQUIPMENT IDENTIFICATION

A. Each piping system furnished and installed under this work shall be identified and the direction of flow indicated by means of colored labels and flow arrows, all as specified herein. The labels shall be applied after all painting, priming, and cleaning of the piping and insulation is completed.

B. Provide prefabricated coiled plastic piping labels as manufactured by Marking Services Incorporated (MSI), or approved equal. Labels shall comply with ASME A13.1 with regard to color, letter height, and marker size. The labels shall have black or white lettering and flow arrows on colored backgrounds and shall not require adhesive. The background colors shall conform to the color schedule included in the 'Execution' section of this specification.
   1. For pipe labels used indoors use coiled polyester labels, MSI Model MS-975, or equal.
   2. For pipe labels used outdoors use coiled polyester labels, MSI Model MS-995, or equal.
   3. For piping with an outside diameter, including insulation, greater than 6 inches provide the label manufacturer's nylon straps to secure label to piping. Labels shall lie smoothly against pipe or insulation completely around the pipe.
   4. The size of the lettering and label shall be such that the lettering can be easily read from the floor and the colors shall be easily discernible.

C. Provide a white plastic lamacoid plate for each and every piece of equipment installed in this work. Lettering on plate shall be black, with size of lettering to suit equipment. Lettering shall be a minimum of 1/2 inch in height. Plates shall be riveted or bolted to equipment near electrical disconnect or control access panel.

D. Where mechanical or plumbing equipment requiring access is located above a ceiling or behind an access panel, provide an adhesive clear plastic label with 3/8" black lettering on the ceiling grid or access panel identifying the equipment.

E. Available Manufacturers: Subject to compliance with requirements, manufacturers which may be incorporated in the work include the following, or approved equal:

Marking Services Incorporated (MSI)
LEM Products
Seton
Craftmark

2.22 DETECTABLE UNDERGROUND WARNING TAPE AND TRACER WIRE

A. Protect the following underground piping and conduit systems (when shown on the mechanical and/or plumbing drawings) with a detectable underground warning tape, as manufactured by Seton, or approved equal.

1. All gas piping.
2. All heat pump ground loop piping.
3. Temperature control communication conduits.

B. Detectable underground warning tape shall consist of 5 mil foil tape printed with associated pipe service (e.g., 'Caution Gas Line Below').

C. Identify heat pump ground loop piping with tracer wire. Tracer wire shall consist of #10 AWG wire with HDPE jacket and shall be located no more than 12" above the horizontal piping. The use of THHN is not permitted for use as tracer wire.

D. At contractor's option, detectable underground warning tape shall consist of a No. 12 AWG solid copper tracer wire embedded in a 12 mil woven polyethylene jacket. The jacket shall be water and corrosion resistant, able to be elongated up to 500% before breaking, with custom colors and labeling.

E. The depth of the marking tape shall not be less than 18", shall not exceed half the depth of the pipe, and shall be installed in strict accordance with the manufacturer's written installation instructions.

1. Tape buried up to 24" deep shall be a minimum of 3" wide.
2. Tape buried greater than 24" deep shall be a minimum of 6" wide.

F. The methodology for locating the installed detectable underground warning tape shall be demonstrated by the Contractor utilizing an appropriate locating device. Locating device shall be Ridgid 'Seetech', Ridgid 'Navitrack', or approved equal.

2.23 PAINTING

A. In general, painting will be done by others. Exposed piping and unfinished portions of equipment to be painted shall be cleaned by this Contractor of grease, oil, rust, or dirt in preparation for painting. Spot prime all factory primed surfaces as necessary to repair any damage to finish.

2.24 CONCRETE WORK

A. Where specifically indicated on the drawings or specified as part of the mechanical work, this Contractor shall furnish and install concrete work such as thrust blocks and/or spring isolator bases.

B. Concrete and reinforcing steel shall be equal to that specified for general construction.

C. Except as noted above, concrete work will be furnished and installed by others. This Contractor shall coordinate all requirements accordingly.

2.25 ELECTRICAL DISCONNECTS

A. The short circuit current rating (SSCR) of each integral or factory-furnished disconnect switch provided by Division 23 shall match or exceed the SSCR of the source panel or distribution board. Coordinate with Division 26 for the results of the Short Circuit Studies required in the Division 26 specifications prior to release of order(s) for disconnects. This requirement applies to all electrical disconnects, including but not limited to, disconnects for chillers, boilers, variable frequency drives, air handling units, rooftop units, condensing units, etc.

2.26 ELECTRIC MOTORS

B. Electric motors larger than 1/2 horsepower (hp) rating shall be, unless otherwise noted, shall be ball bearing, open drip proof, squirrel cage, induction type, normal starting torque, 3 phase, 60 cycle service, 40°C continuous rating, and shall conform in all respects to latest applicable standards of NEMA and AIEE. Motors shall be Century, Louis Allis, Baldor, or equal. Motors located outdoors shall be TEFC type.

C. All motors 1 hp and above shall be high efficiency type, Century E-Plus, or approved equal.

D. Motors utilized with variable frequency drives shall be rated as inverter duty per NEMA standards.

E. Motors shall have nameplate voltage rating of operating voltage specified in subsequent sections of specifications or as shown on drawings and shall have a 1.15 service factor.

F. For normal applications, motors shall be furnished for normal starting torque duty. It shall be this Contractor's responsibility, however, to provide motors and starters (where starters are furnished under this section) having suitable starting torque and current characteristics to allow starting the equipment within the branch circuit protection provided and within the overload protection required by code.

G. Splash-proof or totally enclosed motors having a continuous duty temperature rise rating not exceeding 35°C shall have adequate starting torque, as recommended by the manufacturer, for the service intended.

H. All motors shall be rated at $\pm$10% of the scheduled voltage. If not, provide each motor with a boost transformer sized for the intended use and installed in a rated enclosure.

1. Boost transformers for equipment provided under the mechanical work shall be furnished by the mechanical contractor and turned over to the electrical contractor for installation, unless otherwise noted.

I. Shaft Grounding:

1. All variable frequency drive motors less than 300 hp shall have a single shaft grounding system to protect the bearings from capacitive discharge through the bearings.
2. Available Manufacturers: Subject to compliance with requirements, manufacturers which may be incorporated in the work include the following, or approved equal:

   CR Series by Shaft Grounding Systems
   AEGIS SGR Conductive Microfiber Brush

2.27 ELECTRIC MOTOR STARTERS

A. Magnetic motor starters for equipment provided under the mechanical work shall be furnished by the mechanical contractor and turned over to the electrical contractor for installation, unless otherwise noted. All motor starters shall be by the same manufacturer, Westinghouse, Square D, Cutler-Hammer, General Electric, or approved equal.

B. Magnetic motor starters provided as part of motor control centers shall be provided and installed by the electrical contractor.

C. Unless otherwise noted, magnetic motor starters shall be furnished in a NEMA 1 enclosure for inside installation and in a gasketed NEMA 4 enclosure for outside installation, with three thermal overloads for three phase motors and one overload element for single phase motors. All overloads shall be ambient compensated.

D. Submit schedule to the Architect/Engineer denoting the following:
   1. Designation of each motor
   2. Name plate rating of each motor
   3. Running current of each motor
   4. Catalog number and rating of starter overload elements
   5. Circuit breaker trip size (when in combination starter)

E. Combination magnetic starters shall be Westinghouse Type A206 with circuit breaker disconnect and trip size of breaker as required for motor size, or as otherwise noted.

F. Magnetic motor starters shall be Westinghouse Type A200, or approved equal.

G. Manual motor starters shall be Westinghouse Type MST01 less enclosure, or approved equal.

H. Magnetic motor starters shall be provided with cover-mounted Hand-Off-Auto 'Oil-Tight' type switches as scheduled with integral fused 120 volt single phase control transformers.

2.28 FLEXIBLE CONNECTIONS

A. Flexible Connections (Pumps)
   1. Provide flexible connections that are 9 to 14 inches long where indicated on the drawings and/or as required to accommodate movement or vibration of the piping system.
   2. Flexible connections shall be all stainless steel with carbon steel flanges. Flexible connections shall be rated for no less than 160 psi working pressure at 70°F. Flexible connections shall be Twin City Hose Model TCHS, or approved equal.

B. Flexible Connections (Air Handling Units)
   1. Provide flexible connections that are 9 to 14 inches long where indicated on the drawings and/or as required to accommodate movement or vibration of the piping system.
   2. Flexible connections shall be all stainless steel with carbon steel flanges. Flexible connections shall be rated for no less than 160 psi working pressure at 70°F. Flexible connections shall be Twin City Hose Model TCHS, or approved equal.

C. Flexible Connections (Rooftop Units, Fan Coil Units, Heat Pumps, Motorized Equipment)
   1. Provide 18 inch long flexible connections where indicated on the drawings and/or as required to accommodate movement or vibration of the piping system.
   2. Flexible connections shall be all stainless steel with carbon steel ends. Flexible connections shall be rated for no less than 370 psi working pressure at 70°F. Flexible connections shall be Twin City Hose Model HPH, or approved equal.

2.29 PRE-FABRICATED ROOF CURBS

A. Provide manufacturer's standard shop-fabricated units, modified if necessary, to comply with project requirements. All roof curbs shall be secured to the roof support structure.

B. Roof curbs for equipment weighing over 400 lbs shall be seismically designed and rated, with seismic calculations prepared by a Nevada licensed structural engineer, based on an Importance Factor of 1.0, except for critical buildings or applications which require a higher Importance Factor based on the specific application.

C. The roof curb height listed on the drawings indicates the minimum height of the curb at the lower end of the roof slope. The Contractor is responsible for confirming the roof insulation assembly depth on the architectural drawings in order to determine the actual required height of each roof curb. All roof curbs shall be constructed such that the top of the curb is a minimum of 14 inches above the lowest point of the finished roof surface.

D. Fabricate structural framing for units of structural quality sheet steel formed to manufacturer's standard profiles for coordination with roofing, insulation, and deck construction. Include 45 degree cant strips and deck flanges with offsets to accommodate roof insulation. Weld corners and seams to form water-tight units.

E. Where gauge is not indicated fabricate units of 14 gauge metal.

F. Sloping Roof Decks: Where the finished roof slope is less than 1" per foot, provide tapered wood nailers (treated wood) at top of support units to form a level top edge.

G. Provide pressure-treated wood nailer, not less than 1-5/8" thick and of not less than width of support wall assembly. Anchor nailer securely to top of metal frame unit.

H. Install 2-1/2” thick rigid insulation in the roof curb assembly just below the wood nailers and insulate the inside of roof curb structural support walls with R-30 fiberglass batt insulation (see the mechanical equipment curb detail on the drawings for additional information and requirements).

I. For deck slopes of 1" per foot or more, fabricate support units to form a level top edge.

J. Available Manufacturers: Subject to compliance with requirements, manufacturers offering prefabricated seismic roof curbs which may be incorporated in the work include the following, or approved equal:

Same Manufacturer as Equipment
MicroMetl
Thybar

2.30 WELDING

A. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

B. Steel Support Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M (Structural Welding Code - Steel).

C. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code Section IX. Comply with ASME B31.9 (Building Services Piping) for materials, products, and installation.

PART 3 - EXECUTION

3.1 INSTALLATION OF PIPING SPECIALTIES

A. Pipe Escutcheons: Install pipe escutcheons on each pipe penetration through floors, walls, partitions, and ceilings where penetration is exposed to view and on exterior of building. Secure escutcheon to pipe or insulation so escutcheon covers penetration hole and is flush with adjoining surface.

B. Sleeves: Secure sleeves to metal or wood forms in such a manner that they will not become displaced during pouring of concrete. Fill sleeves on deck with sand. After forms have been removed from concrete, the sleeves shall be removed from the openings.

C. Core drill properly sized holes in the concrete to replace metal sleeves that are crushed or knocked out of position during pouring of concrete.

D. Provide piping passing through concrete fire walls with sleeves of standard black steel pipe nominally one size larger than pipe enclosed, but in the case of insulated pipe, large enough for insulation to pass through. Caulk space between pipe and sleeve with fire rated wicking, and provide metal retainer plates at both sides of the wall.

3.2 INSTALLATION OF LOW PRESSURE STRAINERS

A. Install low pressure strainers full size of connected piping in accordance with manufacturer's installation instructions. Install pipe nipple and shutoff valve in strainer blow down connection, full size of connection, except for strainers 2 inches and smaller installed ahead of control valves feeding individual terminals. Where indicated, provide drain line from shutoff valve to plumbing drain, full size of blow-down connection.

B. Locate strainers in the supply line ahead of the following equipment and elsewhere as appropriate, if an integral strainer is not included in the equipment:

Pumps
Temperature control valves
Pressure reducing valves
Temperature and/or pressure regulating valves

3.3 INSTALLATION OF HANGERS AND SUPPORTS

A. See Specification Section 230530 (Hangers and Supports for HVAC Systems). Where special hanger/support of piping or ductwork is detailed or shown on the drawings, the drawings shall be followed.

3.4 INSTALLATION OF VALVES

A. Install valves where required for proper operation of piping and equipment, including valves in branch lines where necessary to isolate sections of piping. Locate valves so as to be accessible and so that separate support can be provided when necessary.

B. Install valves with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane.

C. Provide union at each connection to equipment and downstream of each valve. Provide unions at both ends of valves when valves cannot be turned due to an obstruction.

D. After piping systems have been tested and put into service, but before final testing, adjusting, and balancing, inspect each valve for possible leaks. Adjust or replace packing to stop leaks; replace valve if leak persists.

E. Tag each valve and provide a complete listing of valve locations and functions. Valve and tag listing shall be laminated and turned over to the Owner for posting as desired. In addition, where valves are located above a ceiling or behind an access panel, provide an adhesive clear plastic label with black 3/8” lettering on ceiling grid or access panel identifying the valve.

3.5 INSTALLATION OF UNIONS AND FLANGES

A. Install unions and flanges so that piping can be easily disconnected for removal of tanks, equipment, and valves. Provide a minimum of two unions at each three-way valve.

3.6 INSTALLATION OF EXPANSION ANCHORS

A. Where permitted in other sections of this specification, expansion anchors may be used in hardened concrete.

B. Job testing: Load test 50 percent of the expansion anchors on each job to twice 80 percent of the ICBO recommended allowable load in tension for that particular anchor, except that if the design load is less than 75 pounds, only one anchor in ten need be tested. If any anchor fails, then test all anchors. Perform the load test in the presence of the Building Inspector.

3.7 INSTALLATION OF CATHODIC PROTECTION

A. Install dielectric unions in the following locations:

1. At points in piping where dissimilar metal pipes are connected together.
2. Any special applications shown on the drawings.

3.8 INSTALLATION OF THERMOMETERS

A. Thermometers for piping systems shall be installed so that the liquid flows completely around the sensing well. Pipe sizes at the bulb shall be increased where necessary to allow for full flow without excessive resistance.

B. Where shown on the temperature control diagrams, the temperature control subcontractor shall furnish and install remote panel-mounted thermometers. Duct-mounted thermometers may be omitted at these locations.

C. Thermometers shall be placed at all locations shown on the drawings.

D. In cases where the specified thermometers cannot be located so as to be easily read, a remote reading type thermometer shall be installed, as approved by the Architect/Engineer.

E. Thermometers provided as part of the temperature control work and located on a control panel need not be duplicated by the requirements listed above.

3.9 INSTALLATION OF GAUGES

A. Provide gauge connections at the following locations:

Suction and discharge of geothermal bore field pumps.

Inlet and outlet of butterfly type balancing valves.

Elsewhere as shown on the drawings.

B. Gauges shall be provided in convenient locations within approximately 3 feet of the flanges or connections and elsewhere as may be shown on the drawings.

C. Gauge Valves and Siphons

1. A needle point globe valve, Crane No. 88 or equal, shall be installed at each gauge.
2. A gauge siphon shall be installed at each hot water gauge.

3.10 INSTALLATION OF PIPE IDENTIFICATION

A. Identification shall be applied to all piping, except piping located in furred spaces without access to permit entrance of personnel, and piping buried in the ground or concrete.

B. The legend and flow arrow shall be applied at all valve locations, at all points where piping enters or leaves a wall, partition, cluster of piping, or similar obstruction, and at approximately 20 foot intervals on pipe runs.

C. Practical variations or changes in locations and spacing may be made with the specific approval of the Architect/Engineer to meet specific conditions.

D. Wherever two or more pipes run parallel, the printed legend and other markings shall be applied in the same relative location so that all piping is easily identified.

E. Markings shall be located to be conspicuous from any reasonable vantage point.

F. The legends and flow arrows shall be in the colors as indicated in the pipe marking schedule.

G. Pipe labels shall be as described in Section 2.9 of this specification.

H. Pipe Marking Schedule:

Legend	Color
Heat Pump Supply and Return Water	White on Gray
Refrigerant Piping	Black Letters on Orange Background

I. Where different equipment such as fire sprinklers are supplied from a common main, such as a domestic water main, the main should be identified as ‘Domestic Water’ and each respective branch takeoff as ‘Fire Water’, etc.

J. Bore field circuit piping in the mechanical room shall be labeled to coincide with the GPS numbering of the bore field

3.11 INSTALLATION OF AIR VENTS

A. Install air vents in hydronic systems at all high points and as required to adequately bleed all air from the piping systems and equipment during initial filling, normal operation, and subsequent filling of each piping system.

B. Install air vents in steam and condensate systems at all high points and as required to adequately bleed all air from the piping systems and equipment during initial filling, normal operation, and subsequent filling of each piping system. Air vents for steam systems shall be balanced pressure type, Spirax Sarco Model VS-204, or approved equal by Armstrong.

3.12 DEMOLITION WORK

A. Unless specifically indicated otherwise, demolition work shall include removal of all associated equipment, electrical/controls components, conduit, and wiring, piping/valves and accessories, and supports. The surfaces where the demolition work was performed shall be restored to match the adjacent surfaces to the best extent practical.

3.13 FORMING, CUTTING, AND PATCHING

A. Coordinate with other contractors as necessary to provide any special forming, recesses, chases, etc., and provide wood blocking, backing, and grounds as necessary for proper installation of mechanical work.

B. If this Contractor fails to coordinate with other contractors at the proper time or fails to locate items properly, resulting in extra work, the Contractor is responsible for the additional work, at no cost to the Owner.

C. This Contractor is responsible for proper placement of pipe sleeves, hangers, inserts, and supports for all work.

D. Cutting, patching, and repairing of existing (prior) construction to permit installation of piping, conduit, etc. is the responsibility of the Contractor. Repair or replace any damage that occurs to existing work in a first class manner using skilled mechanics for each trade involved.

E. Cut existing construction in a neat and workmanlike manner by the use of a concrete saw. Use of pneumatic devices is not acceptable.

F. Core openings through existing construction as required for the passage of any new piping and/or conduit. Cut holes of the minimum diameter required to suit the size of the pipe to be installed, including the associated insulation.

3.14 ELECTRICAL WORK

A. Adequate working space shall be provided around electrical equipment in compliance with the National Electrical Code and other applicable codes. Mechanical work shall be coordinated with the electrical work in order to comply with these requirements. Any work which does not conform to these requirements shall be corrected without additional cost to the Owner.

B. Furnish and install all line voltage and low voltage temperature control wiring in the mechanical work (typically furnished and installed by the temperature control subcontractor) including all interlock wiring between motor starter coils, interlock relays, and temperature control equipment. Unless noted otherwise, this does not include primary control wiring between starters and pushbuttons, other manual starter switches, or branch power circuits required for the temperature control system.

1. Starters located in motor control centers will be provided under the electrical work. The Contractor is referred to electrical drawings for motors served by motor control centers.

2. Motors furnished under the mechanical work shall be furnished by the mechanical contractor, but such equipment shall be delivered to the electrical contractor for mounting and connecting to power wiring. Coordinate all motor starter requirements with the electrical contractor.
3. Temperature control equipment, including relays shown on control diagram, shall be furnished and installed by the temperature control subcontractor.
4. Electrical devices with piping connections, such as solenoid valves, insertion thermostats, strap-on aquastats, and similar items which are to be wired under the electrical work or by the temperature control subcontractor, shall be installed by the mechanical contractor.

C. Equipment furnished in this work that is factory wired but requires modification to internal wiring to meet specifications or drawing requirements shall have such internal modifications made at factory before shipment.

D. All electrical work and equipment, including internal wiring, must comply with applicable codes and applicable portions of electrical specifications. Route line and low voltage control wiring in conduit. Conduit for temperature control wiring shall be responsibility of the mechanical contractor and shall be of type specified in electrical specifications.

3.15 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.16 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.17 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 05 10 - VALVES FOR HVAC SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of valves specified in this section include the following:

- Ball Valves
- Butterfly Valves
- OS&Y Valves
- Check Valves
- Manual Balance Valves
- Automatic Pressure-Compensating Flow Limiting Valves
- Air Vent Valves
- Tempering Valves
- Pressure Relief Valves
- Temperature and Pressure Relief Valves
- Pressure Reducing Valves
- Emergency Gas Shutoff Valves
- Miscellaneous/Specialty Valves

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide factory-fabricated valves and piping specialties as recommended by the manufacturer for use in the service indicated.

B. All valves, fittings, and accessories located in potable water systems shall be constructed of appropriate materials and conform to the requirements of NSF/ANSI Standards 61 and 372.

C. Unless otherwise indicated, provide valves of same size as the upstream pipe size.

2.2 VALVES

A. Provide factory-fabricated valves as recommended by the manufacturer for use in the service indicated. Provide valves of types and with pressure ratings indicated for each service, or if not indicated, provide proper selections to comply with the installation requirements. Provide sizes and connections which properly mate with pipe, tube, and equipment connections.

B. Unless otherwise indicated, valves shall be the same size as the upstream pipe size.

C. Provide valves as shown on drawings and as necessary to segregate branches and equipment.

D. Furnish discs suitable for the service intended. Furnish a brass tag for each valve identifying the applicable service. Properly pack and lubricate all valves per manufacturer’s recommendations. Place a union adjacent to each threaded valve. Provide a union on both sides of soldered valves. Furnish the flow performance curve for each valve.

E. All valves 6 inch and larger located 10 feet or higher above finished floor shall be provided with chain operators.

F. Provide flanged valves in welded pipe, provide ball valves in water lines, unless otherwise indicated on the drawings.

G. Valves shall be full size of pipe, manufactured by Nibco, Milwaukee, Apollo, or equal, in accordance with the following listing:

Ball Valves	2" and below	Nibco T-585HP-66	Milwaukee BA-400S
Butterfly Valves	2-1/2" and above	Nibco LD-2022	Milwaukee HL-234E
OS&Y Valves	2-1/2" and above	Nibco F-667-O	Milwaukee F-2894-M
Check Valves	2” and below	Nibco T-453-B	Milwaukee 508
	2-1/2" and above	Nibco F-968-B	Milwaukee F-2970-M
Gas Valves	4” and below	Nibco T-FP-600A	Apollo 94ALF-A
	5” and above	Nordstrom 149	Resun R-1431-WGA

H. Ball Valves: All ball valves shall be two-piece bronze body with stainless steel ball and stem, PTFE packing/seats, and balancing handle. See the preceding table for acceptable valve manufacturers and models.

I. Butterfly Valves: All butterfly valves shall be lug style with ductile iron body, stainless steel disc and stem, EPDM seals, and balancing handle with memory stop. See the preceding table for acceptable valve manufacturers and models.

J. Motorized Ball Valves: Provide motorized ball valves where indicated on the drawings. Motorized ball valves shall be Belimo B2 Series, or approved equal.

K. Motorized Butterfly Valves: Provide motorized butterfly valves where indicated on the drawings. Motorized butterfly valves shall be Belimo F6 Series, or approved equal

L. Lockshield valves shall be lead-free ball type with locking lever, Nibco T-585-80-LF-LL, Crane D171LS, or approved equal.

M. Globe valves and their trim shall be selected for the specific service that they are associated with. Globe valves shall be Nibco F-718-B, Milwaukee 2981-M, or approved equal.

N. Gate valves and their trim shall be selected for the specific service that they are associated with. Gate valves shall be Nibco NP450, Milwaukee 1140, or approved equal.

O. Manual Balance Valves (2” and Below): Fixed port venturi style, Pro Hydronic Specialties CBV Series, IMI Flow Design AccuSetter UA Series, Pro Hydronic Specialties CBVF Series, Taco Accu-Flo, Bell & Gossett Circuit Setter Plus, Nibco T-1810, or approved equal. Variable orifice balancing valves are not acceptable.

P. Manual Balance Valves (2-1/2” and Above): Fixed port venturi style, Pro Hydronic Specialties CBVF Series, IMI Flow Design AccuSetter AF Series, Hays Series CBVF, Nexus Series NVFB, Bell and Gossett Circuit Setter Plus, Nibco F739, or approved equal. Variable orifice balancing valves are not acceptable.

Q. Automatic Pressure-Compensating Flow Limiting Valves: Valves shall be Pro Hydronic Specialties Model AFLB, IMI Flow Design Model AC, Hays Mesurflo Model 2517, Nibco Model T-1880, or approved equal. Assembly shall include removable stainless steel cartridge, union, and test ports. All ball valves shall have stainless steel ball and stem. All butterfly valves shall have stainless steel disc and stem.

R. Strainer Assemblies for Coil Kits: Strainer assemblies shall be Pro Hydronic Specialties Model IVY for pipe sizes 2” and below, and Pro Hydronic Specialties Model CBYS for pipe sizes 2-1/2” and above, or approved equal. Assembly shall include an isolation valve, 20 mesh wye strainer, drain valve with hose fitting, 1/4” tappings for accessories, and a union. All ball valves shall have stainless steel ball and stem. All butterfly valves shall have stainless steel disc and stem.

S. Manual Air Vent Valves: Manual air vents shall be furnished as indicated on the drawings, complete with ball type isolation valve, Hoffman Model 78, or approved equal. Valve pressure rating shall be as required for the system in which installed.

T. Automatic Air Vent Valves: Automatic air vents shall be furnished as indicated on the drawings and shall be Hoffman No. 79, Spirotherm Spirotop, or approved equal. Pipe vents to the nearest floor sink. Valve pressure rating shall be as required for the system in which installed.

U. Tempering Valves: Provide tempering valves as scheduled on the drawings. Install per manufacturer's written recommendations. Tempering valves shall be Lawler Series 61, or approved equal, with bronze finish, thermometer, and dual tempered water isolation valves.

V. Pressure Relief Valves

1. Provide ASME rated pressure relief valves and/or combination temperature and pressure relief valves as indicated on the drawings. Valve size and capacity shall be as required for proper relieving capacity equal to or greater than the total of the associated equipment output rating(s). Valves shall be sized and rated for compliance with Sections I, IV, and VIII of the ASME Boiler and Pressure Vessel Code, and ANSI Z21.22, as applicable.
2. Pressure Relief Valves: Where indicated on the drawings for boilers, heat exchangers, chillers, etc. provide bronze body relief valves with test lever, complying with the listing requirements for discharge capacity. Valves shall be Watts Series 174A, Series 374, Series 740, or approved equal.
3. Combination Temperature and Pressure Relief Valves: Where indicated on the drawings and in these specifications provide bronze body relief valves with test lever and thermal sensor (thermostat), complying with listing requirements for temperature and pressure discharge capacity. Valves shall be Watts XL Series, or approved equal.
4. Available Manufacturers: Subject to compliance with requirements, manufacturers offering relief valves which may be incorporated in the Work include the following, or approved equal:

   Watts
   Bell and Gossett
   Spirax Sarco

W. Pressure Reducing Valves

1. Pressure reducing valves shall comply with ASSE Standard 1003.
2. Pressure reducing valves shall be provided with the manufacturer's upstream strainer, and with an integral bypass capability. Provide upstream and downstream pressure gauges, and a full size valved bypass at each pressure reducing valve location.
3. Pressure reducing valve size shall be as indicated on the drawings, and/or as appropriate for the associated maximum water flow. Pressure reducing valves for closed hot water and chilled water system make-up shall be 1 inch unless indicated otherwise on the drawings. Provide parallel valves for water flows that are beyond the capacity of a 3 inch pressure reducing valve.
4. Valve Body shall be lead free brass or bronze. Valve end connections shall be threaded for valve sizes 2-1/2 inch and smaller, flanged for 3 inch valves.
5. Valves shall be rated for an initial pressure of 150 psi. Valves shall be selected for inlet and outlet pressures as indicated on the drawings.
6. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the work include the following, or approved equal:

   Watts Model 223-S-B
   Zurn Model 500XLYSBR

X. Emergency gas shutoff valves: See specification section 22 15 00 Facility Natural Gas

Y. General Purpose Solenoid Valves: General purpose solenoid valves for air or water shall be Asco Series 8210, or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION OF VALVES

A. Install valves where required for proper operation of piping and equipment, including valves in branch lines where necessary to isolate sections of piping. Locate valves so as to be accessible and so that separate support can be provided when necessary.

B. Install valves with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane.

C. Provide a union at each connection to equipment and downstream of each valve. Provide unions at both ends of valves when valves cannot be turned due to an obstruction.

D. After piping systems have been tested and put into service, but before final testing, adjusting, and balancing, inspect each valve for possible leaks. Adjust or replace packing to stop leaks; replace valve if leak persists.

E. Tag each valve and provide a complete listing of valve locations and functions. Valve and tag listing shall be laminated and turned over to the Owner for posting as desired. In addition, where valves are located above a ceiling or behind an access panel, provide an adhesive clear plastic label with black 3/8” lettering on ceiling grid or access panel identifying the valve.

F. Install check valves with a minimum of 5 pipe diameters downstream of each pump discharge or change in direction (to avoid excessive turbulence at the check valve).

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.3 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.4 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 05 20 - OPERATION AND MAINTENANCE OF HVAC SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. This section consists of general requirements covering certain parts of the HVAC work and is supplemented by other specification sections covering additional work, requirements, and materials specifically applicable to the work of each section. Requirements of other sections of the specifications, if in conflict with these requirements, shall govern.

1.3 OPERATING AND MAINTENANCE INSTRUCTIONS

A. Furnish the Architect/Engineer with two complete sets of typewritten operating and maintenance instructions, descriptive literature, catalog cuts, and diagrams covering all items of operation and maintenance for each and every mechanical system and piece of equipment furnished under these specifications.

B. In addition to the bound hard copies the Contractor shall provide an electronic copy (pdf file).

C. The Contractor shall begin compiling the above data (including obtaining operating and maintenance instruction data, catalog cuts, and diagrams from the manufacturer of the reviewed equipment) immediately upon review of his list of materials, so as not to delay the final installation and acceptance of the work.

D. Bind and index each set in a durable, hardboard binder. Final observation should not be requested until the operating and maintenance binders are submitted and have been reviewed by the Architect/Engineer.

E. Incorporate complete operating instructions including starting, stopping, and description of emergency manual operation methods for the following:

Heating Systems
Ventilating Systems
Air Conditioning Systems
Piping Systems
Temperature Control Diagrams
Test Data and Startup Reports

F. Provide charts and diagrams as required.

G. Provide operating manual for all equipment listed in individual sections of the specification.

H. Provide maintenance instructions for each item of individual equipment covering pertinent maintenance data, such as lubricants to be used, frequency of lubrication, inspections required, adjustments required, etc.

I. Provide parts bulletins containing manufacturer's part numbers, instructions, etc. for each item of equipment. Strip bulletins so that useless bulk is avoided.

J. Post service telephone numbers and/or addresses in an appropriate place as designated by the Architect/Engineer or Owner.

END OF SECTION

SECTION 23 05 30 - HANGERS AND SUPPORTS FOR HVAC SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Section 230000 (Heating, Ventilating, and Air Conditioning), Section 230500 (Basic Materials and Methods for HVAC), and Section 230540 (Seismic Bracing for HVAC Systems) are hereby made a part of this section.

1.2 GENERAL

A. The following information is for pipe hanger and support layout and design reference only. The actual design of all hangers, supports, and seismic bracing is the responsibility of the Contractor per the following specification sections:

Specification Section 23 05 30 (Hangers and Supports for HVAC Systems)
Specification Section 23 05 40 (Seismic Bracing for HVAC Systems)

B. Ductwork: Hangers and supports for rectangular and round ductwork shall be designed in accordance with the latest adopted edition of the SMACNA HVAC Duct Construction Standards. Vertical duct supports shall also be designed in accordance with the latest adopted edition of the SMACNA HVAC Duct Construction Standards. Note that the SMACNA HVAC Duct Construction Standards require that duct hangers also be installed within 2 feet of duct elbows and within 4 feet of duct branch fittings.

C. Rectangular Ducts: (10’ & 8’ maximum spacing with strap or hanger rod sizes based on duct size).

D. Round Ducts: (12’ maximum spacing with strap or hanger rod sizes based on duct size).

E. Piping: Hangers and supports for piping shall be designed in accordance with the latest adopted edition of the standards and codes listed below, and with any other applicable standards. Except in cases where a pipe stress analysis is performed to justify adjusted support and restraint spacing, pipe hangers and supports shall not be placed at intervals that are further apart than the requirements listed in UPC Table 313.3 and in UMC Table 313.3.

Steel Piping	Maximum Spacing	Reference
1-1/4” and smaller	7 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1-1/2”	9 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2”	10 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2-1/2”	11 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3”	12 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3-1/2”	13 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
4”	14 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
5”	16 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
6”	17 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
8”	19 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
10”	22 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
12”	23 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
14”	25 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
Copper Piping	Maximum Spacing	
3/4” and smaller	5 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1”	6 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1-1/4”	7 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
1-1/2”	8 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2”	8 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
2-1/2”	9 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3”	10 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
3-1/2”	11 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
4”	12 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
5”	13 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
6”	14 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
8”	16 feet	ANSI/MSS SP-69 & SP-58 Tables 3 & 4
Gas Piping	Maximum Spacing	
1/2”	6 feet	International Fuel Gas Code
3/4” & 1”	8 feet	International Fuel Gas Code
1-1/4” and larger	10 feet	International Fuel Gas Code

1.3 SUMMARY

A. Section Includes:
   1. Metal Pipe Hangers and Supports
   2. Thermal Hanger Shield Inserts
   3. Fastener Systems
   4. Pipe Stands
   5. Ductwork Supports
   6. Equipment Stands
   7. Equipment Supports

B. Related Requirements: All hangers and support systems shall be designed, selected, and installed by the Contractor to comply with the requirements listed in Section 230540 (Seismic Bracing for HVAC Systems).

C. Costs for hanger, support, and seismic bracing systems complying with the requirements listed herein are the responsibility of the Contractor and shall be included in the Contractor's bid. No extra cost will be allowed for failure to include the associated costs in the Contractor's bid.

D. In no case shall hangers and/or supports for HVAC piping, ductwork, or equipment be attached to a metal roof deck, unless provisions or allowances are explicitly shown on the structural drawings.

1.4 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Show fabrication and installation details for the following (Include product data for all components):
   1. Metal Framing (Strut) Systems
   2. Trapeze Pipe Hangers
   3. Pipe Stands
   4. Ductwork Supports
   5. Equipment Supports

C. Delegated Design Submittals: Provide comprehensive, all-inclusive, delegated design submittals for all listed items. Submittals shall comply with all performance requirements and design criteria, including analysis data, signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Details for fabrication and assembly of trapeze hangers.
   2. Design calculations utilized for designing the trapeze hangers.
   3. Design details and calculations for ductwork and equipment supports.

D. The work of this section shall be coordinated with the requirements for the Contractor furnished seismic design submittal for hangers and supports specified in Section 230540 (Seismic Bracing for HVAC Systems). Design and detailing of seismic bracing, hangers, and supports is the responsibility of the Contractor.

E. Submittals shall be fully coordinated with the structural drawings and shall include all applicable structural and seismic attachment details. Locations and the methods of attachment of hangers and supports to the main structural frame shall comply with the limitations specified in the structural drawings. Submittals shall include all support anchorage loads and vectors broken out by discrete load type. Each specific load shall be indicated in the submittals and the structural element that the support is attached to shall be clearly depicted/identified.

F. Shop drawing submittals will be reviewed by both the design mechanical engineer and the design structural engineer.

1.5 QUALITY ASSURANCE

A. Structural Steel Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M (Structural Welding Code - Steel).

B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code, Section IX.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Where required, engage a licensed professional engineer (licensed in the state where the project is located), to design trapeze pipe hangers/supports, ductwork hangers/supports, & equipment hangers/supports.

B. Structural Performance: Hangers and supports for HVAC piping, ductwork, and equipment shall withstand the effects of gravity loads and stresses within limits and under conditions indicated according to ASCE Standard 7-16.
   1. Design hangers/supports for piping, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
   2. Design hangers/supports for ductwork and associated accessories.
   3. Design equipment hangers/supports capable of supporting combined operating weight of supported equipment, including connected systems and components.
   4. Design seismic restraint hangers and supports for piping, ductwork, and equipment. See Section 230540 (Seismic Bracing for HVAC Systems).
   5. Design of connections for hangers, supports, and bracing shall comply with the requirements indicated on the structural drawings.

2.2 DUCTWORK HANGERS AND SUPPORTS

A. Hanger Rods for Noncorrosive Environments: Galvanized steel rods and nuts.

B. Hanger Rods for Corrosive Environments: Electro-galvanized, all-thread rods, or galvanized rods with threads painted with zinc-chromate primer after installation.

C. Strap and Rod Sizes: Comply with SMACNA HVAC Duct Construction Standards - Metal and Flexible, Table 5-1 (Minimum Hanger Sizes for Rectangular Ducts) and Table 5-2 (Minimum Hanger Sizes for Round Ducts).

D. Steel Cables for Galvanized Steel Ducts: Galvanized steel complying with ASTM A603.

E. Steel Cables for Stainless Steel Ducts: Stainless steel complying with ASTM A492.

F. Steel Cable End Connections: Galvanized steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic locking and clamping device.

G. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

H. Trapeze and Riser Supports:
   1. Supports for Galvanized Steel Ducts: Galvanized steel shapes and plates.
   2. Supports for Stainless Steel Ducts: Stainless steel shapes and plates.
   3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

2.3 METAL PIPE HANGERS AND SUPPORTS

A. Carbon Steel Pipe Hangers and Supports:
   1. Description: MSS SP-58, Types 1 through 58, factory fabricated components.
   2. Galvanized Metallic Coatings: Pre-galvanized, hot dip galvanized, or electro-galvanized.
   3. Non-Metallic Coatings: Plastic coated or epoxy powder coated.

4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support the bearing surface of the piping.
5. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.

B. Stainless Steel Pipe Hangers and Supports:
1. Description: MSS SP-58, Types 1 through 58, factory fabricated components.
2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.
3. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.

C. Copper Pipe and Tube Hangers:
1. Description: MSS SP-58, Types 1 through 58, copper plated steel, factory fabricated components.
2. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.

2.4 TRAPEZE PIPE HANGERS

A. Description: MSS SP-58, Type 59, shop or field fabricated pipe support assembly made from structural carbon steel shapes with MSS SP-58 carbon steel hanger rods, nuts, saddles, and U-bolts.

2.5 METAL FRAMING (STRUT) SYSTEMS

A. Metal Framing Manufacturers Association (MFMA) Metal Framing Systems:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
a. B-line
b. Unistrut
c. Flex-Strut
d. G-Strut
e. Miro Industries
2. Description: Shop or field fabricated, pipe support assembly made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.
3. Standard: Comply with MFMA-4 factory fabricated components for field assembly.
4. Channels: Continuous slotted carbon steel channel with in-turned lips.
5. Channel Width: Selected for applicable load criteria.
6. Channel Nuts: Formed or stamped nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.
7. Hanger Rods: Continuous thread rod, nuts, and washers made of carbon steel.
8. Metallic Coating: Zinc dichromate finish applied over an electro-galvanized zinc plating.

2.6 THERMAL HANGER SHIELD INSERTS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
1. Pipe Shields
2. nVent/Caddy
3. Buckaroos
4. Carpenter & Paterson
5. Piping Technology & Products
6. Rilco Manufacturing
7. Value Engineered Products

B. Standard Insulation Insert Material for Cold Piping: Polyisocyanurate high density insulation, with 125 psi minimum compressive strength, a flame spread/smoke developed rating of 25/50 or less, and vapor barrier.

C. Standard Insulation Insert Material for Hot Piping: Polyisocyanurate high density insulation, with 125 psi minimum compressive strength, a flame spread/smoke developed rating of 25/50 or less; or Calcium Silicate with 100 psi minimum compressive strength.

D. Structural/Seismic Insert Material for Cold Piping: Polyisocyanurate high density insulation, with a minimum density of 14 lbs/ft^3, a minimum compressive strength of 900 psi, and a flame spread/smoke developed rating of 25/50 or less. Structural inserts shall be used as recommended by the insert manufacturer to meet load ratings.

E. Structural/Seismic Insert Material for Hot Piping: Calcium Silicate with a minimum density of 28 lbs/ft^3 and a minimum compressive strength of 900 psi. Structural inserts shall be used as recommended by the insert manufacturer to meet load ratings.

F. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

G. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

H. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

I. Provide a vapor barrier steel jacket around insulation. Insulation jackets shall be galvanized steel conforming to ASTM A653. Hanger bearing surface shall consist of a galvanized sheet metal insulation protection shield or casing.

J. Thermal hanger supports shall be load rated. Load ratings shall be established by the pipe support manufacturer based upon testing and analysis in conformance with the current edition of following codes and standards: ASME B31.1, MSS SP-68, SP-69, and SP-89.

K. Unless otherwise indicated, thermal hanger supports shall be as indicated in the following schedule, or approved equal. The listed model numbers are based on Pipe Shields.
   1. Pipe supported on hangers: Models A2000, A4000, A9000, and D3000 series.
   2. Pipe supported on flat surfaces: Models A2000, A4000, A6000, A7000, A7200, and A7400.
   3. Pipe Supported on pipe rolls: Models A4000, A6000, A8200, and A8400.
   4. Pipe supported on slides and guides: Model B series.
   5. Riser pipe supports: Model E series.

L. The selected model(s) shall conform to pipe service, support style, and support spacing.

M. Pipe support spacing shall be in accordance with the manufacturer's recommendations, but in no case shall exceed the maximum spacing required by ASME B31.1.

2.7 FASTENER SYSTEMS

A. Powder Actuated Fasteners: Threaded steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used. Powder actuated fasteners may only be utilized for point loads or 50 lbs or less.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
      a. Hilti
      b. ITW Ramset/Red Head
      c. MKT Fastening
      d. Simpson Strong-Tie

B. Mechanical Expansion Anchors: Insert wedge type anchors for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

1. Indoor Applications: Zinc-coated stainless steel.
2. Outdoor Applications: Stainless steel.
3. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include the following:
   a. Hilti
   b. ITW Ramset/Red Head
   c. MKT Fastening
   d. B-line

2.8 PIPE STANDS

A. General Requirements for Pipe Stands: Shop or field fabricated assemblies made of manufactured corrosion resistant components to support roof mounted piping.

B. Compact Pipe Stand:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Miro Industries
      b. PHP Systems/Design
      c. RectorSeal HVAC
      d. Rooftop Support Systems
   2. Description: Single base unit with integral rod roller, pipe clamps, or V-shaped cradle to support pipe, for roof installation without membrane penetration.
   3. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate.
   4. Hardware: Galvanized steel or polycarbonate.
   5. Accessories: Protection pads.

C. Low Profile, Single Base, Single Pipe Stand:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Miro Industries
      b. PHP Systems/Design
      c. Rooftop Support Systems
   2. Description: Single base with vertical and horizontal members, and pipe support, for roof installation without membrane protection.
   3. Base: Single, vulcanized rubber, molded polypropylene, or polycarbonate.
   4. Vertical Members: Two, galvanized stainless steel, continuous thread 1/2 inch rods.
   5. Horizontal Member: Adjustable horizontal, galvanized stainless steel pipe support channels.
   6. Pipe Supports: Roller strut clamps, clevis hanger, or swivel hanger.
   7. Hardware: Galvanized stainless steel.
   8. Accessories: Protection pads.
   9. Height: 12 inches above roof Insert lesser dimension above roof.

D. High Profile, Single Base, Single Pipe Stand:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Miro Industries
      b. PHP Systems/Design
      c. Rooftop Support Systems
   2. Description: Single base, vertical and horizontal members, and pipe support, for roof installation without membrane penetration.

3. Base: Single vulcanized rubber or molded polypropylene.
4. Vertical Members: Two, galvanized stainless steel, continuous thread 1/2 inch rods.
5. Horizontal Member: One, adjustable height, galvanized stainless steel pipe support slotted channel or plate.
6. Pipe Supports: Roller strut clamps, clevis hanger, swivel hanger.
7. Hardware: Galvanized stainless steel.
8. Accessories: Protection pads, 1/2 inch continuous thread galvanized steel rod, 1/2 inch continuous thread stainless steel rod.
9. Height: 36 inches above roof Insert lesser dimension above roof.

E. High Profile, Multiple Pipe Stand:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
a. Miro Industries
b. PHP Systems/Design
c. RectorSeal HVAC
d. Rooftop Support Systems
2. Description: Assembly of bases, vertical and horizontal members, and pipe supports, for roof installation without membrane penetration.
3. Bases: Two or more; vulcanized rubber molded polypropylene insert material.
4. Vertical Members: Two or more, galvanized stainless steel channels.
5. Horizontal Members: One or more, adjustable height, galvanized stainless steel pipe supports.
6. Pipe Supports: Roller strut clamps, clevis hanger, swivel hanger.
7. Hardware: Galvanized stainless steel.
8. Accessories: Protection pads**,** 1/2 inch continuous thread rod.
9. Height: 24 inches above the roof or as indicated on the drawings.

F. Curb Mounted Type Pipe Stands: Shop or field fabricated pipe supports made from structural steel shapes, continuous thread rods, and rollers, for mounting on permanent stationary roof curb.

2.9 EQUIPMENT SUPPORTS

A. Description: Welded, shop or field fabricated equipment supports made from structural carbon steel shapes.

2.10 OUTDOOR EQUIPMENT STANDS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. MIRO Industries
2. RectorSeal HVAC
3. Rooftop Support Systems

B. Description
1. Description: Individual foot supports with elevated adjustable channel cross bars and clamps/fasteners/bolts for ground or roof supported outdoor equipment components, without roof membrane penetration, in a pre-fabricated system that can be modularly assembled on site.
2. Foot Material: Rubber or polypropylene.
3. Rails Material: Hot dip galvanized carbon steel.
4. Wind/Sliding Load Resistance: Up to 120 mph, or as indicated on the structural drawings.

2.11 MATERIALS

A. Aluminum: ASTM B221.

B. Carbon Steel: ASTM A1011/A1011M.

C. Structural Steel: ASTM A36/A36M, carbon steel plates, shapes, and bars; galvanized.

D. Stainless Steel: ASTM A240/A240M.

E. Threaded Rods: Continuously threaded. Zinc plated or galvanized steel for indoor applications and stainless steel for outdoor applications. Mating nuts and washers shall be same or similar materials as rods.

F. Grout: ASTM C1107/C1107M, factory mixed and packaged, dry hydraulic cement, non-shrink and non-metallic grout; suitable for interior and exterior applications.
   1. Properties: Non-staining, non-corrosive, and non-gaseous.
   2. Design Mix: 5,000 psi, 28 day compressive strength.

PART 3 - EXECUTION

3.1 APPLICATION

A. Comply with all requirements in other section of the specifications for firestopping materials and installation for penetrations through fire rated walls, ceilings, and assemblies.

B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lbs.

3.2 HANGER AND SUPPORT INSTALLATION

A. Metal Pipe Hanger Installation: Comply with MSS SP-58. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.

B. Metal Trapeze Pipe Hanger Installation: Comply with MSS SP-58. Arrange for grouping of parallel runs of horizontal piping, and support together on field fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
   2. Field fabricate from ASTM A36/A36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.

C. Thermal Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

D. Fastener System Installation:
   1. Install powder actuated fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder actuated tool manufacturer. Install fasteners according to powder actuated tool manufacturer's operating manual.
   2. Install mechanical expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

E. Pipe Stand Installation:
   1. Pipe Stand Types Except Curb Mounted Type: Assemble components and mount on smooth roof surface. Do not penetrate the roof membrane.
   2. Curb Mounted Type Pipe Stands: Assemble components or fabricate pipe stands and mounts on a permanent, stationary roof curb.

F. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.

G. Equipment Support Installation: Fabricate from welded structural steel shapes.

H. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

I. Install lateral bracing with pipe hangers and supports to prevent swaying.

J. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, 2-1/2” pipe size and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

K. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

L. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

M. Insulated Piping:
   1. Attach clamps and spacers to piping.
      a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
      b. Piping Operating below Ambient Air Temperature: Use thermal hanger shield insert with clamp sized to match OD of insert.
      c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
   2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation. Optional: Thermal hanger shield inserts may be used. Include steel weight distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
   3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees. Optional: Thermal hanger shield inserts may be used. Include steel weight distribution plate for pipes 4” and larger if pipe is installed on rollers.
   4. Shield Dimensions for Pipe: Not less than the following:
      a. 1/2” to 3-1/2” pipe: 12 inches long and 0.048 inch thick.
      b. 4” pipe: 12 inches long and 0.06 inch thick.
      c. 4” and 5” pipe: 18 inches long and 0.06 inch thick.
      d. 8” thru 14” pipe: 24 inches long and 0.075 inch thick.
      e. 16” thru 24” pipe: 24 inches long and 0.105 inch thick.
   5. Pipes 8” and Larger: Include wood or reinforced calcium silicate insulation inserts of length at least as long as protective shield.
   6. Thermal Hanger Shields: Install with insulation same thickness as piping insulation.

3.3 EQUIPMENT HANGERS/SUPPORTS

A. Fabricate structural steel supports to suspend equipment from structure overhead or structural steel stands to support equipment above the floor.

B. Grouting: Place grout under supports for equipment and make bearing surface smooth.

C. Provide lateral bracing for equipment supports to prevent swaying.

3.4 DUCTWORK HANGERS/SUPPORTS

A. Fabricate structural steel supports to suspend ductwork from structure overhead.

B. Fabricate structural steel stands to support ductwork above the floor (when indicated on the drawings). Provide lateral bracing for ductwork supports to prevent swaying.

3.5 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1/D1.1M procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.6 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous thread hanger and support rods to 1-1/2 inches.

3.7 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field painted surfaces.
   1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing repair paint to comply with ASTM A780/A780M.

3.8 HANGER AND SUPPORT SCHEDULE

A. Specific hanger and support requirements are in sections specifying piping, ductwork, and equipment.

B. Comply with MSS SP-58 for pipe hanger selections and applications that are not specified in piping system sections.

C. Use hangers and supports with galvanized metallic coatings for piping, ductwork, and equipment that will not have field applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use carbon steel pipe hangers and supports metal trapeze pipe hangers and metal framing systems and attachments for general service applications.

F. Use copper plated pipe hangers and copper or stainless steel attachments for copper piping and tubing.

G. Use padded hangers for piping that is subject to scratching.

H. Use thermal hanger shield inserts for insulated piping and tubing.

I. Horizontal Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system sections, install the following types:
   1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of non-insulated or insulated, stationary pipes 1/2” thru 30” size.
   2. Yoke Type Pipe Clamps (MSS Type 2): For suspension of up to 1050°F, pipes 4” thru 24” size, requiring up to 4 inches of insulation.
   3. Carbon or Alloy Steel, Double Bolt Pipe Clamps (MSS Type 3): For suspension of pipes 3/4” thru 36” size, requiring clamp flexibility and up to 4 inches of insulation.
   4. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes 1/2” thru 24” size if little or no insulation is required.
   5. Pipe Hangers (MSS Type 5): For suspension of pipes 1/2” thru 4” size, to allow off center closure for hanger installation before pipe erection.
   6. Adjustable Swivel Split or Solid Ring Hangers (MSS Type 6): For suspension of non-insulated, stationary pipes 3/4” thru 8” size.
   7. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of non-insulated, stationary pipes 1/2” thru 8” size.
   8. Adjustable Band Hangers (MSS Type 9): For suspension of non-insulated, stationary pipes 1/2” thru 8” size.
   9. Adjustable, Swivel Ring Band Hangers (MSS Type 10): For suspension of non-insulated, stationary pipes 1/2” thru 8” size.
   10. Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11): For suspension of non-insulated, stationary pipes 3/8” thru 8” size.
   11. Extension Hinged or Two Bolt Split Pipe Clamps (MSS Type 12): For suspension of non-insulated, stationary pipes 3/8” thru 3” size.
   12. U-Bolts (MSS Type 24): For support of heavy pipes 1/2” thru 30” size.
   13. Clips (MSS Type 26): For support of insulated pipes not subject to expansion or contraction.
   14. Pipe Saddle Supports (MSS Type 36): For support of pipes 4” thru 36” size, with steel pipe base stanchion support and cast iron floor flange or carbon steel plate.
   15. Pipe Stanchion Saddles (MSS Type 37): For support of pipes 4” thru 36” size, with steel pipe base stanchion support and cast iron floor flange or carbon steel plate, and with U-bolt to retain pipe.
   16. Adjustable Pipe Saddle Supports (MSS Type 38): For stanchion type support for pipes 2-1/2” thru 36” size if vertical adjustment is required, with steel pipe base stanchion support and cast iron floor flange.
   17. Single Pipe Rolls (MSS Type 41): For suspension of pipes 1” thru 30” size , from two rods if longitudinal movement caused by expansion and contraction might occur.
   18. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes 2-1/2” thru 24” size, from single rod if horizontal movement caused by expansion and contraction might occur.
   19. Complete Pipe Rolls (MSS Type 44): For support of pipes 2” thru 42” size if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is unnecessary.
   20. Pipe Roll and Plate Units (MSS Type 45): For support of pipes 2” thru 24” size if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is unnecessary.
   21. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes 2” thru 30” size if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

J. Vertical Piping Clamps: Unless otherwise indicated and except as specified in piping system sections, install the following types:
   1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers 3/4” thru 24”.
   2. Carbon or Alloy Steel Riser Clamps (MSS Type 42): For support of pipe risers 3/4” thru 24” size if longer ends are required for riser clamps.

K. Hanger Rod Attachments: Unless otherwise indicated and except as specified in piping system sections, install the following types:
   1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
   2. Steel Clevises (MSS Type 14): For 120 to 450°F piping installations.
   3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
   4. Malleable Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
   5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450°F piping installations.

L. Building Attachments: Unless otherwise indicated and except as specified in piping system sections, install the following types:
   1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
   2. Top Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.
   3. Side Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
   4. Center Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
   5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
   6. C-Clamps (MSS Type 23): For structural shapes.
   7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
   8. Side Beam Clamps (MSS Type 27): For bottom of steel I-beams.
   9. Steel Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
   10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
   11. Malleable Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
   12. Welded Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
      a. Light (MSS Type 31): 750 lbs.
      b. Medium (MSS Type 32): 1500 lbs.
      c. Heavy (MSS Type 33): 3000 lbs.
   13. Side Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
   14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
   15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

M. Saddles and Shields: Unless otherwise indicated and except as specified in piping system sections, install the following types:
   1. Steel Pipe Covering Protection Saddles (MSS Type 39): To fill interior voids with insulation that matches adjoining insulation.
   2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
   3. Thermal Hanger Shield Inserts: For supporting insulated pipe.

N. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system sections, install the following types:
   1. Restraint Control Devices (MSS Type 47): Where indicated to control piping movement.
   2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
   3. Spring Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.
   4. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
   5. Variable Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
   6. Variable Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
   7. Variable Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.
   8. Constant Supports: For critical piping stress and if necessary, to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load adjustment capability. These supports include the following types:
      a. Horizontal (MSS Type 54): Mounted horizontally.
      b. Vertical (MSS Type 55): Mounted vertically.
      c. Trapeze (MSS Type 56): Two vertical type supports and one trapeze member.

O. Comply with MSS SP-58 for trapeze pipe hanger selections and applications that are not specified in piping system sections.

P. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system sections.

Q. Use powder actuated fasteners and mechanical expansion anchors instead of building attachments where required in concrete construction.

END OF SECTION

SECTION 23 05 40 - SEISMIC BRACING FOR HVAC SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Section 230000 (Heating, Ventilating, and Air Conditioning), Section 230500 (Basic Materials and Methods for HVAC), and Section 230530 (Hangers and Supports for HVAC Systems) are hereby made a part of this section.

1.2 GENERAL

A. Seismic bracing for mechanical systems (equipment, ductwork, piping, and conduit) shall comply with all applicable requirements of the latest adopted edition of the International Building Code (IBC) including all applicable provisions of the latest adopted edition of the American Society of Civil Engineers (ASCE) Minimum Design Loads for Buildings and Other Structures (ASCE Standard 7-16). Basic seismic design criteria for each project shall be as listed on the structural drawings for that project.

B. The anchorage calculations shall show compliance with the latest adopted edition of the American Concrete Institute (ACI) Standards, Handbooks, and Manuals where anchoring to concrete for the project-specific loads and conditions, including project specific calculations for anchors, clips, and fasteners.

C. Anchorage calculations for seismic roof curbs shall be included in seismic roof curb submittal, including a stamped plan or detail showing the anchorage requirement. This detail shall include specific anchor type, diameter, embedment, and layout or spacing.

D. Compliance with the applicable seismic bracing requirements for equipment, ductwork, piping, and conduit shall be accomplished utilizing the most current version of one of the following design manuals, or approved equal.

International Seismic Application Technology (ISAT) Design Manual
Mason Industries Seismic Restraint Design Manual
Vibro-Acoustics Seismic Design Manual
SMACNA Seismic Restraint Manual (Guidelines for Mechanical Systems)

E. Component Importance Factors (Ip) for all equipment, ductwork, piping, and conduit shall be determined and assigned in accordance with ASCE Standard 7-16 Section 13.1.3.

F. Design and detailing of seismic bracing, hangers, and supports for equipment, ductwork, piping, and conduit is the responsibility of the Contractor.

G. Design of connections for hangers, supports, and bracing shall comply with the requirements indicated on the structural drawings.

H. The work of this section shall be coordinated with the requirements for the Contractor furnished delegated design submittal for hangers and supports specified in Section 230530 (Hangers and Supports for HVAC Systems). Design and detailing of seismic bracing, hangers, and supports is the responsibility of the Contractor.

1.3 SUBMITTALS

A. The Contractor shall provide the required number of seismic shop drawing submittal sets for review and approval by the Engineer. Submittals shall include a comprehensive set of shop drawings clearly depicting the seismic bracing requirements for all equipment, ductwork, piping, and conduit. Any piping or conduit that does not require seismic bracing shall be specifically identified in the submittal, and the reason for exemption shall be provided. Cite any and all references for the exemption. In cases where seismic bracing is not required due to the supported items being less than 12 inches below the supporting structure, a single note may be provided to cover those locations.

B. Submittals shall be fully coordinated with the structural drawings and shall include all applicable structural attachment details. Seismic bracing shop drawings shall include all vertical support anchorage loads and all seismic bracing anchorage loads. Each specific load shall be indicated and the structural element that the support is attached to shall be clearly depicted/identified. Seismic bracing submittals shall be stamped and signed by a structural or civil engineer with current registration licensed in the State of Nevada (or licensed in the state where the project is located, if the project is located outside the State of Nevada).

C. Seismic shop drawing submittals will be reviewed by both the design mechanical engineer and the design structural engineer.

1.4 SITE VISITS (QUALITY CONTROL)

A. An authorized representative of the seismic bracing system manufacturer shall visit the job site during the construction period to confirm that the seismic bracing installation complies with the shop drawings, with all applicable code requirements, and with the seismic bracing system manufacturer's written installation requirements and associated details. As a minimum, an authorized representative shall visit the site when the seismic bracing installation is complete (and prior to installation of the ceilings).

B. A written report shall be issued within one week the site visit summarizing the observations made during the site visit and listing all required corrective actions and/or deficiencies. The report shall be made available to both the design mechanical engineer and the design structural engineer.

C. After all equipment installation is complete and all seismic bracing has been verified, the authorized representative that conducted the field verification shall issue a letter certifying that the installation is complete and that the installation complies with the specified requirements

D. Site visits shall be coordinated with the Owner and shall be scheduled in writing a minimum of one week prior to the proposed site visit date.

END OF SECTION

SECTION 23 07 00 - HVAC INSULATION

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of mechanical insulation specified in this section include the following:

1. Piping System Insulation:
   Heat Pump Loop Supply and Return Piping
   Condensate Drains
   Refrigerant Piping
2. Ductwork System Insulation:
   Supply Air and Return Air Ducts
   Outside Air Intake Ducts
   Kitchen Hood Exhaust Ducts
3. Equipment Insulation:
   Heat Pump Loop Pumps
   Heat Pump Loop Air Separator
   Removeable Insulating Jackets

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firm regularly engaged in manufacture of mechanical insulation products, of types and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Installer Qualifications: Insulation specialty firm with at least 5 years successful installation experience on projects with mechanical insulations similar to that required for this project.

C. SMACNA Compliance: Comply with applicable portions of Sheet Metal and Air Conditioning Contractor's National Association (SMACNA) recommendations for all work in this section.

D. ASHRAE Standards: Comply with applicable portions of American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE) recommendations for all work in this section.

E. NFPA Standards: Comply with applicable portions of ANSI/NFPA Standard 90A (Standard for the Installation of Air Conditioning and Ventilating Systems) and ANSI/NFPA 90B (Standard for the Installation of Warm Air Heating and Air Conditioning Systems) for all work in this section.

F. NAIMA Standards: Comply with all applicable portions of the North American Insulation Manufacturers Association (NAIMA) standards for all related work in this section.

G. MICA Standards: Comply with all applicable portions of the Midwest Insulation Contractors Association standards for all related work in this section.

H. Install thermal insulation products on equipment in accordance with manufacturer's written instructions and in accordance with recognized industry practices to ensure that insulation serves its intended purpose.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of insulation. Submit schedule showing manufacturer's product number, k-Value, thickness, density, and furnished accessories for each mechanical system requiring insulation. Include complete description of installation methods with this submittal.

PART 2 - PRODUCTS

2.1 PIPE INSULATION MATERIALS

A. General: All pipe insulation conductivities and thicknesses shall meet or exceed the requirements listed in 2018 International Energy Conservation Code Table C403.11.3. All conductivity values listed in this specification section are in Btu-in/(hr-ft^2-°F).

B. Flame/Smoke Spread Ratings: Insulation installed inside the building shall consist of composite mechanical insulation (insulation, jackets, coverings, sealers, mastics, and adhesives) with a flame spread rating of 25 or less and a smoke developed index of 50 or less, in accordance with ASTM E84.

C. Kitchens: All insulated piping exposed in kitchen areas shall be covered with Type 304 stainless steel jacketing secured with 3/4” wide stainless steel bands at 12” on center.

D. Aluminum Jacketing shall be Johns Manville ‘JM Aluminum Jacketing’ with ‘Polyfilm Moisture Barrier’ and stucco-embossed finish, or approved equal, and shall be installed in conformance with the manufacturer’s written instructions. Secure jacketing with 3/4” wide Type 304 stainless steel bands at 12” on center. Finish all cold fittings as required to provide a vapor-tight seal. Aluminum and/or stainless steel jacketing shall be provided in the following thicknesses:
   1. For Insulation Outside Diameters under 8”: .016 inch thick jacketing
   2. For Insulation Outside Diameters 8” thru 24”: .024 inch thick jacketing

E. Lower Level Exposed in all piping applications shall mean any exposed pipe in a mechanical room, mezzanine area, or other accessible space that is less than 8’-0” above finished floor.

F. Higher Level Exposed in all piping applications shall mean any exposed pipe in a mechanical room, mezzanine area, or other accessible space that is 8’-0” or more above finished floor.

G. Fiberglass Insulation (Concealed Applications)
   1. Fiberglass insulation shall be Johns Manville Microlok HP, or approved equal, with factory-applied fire-retardant ASJ jacket, self-sealing laps, and shall be applied per manufacturer's written recommendations. Conductivity shall be 0.23 at 75°F, 0.25 at 125°F, and 0.28 at 200°F. Insulation shall be rated for applications from 0°F up to 850°F. Insulation flame spread/smoke developed rating shall be 25/50 or less in accordance with ASTM E84.
   2. Insulate and cover all fittings with Johns Manville Zeston Series 2000 standard gauge pre-molded fitting covers secured with serrated tacks, adhesive, and/or Zeston Z-Tape.
   3. Install a segment of rigid calcium silicate insulation at each pipe hanger for pipe sizes 2-1/2 inches and larger.
   4. Finish all cold fittings with Zeston Z-tape to provide a vapor-tight seal.
   5. Seal all raw ends of insulation with Childers CP-10 weather barrier sealant, or equal.
   6. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:
      Johns Manville, CertainTeed, Owens Corning

H. Fiberglass Insulation (Lower Level Exposed Applications)
   1. Fiberglass insulation shall be Johns Manville Microlok HP, or approved equal, with factory-applied fire-retardant ASJ jacket, self-sealing laps, and shall be applied per manufacturer's written recommendations. Conductivity shall be 0.23 at 75°F, 0.25 at 125°F, and 0.28 at 200°F. Insulation shall be rated for applications from 0°F up to 850°F. Insulation flame spread and smoke developed rating shall be 25/50 or less in accordance with ASTM E84. Lower level exposed piping shall be covered with aluminum jacketing.
   2. Insulate and cover all fittings with aluminum jacketing and aluminum fitting covers.
   3. Install a segment of rigid calcium silicate insulation at each pipe hanger for pipe sizes 2-1/2 inches and larger.
   4. Finish all cold fittings with Zeston Z-tape to provide a vapor-tight seal.
   5. Seal all raw ends of insulation with Childers CP-10 weather barrier sealant, or equal.
   6. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:
      Johns Manville, CertainTeed, Owens Corning

I. Fiberglass Insulation (Higher Level Exposed Applications)
   1. Fiberglass insulation shall be Johns Manville Microlok HP Ultra with performance characteristics as specified for Johns Manville Microlok HP insulation plus a factory-applied polypropylene coating that is cleanable/washable.
   2. Insulate and cover all fittings with Johns Manville Zeston Series 2000 standard gauge pre-molded fitting covers secured with serrated tacks, adhesive, and/or Zeston Z-Tape.
   3. Install a segment of rigid calcium silicate insulation at each pipe hanger for pipe sizes 2-1/2 inches and larger.
   4. Finish all cold fittings with Zeston Z-tape to provide a vapor-tight seal.
   5. Seal all raw ends of insulation with Childers CP-10 weather barrier sealant, or equal.
   6. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:
      Johns Manville, CertainTeed, Owens Corning

J. Closed Cell Polyisocyanurate Insulation with Aluminum Jacketing
   1. Closed cell polyisocyanurate insulation shall be Johns Manville Trymer 25-50 with vapor retarder film, and aluminum jacketing, or approved equal. Install insulation and jacketing per the manufacturer's written recommendations. Conductivity shall be 0.19 at 75°F, 0.23 at 125°F, and 0.26 at 200°F. Insulation shall be rated for applications from 0°F up to 300°F. Insulation flame spread and smoke developed rating shall be 25/50 or less in accordance with ASTM E84.
   2. Covering: Cover pipe and fitting insulation with Johns Manville Saranex 540-CX vapor retarder film and Saranex vapor retarder tape. Finish all cold fittings as required to provide a vapor-tight seal.
   3. Jacketing: Cover pipe and fitting insulation with stucco-embossed aluminum jacketing.

K. Calcium Silicate Insulation with Aluminum Jacketing
   1. Calcium silicate insulation shall be Johns Manville Thermo-1200, or approved equal, and shall be installed per manufacturer’s written recommendations. Conductivity shall be 0.36 at 125°F and 0.39 at 200°F. Insulation shall be rated for hot water, steam, or steam condensate applications up to 1200°F. Insulation flame spread and smoke developed rating shall be 25/50 or less in accordance with ASTM E84.
   2. Jacketing: Cover pipe and fitting insulation with stucco-embossed aluminum jacketing.
   3. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:
      Johns Manville
      Thermal Pipe Shields

2.2 HEAT PUMP LOOP PIPING (INDOORS)

A. Insulate lower level exposed heat pump loop supply and return piping with fiberglass insulation covered with aluminum jacketing and aluminum fitting covers.

B. Insulate higher level exposed heat pump loop supply and return piping with fiberglass insulation with polyurethane coated ASJ jacketing and heavy gauge pre-molded fitting covers.

C. Insulate concealed heat pump loop supply and return piping with fiberglass insulation covered with ASJ jacketing and heavy gauge pre-molded fitting covers

D. Minimum Insulation Thickness:

1. All pipe sizes: 1/2 inch

2.3 COLD WATER MAKE-UP PIPING (OUTDOORS)

A. Insulate cold water make-up piping installed outdoors with closed cell polyisocyanurate insulation with vapor retarder film, covered with aluminum jacketing and aluminum fitting covers.

B. Minimum Insulation Thickness:

1. Piping 1-1/4 inches and smaller: 1 inch
2. Piping 1-1/2 inches and larger: 1 inch

2.4 CONDENSATE DRAIN PIPING (INDOORS)

A. Insulate condensate drain piping installed inside the building with fiberglass Insulation. Insulation is not required on condensate overflow drain piping.

1. Minimum Insulation Thickness for all pipe sizes: 1 inch

2.5 REFRIGERANT PIPING INSULATION (INDOORS)

A. Insulate refrigerant suction piping installed indoors with 3/4 inch thick AP Armaflex closed cell foam pipe insulation. Flame spread and smoke developed rating shall be 25/50 or less in accordance with ASTM E84. Fittings and valves shall be covered with segmented sections of the pipe insulation installed in accordance with the insulation manufacturer's instructions. All joints between sections of insulation shall be sealed with Armaflex No. 520 adhesive.

B. Insulate both liquid and suction lines on mini-split system heat pumps and variable refrigerant systems that incorporate heat recovery using the aforementioned insulating materials.

2.6 REFRIGERANT PIPING INSULATION (OUTDOORS)

A. Insulate refrigerant piping installed outdoors with 1 inch thick Johns Manville Trymer 25-50 with vapor retarder film, covered with aluminum jacketing and aluminum fitting covers secured with 3/4” wide stainless steel bands at 12” on center. Trymer 25-50 closed cell polyisocyanurate insulation is required on outdoor refrigerant piping because it does not expand and contract during weather extremes like Armaflex closed cell foam pipe insulation.

B. Insulate both liquid and suction lines on mini-split system heat pumps and variable refrigerant systems that incorporate heat recovery using the aforementioned insulating materials.

2.7 DUCTWORK INSULATION MATERIALS

A. General: All duct insulation R-Values and thicknesses shall meet or exceed the requirements listed in International Energy Conservation Code Section C403.11.1.

B. See Specification Section 233100 (HVAC Ductwork) for additional related requirements.

C. Ductwork Insulation

1. All concealed supply air ductwork (rectangular and round) shall be externally insulated unless indicated otherwise on the drawings.

2. All concealed return air ductwork (rectangular and round) that is located in a return air plenum is not required to be insulated, unless indicated otherwise on the drawings.
3. Supply air and return air ductwork that is exposed in a conditioned space does not require insulation.

D. Ductwork Liner Insulation (See Specification Section 233100 (HVAC Ductwork).

E. External Duct Wrap Insulation

1. Unless indicated otherwise, wrap all concealed supply air and return air ductwork with 2-1/5 inch thick, 0.75 pcf density, fiberglass duct insulation with reinforced foil facing (Johns Manville Microlite FSK Type 75, or equal, with an R-value equal to 6.0).
2. Unless indicated otherwise, wrap all concealed outside air ductwork with 2-1/5 inch thick, 0.75 pcf density, fiberglass duct insulation with reinforced foil facing (Johns Manville Microlite FSK Type 75, or equal, with an R-value equal to 6.0).
3. Any exposed supply air or return air ductwork that is indicated on the drawings to be insulated shall be insulated with Johns Manville PSK white or black insulation, or approved equal, with matching PSK seaming tape.
4. In addition to the insulation manufacturer's tape flap, all insulation seams shall be sealed with pressure-sensitive tape (Shurtape AF-984CT, or equal). Longitudinal seams shall have a 4 inch overlap of the foil facing secured with outward clinching staples and pressure sensitive tape.
5. In addition to the specified seam sealing procedure, secure insulation with 16 gauge galvanized wire tied on 16" centers and within 8 inches of insulation seams.
6. Secure insulation on the underside of ducts that are wider than 24 inches with either weld-pins or with Duro-Dyne PBH Dynastick Fasteners adhered with Duro-Dyne PBACZVOC Dynastick Adhesive. Weld pins or fasteners shall be placed on 18" centers and within 6 inches of insulation seams. Any penetrations from pins in the insulation shall be sealed with pressure-sensitive tape. Galvanized wire ties are not required on any rectangular duct sections where the insulation is secured with pins and washers as outlined in this paragraph.

F. Kitchen Non-Grease Hood Duct Insulation: Ductwork above ceilings shall be insulated with 2-1/5 inch thick, .75 lb fiberglass insulation (Johns Manville Microlite FSK Type 75, or approved equal, with an R-value equal to 6.0). Insulation shall be applied with a non-flammable adhesive and secured with galvanized wire on 16" centers and within 8 inches of insulation seams.

2.8 EQUIPMENT INSULATION MATERIALS

A. General: All equipment insulation R-Values and thicknesses shall meet or exceed the requirements listed in International Energy Conservation Code Section C403.11.3.

B. Heat Pump Loop Equipment

1. Insulate all heat pump loop equipment which does not have factory-applied insulation, including heat pump loop pump bodies and air separators. Do not insulate heat pump loop expansion tanks.
2. Flat insulation shall be 3 lb density fiberglass board with thickness as required for the operating temperature of the associated fluid inside the equipment. Insulation shall be Johns Manville Series 800 Spin-Glas with reinforced FSK jacket, Owens Corning Series 700 fiberglass board insulation with reinforced FSK jacket, or approved equal.
3. Curved insulation shall be 2.5 lb density semi-rigid fiberglass. with thickness as required for the operating temperature of the associated fluid inside the equipment. Insulation shall be Johns Manville Micro-Flex large diameter pipe and tank insulation with reinforced FSK jacket, Owens Corning large diameter pipe and tank insulation with reinforced FSK jacket, or approved equal.
4. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:

   Johns Manville

Owens Corning

C. Removable Insulating Jackets
   1. Removable insulating jackets shall be provided for the following items.
      Heat pump loop pumps.
      Motorized control valves located indoors and/or outdoors.
      Flanged valves located indoors and/or outdoors.
   2. Insulation and jacket material shall be rated for the operating temperature of the equipment and/or fluid being insulated. Insulating jackets shall be removable and reusable, thermal and acoustical insulating jackets, constructed of minimum 18 ounce material, and sewn with Kevlar thread.
   3. Jackets for applications above 250°F (e.g., high temperature hot water and steam valves in exterior valve vaults) shall be fabricated with either silicone or PTFE-coated fiberglass fabric inner and outer material, and minimum 4” thick needled fiberglass insulation (see pipe insulation section for required thickness based on pipe size and temperature). The inner layer shall include a stainless steel mesh liner.
   4. Jackets for hot water applications 250°F and below (e.g., hot water valves in exterior valve vaults) shall be fabricated with PTFE-coated fiberglass fabric inner and outer material and minimum 2” thick needled fiberglass insulation (see pipe insulation section for required thickness based on pipe size and temperature).
   5. Jackets for cold/chilled water applications shall be fabricated with PTFE-coated fiberglass fabric inner and outer material and 1” thick needled fiberglass insulation.
   6. Insulating jackets shall be secured with stainless steel d-rings with straps and Velcro fasteners.
   7. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following:
      Insultech
      MIT International
      Thermal Energy Products

D. Ice Machines: Insulate all ice machine drain piping which does not have factory-applied insulation with fiberglass Insulation. Insulation is not required on ice machine overflow drain piping. Minimum Insulation Thickness for all pipe sizes: 1 inch.

E. Manholes and Handholes: Manholes and handholes shall be made accessible by beveling the insulation around the manhole, and covering the manhole with a removable insulating fiberglass blanket, same thickness as the adjacent equipment insulation. Manhole and handhole covers shall be finished the same as the tank covering.

PART 3 - EXECUTION

3.1 INSTALLATION OF PIPING INSULATION

A. The term ‘piping’ used herein shall include pipe, valves, strainers, and fittings. Apply insulating cements to fittings, valves, and strainers, and trowel smooth to the thickness of adjacent covering. Covering on valves shall extend up to the bonnet. The covering cement shall be of the types specified herein.

B. Install all insulation products in accordance with the manufacturer's written instructions and in accordance with recognized industry practices.

C. Install insulation on pipe systems subsequent to installation of heat tracing, testing, and acceptance of tests.

D. Install insulation materials with smooth and even surfaces. Insulate each continuous run of piping with full length units of insulation, with single-cut pieces to complete each run. Do not use cut pieces or scraps abutting each other.

E. Clean and dry pipe surfaces prior to insulating. Butt insulation joints firmly together to ensure complete and tight fit over surfaces to be covered.

F. Extend piping insulation without interruption through walls, floors, and similar penetrations, except piping through fire walls.

G. Install pipe hangers on the outside of the insulation and not in contact with the pipe. Protect insulation as specified in Specification Section 230500 (Basic Materials and Methods for HVAC) under 'Hangers and Supports for Ductwork and Piping'.

H. Install a 6 inch long section of rigid insulation at each pipe saddle and/or hanger. Rigid sections shall be calcium silicate, except on chilled water piping where rigid sections shall be foamglas.

I. Seal all raw ends of insulation with Childers CP-10 weather barrier sealant, or approved equal.

3.2 INSTALLATION OF DUCTWORK INSULATION

A. Install insulation products in accordance with the manufacturer's written instructions and in accordance with these specifications.

B. Extend ductwork insulation without interruption through walls, floors, and similar penetrations, except ductwork through fire rated walls and where otherwise indicated.

C. Except where otherwise indicated, external duct insulation may be omitted on ductwork where internal duct liner insulation has been specified.

D. Except where otherwise indicated, ductwork exposed in conditioned spaces is not required to be insulated.

3.3 INSTALLATION OF EQUIPMENT INSULATION

A. Install all equipment insulation materials with smooth and even surfaces and on clean and dry surfaces. Replace any poorly fitted joints. Do not use mastic or joint sealer as filler for gapping joints and excessive voids resulting from poor workmanship.

B. Do not apply insulation to equipment, flues, breechings, or stacks while hot.

C. Do not insulate cleanouts, ASME stamps, or equipment manufacturer's nameplates. Provide neatly beveled edges at interruptions of insulation.

3.4 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective insulation. Leave entire work in condition satisfactory to the Architect/Engineer. At completion, carefully clean equipment installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.5 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 08 00 - TESTING, ADJUSTING, AND BALANCING OF HVAC SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

B. Section 230910 (Sequence of Operation) is hereby made a part of this section.

1.2 WORK INCLUDED

A. Temperature performance testing on all heat transfer equipment and/or components.

B. Test and balance of air distribution systems and associated equipment and apparatus.

C. Test and balance of hydronic distribution systems and associated equipment and apparatus.

D. Testing, setting, and adjusting speed and volume of systems, recording data, conducting tests, preparing and submitting reports, and recommending modifications to work as required by the contract documents.

E. Component types of testing, adjusting, and balancing specified in this section includes the following as applied to mechanical equipment:

Central Plant Equipment (Pumps, Boilers, Closed Circuit Fluid Cooler, etc.)
Make-Up Air Units
Fans
Fan Coil Units
Heat Pumps (Air and Water)
Ductwork Systems
Air Distribution
Piping Systems
Balancing Valves for HVAC Systems
Balancing Valves for Plumbing Systems

1.3 QUALITY ASSURANCE

A. Balance Agency: Provide services and facilities of an independent agency that specializes in testing, analysis, and balancing of hydronic systems and air distribution for heating and/or cooling systems. Work shall be done by qualified engineering technicians and trained personnel, using instruments certified accurate to limits used in standard practice for testing and balancing of hydronic and air distribution for heating-cooling systems. The balance agency shall field test air and hydronic flows in accordance with the methods prescribed by the Associated Air Balance Council, National Standard Volume 1, latest edition.

B. The balance agency shall be a member of the Associated Air Balance Council. Subject to compliance with requirements, the balance agency shall be one of the following (no exceptions):

RS Analysis
Raglen System Balance

C. The balance agency shall submit the results of tests in this section to the Architect/Engineer for review and acceptance.

D. AABC Compliance: Comply with AABC ‘National Standards’ Volume 1, as applicable to mechanical air and hydronic distribution systems and associated equipment and apparatus.

E. Industry Standards: Comply with ASHRAE recommendations pertaining to measurements, instruments, and testing, adjusting and balancing, except as otherwise indicated.

F. Reference Standards:
   1. AABC (Associated Air Balance Council) AABC National Standards Volume 1.
   2. ASHRAE (American Society of Heating, Refrigerating, and Air Conditioning Engineers).

G. Test Instruments: Utilize test instruments and equipment for the test and balance work required, of type, precision, and capacity as recommended in AABC National Standards Volume 1.

1.4 SUBMITTALS

A. Provide a test and balance agenda that includes step-by-step testing and balancing procedures, test sheets, and schematic drawings, all being specific to the project.

B. Provide submittals to indicate the extent of work proposed. Submit certified test reports as hereinafter specified signed by test and balance technician/supervisor that performed test and balance work.

C. Include identification and types of instruments used and their most recent calibration date with submission of final test report.

D. The completed balance report shall be submitted for review and approval prior to requesting final observation of the project.

1.5 GENERAL REQUIREMENTS

A. The test & balance agency shall perform the following during the installation phase of systems:
   1. Study the design drawings and specifications and prepare a schedule to physically inspect mechanical equipment for the hydronic and air distribution systems to be tested and balanced. The Contractor shall provide the balance agency with one copy of the contract drawings and specifications, mechanical equipment submittals, and change orders as necessary for proper balancing of the hydronic and air distribution systems.
   2. The test and balance agency shall submit blank copies of test sheets for all items of equipment for review by the Mechanical Engineer and CxA before testing begins.
   3. The test and balance agency shall make field inspections prior to closing in portions of systems to be balanced. The balance agency shall verify that all work, fittings, dampers, balancing devices, etc. are properly fabricated and installed as shown or specified and that the balance agency will be able to properly balance the systems. Any problems or deficiencies shall be reported in writing to the Contractor, Mechanical Engineer, and CxA as soon as possible.
   4. Prepare a testing and balancing schedule, test record forms, and necessary technical information regarding hydronic and air distribution systems for the installed heating and cooling equipment.
   5. Provide written documentation when the above noted items have been completed, (see example checklist provided at the end of this section). A single page letter signed off by the mechanical contractor and the test and balance agency will suffice.
   6. Recommend adjustments and/or corrections to mechanical equipment and hydronic and air distribution systems that are necessary for proper balancing of systems. Provide written documentation of the recommended items to the Architect/Engineer for review.

B. Patching Materials: Except as otherwise indicated, use same products as used by original installer for patching holes in insulation, ductwork, and housings which have been cut or drilled for test purposes, including access for test instruments, attaching jigs, and similar purposes. At tester's option, plastic plugs with retainers may be used to patch drilled holes in low pressure ductwork and housings (2” w.g. and below).

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 TESTING AND BALANCING

A. Upon completion of hydronic and air handling systems, the test and balance agency shall complete tests, analysis, and balance of hydronic and air handling systems for all heating and cooling equipment.

B. The report shall include as minimum, design and actual information for the following:
   1. All mechanical equipment scheduled on the drawings.
   2. Central plant equipment: Performance data for accessory equipment, pumps, etc.
   3. Motors, pumps, and fans: Horsepower, brake horsepower, revolutions per minute, actual amperage, full load rated amperage, pump flow and head data, etc.
   4. Supply, return, and exhaust fans: CFM, static pressure, and outlet velocity.
   5. Pumps: Suction, discharge, and shutoff pressures.
   6. Heat Pumps: GPM flow and fluid temperatures, and air temperatures at inlet and outlet.
   7. Inlets, outlets, and main branch ducts: CFM and air velocity.
   8. All rooms: Air temperature during testing.
   9. Other information as required to establish completely balanced systems under design conditions.

3.2 BALANCING REQUIREMENTS

A. All air and water systems and devices shall be balanced to within +0% to +5% of design.

B. All air systems and air distribution devices (supply, return, and exhaust) shall be balanced to within 0 to +10% of design. This requirement applies to all main supply, return, and exhaust air ducts, as well as all air distribution devices.

C. Make allowance for air filter resistance at time of tests (by false-loading the filter bank with cardboard or other suitable material such that the test results can be repeated). Test and balance all main supply and return air ducts to the design air quantities.

D. After final air and hydronic testing and balancing make necessary adjustments to obtain uniform temperatures as required during actual occupancy.

E. Take static pressure and air velocity readings with instruments that have been recently calibrated. Take final velocity readings with an Alnor velometer, Anemostat air meter, or vane type anemometer, all recently calibrated prior to testing. Include certified correction curves for each calibration as part of the record. Certify instruments are accurate to standards currently used in common practice for system balance work. Use test cones for diffusers.

F. Run tests with supply, return, and exhaust systems operating and doors, windows, etc. closed or under normal traffic. Conduct final testing with cooling coils under load to ensure that static pressures are or near design conditions.

G. Adjust deflection of supply outlets to ensure proper and uniform air distribution.

H. Work with the temperature control subcontractor in adjustment of automatic dampers, valves, thermostats, etc. as required to maintain proper temperatures in all portions of the building.

I. The Contractor responsible for installing heating, cooling, and ventilating equipment shall make any changes, additions, or modifications to dampers, fan drives, motor sheaves, pump impellers, motors, and other equipment as necessary for proper air and hydronic balance.

J. Balance of systems shall be reviewed by the Architect/Engineer. During this review the mechanical contractor shall furnish workmen, materials, ladders, etc. to enable the Architect/Engineer to witness all readings as may be directed. If any errors are found, the Testing and Balancing Agency shall readjust the system to the satisfaction of the Architect/Engineer.

K. A kitchen hood performance test per 2018 Uniform Mechanical Code Section 511.2.2.1 shall be conducted upon completion and before final approval of the installation of a ventilation system serving commercial cooking appliances. The test shall verify the rate of exhaust airflow in accordance with UMC Sections 508.5.1.2 through 508.5.1.5. The permit holder shall furnish the necessary test equipment and devices required to perform the tests (see ASHRAE Standard 154 Section 4.7.1). The permit holder shall verify the capture performance of Type I and Type II hoods. A field test shall be conducted with all appliances under the hoods operating at design capacity, and with all sources of replacement air operating at design airflows for a restaurant. Capture and containment shall be verified visually by observing smoke or steam produced by actual cooking operation or by simulating cooking using devices such as smoke candles or smoke puffers. Smoke bombs shall not be used (see ASHRAE Standard 154 Section 4.7.2).

L. See the Field Observation Checklist Example on the following page.

END OF SECTION

Field Observation Checklist (Example)			
YES	**NO**	**N/A**	
□	□	□	Is the ductwork intact?
□	□	□	Are any endcaps missing?
□	□	□	Are the access doors installed and secured tightly?
□	□	□	Are there openings in the ductwork?
□	□	□	Are any inlets or outlets missing?
□	□	□	Are the turning vanes installed correctly?
□	□	□	Is the ductwork, including fan inlets and outlets, installed according to the drawings and specifications?
□	□	□	Is the ductwork free of debris?
□	□	□	Are all duct dampers, including fire and smoke dampers, installed and accessible?
□	□	□	Are all terminal boxes, reheat coils, reheat components, etc. installed and accessible?
□	□	□	Does the return air have an unobstructed path from each conditioned space back to the unit?
□	□	□	Is the building architecturally complete?
□	□	□	Are all doors, windows, ceilings, partitions, etc. installed?
□	□	□	Are filters installed correctly and have frames that will not allow leakage?
□	□	□	Are the coils clean and properly installed?
□	□	□	Are the drive components installed?
□	□	□	Are the automatic control dampers installed in the correct locations?
□	□	□	Are the fan housings, plenums, etc. installed according to the drawings and specifications and properly sealed?
□	□	□	Are the flexible connections installed properly?
□	□	□	Are the fan wheels aligned properly with proper clearance between the fan and housing?
□	□	□	Are suitable traverse locations available?
□	□	□	Is the piping intact and free of leaks?
□	□	□	Are the pumps, piping, and equipment installed according to the drawings and specifications?
□	□	□	Are all valves, flow meters, and temperature-pressure taps installed to allow for a complete TAB?
□	□	□	Are all valves, flow meters, and temperature-pressure taps accessible?
□	□	□	Are all valves piped correctly?
□	□	□	Are all terminal unit coils installed correctly and accessible?
□	□	□	Are the terminal units piped correctly?
□	□	□	Are the piping systems free of debris?
□	□	□	Have the piping systems been cleaned and flushed?
□	□	□	Are all air vents properly installed?
□	□	□	Are vibration isolators properly installed and adjusted?
□	□	□	Are flexible connections installed properly?

Notes: This checklist is an example and shall be customized for each individual project.
N/A = Not Applicable to this project.

SECTION 23 08 10 - COMMISSIONING OF MECHANICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Division 01, Section 01 91 13, General Commissioning Requirements

B. All Division 23 Sections.

1.3 REFERENCES

A. American Society for Testing and Materials (ASTM)

B. BCA - Building Commissioning Association.

1. International Energy Conservation Code (IECC) 2018 – Section C408: Maintenance Information and System Commissioning

1.4 DEFINITIONS

A. Basis of Design (BOD): The documentation of design criteria and assumptions for systems, components, and methods chosen to meet the Owner’s Project Requirements and applicable regulatory requirements, standards, and guidelines. The document includes narrative descriptions of the systems to be commissioned. The BOD is prepared by the Design Professionals.

B. Building Automation System (BAS): The automated building system providing control and user interaction with select building systems, such as the HVAC, domestic hot water and lighting systems. Also, often referred to as building management system (BMS), energy management system (EMS), or an energy management and control system (EMCS).

C. Commissioning (Cx): A quality-focused process to verify and document that building systems are installed and perform as intended per the OPR, BOD and design documents.

D. Commissioning Authority (CxA): An independent entity hired directly by the Owner to lead, oversee and review the completion of the commissioning process and tasks. The CxA is not responsible for the design or construction of the project. The CxA is the authority on commissioning process, program elements and results, and assists the construction team with coordinating and completing tasks. And reviews and witnesses the completion of the process and tasks using a sampling approach.

E. General Contractor (GC): The contractor directly contracted to the Owner with overall responsibility for the project construction and all commissioning activities described herein.

F. Functional Performance Test (FPT): A test of the dynamic function, operation and control of the equipment and systems to verify system performance to the fullest extent. Systems are tested under various operating modes and control sequences including failure modes. The FPTs are performed using manual (direct observation) or monitoring methods. The FPTs can include sequence of operation tests, verification tests, performance tests, integrated systems tests, and trend analysis (monitoring). FPTs are often referred to as acceptance testing.

G. HVAC: Heating, ventilation, air conditioning.

H. Installation Verification (IV): Field verification and documentation of proper installation of system equipment, assemblies, and components, per design documents, manufacturer guidelines and industry standards. The IV process is typically complete when systems are ready for startup or operation.

I. Owner's Project Requirements (OPR): A document describing the operational and functional requirements of a project, the expectations of how the facility will be used and operated, and the equipment and system expectations and requirements, as defined by the Owner. This document provides an explanation of the ideas, concepts, goals, success criteria, and supporting information for the project.

J. Pre-Functional Test (PFT): A test or check performed on a piece of equipment, system or controls before, during, or after the initial startup and operation, but prior to the FPT phase. The PFT is performed to confirm, verify and document the system equipment and individual components are working properly, are controlled properly and meeting applicable performance requirements and specifications. PFT examples prior to equipment startup include pipe system hydrostatic pressure tests, verifying and documenting completion of the pipe system clean and flush, and duct leakage tests. Examples during equipment startup and operation include checking fan rotation and measuring and checking operating temperatures, pressures and motor electrical parameters. Examples after equipment startup include: the BAS control system pre-functional checks and point-to-point tests, and HVAC system TAB.

K. Startup: Initial starting or activating of equipment usually performed by the Trade Contractor or the Manufacturer's authorized representative, including applicable PFTs during the startup process.

L. Systems Manual: A manual that provides the operating staff the information needed to understand and optimally operate the commissioned systems. It expands upon the scope of traditional operating and maintenance documents and is compiled of multiple documents such as the final BOD, single line diagrams, and as-built controls drawings and sequences of operation.

M. TAB: Testing, Adjusting, and Balancing (TAB) work on the HVAC&R air and water systems to ensure design flow, pressure and temperature conditions are met. Performed by the TAB Trade Contractor.

N. Trade Contractor: A subcontractor who provides and installs specific building components and systems and/or provides certain services.

1.5 GENERAL COMMISSIONING DESCRIPTION

A. Commissioning is a quality-focused process for achieving, verifying and documenting that building systems are installed and perform functionally as intended according to the OPR, BOD, and the requirements of the design documents.

B. The work includes the completion and documentation of formal commissioning procedures by the GC, Trade Contractors, and the Manufacturer Representatives.

1. The GC and Trade Contractors shall provide the quality control for the installation, startup, checkout and testing of the systems. The commissioning process provides independent review and witnessing by the CxA (using a sampling approach) throughout the process and during qualitative functional performance testing, to observe and verify the implementation of the process, specific tasks and quality control efforts.
2. Refer to Section 01 91 13, General Commissioning Requirements for summary description of the general commissioning process and requirements.
3. The Trade Contractors and the Manufacturer Representatives shall be responsible for participation in the commissioning process as outlined in this specification and Section 01 91 13 General Commissioning Requirements.

C. Systems and equipment to be commissioned:

1. HVAC Systems including all equipment and controls.
    a. Boiler Systems
    b. Chiller Systems
    c. Snow Melt System
    d. Water Source Heat Pumps
    e. Kitchen makeup air and hood exhaust
    f. Terminal Units
    g. DX Split Systems
    h. Elevator relief hood
    i. Individual toilet and custodial exhaust
    j. Fans
    k. Wall heaters
    l. Piping Heat Trace
    m. Renewable Electrical Systems (PV)

2. BAS.

D. Systems and equipment not included in the commissioning are listed below. Commissioning of these systems may fall under the responsibility of the Contractor and/or the Authority Having Jurisdiction (AHJ) as noted in the specifications.

a. Process systems and equipment.
b. Walk-in cooler refrigeration systems.
c. Building Envelope
d. Fire protection
e. Life Safety Systems
f. Security Systems
g. Exterior Water Systems

1.6 COMMISSIONING TEAM

A. The Commissioning Team is comprised of the following:

1. Owner and Owner's Representatives
2. Commissioning Authority (CxA).
3. Design Professionals
4. General Contractor (GC)
5. Trade Contractors responsible for systems covered in this section include:
   a. Mechanical Contractor
   b. BAS Contractor
   c. TAB Contractor
6. Manufacturer Representatives supplying equipment, materials, components and controls for the systems to be commissioned.

1.7 COMMISSIONING PROCESS

A. Submittal Reviews by the CxA

1. The CxA will review pertinent Trade Contractor submittals for the appropriate systems in the commissioning scope, concurrently with the Design Team and will provide review comments to the Design Team.
2. The GC shall provide a submittal log to the CxA for referencing the requested submittals to be reviewed by the CxA (for which the GC shall issue to the CxA concurrently with the submission to the Design Team). Alternatively, the GC shall include the CxA on the distribution of all Trade Contractor submittals issued to the Design Team, for systems applicable to this specification.
3. The GC shall issue the requested submittals to the CxA for review at the same time they issue the submittals to the Design Team.

4. The CxA will also use the information from the submittals to develop commissioning forms and test procedures.

B. Cx Plan and Form/Procedure Development

1. The CxA prepares a Preliminary Cx Plan either during the project final design phase or early construction phase. The Cx Plan provides guidance in the execution of the commissioning process during construction.
2. Commissioning during construction begins with a kickoff meeting conducted by the CxA where the CxA reviews the commissioning process and responsibilities with the appropriate team members. The CxA presents the Preliminary Cx Plan and discusses the project specific requirements.
3. The GC and Trade Contractors shall submit to the CxA, for review and approval, their "blank" forms and written procedures for completing all of the required Cx pre-functional tasks including IV, Startup, and PFTs prior to conducting any of these tasks. See Paragraph 1.9 for the submittal requirements for the contractor blank forms and procedures, including the content requirements. The project specific procedures and blank forms will be further described in the Cx Plan.
    a. IV forms are to provide field verification and documentation of proper installation of system equipment, assemblies, and components, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup forms.
        i. The IV forms are either supplied by the Trade Contractor and/or the Manufacturer and shall include all checklists and verification requirements from the Manufacturer's installation and operation manual (IOM).
        ii. The Trade Contractors are to verify equipment installation per the Manufacturer's guidelines and requirements, and thus are to use and complete any applicable equipment IV checklists contained in the Manufacturer's IOM, in addition to any IV forms used by the Trade Contractors to verify system, equipment and assembly installation per design and industry standards.
        iii. The Trade Contractor IV forms may also contain any applicable design or shop drawings, plans, details, or single line diagrams that will be field verified and signed off / checked by the Trade Contractor to document installation verification per design (particularly for piping and ductwork).
    b. The Startup forms and procedures are either supplied by the Manufacturer and/or installing Trade Contractor and shall be used to document the completion of the formal startup procedures and associated checks and verifications during the startup and initial operation. And shall include all required startup and checkout procedures from the Manufacturer's IOM.
        i. Where applicable, these forms shall include checks of the equipment internal / factory provided controls including sensors and control devices.
        ii. Where required per the design specifications, the startups shall be completed by the authorized Manufacturer's representative.
    c. PFT forms and procedures are Trade Contractor provided forms and written procedures used to document the completion and results for the various checks and tests performed before, during, or after startup.

i. Example PFTs include applicable refrigerant pipe tests, hydronic pipe system hydrostatic pressure tests, duct leakage tests, duct cleanness tests, hydronic pipe system flush & clean checks and documentation, hydronic water treatment tests, BAS pre-functional checks and point-to-point tests and HVAC system TAB.

4. The CxA may create Checklists to track the contractor submittals and CxA's review of the blank forms and procedures for IV, Startup, and PFTs.

5. The CxA reviews the blank forms and procedures for all IV, Startup and PFT tasks, and will issue any comments, which may include additions or changes to be made by the Trade Contractor to the forms and procedures, and/or supplemental forms may be issued by the CxA, where appropriate, to improve the forms and commissioning process.

6. The CxA will develop FPT procedures and forms and provide the draft forms to the GC and Trade Contractors for review and comment.

C. Pre-Functional Activities and Tasks

1. Meetings will be conducted throughout construction with commissioning team members, as required, to plan, coordinate, and schedule commissioning activities, review documentation, and resolve Cx issues.

2. The Trade Contractors shall provide any factory test reports and results required per the design specifications for review by the CxA.

3. The Trade Contractors shall perform the IV, Startup and PFT tasks for all systems and equipment (no sampling allowed), unless the contract or design documents allow for sampling of the pre-functional tests (as example, if sampling were allowed for pre-functional HVAC system duct leakage tests).

4. In general, the GC and Trade Contractors are to complete the IV prior to Startups, but where appropriate and approved by the CxA, the IV and Startup can be combined into one task.

5. The Trade Contractors shall document the completion of the IV, Startup and PFT tasks on the IV, Startup, and PFT forms.

6. The GC shall submit all completed IV, Startup, and PFT forms to the CxA for review prior to conducting the FPTs.

7. The CxA will review the completed IV, Startup, and PFT forms. The CxA will also conduct various field observations and reviews of the installation including reviews of the completed IV forms, and may witness a sample of the Startup and PFT activities. Some witnessing of the PFT activities may be performed as back-checks conducted by the Trade Contractor with the CxA, after PFT forms are complete (e.g., back-checks of the BAS pre-functional checks/tests and TAB).

8. The Trade Contractor shall resolve any IV, Startup and PFT issues or results deemed unacceptable by the CxA.

9. The CxA may create Checklists to track the status and completion of the IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

D. Functional Performance Testing

1. FPTs are to test the dynamic function, performance and control of the equipment and systems under various modes of operation. These tests verify the correct

implementation of the sequences of operation and the system performance meets the design criteria. The FPTs are performed using manual (direct observation) or monitoring methods. FPTs include the following types of tests, where applicable:

a. Sequence of Operation Tests

   i. Sequence of operation tests are witnessed by the CxA for each unique sequence of operation but may not necessarily be repeated across identical systems, equipment or spaces, if the contractor has verified the same programmed sequence of operation code (as tested) has been programmed across multiple identical systems, equipment or spaces, based sample verification tests witnessed by the CxA.

   ii. Testing certain critical or important sequences with a higher sample rate across identical systems, equipment or spaces, beyond the individual sequence of operation tests may be required and will be determined by the CxA.

b. Verification Tests.

   i. Verification tests are often less detailed tests than the sequence of operation tests and are typically witnessed by the CxA at a higher sample rate.

   ii. Examples of verification tests include: a) verifying the control settings and programmed sequence of operation code is the same as the as-tested code per the sequence of operation tests, b) verifying the alarm points are configured per the sequence of operation tests (without having to repeat the actual sequence tests), c) reviewing and confirming control point displays and system graphics, and the required setpoints such as the BAS VAV min, max cool, max heat airflow setpoints.

c. Performance Tests.

   i. Performance tests are to be performed after the sequence of operation and verifications tests, and are focused on testing and verifying performance (i.e., HVAC system air and water flow rates, temperatures, pressures are achieved at both minimum and near maximum load conditions).

   ii. Examples include: a) testing VAV terminal unit maximum airflow rates and reheat coil airside temperature rise are achieved per design b) testing AHU minimum outside air ventilation rates per design are achieved at both minimum and maximum supply airflows c) testing the AHU supply airflow and temperature performance at simulated high cooling load conditions per design, d) Testing the chilled water system flow and cooling capacity performance at simulated high cooling load conditions per design.

d. Integrated Systems Tests.

   i. Integrated systems tests verify the operation and performance of multiple systems together operating in a coordinated, stable and efficient manner. Often the integrated systems tests are combined with the performance tests.

   ii. Examples include verifying the operation and performance of the central heating and chilled water systems with the performance of terminal and/or air handling units, from simulated minimum to near maximum load conditions, including staging up and down of central equipment (chiller, boilers, pumps, etc.).

   iii. Integrated systems tests may also be conducted via analysis of BAS trend data.

2. The CxA will develop FPT forms that contain:
    a. Specific step-by-step procedures to execute the test in a clear, sequential and repeatable format, including any control system point value or setpoint overrides required to simulate a test condition or sequence mode.
    b. The expected system response and acceptance criteria of proper performance with a Yes/No check box to allow for clearly marking whether or not proper performance of each part of the test was achieved.
    c. A section for recording actual system response, notes and comments.
3. Execution of the FPTs:
    a. Once the IV, Startup and PFT forms are complete, the Trade Contractors shall execute the FPTs, with the FPTs witnessed by the CxA, unless otherwise by the CxA.
    b. The GC and Trade Contractors are responsible for ensuring all systems are installed, operating and performing per the requirements of the contract and design documents, and are ready for the FPTs.
    c. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.
    d. A percent sampling approach may be used for executing the FPTs of identical systems and equipment. The approximate system sampling rates for the manual (direct observation) FPTs are defined in Part 3 of this specification and/or in the Cx Plan.
    e. The acceptance criteria for the FPT sampling shall be zero, meaning, any FPTs that do not pass shall require the Trade Contractor to resolve the issue for all applicable systems and equipment (even those specifically not in the original sample) and new sample rates selected for a re-test executed by the Trade Contractor and witnessed by the CxA. The CxA shall deem the FPTs acceptable after all FPTs, including re-tests, have passed and resolution of all issues completed.
    f. The CxA will document the results of all FPTs on the associated FPT forms created by the CxA, unless indicated otherwise on the FPTs.
    g. The Cx Plan will define any required seasonal or deferred testing.

E. Cx Issues and Recommendations

1. Throughout the process, the CxA records Cx issues, observations and recommendations on the Cx Issues Log and distributes the Cx Issues Log to the team.
2. The Cx Issues Log requires contributions and input from each of the Cx team members and as such everyone on the Cx Team has a responsibility to update the log via the agreed upon mechanism.
3. The software program and format for the Cx Issues Log will be provided by the CxA or another software program and format may be used as approved by the CxA.
4. The GC and Trade Contractors shall correct the Cx issues and recheck or retest the system(s) without delay at no additional cost to the Owner.
5. The CxA will verify the completion of the issues and recommendations via onsite reviews or witnessed retests, documentation or photographs provided by the GC and Trade Contractors, or based on information and communications provided by the GC and Trade Contractors.

F. Training Verification

1. The GC shall submit a comprehensive Training Plan with specific training agendas and materials provided by the Trade Contractors, for review by the Design Team, CxA and Owner, prior to conducting any training.
2. The Training Plan shall meet the specific requirements in the contract documents and specifications for each applicable system to be commissioned, and may include both operations and maintenance (O&M) staff training and building occupant training.
3. The GC shall coordinate with the Owner and/or Owner's Representatives, as needed, regarding any specific requirements for occupant training.
4. The CxA will verify completion of the training by receiving a copy of all training class sign-in sheets and any training materials / handouts, to be provided by the GC or Trade Contractors. The CxA may also sample witness some of the training sessions.
5. The Trade Contractors will ensure all O&M manuals have been submitted to the Owner per the contract documents. The CxA may request copies of the O&M manual submittals for verification purposes.

G. Cx Report and Documentation

1. The CxA will develop an ongoing Cx plan, with assistance from the GC and Trade Contractors.
2. The CxA will complete the Commissioning Report and all associated documentation for the Owner with assistance from the GC and Trade Contractors.

H. Post-Occupancy Warranty Phase Commissioning

1. The CxA will report any identified operational or performance issues (identified by the building O&M staff or warranty phase Cx activities) to the GC via a Warranty Phase Cx Log for resolution by the GC and Trade Contractors during or prior to the end of the warranty period.
2. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.
3. The CxA may conduct onsite visits to review system operation and performance with the Owner's O&M team and/or may review system trend data during the Warranty Phase and will report any identified issues and recommendations from the trend analysis.
4. No later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy, the CxA will return to the facility to interview facility O&M staff, walk the facility and review systems operation and trend data where applicable. Key representatives from the GC and Trade Contractors shall attend a site walk-through and meeting, as determined by the CxA.

1.8 COMMISSIONING RESPONSIBILITIES

A. General

1. The Commissioning Team and all others involved in the commissioning process shall follow the Commissioning Plan, attend the commissioning kickoff meeting, and attend additional commissioning meetings as necessary.

B. Commissioning Authority (CxA)

1. See Section 01 91 13, General Commissioning Requirements.

C. Owner

1. See Section 01 91 13, General Commissioning Requirements.

D. Design Team

1. See Section 01 91 13, General Commissioning Requirements.

E. General Contractor

1. See Section 01 91 13, General Commissioning Requirements.

F. All Trade Contractors

1. Submit project specific written procedures and blank forms for completing all IV, Startup, and PFT tasks, including manufacturer's installation checks and startup procedures, as a commissioning submittal. See Paragraph 1.9. Electronic files are acceptable.
2. Provide any equipment and construction submittals and shop drawings, including detailed sequences of operation (including any local, stand-alone controls independent of the BAS controls), complete controls points list (for all BAS, local equipment provided, and local stand-alone control points), system diagrams showing all control points, sensor locations, actuators, and controllers, and any other requested contract documentation for systems to be commissioned, as requested by the CxA. The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. Electronic files are acceptable.
3. Provide a list of any test metering and sensors to be used for sensor and device verification and calibration purposes. The list shall include test meter and sensor accuracy for comparison to the BAS and local control system sensor accuracy requirements specified in contract documents. All test meter and sensors shall have been calibrated within a year and have calibration documentation.
4. Attend commissioning meetings as directed by the CxA and GC to facilitate the commissioning process.
5. Assign personnel with expertise and authority to act on behalf of the Trade Contractor and schedule them to participate in and perform assigned commissioning tasks.
6. Ensure that any required manufacturer factory tests are performed and provide the factory test data and results where required.
7. Demonstrate and document proper system installation, startup and performance.

a. Perform IV, Startup and PFT tasks for all systems and equipment (no sampling), unless the contract or design documents allow for sampling of these tasks.

b. Ensure that any required manufacturer's representative field tests, inspections, startup and checkout of selected equipment are performed per the contract documents. Provide completed manufacturer documentation and commissioning forms for these activities.

c. Complete all IV, Startup and PFT documentation clearly and legibly.

8. Provide a schedule and access for the CxA to witness any equipment Startup and PFT tasks. Notify the GC and CxA at least 10 days in advance of Startup and PFT tasks.

9. Address applicable Cx issues promptly. All IV, Startup and PFT issues must be resolved before the FPTs can proceed.

10. Assist the CxA in preparing the FPT procedures, clarifying the operation and control of commissioned equipment where the specifications, control drawings or equipment documentation are not sufficient for writing detailed testing procedures.

11. Review the FPT procedures to ensure feasibility, safety and equipment protection, and provide necessary written alarm limits, setpoint changes and overrides to be used during the tests.

12. Setup any control system software points, global commands, overrides of any sensor values or relays, and overrides of any setpoints or schedules, to simulate certain conditions and operating modes, in order to conduct the FPTs.

13. Configure all control settings, schedules, alarms, graphics and programming logic for all control systems and any local equipment or stand-alone controls per the project specific sequence of operations.

14. Prior to conducting the CxA witnessed FPTs, place the systems and controls into the operating modes and test and verify all sequences of operation. Check all control system safety cutouts, alarms, and interlocks with other systems during each mode of operation prior to the FPTs. Ensure all systems are operating and performing per the design requirements, and have been pre-tested per the FPTs, and are ready for the CxA witnessed FPTs.

    a. The Trade Contractors shall determine the appropriate level of pre-testing, to prepare for the CxA witnessed FPTs.

15. Perform the FPTs, with the FPTs witnessed by the CxA. Provide at least 10 days advance notice to the GC and CxA for scheduling the FPTs.

16. Setup the BAS and any other control system trends and provide all requested Trend data for the FPTs and post-occupancy warranty phase commissioning review to the CxA.

    a. As an Owner approved option, the Trade Contractors may provide the CxA remote access to the BAS and any other control system, with the Owner's permission, which will allow the CxA to easily and directly download the trend data files.

17. Prepare a training agenda for each training class for the equipment and systems to be commissioned.

18. Coordinate with the GC and Owner to schedule and plan training. Execute training of Owner's personnel per approved training agenda and schedule. Provide copies of training class sign-in sheets and materials / handouts.

19. Prepare O&M Manuals according to the Contract Documents.
20. Assist the CxA in developing the Systems Manual, including providing as-built drawings, controls sequences, setpoints, single-line diagrams, etc., necessary for the Systems Manual.
21. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Contractors shall participate in the FPTs as required for operation of the inter-related systems.

G. BAS Trade Contractor

1. In addition to the general Trade Contractor responsibilities outlined above, the BAS Trade Contractor responsibilities during commissioning shall also include, but are not limited to the following.
2. The BAS Trade Contractor shall support commissioning by participating in the BAS PFT Field Back-check Verifications, in which the BAS Trade Contractor reviews and demonstrates specified results to the CxA, after completing and submitting the BAS PFT forms.
    a. The BAS PFT Field Back-check Verifications shall include field review of the control system graphics, sensor / device installations and live readings, and also field demonstrations (back-check) of the pre-functional checks and tests performed by the Trade Contractors and witnessed by the CxA, for an approximate 10% to 30% sample, to be selected by the CxA for each major system, or what can be accomplished in 1/2 day.
    b. Any Cx issues reported by the CxA shall be reviewed and addressed by the BAS and Mechanical Trade Contractors, and if required, the PFT forms shall be revised and resubmitted, prior to performing any FPTs.
3. The BAS Trade Contractor shall configure all BAS or local control graphics and programming logic for the sequence of operations and associated setpoints, schedules, and alarms and verify the system operation, including testing and completing the control loop tuning, prior to starting FPTs.
4. Prior to conducting the FPTs, the BAS Trade Contractor shall meet with the CxA to review the programmed sequences of operation and sample system graphics with the CxA.
    a. The lead programmer from the BAS Trade Contractor shall be in attendance.
    b. The intent of this requirement is to reduce field testing time by reviewing with the CxA the actual programmed sequence logic and graphics relative to the approved submittal, sequences and FPT forms, in order to confirm the actual programming and graphics prior to field testing, and to allow for any changes and adjustments.
    c. The BAS programming and graphics review time is estimated to not be more than 1/2 day in duration.
5. Prior to conducting the CxA witnessed FPTs, place the systems and controls into the operating modes intended for testing. Check all control system safety cutouts, alarms, and interlocks with smoke control and fire-life safety during each mode of operation prior to functional testing. Ensure all systems are operating and performing per the

requirements of the contract and design documents, and have been pre-tested per the FPTs, and are ready for the CxA witnessed FPTs.

a. The Trade Contractors shall determine the appropriate level of pre-testing, to prepare for the CxA witnessed FPTs.

6. The BAS Trade Contractor shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures.

7. The FPTs shall be conducted onsite by the BAS Trade Contractor's lead programmer for the project who programmed the sequences of operation and configured the graphics. Conducting the FPTs offsite (remotely) shall only be approved by the CxA.

8. The BAS Trade Contractor shall set up the appropriate trends per the Trend Setup Verification forms provided by the CxA and shall provide trend data into a usable electronic format files, such as a text, CSV or Excel format, to the CxA. The CxA will analyze and review the trend data as part of the FPT. These trends shall be setup prior to conducting any sequence of operation functional tests.

a. The trend points list may include both hardware (inputs, outputs) and virtual / software points.

b. The appropriate trend intervals and minimum duration will be provided by the CxA either in a Trend Setup Verification form or in the FPT forms.

c. As an Owner approved option, the BAS Trade Contractor may provide the CxA remote access to the control system, with Owner permission, that will allow the CxA to easily and directly download the trend data files.

9. The BAS Trade Contractor shall also provide trend data to the CxA during the post-occupancy warranty phase for review by the CxA, where required.

10. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Contractors shall participate in the FPTs as required for operation of the inter-related systems.

H. TAB Trade Contractor

1. In addition to the general Trade Contractor responsibilities outlined above, the TAB Trade Contractor responsibilities during commissioning shall also include, but are not limited to the following.

2. Provide access for the CxA to witness TAB work. Notify the GC and CxA at least 10 days in advance of TAB work.

a. Immediately report any issues and deficiencies discovered which may affect or delay the commissioning process.

3. Submit a Draft / Preliminary TAB Report with the completed field forms and data to the Design Professional and CxA for review, within 72 hours following completion of the TAB, and prior to any TAB Field Verification conducted with the CxA (see below), and prior to conducting the FPTs.

a. The CxA will review and provide any comments to the GC and TAB Contractor. The TAB Contractor shall respond to and address comments provided by the Design Professionals and the CxA.

4. The TAB Trade Contractor shall support commissioning by participating in the commissioning TAB Field Back-check Verifications, in which the TAB Trade Contractor demonstrates specified results to the CxA, after completion of the Preliminary TAB Report.

   a. The TAB Field Back-check Verifications shall include field demonstrations of any final setpoints and back-check measurements of the air-side and water-side systems, performed by the TAB Trade Contractor and witnessed by the CxA and/or the Design Professional, for an approximate 10% to 30% sample to be selected by the CxA, or what can be accomplished in 2 full day.

   b. If the field verification back-checks yield results that are outside the TAB tolerances for more than 5% of the sample, the TAB shall be considered incomplete.

   c. Submit the Final TAB Report to the Design Professional and CxA for review after review of the Draft TAB Report and completion of TAB Field Back-Check Verifications.

1.9 SUBMITTAL REQUIREMENTS FOR COMMISSIONING

A. Trade Contractor Pre-Functional Procedures/Plans and Blank Forms.

1. The Trade Contractors shall submit to the CxA all applicable project specific procedures/plans and blank forms for all required IV, Startup and PFT tasks for the project, at least 4 weeks in advance of performing any of these tasks. Provided below are the potential procedures/plans and blank forms required for mechanical systems, including the content requirements for each. The requirements for the project specific procedures and blank forms will be further described in the Cx Plan.

   a. HVAC IV Forms (Equipment, Ductwork and Piping) - including the following.

      i. IV forms are to provide verification of the make/model, components, and accessories upon receipt of the equipment and to provide field verification and documentation of proper installation of system equipment, assemblies, and components per design and manufacturer requirements, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup forms.

      ii. The IV forms are either supplied by the Trade Contractor and/or the Manufacturer, and shall include all checklists and verification requirements from the manufacturer's installation and operation manual (IOM). The Trade Contractors are to verify equipment installation and access per the manufacturer's guidelines and requirements, and thus are to use and complete any applicable equipment IV checklists contained in the IOM, in addition to any IV forms used by the Trade Contractors to verify system, equipment and assembly installation per design and industry standards.

      iii. The IV forms shall also include any applicable design or shop drawings, plans, details, or single line diagrams that will be field verified and signed off / checked particularly for verification of the system ductwork, piping, and coil valve connections.

      iv. The IV forms shall also include any local HVAC equipment factory controls or local stand-alone HVAC controls that are not installed by the BAS Contractor.

   b. HVAC System Startup Procedures and Forms - including the following.

i. The startup procedures and forms can be supplied by the installing contractor and/or the manufacturer and shall include all required startup and checkout procedures from the manufacturer's IOM.

ii. Where required per the design specifications, the startups shall be completed by the authorized manufacturer's representative. In the submittal for the startup procedures and blank forms, the contractor shall indicate which startups will be completed by the authorized manufacturer's representative.

iii. The startup procedures and forms shall also include the checkout and verification of any local HVAC equipment factory controls or local stand-alone HVAC controls that are not installed by the BAS Contractor, including any configuration and programming checks per the project design sequence of operation.

c. Duct Leakage Test Procedures and Forms (if applicable) - including the following.

i. Floor plan drawings showing the duct section(s) to be tested.

ii. The total duct surface area square footage for each duct section to be tested. Provide supporting calculations showing how the square footage was calculated for each duct section.

iii. The required duct leakage class (CL per SMACNA Duct Leakage Test Manual) for each duct section to be tested, per the project specifications or the SMACNA Duct Leakage Test Manual if not defined in the specifications.

iv. The intended test static pressure for each duct section.

v. The calculated allowable leakage rate (cfm) for each duct section to be tested, based on the required duct leakage class for each section, the total duct square footage for each section and the intended test pressure (calculated following the methods and equations outlined in the SMACNA Duct Leakage Test Manual).

vi. Test fan orifice certificate of calibration sheet and chart showing the orifice pressure drop and airflow (cfm).

vii. The forms to be used for completing the duct leakage tests, prepopulated with the above information and test criteria.

d. Underfloor Air Distribution (UFAD) Leakage Test Procedures and Forms - including the following.

i. Floor plan drawings showing the UFAD plenum(s) to be tested.

ii. For each UFAD plenum to be tested, provide the following:

iii. The plenum dimensions and calculated area (square footage).

iv. The acceptable maximum leakage criteria (cfm per square foot) for any required Category 1, Category 2 and Total Category 1 + 2 leakage, per the project specifications, and the associated absolute leakage rates (cfm) for each plenum. If the project specifications do not define the leakage criteria, the CxA shall define the leakage criteria with the Owner's approval.

v. The specific tests procedures for each type of test (Category 1 or Total Category 1 + 2), including any associated temporary test taping or sealing to be performed prior to the tests, the plenum test static pressure, the plenum pressure measurement locations and manometers to be used, and any diagnostic procedures (such as smoke testing) to be performed upon tests not passing.

vi. Test fan orifice certificate of calibration sheet and chart showing the orifice pressure drop and airflow (cfm).

vii. The forms to be used for completing the duct leakage tests, prepopulated with the above information and test criteria.

e. Hydronic Pipe Pressure / Leak Test Procedures and Forms - including the following.

i. The sections of pipe to be tested and the associated test methods (hydrostatic, compressed air), pressures and durations,

ii. The applicable forms to be used to document the completion of the pressure / leak tests.

f. Refrigeration Pipe Test Procedures and Forms - including the following.

i. The refrigeration piping to be tested, for the pipe evacuation and refrigerant charging prior to startup.

ii. The methods and procedures, equipment and gases to be used, and the test pressures and durations per the design and/or manufacturer requirements.

iii. The applicable forms to be used to document the completion of the refrigeration pipe tests.

g. Hydronic Pipe Clean and Flush Procedures and Forms - including the following.

i. The intended durations for all pipe cleaning and flushing (or pre-flushing, cleaning and flushing).

ii. The location of any temporary bypasses, permanent bypasses with valves, u-loop connections, etc., to be used.

iii. The procedures for cleaning of the system strainers and the replacement of any construction / start-up strainers with final strainers.

iv. The intended water sampling or testing to be performed, such as measuring the make-up water quality and flush water quality (to confirm they match for completion of the final flush).

v. The product data for cleaning or disinfecting agents to be used.

vi. The product data for the corrosion inhibitors and any other chemical to be used in the final system fill (this data can be provided in the water treatment procedures).

vii. The applicable forms to be used to document the completion of the clean and flush activities including actual durations and the final cleaning or replacement of the system strainers.

h. Hydronic Water Treatment Plan/Procedures - including the following.

i. The proposed chemicals, corrosion inhibitors and biocides, to be used.

ii. The water chemistry analysis and corrosion testing to be conducted.

iii. The intended final water chemistry limits or ranges (including steel, iron and copper levels) to be achieved, per the specifications and any specific manufacturer requirements, and/or any recommended deviations from the specifications and why.

iv. The timing for submitting the Water Treatment Analysis Reports for review by the Design Team and CxA.

i. BAS Controls PFT Procedures and Forms. The BAS PFTs shall include the following installation and pre-functional checks, and point-to-point tests, as described below and per the design specifications (i.e., the procedures shall include more than just point-to-point tests).

   i. Installation verification of the control input and output points (sensors, actuators, relays, etc.) to verify all points have been installed per the design and the physical installation of each point has been verified.

   ii. Checks of the BAS program setup/configuration parameters (i.e., point type, and range / scale) to verify the BAS parameters match the physical sensor/device parameters.

      1. The contractor forms shall include columns for the checking and documenting the BAS program point type and range/scale parameters (and any other applicable parameters), and columns for checking and documenting the actual sensor/device point type and range/scale (and any other applicable parameters). Both sets of columns are required to document the BAS parameters and the actual sensor/device parameters match.
         a. For example, for a differential pressure analog input point, checking and documenting the BAS point type configuration is AI, DPT, 0 to 5 in w.c., 4 to 20 mA, etc., and checking and documenting the actual sensor/device type and range/scale is a DPT, 0 to 5 in w.c., 4 to 20 mA, etc. For this example, the checks confirm the DPT input range in the BAS is indeed 0 to 5 in. (same as the actual DPT) and not 0 to 10 in.
         b. For example, for a valve actuator analog output point, checking and documenting the BAS point type configuration is AO, proportional 0 to 100% open, 0 to 10 VDC, and documenting the actual valve type and range/scale is a modulating valve actuator, proportional 0 to 10 VDC, etc. For this example, the checks confirm the valve actuator output range in the BAS is indeed 0 to 10 VDC (same as the actual valve actuator) and not 2 to 10 VDC.

   iii. Point-to-point tests to verify the BAS input values/reading and output commands at the system graphics matches the actual sensor/device physical reading, operation, or position, and/or to verify the accuracy of any input readings (temperatures, flow rates, etc).

      1. The BAS Contractor shall provide written procedures as to how they are going test each point type (AO, AI, BO, BI). See below the minimum requirements to be included in the procedures for testing analog inputs and outputs. Any additional requirements per the design specifications shall also be included in the submitted procedures.
      2. The forms shall include columns for the documenting the BAS input readings or output commands (at the BAS graphics), and documenting the actual physical reading, operation, or position, to verify they match or are within acceptable tolerances.
      3. For analog input (AI) sensors/transmitters that are factory calibrated (no field calibration is required per the Specifications), all sensor readings on the BAS graphics shall be recorded on the forms and shall be verified as follows:
         a. If the sensor/transmitter has a local readout, then also record and verify the actual sensor/transmitter reading matches the BAS reading.
         b. If the sensor/transmitter does not have a local readout, then verify the BAS reading is within the expected range (based on the operating

condition and/or compared to other sensors measuring the same condition) OR verify the BAS reading based on a comparison measurement using a hand-held sensor of equal accuracy (as required per the design specifications).

c. Sensor readings that are questionable, outside the expected range shall be checked by the BAS Trade Contractor using a hand-held sensor of equal accuracy.

4. For analog input sensors that require field calibration, follow the manufacturer requirements for calibration and record the calibration results in the PFT forms, including any readings using a hand-held sensor or measurement device of equal accuracy.
5. For analog output (AO) points (e.g., actuators and VFD speeds), the points shall be physically checked to verify the commanded versus actual position or speed as follows:
   a. the commanded full (100%) open position / speed,
   b. commanded half (50%) open position / speed and
   c. commanded fully closed position (0% open) / minimum speed.
6. For all terminal units (including lab controls), also include the following:
   a. The point-to-point tests are to include disconnecting the sensor / thermostat or adjusting the local thermostat setpoint adjustment to verify it's connected to and controlling the correct terminal unit.
   b. Commanding the supply airflow damper / valve to both fully closed and fully open and recording and verifying the airflow readings (i.e., no airflow when closed and near or greater than the design/max airflow when fully open).
   c. Commanding the reheat coil valve to both fully closed and fully open and recording the unit discharge air temperature (DAT) reading and verifying the DAT readings for both commands (i.e., the DAT is the same as the AHU when the valve is closed and the DAT is near the design DAT when fully open).

iv. Checks to verify all of the network integration points to the BAS via network interface communications (e.g., BACnet, Modbus, etc.), including both read only and writable points.

v. Checks to verify all of the control sequence programming, graphics, alarms, trend logs and network communications, including verification that all point values and adjustable setpoints are properly displayed on the system graphics and the sequence of operation programming including alarms is completed per the current sequence of operation.

j. TAB Plan, Forms and Qualifications – including the following.

i. An outline of the TAB procedures and approach for each system type. The TAB procedures and approach shall satisfy the contract documents and TAB specifications. If TAB procedures and approach are not defined in the contract documents or TAB specifications, then the TAB procedures and approach shall meet the requirements of NEBB Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems Section 7.3 (Preliminary TAB Procedures) and/or AABC National Standards Section 20.4 (Procedures).

ii. A project specific list of the BAS / EMCS control sequence of operation setpoints that will be determined by TAB, and the associated specific procedures

to determine the BAS setpoints. The TAB Trade Contractor shall coordinate with the BAS Trade Contractor to obtain and review the sequence of operation.

iii. The associated TAB forms and the drawings to be used in the TAB work. The TAB drawings shall include the locations of all the designated flow control and balancing devices and all testing and measurement locations. And the TAB forms shall be pre-filled with all available project design parameters.

iv. TAB contractor qualification certificates.

v. TAB instrument calibration certificates.

k. Procedures/Plans for all other applicable mechanical systems IV and PFT tasks, per the project design and specifications or as requested by the CxA.

2. The CxA will review these submitted commissioning procedures/plans and forms including whether all project specific requirements are included.

3. The CxA may request additional data, changes and/or additions to these forms prior to their use, including forms any supplemental forms provided by CxA, based on the construction documents and specifications, manufacturer installation manuals and procedures, and/or industry standards or guidelines.

B. Training Agenda. The Trade Contractors shall develop a Training Agenda for each training session, per the requirements of the contract documents and specifications, and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and occupant training. The Training Agenda shall be included in the comprehensive Training Plan to be submitted by the GC for review by the CxA, Design Professionals, and/or the Owner (see Section 01 91 13). The GC and Trade Contractors shall coordinate to fully develop the comprehensive Training Plan with input from the Owner.

1. The Training Agenda for each training session shall include the following:

a. equipment and/or systems covered;

b. recommended attendees;

c. proposed location;

d. estimated duration;

e. level of instruction to be provided and an outline of the training topics and subjects to be covered;

f. list of any materials and handouts to be provided (or provided in advance);

g. company to provide the training and the instructor’s name and qualifications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 MEETINGS, SCHEDULING AND COORDINATION

A. See Section 01 91 13.

3.2 DOCUMENTATION

A. The Trade Contractors have specific responsibilities for assisting in the development of equipment check, test and verification procedures and forms, and in performing and documenting commissioning tests, as directed by the GC and as overseen by the CxA.

B. The Trade Contractors shall provide, wherever the Contract Documents require, system checks and testing, test reports, factory test data and reports, checklists, operational verifications and demonstration, etc., whether specified or not in the commissioning sections.

3.3 TEST EQUIPMENT

A. The Trade Contractors shall provide all test equipment in sufficient quantities to execute all Startup, PFT and FPT tasks in an expedient fashion.

B. The test equipment shall be of industrial quality and suitable for testing and calibration with accuracy within the tolerance necessary to demonstrate system performance per the Contract Documents. If not otherwise specified, the following minimum requirements apply:

C. Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5 degree F and a resolution to + or – 0.1 degree F.

D. Pressure sensors shall have an accuracy of + or – 2.0 percent of the value range being measured (not full range of meter) and have been calibrated within the last year.

E. The test equipment shall have calibration certification per equipment manufacturer's interval level or within one year if not otherwise specified. The calibration tags shall be affixed or certificates readily available for all test equipment.

3.4 COMMISSIONING PRE-FUNCTIONAL TASKS

A. The Trade Contractors shall conduct all IV, startup procedures and pre-functional tests (PFTs) without compromise to human or equipment safety. The GC and Trade Contractors shall be responsible for the liability and safety of conducting all startup, checks and tests.

B. The Trade Contractors shall clearly identify and list any issues and deficiencies resulting from the IV, Startup and PFT tasks on the associated forms and immediately notify the CxA. The CxA will additionally document the issues on the Cx Issues Log. Once issues and deficiencies are corrected and verified, the associated forms shall be updated and resubmitted, and any necessary field review, back-checks or re-tests witnessed by the CxA.

C. The GC and Trade Contractors shall provide a minimum 10 days' notice to the CxA for witnessing equipment Startup and PFT tasks.

D. The sample rates for the CxA witnessing of HVAC duct and pipe system PFT tasks and equipment startups, will be defined in the Cx Plan.

E. For the BAS Pre-Functional Checks and for the TAB, the CxA will witness a Field Back-check Verifications as described in Part 1, Paragraph 1.8.

F. The GC and Trade Contractors shall ensure the completion of the IV, Startup and PFT forms. Review and approval of the completed IV, Startup and PFT forms by the CxA is required prior to conducting the FPTs. The CxA may create System Readiness Checklists to track the status of the IV, IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

3.5 FUNCTIONAL PERFORMANCE TESTS

A. The Trade Contractors shall perform all FPTs per the final FPT forms, for all systems and equipment in the scope of commissioning. The FPTs shall be witnessed by the CxA, unless stated otherwise by the CxA. The Trade Contractors may need to complete off hours or weekend work in order to complete the FPTs. The CxA will document all testing results on the FPT forms.

B. As outlined in the Part 1, a sampling approach shall be used for the FPTs of identical systems and equipment, using the sample rates as defined in the Cx Plan, with the specific systems and equipment selected by the CxA.

1. FPT Sample Rates for Terminal and Single-Zone Units.
    a. Sequence of Operation Tests for each unique unit type of sequence of operation (e.g., Heat Pumps, Dx Splits cooling only, FCU cooling only, FCU with cooling and heating, etc.).
    b. Verification Tests (to verify setpoints, graphics, programming, etc.) for approximately 25% of the units by type or at least two units for each type (whichever is greater), as selected by CxA.
    c. Performance Tests for approximately 25% of the units by type or at least two units for each type (whichever is greater), as selected by CxA. A higher sample rate may be achieved for the terminal units through the use of BAS global commands.
    d. The sampling rate may increase for any specific units serving critical spaces that have redundant back-up FCU or DX split units.
2. FPT Sample Rates for Miscellaneous Fans (excluding kitchen exhaust fans).
    a. Sequence of Operation and Verification Tests for 25% of the fans.
    b. OR
    c. Sequence of Operation Tests for each unique fan type / sequence of operation (e.g., constant speed scheduled general exhaust fan, electrical room exhaust fan controlled based on temperature, interlocked constant speed exhaust fan, etc.).
    d. Verification Tests for approximately 25% of the fans by type or at least two fans for each type (whichever is greater), as selected by CxA.
3. FPT Sample Rates for Kitchen Hood Control System and Exhaust Fans.
    a. Sequence of Operation Tests for each unique system type or configuration, including systems fans (all sequences tested), with an approximate 30% to 50% sample rate for testing the same sequence across multiple identical hoods and fans within the system.
    b. Verification Tests and Performance Tests for approximately 40% to 60% of the hoods and fans or at least two hoods and two fans (whichever is greater), as selected by CxA.
    c. An integrated system test with the associated make-up air unit or dedicated air handling unit, including space pressure control.

4. FPT Sample Rates for Central Plant Systems – Chilled Water, Heating Hot Water.
    a. All Sequence of Operation and Verification Tests for each system in its entirety (no sampling).
    b. An Integrated Systems and Performance Tests with the FCU (air-side) systems.
5. FPT Sample Rates for BAS Energy and Water Metering / Sub-Metering System (for Electric, Gas and Water Meters).
    a. Verification Tests and/or Trend Analysis to verify trend log functions and meter recordings for *** all **** approximately 30% to 50% *** of the metering points, depending on the number of metering points, as selected by the CxA.

C. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

D. The GC and Trade Contractors shall coordinate all FPTs with the CxA, and provide a minimum of 10 days' notice prior to conducting each test.

E. The GC and Trade Contractors shall have responsibility for the liability and safety of conducting all functional performance tests.

F. The Trade Contractor executing the test shall provide all necessary materials, system modifications, etc. to produce the necessary flows, pressures, temperatures, etc. to execute the test according to the test procedures.

1. The Trade Contractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures. For example, globally adjusting the space temperature setpoints for all terminal units on a floor or AHU or the building. Or as another example, globally overriding the economizer status command for all AHUs.

G. At completion of the test, the Trade Contractor shall return all affected building equipment and systems to their pre-test normal condition.

3.6 TREND ANALYSIS

A. The CxA may conduct trend analysis as part of the FPT process, after completion of the onsite field conducted FPTs and correction of all issues and deficiencies, to verify integrated system operation and performance.

B. The CxA will prepare a BAS trend points list including the trend interval. The BAS Trade Contractor shall set up the trend log definitions prior to the start of the sequence of operation FPTs.

C. The BAS Trade Contractor shall provide the trend to the CxA in an electronic format, either a text file, CSV file or Excel file, with related system parameters grouped together. The estimated duration for the trend data is 1 to 3 weeks (with a minimum of 1 weeks' worth of data).

D. If the CxA discovers any control or performance issues during trend analysis, the Trade Contractors shall correct the issues and provide new trend data for analysis verification by the CxA.

3.7 COMMISSIONING ISSUES, BACK-CHECKS AND RE-TESTS

A. When Cx issues are identified during testing, the CxA will discuss with the executing Trade Contractor and/or GC and determine whether or not testing can proceed. The CxA may allow immediate correction of minor issues and deficiencies identified during testing. The Cx issue and any identified resolution will be documented on the test form in use in addition to the Cx Issues Log.

B. The CxA will maintain and update the Cx Issues Log and document the issue resolution process. Copies will be distributed to the GC, Owner, and Trade Contractors as appropriate. The Trade Contractors shall provide updates and comments regarding issue status and resolution.

C. The Trade Contractors shall promptly correct all Cx issues. The responsible party shall correct the issue and inform the GC and CxA of the resolution and completion date, and update the Cx Issues Log accordingly (in the fields assigned for contractor updates).

D. The CxA will record completion on the Cx Issues Log after a successful witnessed re-test, field review, back-check, verification obtained through appropriate documentation or photographs, or acceptance by the Design Team or Owner. The GC shall reschedule any applicable re-testing with the CxA and Trade Contractor. The Trade Contractor shall retest until achievement of passing performance or Owner acceptance of the noted issue.

E. Where sampling is used for the PFTs and FPTs, the results shall be deemed acceptable once all noted issues are resolved and any new sample tests or checks have passed.

F. Additional parties may require input during a dispute regarding a Cx issue. Regardless of the validity or responsibility of the issue, the CxA will have the final interpretive authority on Cx issues and the Owner will have the final approval authority.

G. The CxA may recommend solutions to Cx issues. However, the GC and Trade Contractors ultimately have the burden of responsibility to solve, correct and perform required retests.

H. Back-checks, Verifications and Re-testing:

1. The CxA will witness one (1) re-test or will perform one (1) field back-check or verification of any Cx issue.
2. The CxA’s total onsite time for re-test witnessing and field verification or back-check of Cx issues will be limited to no more than 16 work days (full 8-hour work days) for all applicable mechanical, electrical, and plumbing systems in the commissioning scope.
3. The Owner may back-charge the GC for any additional fees from the CxA, resulting from any additional re-testing or field back-checks or verification beyond this allocated total time.
4. The GC must provide a minimum 48 hours’ notice for scheduling any re-testing, though the CxA will attempt to accommodate a shorter timeframe if feasible.
5. Any required re-testing shall not be considered a justified reason for a claim of delay or for a time extension.
6. For any re-testing required, the CxA will determine if the entire test must be re-tested or if it is acceptable to re-test specific portions of the test that had failed.

3.8 DEFERRED & SEASONAL TESTING

A. Before or during the end of the first year warranty period, the Trade Contractor shall complete any seasonal or deferred testing, required per the design specifications and as defined in the Cx Plan. The Trade Contractors shall complete tests in the same manner as all other commissioning tests, including CxA witnessing.

1. Seasonal integrated systems and performance tests of the HVAC systems (heating or cooling) conducted during the opposite season in which the construction phase FPTs were conducted, may be required depending on the ambient conditions during the construction phase FPTs. The agreed upon seasonals tests for the HVAC systems will be outlined in the Cx Plan.

B. The GC and Trade Contractor shall coordinate with CxA and Owner and schedule all deferred and seasonal testing.

3.9 TRAINING VERIFICATION

A. The GC and Trade Contractors shall coordinate and schedule the training for the Owner's facility and operations personnel, and building occupants. The GC shall ensure that training is completed per the requirements of the contract documents and specifications.

B. Trade Contractors responsible for specific equipment and system training shall submit to the GC, a written training agenda for each training class for the equipment and systems to be commissioned. The GC shall submit a comprehensive Training Plan, including the specific training agendas, to Owner, Team and CxA for review and approval. See also Section 01 91 13.

C. The CxA will review the Training Plans for commissioning verification prior to conducting the actual training.

D. For verification of actual training conducted, the GC shall submit to CxA 'attendee signed' attendance sheets for each training session conducted and a copy of any final training presentations or handout materials.

3.10 COMMISSIONING ACCEPTANCE, CLOSE-OUT AND REPORTING

A. Completion of the main commissioning activities (system readiness checks, functional performance testing, and training) shall be accomplished as a prerequisite for substantial completion. Completion of any re-testing shall be completed prior to final acceptance of commissioning.

B. After completion of the main commissioning activities and following review of the completed commissioning documents, test results and the current Cx Issues Log with the Owner, the Owner will indicate whether they accept completion of the project construction phase commissioning or if not, the requirements for acceptance. Upon Owner acceptance, any remaining open Cx issues will be transferred to the warranty phase Cx Issues Log for tracking resolution and completion as part of the warranty phase commissioning.

C. Upon completion of all commissioning activities, the CxA will prepare and submit to the Owner a Cx Report detailing all completed commissioning activities and documentation. The GC shall support this effort by providing all Trade Contractor commissioning documentation.

D. The CxA will complete a Systems Manual for the systems and equipment commissioned, following the LEED requirements, with assistance provided by the GC and Trade Contractors. The Systems Manual will provide the operating staff the information needed to understand and optimally operate the commissioned systems. It will also include the current facility requirements, and an ongoing commissioning plan.

3.11 POST-OCCUPANCY WARRANTY PHASE COMMISSIONING

A. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA, to be witnessed by the CxA, unless stated otherwise by the CxA.

B. The CxA may conduct onsite reviews of the system operation and performance, meet with the O&M Team to discuss system operation and performance, and may also review BAS trend data during the Warranty Phase. The BAS Trade Contractor shall be responsible for providing post-occupancy trend data to the CxA.

C. The CxA will report any identified issues and recommendations to the GC via a Warranty Phase Cx Issues Log for review and resolution by the GC and Trade Contractors prior to the end of the warranty period, for any issues or recommendations identified either by the CxA or the Owner. The GC shall work with the Trade Contractors and O&M staff to make corrections and adjustments as required to address the issues and recommendations.

D. Key representatives from the GC and Trade Contractors shall attend a near end of warranty commissioning review meeting, to be scheduled with the Owner's facility staff and the CxA, no later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy.

1. During this meeting, the operation and performance of the systems will be discussed with the Owner's staff, the results of any commissioning reviews and trend analysis will be discussed and the Warranty Phase Cx Issues Log will be reviewed. If needed, a walk-through of the systems with the Owner's staff will be conducted.
2. Next steps and actions items for any open Cx issues and recommendations will be discussed and documented via meeting minutes or a field report issued by the CxA. The intent is to resolve any open Cx issues prior to the end of the warranty phase.

E. After correcting noted Warranty Phase Cx issues, the GC shall notify the CxA, and the CxA will back-check and verify resolution of the issues and recommendations.

F. Issues identified during the warranty period will remain warranty phase Cx issues until satisfactory completion by Trade Contractors, even if the warranty period expires during the correction and back-check period.

END OF SECTION 23 08 10

SECTION 23 08 20 - COMMISSIONING OF HVAC SYSTEMS – ENGINEER REQUIREMENTS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

B. When applicable to the specific project, Section 230800 (Third Party Commissioning of HVAC Systems) is hereby made a part of this section.

1.2 GENERAL

A. The mechanical systems commissioning process shall demonstrate that each temperature control sequence and the associated test and balance data corresponds with the contract documents and with the final test and balance report. The finalized temperature control software with graphic displays shall be installed and operational (at all required locations) and the final test and balance report shall be provided for review and acceptance by the Owner and the Engineer a minimum of ten days prior to requesting date(s) for the formal on-site mechanical systems commissioning session(s). Additionally, the temperature controls contractor and the test and balance contractor (along with any other necessary parties) shall complete a ‘dry-run commissioning’ and shall certify in writing that all mechanical systems are operating in accordance with the finalized written control sequences prior to requesting dates for the formal on-site mechanical systems commissioning sessions.

B. The test and balance contractor shall thoroughly review all temperature control sequences prior to bidding to ensure that all control sequences requiring testing and balancing are understood and accounted for in the test and balance scope of work.

C. The mechanical systems commissioning process shall demonstrate that the quantities read and displayed by the control system are in agreement with actual/tested quantities (e.g., variable air volume box cfm readings, minimum outside air cfm readings, air temperatures, water temperatures, duct static pressures, building static pressures, etc.). The mechanical systems commissioning process shall also demonstrate that all quantities listed in the final test and balance report (cfm readings, gpm readings, temperature differences, pressure drops, etc.) are correctly reported.

D. The Contractor should anticipate that the original written control sequences will be reviewed and revised on an ongoing basis during the submittal review process, during the programming process, and during construction, until such time that the sequences are finalized. The finalized temperature control sequences will likely include additional detail and/or modifications to the original sequences contained in the contract documents (since such details are commonly omitted from the original written control sequences and are developed after the equipment submittals and the temperature control system submittals are received). The work associated with these additions and/or revisions to the written control sequences shall be provided by the Contractor at no additional cost to the Owner.

E. The demonstration of each control sequence shall be performed under conditions which simulate as close to an actual condition as possible. The Contractor shall provide all necessary materials and temporary system modifications as required to ‘false-load’ the system(s) to demonstrate each temperature control sequence (including appropriate test gas as required to simulate a refrigerant leak in the chiller room). The temperature control system software shall be configured and programmed to allow for temporarily overriding analog inputs in order to facilitate demonstration of the temperature control sequences.

F. The temperature controls contractor shall provide and utilize a laptop computer equipped with the complete graphic interface software package (the software on the laptop computer shall be identical to the software provided to the Owner) during the on-site commissioning session. The laptop computer shall be utilized by the temperature controls contractor such that the on-site desktop computer is left available for use by the Owner and/or his representatives during the commissioning session(s). The requirement for a separate laptop computer is intended to facilitate review of multiple issues at any one time.

G. The Contractor shall provide access to the finalized temperature control system programming and/or flow charts as may be applicable for review and assessment as part of the commissioning process. In addition to real-time access to programming the Contractor shall also provide hard copies to allow for off-site review and assessment prior to commencement of the initial on-site commissioning session.

H. Mechanical systems commissioning shall be conducted with representatives from the following entities (all required participants shall be confirmed with the Owner's project manager):

1. General Contractor (with a complete set of plans, specifications, and addenda; and with two 30" by 60" tables with six folding cushioned chairs).
2. Mechanical Contractor (with a complete set of mechanical equipment submittals and operating and maintenance manuals). Submittal data shall include all pump curves and fan curves.
3. Temperature Controls Contractor (with a laptop computer loaded with the finalized programming and graphic interface software).
4. Test and Balance Contractor (with a complete set of testing apparatus as utilized during testing and balancing and a complete copy of the final test and balance report).
5. Electrical Contractor (for discussion/verification of electrical power provisions at all equipment).
6. Factory-authorized technicians for all major equipment (chillers, boilers, cooling towers, variable frequency drives, etc.). Technicians shall be available to verify that equipment start-up has been properly completed and to make any necessary or desired adjustments to equipment control settings.
7. Chemical Treatment Contractor (with copies of all water treatment reports).
8. Owner's designated representative(s).
9. Mechanical Engineer and/or his designated representative (as necessary).
10. Third party commissioning agent (when applicable).

I. The aforementioned representatives shall be present during all portions of the testing (and re-testing as required) and shall be equipped to promptly remedy any deficiencies observed during the commissioning process. The chemical treatment contractor and the factory-authorized technicians for major equipment will be required to attend only as necessary to confirm completion of their portion of the work.

J. The temperature controls contractor and the test and balance contractor (along with any other necessary parties) shall conduct a 'dry-run commissioning'. The dry-run commissioning effort shall include a complete checkout of every control sequence and confirmation of proper valve, damper, and equipment operations during each control mode (all occupied mode and unoccupied mode sequences). The dry-run commissioning effort shall also include verification that all mechanical equipment is fully functional and shall include a complete review of each item on the commissioning checklist. Written confirmation shall be provided stating that the dry-run commissioning procedures (including review and confirmation of each item on the checklist) have been completed in their entirety prior to requesting a date for the formal on-site commissioning session(s). The dry-run commissioning checkout shall include generation of screen prints as described in this specification.

K. Should any of the aforementioned requirements not be met on the date that the commissioning process commences and/or if deficiencies are observed during the commissioning process the commissioning will be considered a failure and the deficiencies will be required to be remedied prior to requesting a date for re-commissioning. There will be no additional costs allowed to the Contractor for re-commissioning sessions as may be required to address work that is found to be in non-compliance with the requirements of this specification and/or in non-compliance with the remainder of the contract documents.

L. The Contractor shall include an adequate time period and adequate resources for all commissioning tasks in the project schedule. The necessary time periods shall be carefully reviewed with all of the appropriate subcontractors to ensure that the subcontractors are in agreement with the time allotted for each scheduled task.

M. Successful completion of the entire mechanical systems commissioning scope of work shall be a condition of Substantial Completion. The building shall be considered 'ready to utilize for its intended use' only at such time that the entire mechanical systems commissioning scope of work is successfully completed and accepted by the Owner.

1.3 SCREEN PRINTS

A. The temperature controls contractor shall generate a complete set of color screen prints that depicts the function of the various mechanical systems during each mode of operation. The submitted screen prints shall include, but not be limited to, screen prints that depict the following list of operating modes. The following list is intended to be a minimum list of typically required screen prints. The temperature controls contractor shall provide a complete set of screen prints as necessary to depict all operating modes pertaining to the mechanical systems on the specific project.

1. Closed Circuit Fluid Cooler system screen with fluid cooler(s) operating at or near full load (create load as required).
2. Heating water system screen operating at or near full load (create load as required).
3. Heat Pump summaries with zones set to full cooling.
4. Heat Pump summaries with zones set to full heating.
5. Heat Pumps economizer mode operation.
6. Heat Pumps in minimum outside air mode.
7. Heat Pumps disabled during unoccupied mode (with all valves and dampers closed).
8. Exhaust fan summary with all fans operating normally during occupied mode.
9. Split System heat pumps summary with all units operating in full cooling.
10. Split System heat pumps summary with all units operating in full heating.
11. Makeup air unit summary with zone set to full cooling
12. Makeup air unit summary with zone set to full heating

1.4 PRE-COMMISSIONING/PRE-BALANCING MEETING

A. A pre-commissioning/pre-balancing meeting shall be scheduled with the Owner and/or the Owner's representatives, with all appropriate subcontractors in attendance, a minimum of two weeks prior to the scheduled start of testing and balancing (earlier on larger projects). The meeting will be utilized to review and discuss the finalized temperature control sequences and some of the specific requirements for testing and balancing of the mechanical systems. The most current revised temperature control sequences will be distributed and reviewed during this meeting.

B. Testing and/or balancing of minimum outside air quantities shall not be commenced until the method of measurement and verification is reviewed and agreed upon.

1.5 SCHEDULING

A. The following list is a general set of tasks and criteria for each task. This list is intended to facilitate discussion and planning of an appropriate schedule for some of the work related to mechanical systems commissioning. The time required for each task will vary depending on the size and complexity of the mechanical systems on each particular project. Determination of the dates and duration of each task is the responsibility of the Contractor and shall be developed via review and discussions with all of the involved subcontractors prior to preparing and submitting the proposed schedule. The following events (start date and duration) shall be incorporated into the general contractor's overall project schedule.

1. Establish the date when electrical power will be complete to all mechanical equipment and to all temperature control panels. Also confirm status of network connection to temperature control system (for remote access).
2. Conduct cleaning, flushing, and chemical treatment of all HVAC piping systems (to be witnessed by owner's representatives - see chemical treatment specifications).
3. Conduct start-up and check-out of all major mechanical equipment (heat pumps, pumps, fans, closed circuit fluid coolers, boilers, variable frequency drives, etc.). Coordinate date and time for State Boiler Inspector site visit regarding issuance of boiler operating permits.
4. Begin testing and balancing (required time for completion of testing and balancing shall be determined via consultation with the test and balance contractor).
5. Print and distribute the final test and balance report.
6. Temperature controls contractor (with assistance from the mechanical contractor and the test and balance contractor as necessary) conducts 'dry-run commissioning' utilizing the Mechanical Systems Commissioning Checklist as a guide. All temperature control sequences are to be fully tested/confirmed and all control loops are to be tuned. Note that on most projects approximately half of the work related to this task can be completed during the testing and balancing process.
7. The mechanical contractor (with assistance from the temperature controls contractor) shall provide a copy of the Mechanical Systems Commissioning Checklist with each applicable item checked and initialed by the person responsible for completing the checkout and verification of that item. The completed checklist shall be accompanied with written notification that the pre-commissioning verification process has been successfully completed.
8. The Owner conducts a pre-commissioning review via network interface, commencing after written notice is received stating that the Contractor's pre-commissioning verification process has been successfully completed (requires that the dedicated network connection be in place and functional). This item is typically conducted in two segments.
9. Schedule formal on-site commissioning dates.
10. Allow a minimum of two weeks at the end of the construction schedule for correction and verification of all deficiencies noted during the formal on-site commissioning session(s).

COMMISSIONING CHECKLIST

Central Plant

1. Review location and calibration of outside air temperature sensor.
2. Verify that all strainers have been removed and cleaned (at pumps, boilers, and heat exchanger).
3. Verify pump lead/lag programming and alarm display.
4. Verify pump head and gpm (compare test & balance report to design requirements).
5. Verify boiler integral control setpoints.
6. Verify boiler room emergency shut-down switch locations and operation.
7. Verify boiler lead/lag programming and alarm display.
8. Verify closed circuit fluid cooler integral control setpoints.
9. Verify closed circuit fluid cooler fill pressure and expansion tank charge pressure.
10. Verify heat pump system fill pressure and expansion tank charge pressure.
11. Verify boiler relief valve pressure rating.
12. Verify water treatment reports for the closed circuit fluid cooler system and for the heating water system.
13. Verify location of air vents in each closed loop piping system (purge any remaining air).
14. Verify location & calibration of heat pump system differential pressure sensors.
15. Verify programming of all vfd's (minimum speed, input/output speed calibration, ramp time, etc.).

Heat Pumps and Room Sensors

1. Verify that heat pump mechanical closets are clean.
2. Verify that all dampers open and close completely (adjust linkage as required).
3. Verify unoccupied mode operation (confirm that dampers and valves are fully closed).
4. Verify location of building static pressure sensor(s).
5. Verify calibration of building static pressure sensors(s).
6. Verify minimum outside air control sequences and programmed damper positions.
7. Verify outside air economizer control sequence.
8. Verify building static pressure control sequence.
9. Verify set-up and function of occupancy schedules.
10. Verify set-up and function of holiday schedules.
11. Verify that duct smoke detectors initiate the intended fan shut-down sequence.
12. Verify room sensor programming, displays, and calibration.
13. Verify room sensor unoccupied mode override feature.
14. Verify room sensor labeling.
15. Verify global, remote, and local room setpoint functions.
16. Verify adjustment range for local room setpoint (between 72°F and 76°F).
17. Verify night set-back (heating) control sequence.
18. Verify night set-back (cooling) control sequence.
19. Verify morning warm-up control sequence.
20. Verify that each coil strainer has been removed and cleaned.
21. Verify cfm air flow.
22. Verify discharge air temperatures in both heating and cooling modes (provide screen prints).
23. Verify diffuser air flows at maximum cfm (random verification).

Miscellaneous HVAC

1. Verify that all temperature control system trend logs have been set up and coordinated with the Owner.
2. Verify operation of all fire/smoke dampers (including monitoring of end switches, when applicable).
3. Verify equipment room temperature setpoints and deadbands.
4. Verify that all valves and dampers have been programmed to operate without hunting.
5. Verify that all valves and dampers identified to include spring-return actuators are configured to fail in the appropriate position.
6. Verify set-up of all required alarms (review automatic dial-out or automatic e-mail set-up).
7. Verify that mechanical system roof penetrations are properly installed (per roofing details).
8. Verify/test glycol concentration in piping systems (when applicable).
9. Verify acceptable air noise and equipment noise levels throughout the building.
10. Verify bleed rate at the make-up air unit evaporative cooling section.
11. Verify chemical treatment at all evaporative cooling sections.

END OF SECTION

SECTION 23 08 30 - THIRD PARTY COMMISSIONING OF HVAC SYSTEMS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

B. Section 230810 (HVAC Systems Commissioning) is hereby made a part of this section.

1.2 THIRD PARTY COMMISSIONING AGENT CONTRACT AND PAYMENT

A. The third party commissioning agency will be contracted with and paid by the Owner.

1.3 DESCRIPTION

A. The work of this specification section includes furnishing labor and material to accomplish commissioning of the HVAC systems, including attendance at all third party commissioning meetings.

B. HVAC systems commissioning work includes but is not limited to:

1. Verifying correct operation and functional performance of HVAC systems for compliance with the ‘Design Intent’ as indicated on the drawings and in the specifications.
2. Documenting all HVAC tests, certifications, and inspections.
3. Verifying the completeness and appropriateness of operation and maintenance manuals, as-built drawings, spare parts lists, special tools lists, and other items as may be specified for support of the HVAC systems and equipment.
4. Verifying the operation and maintenance training sessions with the Owner’s personnel for all HVAC systems and equipment.

1.4 QUALITY ASSURANCE

A. Codes, Regulations and Standards:

ASHRAE Guideline 0 - The Commissioning Process (most current edition)

1.5 COORDINATION

A. Coordinate all work, timing, and completion of work with other specification sections as required to ensure that preliminary commissioning can be completed early enough to allow for final commissioning and reports to be completed prior to the Owner taking occupancy of the building or space.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 PARTICIPATION

A. General: The third party commissioning agency will actively participate in the construction phases of the project to ensure compliance with the drawings and specifications and with all commissioning requirements specified in this and other specification sections as relate to commissioning of the HVAC systems.

B. Pre-Construction Meeting: The third party commissioning agency, the general contractor, mechanical contractor, temperature controls subcontractor, test and balance subcontractor, and all other associated subcontractors shall attend the pre-construction meeting(s) and then coordinate the requirements for HVAC systems commissioning throughout construction of the project.

C. Commissioning Meetings: The third party commissioning agency, the general contractor, mechanical contractor, temperature controls subcontractor, test and balance subcontractor, and all other associated subcontractors shall attend the regularly scheduled commissioning coordination meetings and then coordinate the requirements for HVAC systems commissioning throughout construction of the project

END OF SECTION

SECTION 23 09 00 - TEMPERATURE CONTROLS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

B. Section 230910 (Sequence of Operation) is hereby made a part of this section.

PART 2 - SCOPE OF WORK

2.1 GENERAL

A. The control system shall provide direct digital control with a Windows-based user interface. Third party viewing software is not acceptable. The manufacturer and/or his authorized representative shall be responsible for all work under this section of the specifications. Only pre-approved manufacturers and contractors will be allowed and shall be as follows (no substitutions):

Manufacturers	Northern Nevada Contractors	Telephone
Alerton Controls	Cerris Systems (formerly BCS Controls)	(775) 826-8998

B. Furnish and install an energy management control system (EMCS) and direct digital control (DDC) system complete with computer terminal (when specified), modem, surge suppressor, operating software, and training. Install the temperature control system software (most current edition) on the existing computer at the using agency's office and on the computer at the project site (when an on-site computer is specified). When third party software is necessary to allow for control system programming and/or editing of graphic displays that software (most current edition) shall also be provided on each of the aforementioned computers.

C. There shall be no annual maintenance or licensing fees of any kind required to be paid by the Owner at any time during the ongoing use of the installed system and software. Licenses shall be issued and authorized as directed by the Owner. Licenses shall be issued such that they can be modified by the Owner without the permission of the contractor and/or local system integrator. Specific license wording and format shall be provided as part of the contractor's submittals.

D. On any project that involves removal of existing controls, the Owner shall be given an opportunity to identify any control devices that they would like to have turned over to them for potential future use.

E. The temperature control contractor shall assist the testing and balancing contractor with temporary adjustments of control system programming and setpoints as necessary for proper completion of the testing and balancing scope of work.

F. Alerton Controls System

1. The Alerton Controls System shall be configured with multiple Ethernet connections to allow for remote network access and for direct connection of multiple computers via local area network. The Alerton Controls system shall utilize 'Compass' web-based graphic interface software (most current version). Communication with equipment controllers shall be via BACnet IP Ethernet backbone at 100.0 Mbps minimum speed. Controllers for central plant equipment and/or air handling units shall be Alerton ACM series with AXM expansion I/O modules or Alerton VIP series equipment controllers. All equipment controllers shall be furnished with integral hand-off-auto switches. Communication between equipment controllers and application specific controllers (Alerton VLC series) shall be via BACnet MS/TP network at 76.8k minimum speed.

2.2 COMMISSIONING FURNITURE

A. Furnish a folding table (48" x 30" minimum size) and four folding chairs (with cushioned seats) at the location where the commissioning sessions will be conducted. The table and chairs are only intended to be on site during the commissioning sessions, and may be removed by the contractor after successful completion of commissioning.

2.3 SPARE CONTROLLER CAPACITY

A. All controllers for central plant equipment and air handling units (except application-specific controllers for unitary equipment) shall be furnished with a minimum of 10 percent spare capacity to allow for addition of both analog and digital inputs and outputs.

2.4 SUBMITTALS AND AS-BUILT DOCUMENTATION

A. The written control sequences, initial setpoints, dead-bands, and the graphic displays shall all be reviewed and confirmed with the Owner and the Engineer prior to preparing and forwarding the finalized submittals.

B. The submittals shall include complete written control sequences for each item of equipment requiring control. The sequences shall include all setpoints, dead-bands, etc. required for successful operation of the specified equipment. The submitted sequences shall include all necessary sequencing details, whether or not those details are furnished as part of the mechanical engineer's written control sequences (such details are commonly excluded from the Engineer's written control sequences) and all work associated with developing and incorporating those details shall be provided by the Temperature Controls Contractor at no additional cost to the Owner.

C. The Temperature Control Contractor shall prepare and submit a complete listing of BACnet points that are to be set up as trended and stored historical data. The list shall be broken down to include each system and/or item of equipment and shall be reviewed with the Owner and the Engineer for approval prior to setting up the trending in the temperature control system. The BACnet trend log names shall also be provided for approval.

D. After all temperature control sequences have been finalized and have been approved by the Owner and the Engineer (and after the HVAC systems commissioning process has been completed) the Contractor shall provide as-built documentation which shall include both an electronic copy of the finalized programming and a hard copy of the finalized programming (programming flow charts or line code as may be applicable) and written control sequences.

2.5 TRAINING

A. Upon completion of the commissioning process, the Temperature Controls Contractor shall instruct the Owner's designated personnel on the operation of all control system software features, shall provide a complete explanation of the control sequence for each item of equipment, and shall provide instructions on the operation and maintenance of all control devices. Training time shall be a minimum of 8 total hours (consisting of 2 separate 4 hour sessions).

2.6 WARRANTY PERIOD SERVICES

A. The Contractor shall provide full service for the temperature control system for a period of one year after the date of substantial completion. Service shall include, as a minimum, calibration of all sensors and other control devices, adjustments to setpoints, and modifications to control sequences or programming as required/desired to fine-tune and/or finalize all control sequences.

B. The Contractor shall provide a scheduled monitoring and reporting service for the duration of the one year warranty period. Monitoring shall be conducted via the remote control system interface (via modem or network connection) and the associated report shall be issued via email the same day that the monitoring is conducted. Monitoring shall be conducted on a weekly basis, preferably on either Monday or Tuesday. Reports shall include a specific listing of all alarms, all equipment failures, any noted operational problems or irregularities, and a set of screen prints. The weekly reports shall be emailed to the Owner and the Engineer.

2.7 SOFTWARE AND PROGRAMMING REQUIREMENTS

A. Provide a security/password system with two passwords (username and password). The security/password system shall allow access based on user security level as follows:

Level 1 Viewing only
Level 2 Room temperature and occupancy schedule adjustment
Level 3 Adjustment of all setpoints
Level 4 Full access to all setpoints and programming

B. The Temperature Controls Contractor shall program the applicable holidays into the EMCS software for the five years following the date of the installation.

C. Equipment Schedules: Schedules shall be coordinated with the Owner. A separate or combined occupied/unoccupied schedule shall be provided for each air handling unit, fan coil unit, exhaust fan, and/or other individual air handling system as designated by the Owner.

2.8 GRAPHIC DISPLAYS

A. All temperature setpoints and all other setpoints identified as adjustable in the written control sequence shall be adjustable from the appropriate graphic display(s). Setpoints listed in the contract documents are for initial set-up and trial of system operations. Control system shop drawings shall utilize the same (or similar) written sequences with all setpoints, throttling ranges, and differentials identified. As-built drawings shall include this same information with final setpoints resulting from startup, testing, and adjustment.

B. Monitored points and alarms for each system shall be shown on the displays with full color graphics and real-time data as listed below. Where indicated, graphic displays shall be dynamic (animated). All graphic displays shall be submitted to the Owner and the Engineer for review and modification as directed.

C. All temperatures shall be displayed with zero decimal places.

D. All valve and damper positions shall be displayed as percent open and shall be displayed with zero decimal places.

E. All setpoints which are identified as ‘adjustable’ in the written control sequences shall be adjustable via the associated graphic displays (including deadband between room setpoints).

F. All occupied mode and unoccupied mode room temperature setpoints shall have an adjustable deadband (adjustable from the associated graphic display).

G. All displays specified to be dynamic shall depict motion (as a minimum, dynamic displays shall include chiller compressors, boiler burners, rotating fan wheels, and rotating pump impellers).

H. All setpoints adjustable from the graphic displays shall be programmed with the deadband on one side of the setpoint (not split evenly across the setpoint) unless otherwise specified.

I. All outputs shall be programmed with the capability for the user to override the controlled commands/positions via the associated graphic display (this requirement applies to all equipment, valves, dampers, fans, pumps, etc.).

J. Alarm data fields shall be displayed with a red text when an alarm condition exists.

K. A summary table shall be provided in the graphic screens to display the current status of each fire-smoke damper. The summary data shall also include the approximate location of each fire-smoke damper.

L. A set of zone temperature summary screens shall indicate the current room temperature setpoint and current room temperature for each zone. A separate global setpoint and deadband shall be assigned to all zones associated with each air handling unit. The zone summary screens shall also include additional information for each zone such as the remote setpoint and deadband, discharge air temperature, valve position, fan command, fan status, deadband setpoint(s), etc. Summary screen format, function, and required display data shall be coordinated with the Owner prior to developing the graphic displays.

M. Each zone shall be capable of being set to any of three setpoints (depending on which setpoint is selected). The three available setpoints shall be the global setpoint (a single setpoint for all associated zones), the remote setpoint (a separate individually adjustable setpoint for each zone), and the local setpoint (adjustable at the room sensor by utilizing a slide or dial type control on the room sensor). The local setpoint adjustment range shall be programmed to allow adjustment only between a fixed temperature range (typically between 73ºF and 75ºF - range to be confirmed with the Owner prior to programming).

N. The current total cfm of all vav boxes associated with each vav air handling unit shall be calculated and displayed on the appropriate air handling unit screen.

O. Each variable frequency drive shall be programmed to display command, status (via current sensor), input speed, output speed, and alarm/failure status (via alarm contacts at each vfd).

P. Floor Plan(s): Provide a display showing the building floor plan(s) with all space temperature sensors including identification of the associated terminal unit or fan coil unit number. Specifically identify each thermal zone on the associated floor plan (AutoCAD file with thermal zone borders can be obtained from the mechanical engineer at no cost to the Contractor).

Q. The current room temperature status shall be indicated utilizing custom thermal geometry outlines around each thermal zone with dynamic color and opacity based on the current zone temperature.

R. The finalized sequence of operation shall be inserted into the graphics for viewing as a pdf file.

2.9 SPECIALTY CONTROL DEVICES AND REQUIREMENTS

A. Outdoor temperature sensor (dry bulb only) shall be Mamac Systems Model TE-213-F with solar radiation and precipitation shield, Dwyer Model TE-RND with solar radiation and precipitation shield, or approved equal.

B. Current sensors for fan and pump motors less than one horsepower shall be split core digital output type and shall have an adjustable setpoint capability.

C. Duct temperature sensor probes shall have a minimum length of 6 inches and shall be selected with longer lengths when required to ensure accurate temperature readings and to avoid dead air spaces.

D. Averaging sensors and freeze sensors shall be a minimum length of 12 feet. Longer lengths and/or multiple sensors shall be provided as required to ensure adequate coverage of the entire surface of each coil. Sensors shall be sized to provide complete coil coverage based on the requirements listed herein. Averaging and freeze sensor capillaries shall be installed in a serpentine arrangement with coverage extending to within 6” of each coil perimeter edge (top, bottom, and side edges) and shall be installed such that there is no more than 12” between horizontal passes. Averaging sensors shall provide for averaging of the entire length of the capillary element rather than an average of individual sensing locations.

E. Modulating control valves for typical heating and cooling coil applications shall be Belimo characterized control valves, B200S Series (2-way) or Belimo B300S Series (3-way) as indicated on the drawings, with Belimo LRX24 actuators. Control valves for HVAC applications shall be chrome plated brass body with stainless steel ball and stem. All actuators shall include a clutch to allow manual rotation of the valve. Actuators shall be spring return type when indicated on the drawings. Modulating control valves for pipe sizes 2-1/2” and larger shall be flanged body type. Modulating control valves shall be selected for a Cv that is adequately greater than the associated coil pressure drop (see equipment schedules on drawings for coil pressure drops).

F. Carbon Dioxide (CO_2) sensors for indoor applications shall be Vaisala GMW90 series for wall mount applications, Model GMD110 for duct mount applications, or approved equal. There shall be no value displayed on the wall mount sensor (only displayed on the control system remote graphic interface).

G. Carbon Dioxide (CO_2) sensors for outdoor wall mount applications shall be Vaisala GMP343 series, or approved equal.

H. Air filter differential pressure sensors shall be Dwyer Model MS2-X102, or approved equal. Dip switches for pre-filters shall be set for a 0 to 1” w.c. range, and dip switches for final filters shall be set for a 0 to 2” w.c. range.

I. Differential pressure sensors for dry applications shall be Dwyer 650 Series, Veris Industries Model PX, Senva Model P4, or approved equal. Verify desired/required sensing range prior to submitting and/or ordering. Sensor tubing connections shall be fitted with brass test tees for use by the test and balance contractor for verification/calibration.

J. Differential pressure sensors for wet applications shall be Veris Industries PWRLX series, or approved equal. Verify the desired/required sensing range prior to submitting and/or ordering. Sensor tubing connections shall be fitted with brass test tees for use by the test and balance contractor for verification/calibration.

K. Sensors for room differential pressure shall have a control range of ± .10” w.c. Sensors shall be Veris Industries Model PX-01-F (fast response) or Setra Model 2641-0R1WB, furnished with Air Monitor Corporation Model SAP probes. Sensor tubing connections shall be fitted with brass test tees for use by the test and balance contractor for verification/calibration.

L. Heat tracing for piping systems is typically specified to include the heat tracing manufacturer’s outdoor temperature sensor and a BACnet interface gateway. The outdoor air temperature sensor shall be mounted on a north facing wall at approximately 7-6” above grade and shall be wired to the gateway device. The direct digital control system shall display approximately 4 points of data pertaining the electrical heat tracing status. The specific data points shall be coordinated and confirmed during the temperature controls submittal process.

M. Combination carbon monoxide and methane sensors for boiler rooms: Sensors shall include a front display, an audible alarm, dry contacts for remote monitoring by the direct digital control system and the fire alarm system, and shall be mounted at 5 feet above finished floor. Sensors shall be interfaced with the fire alarm panel in accordance with IBC Section 915.

1. Combination carbon monoxide and methane sensors shall be Senva TG Series, AGS Mini-Merlin Model AGSCH4CO-50, or approved equal. The alarm setpoint for carbon monoxide shall be 100 ppm. The alarm setpoint for methane shall be 25% of the lower explosion limit.

N. Carbon monoxide (CO) and nitrogen dioxide (NO_2) sensors for vehicle maintenance bays and welding labs: Sensors shall be analog type with the capability of BACnet communication, and shall be mounted at 5 feet above finished floor. Combination sensors are acceptable when available. Carbon monoxide sensors shall include dry contacts to allow for interface with the fire alarm panel in accordance with IBC Section 915.

1. Carbon monoxide (CO) sensors shall be Senva TGW-C, Macurco CM-6, or approved equal. The alarm setpoint for carbon monoxide shall be 100 ppm.
2. Nitrogen dioxide (NO_2) sensors shall be Senva TGW-N, Macurco TX-6-ND, or approved equal. The alarm setpoint for nitrogen dioxide shall be 3 ppm.
3. Combination sensor may be provided when available. Combination carbon monoxide and nitrogen dioxide sensors shall be Senva TGW-A-CN, Macurco CX-6, or approved equal.
4. Carbon Dioxide (CO_2) sensors for welding labs shall be Macurco IAQ-CO_2-A-W, or approved equal. Provide an audible/visible alarm horn/strobe inside the welding space, Amseco Model CSHB-BG with blue light lens, or approved equal by Kele & Associates. A low level alarm (visible only) shall occur at 1.5% CO_2 concentration and a high level alarm (audible and visible) shall occur at 3.0% CO_2 concentration.

O. Carbon monoxide (CO) sensors for sleeping areas and Group E occupancies served by a gas-fired furnace: Sensors shall be analog type with the capability of BACnet communication, and shall be mounted at 5 feet above finished floor. Sensors shall include dry contacts to allow for interface with the fire alarm panel in accordance with IBC Section 915.

1. Carbon monoxide (CO) sensors shall be Senva TGW-C, Macurco CM-6, or approved equal. The alarm setpoint for carbon monoxide shall be 100 ppm.

P. Air flow measuring stations shall be thermal dispersion type, Ebtron Gold Series Model GTx116, Ruskin Airflow IQ Series Model TDP05K, or approved equal. Sensor density and location shall be configured in strict conformance with the manufacturer's written installation instructions. Duct mounted air flow measuring stations shall be installed with a minimum of 12" of straight duct upstream of the sensor and with a minimum of 6" of straight duct downstream of the sensor. Duct sizing shall ensure a minimum velocity of 250 fpm.

Q. Building static pressure sensors shall have a control range of ± .10" w.c. Sensor shall be Mamac Model PR-275-R2, Dwyer MSX series, Veris Industries Model PX-01-F (fast response), Setra Model 264-0R1WB, or approved equal, and shall be furnished with indoor and outdoor reference probes.

1. Outdoor static pressure probe shall be constructed of anodized aluminum and shall be capable of sensing static pressure to within 2% accuracy when subject to radial wind velocities of up to 80 mph with an approach angle of up to 30 degrees from horizontal. Outdoor probe shall be 'Static Outside Air Probe' by Air Monitor Corporation, Model PE-8000 Outside Air Probe by Paragon Controls, or approved equal.
2. Indoor static pressure probe(s) shall be suitable for flush mounting, shall be constructed of 10 gauge brushed aluminum, and shall be capable of sensing static pressure to within 1% accuracy when subject to air velocities of up to 1,000 fpm. Indoor static pressure probes shall be 'Shielded Static Air Probe No. 3' by Air Monitor Corporation, Paragon PE-7000 Indoor Static Pressure Probe, or approved equal.
3. Provide a surge dampener for each indoor static pressure probe/sensor. Surge dampeners shall be Schneider Electric Model 21-153, Kele & Associates Model SD-01, or approved equal. Interconnecting tubing between sensor and indoor/outdoor probes shall be 3/8" diameter braid-reinforced pvc or polyethylene tubing. Copper tubing is required in any case where the tubing is installed in a return air plenum.

R. Water Flow Meters

1. Water flow meters for heat pump systems shall be electromagnetic type (Onicon Model FT-3100, Rosemount Model 8700, ModMag Model M2000, or approved equal). Turbine type flow meters are not acceptable. Flow meters shall be installed in strict conformance with the manufacturer's installation instructions, including required straight pipe length upstream and downstream of the flow meter. Water flow meters shall be interfaced with and monitored by the direct digital control system.
2. Water flow meters for make-up water serving heat pump system shall be ultrasonic type (Belimo FM series, Onicon F-4600 series, or approved equal). Turbine type flow meters are not acceptable. Flow meters shall be installed in strict conformance with the manufacturer's installation instructions, including required straight pipe length upstream and downstream of the flow meter. Water flow meters shall be interfaced with and monitored by the direct digital control system.

S. Emergency shutdown switches shall be mushroom type with a clear hinged lockout lid (Pilla WPS-MP Series, or approved equal).

T. Audible/visible alarm horn/strobe for seismic gas valves shall be Amseco Model CSHB-BG with blue light lens, or approved equal. The alarm horn/strobe shall be located on the building exterior adjacent to the seismic gas valve (mounted at 7'-6" above finished grade).

2.10 MISCELLANEOUS REQUIREMENTS

A. All control devices shall be installed in reasonably accessible locations. Control devices that may require occasional calibration or adjustment shall be given special consideration with regard to being installed in a reasonably accessible location.

B. Room temperature sensors shall be programmable touchscreen type and shall be provided with an override feature and setpoint adjustment with the ability to be limited or locked out via the operator workstation.

C. Room temperature sensors shall be labeled with the corresponding terminal unit or fan coil unit number. Labels shall be self-adhesive with black lettering (1/8" height lettering).

D. Room temperature sensors installed on an exterior wall shall have a full thickness of insulation placed in the junction box behind the sensor.

E. Room temperature sensors in laboratory areas shall be sealed at the wall penetration behind the sensor to prevent air migration into the sensor from adjacent areas (due to the negative pressure of labs as compared to adjoining spaces).

F. Equipment specified to include a BACnet interface shall be provided with a terminal strip to allow remote control of the equipment via the direct digital control system (verify this requirement on the equipment schedules and/or in the equipment specifications).

G. When an air handling unit is depicted as including a temperature sensor at the inlet and at the outlet of the chilled water and/or heating water coil those sensors shall be 'paired thermistors'.

H. Sensor wells installed in a potable water system shall be stainless steel.

I. All control dampers in stainless steel ductwork shall be constructed of stainless steel and shall have flanged connections.

J. An as-built control diagram shall be laminated and secured inside of each temperature control panel prior to commencement of the final on-site mechanical systems commissioning sessions.

K. Trend logs shall be coordinated with the Owner and shall include as a minimum all identified temperature, pressure, gpm, cfm, percentage, status, and alarm data that is requested.

L. All low voltage wiring (whether plenum rated or not) shall be installed in raceways with the following conditions, clarifications, and exceptions.
   1. Raceways shall be as defined in the National Electrical Code and open cable trays shall not be construed as meeting the definition of a raceway.
   2. Low voltage wiring for temperature controls and energy management systems may be routed utilizing open cable trays above accessible ceilings. Low voltage wiring for temperature controls and energy management systems may also be installed utilizing appropriately spaced and neatly routed j-supports above accessible ceilings. Low voltage wiring routed in walls or at roof penetrations shall be installed in conduit.
   3. Where open cable trays are utilized above accessible ceilings the following conditions apply.
      a. Low voltage wiring routed in open cable trays shall be plenum-rated (whether or not the ceiling space is utilized as a return air plenum).
      b. Low voltage wiring concealed in walls, floors, and above inaccessible ceilings shall be routed in raceways.
      c. Low voltage wiring routed between conduit stubs and cable trays shall be secured with appropriately spaced j-supports.

PART 3 - EXECUTION

3.1 PRE-SEASON STARTUP

A. Within one year of filing of the Notice of Substantial Completion, when all full load tests required under 'Project Completion Tests and Startup' and 'Post Contract Completion Tests' have not yet been performed, the Contractor shall perform startup of any equipment or systems required for heating or cooling season operation when such equipment and systems have remained shut down or remain to be tested under full load. The Contractor shall ensure that all equipment and systems are operating properly before being turned over for the first operational use by the Owner. All such testing shall occur within one year of filing the Notice of Substantial Completion. The Owner will be responsible for providing new air filters for the Contractor to install prior to this testing if necessary.

END OF SECTION

SECTION 23 09 10 - SEQUENCE OF OPERATION

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

B. Section 230900 (Temperature Controls) is hereby made a part of this section.

1.2 SEQUENCE OF OPERATION

HEAT PUMP LOOP

General

The heat pump water pumps (HPWP-1 & HPWP-2) are selected and intended to operate at a maximum flow of 450 gpm with all heat pump water valves open. B-1/B-2, CT-1/CT-2, BP-1/BP-2, and CTP-1/CTP-2 will operate to maintain a specified heat pump loop temperature range.

Status

Building status shall be determined as follows:

1. If the heat pump loop water temperature leaving the central plant is warmer than the heat pump loop water temperature entering the central plant, the system shall be in Cooling Mode.
2. If the heat pump loop water temperature leaving the central plant is cooler than the heat pump loop water temperature entering the central plant, the system shall be in Heating Mode.

Occupied Mode

The lead heat pump water pump (HPWP-1/HPWP-2) VFD shall be enabled and shall be modulated between 25% and 100% speed as required to maintain the heat pump loop differential pressure setpoint (approximately 10 psi - actual pressure as determined by the test and balance contractor).

Whenever lead pump (HPWP-1/HPWP-2) or jocky pump (HPWP-3) fails, the lag pump shall be enabled.

If lead pump (HPWP-1/HPWP-2) is running at minimum speed (25%) and the differential pressure is 0.5 psi (adjustable) above the current setpoint, jockey pump (HPWP-3) shall be enabled and the lead pump shall be disabled. The lead pump shall be re-enabled when the jockey pump (HPWP-3) VFD is running at 100% speed and the differential pressure is 0.5 psi (adjustable) below the current setpoint.

If jockey pump (HPWP-3) is running at minimum speed (25%) and the differential pressure is still greater than the current setpoint, the control valve in the central plant bypass shall be opened as necessary to maintain the minimum jockey pump flow (30 gpm).

If any pump is commanded on and does not see status, an alarm condition shall be indicated.

Unoccupied Mode

During unoccupied hours, the jockey pump shall always be the lead pump. The jockey loop water pump (HPWP-3) VFD shall be enabled whenever any heat pump is enabled for heating or cooling.

Whenever jockey pump (HPWP-3) fails the lead loop water pump (P-1/P-2) shall be enabled and an alarm condition shall be indicated.

BOILER OPERATION

General

The boilers and associated pumps operate in Cascade Control with the lead boiler controlling the rotations and modulation of all boilers in the plant to operate as a single system. Should a boiler or primary pump fail, the lag boiler and associated primary pump shall be enabled by the cascade control, and an alarm condition shall be indicated. Each boiler shall have separate alarm contacts for BMS monitoring. Each boiler in the cascade shall be configured internally to enable ramp delay controls to limit cycling and maximize run times (20%,40%, 60%, 80% holds at 3 minutes each stage). The differential temperature control on each boiler shall be set at 15°F (adjustable) and the offset shall be set at 7°F (adjustable). The manual reset high limit control on each boiler shall be set at approximately 180°F.

When the boiler cascade control is enabled, each boiler's primary heating water pump vfd speed shall be modulated from 25% to 100% of maximum speed utilizing a hard-wired 0-10 volt output from the boiler control panel, as required to maintain the boiler temperature differential setpoint (30°dF, adjustable). The primary heating water pump vfd minimum speed shall be as determined by the test and balance contractor to achieve the boiler manufacturer's listed minimum boiler flow (see boiler manufacturer's data) or programmed as determined by the factory for specified boiler. The primary pump shall not operate below the speed required to maintain the boiler manufacturer's listed minimum flow.
When the boiler cascade control enters a disabled state from an enabled state, the primary heating water pump shall remain enabled by the boiler integral controls for approximately 3 minutes (adjustable) (to prevent residual heat from exceeding the boiler high limit temperature).
The boiler cascade control shall be enabled by BMS with set point signal to boiler cascade control whenever the outside air temperature falls below setpoint (initially 70°F, with a 10°F deadband, off @ 80°F, adjustable) or building enters heating mode. The heating water system enable status shall be programmed with the capability to be overridden on or off via the appropriate graphic display. Status on each boiler and alarm contacts for each boiler must be displayed in the graphics along with firing rate read via BACnet and up to 5 additional points selected by owner during programming coordination.

Emergency Shut-Down

Provide an emergency shut-down switch at each boiler room exit, one just inside of each exterior door and one just outside of each interior door (as required by the ASME Code) to disconnect the power to both boiler burners (do not disconnect power to the boiler pumps). The emergency shut-down switch shall also disable power to gas-fired water heaters in the boiler room, and to any other gas-fired equipment located in the boiler room. Switches shall be bush button type. Provide plastic nameplates to read 'Boiler Emergency Shut-Down'. An alarm condition shall be indicated on the associated graphic display whenever the emergency shut-down switch is enabled (as determined by a control relay monitoring switch status).

Safeties

An alarm condition shall be indicated upon failure of either boiler burner and/or whenever the heat pump loop HPS temperature falls below the alarm setpoint (50°F, adjustable) for more than 5 minutes after the heating water system has been enabled for more than 60 minutes.

CLOSED CIRCUIT FLUID COOLER OPERATION

General

Cooling tower CT-1 and CT-2 and cooling tower water pumps CTP-1/CTP-2 shall only be enabled when the building is in Cooling Mode.

Occupied Mode

If the heat pump loop water temperature entering the central plant is greater than 85°F (adjustable) and the system is in Cooling Mode, the lead cooling tower pump (CTP-1/CTP-2) shall modulate between min flow and max flow (80-170 gpm) through the lead cooling tower (CT-1/CT-2). The associated control valve for lag cooling tower shall be closed. If the heat pump loop water temperature entering the central plant is greater than 88°F (adjustable) and the system is in Cooling Mode, the associated control valve for lag cooling tower shall be open the lead cooling tower pump (CTP-1/CTP-2) shall modulate between min flow and max flow (160-340 gpm) through both cooling towers (CT-1 & CT-2). If the heat pump loop water temperature entering the central plant is greater than 90°F (adjustable) and the system is in Cooling Mode, the cooling tower (CT-1 & CT-2) fans shall modulate between 20% speed and 100% speed to maintain the heat pump loop water temperature entering the central plant between 90°F (adjustable) and 95°F (adjustable). The fans ramp up and down together, equally.
In conjunction with CTP-1/CTP-2 flow modulation and CT-1/CT-2 fan modulation: If ambient temperature is falling and ambient air temperature is less than 35°F (adjustable), cooling tower (CT-1/CT-2) spray pump(s) is disabled. If leaving fluid temperature exceeds 77°F (adjustable) by 2°F (adjustable) for 15 minutes (adjustable), spray pump(s) is enabled.
If the heat pump loop water temperature entering the building exceeds 100°F (adjustable), an alarm shall be sent through the EMS to the operator's terminal.
Occupied mode operation of the heat pump loop shall continue after the building schedule reverts to unoccupied mode and shall not end until the heat pump loop water temperature entering the central plant falls below 85°F (adjustable), regardless of the occupied mode scheduled end time.

Cooling Tower Freeze Protection and Safeties

The cooling tower 1st stage sump heater shall be enabled whenever the sump temperature falls below setpoint (37ºF, adjustable, with a 3ºF deadband, disabled at 40ºF). The cooling tower 2nd stage sump heater shall be enabled whenever the sump temperature falls below setpoint (34ºF, adjustable, with a 4ºF deadband, disabled at 38ºF). An alarm condition shall be indicated whenever either sump heater fails (as determined by current sensor on each sump heater).
The sump heaters shall be disabled and an alarm condition shall be indicated whenever the sump level is too low (as sensed by the low water level float switch - furnished with cooling tower).
The cooling tower fan shall be disabled and an alarm condition shall be indicated whenever the associated vibration switch senses excess vibration.

Cooling Tower Basin Cleaner (BC-1)

The cooling tower basin cleaner pump shall be enabled whenever the lead cooling tower pump (CTP-1/CTP-2) is enabled.
An alarm condition shall be indicated upon failure of the basin cleaner pump (as determined via current sensor). An alarm condition shall also be indicated whenever the basin cleaner differential pressure switch indicates a dirty filter, dirty basket strainer, or high pressure drop condition (contacts furnished with basin cleaner pump package). The basin cleaner bleed valve shall be set to open for 10 seconds every 4 hours (integral control settings).

WATER SOURCE HEAT PUMPS (OCCUPIED AREAS)

General

During both occupied and unoccupied mode operation, whenever there is an initial call for a heat pump to be enabled, the lead loop pump shall be enabled for two minutes (adjustable) prior to enabling the heat pump(s) that initiated the call. This is intended to ensure that when heat pumps are enabled, they will not trip off on their integral flow sensor.
The control system shall display approximately 8 points of data for each water source heat pump via the associated BACnet interface (specific points to be selected during the submittal review process). The following list of data points shall be included as a starting place:

- Heat Pump Enable Status
- Heat Pump Alarm Status
- Current Mode (Heating or Cooling)
- Compressor Enable Status
- Compressor Operating Status
- Supply Air Temperature
- Return Air Temperature

Occupied Mode

The fan shall be enabled to run continuously, outside air damper shall open, and heat pump 2-position control valve shall be open as required to maintain the room temperature setpoint (initial cooling setpoint of 75°F, with a 3°F deadband, initial heating setpoint of 70°F). Both setpoint and deadband shall be adjustable for each heat pump.

Unoccupied Mode

The heat pump loop pumps shall be enabled whenever a space reaches the unoccupied mode room temperature setpoint. There shall be a 3 minute (adjustable) time delay before the associated heat pump(s) are enabled. The time delay is intended to allow flow in the heat pump loop before a heat pump is enabled.

The associated heat pump control valve shall be opened whenever unoccupied heating or cooling is required. The compressor shall be enabled after the heat pump water valve is proven to be open at the end switch, and the associated heat pump(s) shall be controlled to reach the unoccupied mode room temperature setpoint.

The outside air dampers shall remain closed during unoccupied mode.

Unoccupied mode heating shall be enabled whenever a room temperature falls below the unoccupied mode heating setpoint (55°F, with 3°F differential, disabled at 58°F, adjustable).

Unoccupied mode cooling shall be enabled whenever a room temperature rises above the unoccupied mode cooling setpoint (85°F, with 3°F differential, disabled at 82°F, adjustable).

Optimum Start Mode (Morning Warm-Up and Morning Cool-Down Modes)

During morning warm-up and/or morning cool-down modes, the heat pumps shall operate following the appropriate occupied mode sequence (Occupied Heating Mode or Occupied Cooling Mode) with the outside air dampers closed. The optimum start period shall be limited to a maximum of 2 hours (adjustable) prior to the occupied time.
During morning warm-up and/or morning cool-down modes, the heat pumps shall be enabled in groups of 10 heat pumps every 10 seconds.

Unoccupied Override Mode

Whenever one of the room sensor override buttons is pressed during the unoccupied time period, the associated heat pump shall be enabled and controlled in the normal occupied mode for a period of 2 hours (adjustable).

Economizer Mode

See temperature control drawings for HPs with economizer capability. The economizer mode shall be enabled whenever the outside air temperature is 2°F below the return air temperature (with a 2°F deadband, disabled when outside air temperature equals the return air temperature). During economizer mode, the outside air damper and the return air damper shall be modulated together to maintain the supply air temperature setpoint (55°F, adjustable). Whenever the heat pump unit is operating in economizer mode, the outside air dampers shall be fully open before the compressor is enabled. There shall be an additional control parameter that manages the outside air and return air damper positions such that the mixed air temperature does not fall below the mixed air temperature low limit setpoint (50°F, adjustable) at any time. During economizer mode operation, the outside air damper shall not be allowed to close beyond the position that has been determined to allow the minimum outside air cfm (to ensure adequate ventilation air for building occupants). Whenever the outside air temperature is below 30°F, the outside air damper shall be limited such that it does not exceed 50% open.

CO_2 Control of Minimum Outside Air (Demand Control Ventilation)

See mechanical zoning plan for HPs with CO_2 control. The minimum outside air damper position shall be modulated to maintain the indoor CO_2 level setpoint (500 ppm, adjustable) above the outdoor CO_2 level. The setpoint shall have a 200 ppm differential that is evenly split across the setpoint, and shall be restricted to modulate between the fixed upper limit and lower limit cfm values. The upper limit cfm shall be delivered when the indoor CO_2 level is at or above 600 ppm over the outdoor CO_2 level and lower limit cfm shall be delivered when the indoor CO_2 level is at or below 400 ppm over the outdoor CO_2 level.

Safety Control

The duct mounted smoke detector shall disable the fans and dampers whenever smoke is detected and an alarm condition shall be indicated.
If mechanical mezzanine space temperature drops below 50°F (adjustable), the associated heat pump shall be enabled (HP-83). If mechanical mezzanine space temperature drops below 45°F (adjustable), an alarm condition shall be indicated.

WATER SOURCE HEAT PUMPS (UNOCCUPIED AREAS)

The fan shall be enabled to run intermittently and the heat pump 2-position control valve shall be opened as required to maintain the room temperature setpoint (initial cooling setpoint of 85°F, with a 10°F deadband, initial heating setpoint of 55°F). Both setpoint and deadband shall be adjustable for each heat pump. A 3°F (adjustable) throttling range shall be utilized to minimize fan short cycling (such that cooling is enabled at the current cooling setpoint and is disabled at 3° below the setpoint, and heating is enabled at the current heating setpoint and is disabled at 3° above the setpoint).

MAKE-UP AIR UNIT

The make-up air unit shall be enabled to operate whenever the associated kitchen hood exhaust fan are enabled (KEF-1).
The DDC system shall be interfaced with the make-up air unit to provide for occupied mode on-off control, unoccupied mode on-off control, and setting the heating and cooling setpoints. The fan shall be programmed for either continuous or intermittent operation as selected on the associated graphic display. Approximately 8 BACnet data points shall be displayed on the associated graphic screen.

Occupied Mode

The make-up air unit can, heating, and cooling sections shall be sequenced to maintain the room temperature setpoint (initially 78°F, with an 8°F deadband, cooling on at 78°F and heating on at 70°F). Both setpoint and deadband shall be adjustable for each make-up air unit. The integral supply air temperature setpoint for the make-up air unit shall be set at approximately 90°F.

Evaporative Cooler

The sump fill valve shall be open and the drain valve shall be closed whenever the outside air temperature is above setpoint (initially 60ºF, adjustable with a 25ºF deadband, sump drained at 35ºF). The sump fill valve shall be closed and the drain valve shall be open whenever the drain cycle is initiated (at 7:00 a.m. every Monday and Thursday during the summer calendar schedule). The drain cycle shall terminate 5 minutes after it is initiated. The drain cycle summer schedule calendar shall be set initially from May 1 thru September 30.

Unoccupied Mode

The fan shall be disabled and the heating and cooling sections shall be disabled.

Unoccupied Heating Mode

The make-up air unit fan shall be enabled and the heating section shall be enabled whenever the room temperature falls below the unoccupied mode heating setpoint (55°F setpoint with a 5°F differential, off at 60°F). Both setpoint and deadband shall be adjustable.

Override Mode

Whenever the room sensor override button is pressed during the unoccupied time period the unit shall be enabled and controlled in the normal occupied mode for a period of 1 hour (adjustable).

EXHAUST FANS

EF-1 thru 17 General exhaust (enabled during scheduled occupied hours).

KITCHEN EXHAUST FANS

KEF-1 shall be enabled when kitchen hood is turned on.

RELIEF FANS

Relief fans (RF-1 & RF-2) are equipped with an EC motor and VFD and shall be programmed to ramp up and down speed to maintain a positive pressure in the Multipurpose Space (0.02” w.c., adjustable) as compared to outdoors. The required fan speeds shall be determined by the test and balance contractor.

DESTRATIFICATION FANS

Each destratification fan shall be enabled during occupied hours. The fan speed shall be adjustable via the 0-10V control.

ELECTRIC HEAT TRACE MONITORING

The control system shall monitor and display approximately 6 points of data pertaining to the electric heat trace system status. The specific data points shall be coordinated and confirmed during the temperature controls submittal process. The following list of data points shall be included as a starting place:

- Heat Trace Enable Status
- Heat Trace Alarm Status
- Heat Trace Outside Air Temperature
- Heat Trace Pipe Temperature

SNOW AND ICE MELT SYSTEM

The lead snow and ice melt boiler and pump shall be enabled at constant speed whenever a snow and ice condition is sensed by one or more slab sensors (as determined by the slab temperature being below 38°F and water, snow, or ice being present) and the outside air temperature is below the snowmelt enable temperature (40°F, adjustable). Once a snow and ice melt cycle is initiated, the boiler and pump shall remain enabled for a minimum of 120 minutes (adjustable) and until all slab sensors indicate a non-snow and ice condition (as determined by no water, snow, or ice being present). The snow and ice melt boilers shall be set to operate with a 130°F leaving water temperature.

Whenever boiler and pump are enabled, boiler to increase firing rate from minimum by 10% every 5 min until leaving snowmelt water temperature reaches setpoint to minimize shocking the slab with hot water.

The heating water system enable status shall be programmed with the capability to be overridden on or off via the appropriate graphic display. Status on boiler and alarm contact for boiler must be displayed in the graphics along with firing rate read via BACnet and up to 5 additional points selected by owner during programming coordination. When the boiler control enters a disabled state from an enabled state, the pump shall remain enabled by the boiler integral controls for approximately 3 minutes (adjustable) (to prevent residual heat from exceeding the boiler high limit temperature).

Safeties

An alarm condition shall be indicated upon failure of boiler burner and/or whenever the SMS temperature falls below the alarm setpoint (70°F, adjustable) for more than 5 minutes after the snow melt system has been enabled for more than 60 minutes.

GLYCOL FEEDERS

The glycol feeder shall operate using the glycol feeder manufacturer's control panel. The flow meter is intended to provide notification upon detection of a fluid loss in the propylene glycol piping system. An alarm condition shall be indicated whenever a flow of more than 1/2 gpm (adjustable) occurs for a period of more than 60 seconds (adjustable). The flow meter shall have a full size bypass arrangement such that the flow meter can be bypassed during system fill procedures.

An alarm condition shall be indicated whenever the glycol feeder alarm panel indicates a low fluid level condition.

ELECTRIC WALL HEATER (FIRE RISER ROOM)

The integral thermostat shall be set at 55°F. An alarm condition shall be indicated whenever the room temperature falls below the alarm setpoint (45°F, adjustable) and audible/visible alarm shall sound.

ELECTRIC WALL HEATER

The integral thermostat shall be set at 55°F. The space temp shall be monitored.

FIRE-SMOKE DAMPERS

All fire-smoke damper end switches shall be monitored by the control system. The current damper position (open, closed, or fault when neither switch is made) shall be displayed via the ddc interface both in a summary table format. An alarm condition shall be indicated upon closure or fault status of any fire-smoke damper when the associated heat pump is enabled.

ELEVATOR SUMP PUMP MONITORING

An alarm condition shall be indicated whenever the elevator sump pump is enabled (as determined by a current sensor at the pump).

SEISMIC GAS SHUTOFF VALVE

The current status (open or closed) of the seismic gas shutoff valve shall be displayed via the temperature control system. Valve open/closed status shall be as determined by dry contacts on the remote monitoring switch (remote monitoring switch with dry contacts furnished with the valve). Whenever the contacts indicate that the valve is closed an alarm condition shall be indicated.

DOMESTIC HOT WATER RE-CIRCULATING PUMPS

The re-circulating pump shall be enabled continuously during occupied and unoccupied hours. An alarm condition shall be indicated whenever the pump fails (as determined by a current sensor).

DOMESTIC HOT WATER SYSTEM

The domestic hot water and domestic hot water return temperatures shall be monitored. The following points from the electronic mixing valve shall be listed as a starting point:

- Loss of Power
- Broken Temperature Probe
- “Out of Range” Temperature (±10°F)
- Motor Connectivity and Operation
- Maintenance (Service Required) @ <90%Full travel
- Inlet hot water temperature
- Inlet cold water temperature
- Hot water return water temperature

VARIABLE FREQUENCY DRIVES

The minimum speed on each variable frequency drive shall be set at 25% (15 Hertz). The upward and downward ramp times on each variable frequency drive shall be set at 60 seconds.

END OF SECTION

SECTION 23 09 20 - VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 GENERAL

A. This specification is for complete variable frequency drives consisting of a pulse width modulated (PWM) inverter designed for use with NEMA MG Part 31 inverter rated motors.

B. All VFDs installed on the project shall be from the same manufacturer.

C. The VFD manufacturer shall supply UL508/IEC Standard 61800-5 labeled drives with the options specified. To ensure continued technical and logistical support, VFDs manufactured by a third party or brand labeled will not be acceptable.

1.3 QUALITY ASSURANCE

A. Referenced Standards and Guidelines:
   1. Underwriters Laboratory 508 (A) or (C) as appropriate for Industrial Control Panels.
   2. SEMI F47-0706 for voltage sag immunity
   3. EN/IEC/CE mark 61800.3-EMC, EMI &RFI compliance.
   4. The most current adopted edition of the International Building Code (IBC) referencing ASC 7-05 and ICC AC-156.
   5. International Electrotechnical Commission 60721-3c1, 2 & 3 conformed coating on PCBs.
   6. Office of Statewide Health Planning and Development (OSHPD) approval as required.

B. Qualifications:
   1. Drives shall be UL labeled as a complete assembly. The base VFD shall be UL listed for 100 kA SCCR when installed in accordance with the manufacturer's guidelines.
   2. VFD assembly shall be seismically certified and labeled in accordance with latest IBC.
   3. Base VFD shall have CE mark conforming to EN 61800-3 for 1st Environment level (C2).
   4. The base drive shall be SEMI-F47 certified. The drive must tolerate voltage sags from 35- 50%.
   5. VFD enclosures from VFD manufacturer shall be UL rated for proper environment: 1, 12, or 3R, 4, or 4X as indicated on the drawings or herein. Cabinets shall be correctly sized for airflow and heat dissipation with an interlocked handle. Outdoor enclosures shall be constructed of steel (or non-rusting material as appropriate for the installation location) and shall include thermostatically controlled cooling fans and heaters.
   6. Factory authorized start up and owner training should be provided locally upon request. A toll free 24/365 technical support line connected to factory support personnel located in the US shall be available.

C. Acceptable Manufacturers: Subject to compliance with requirements, manufacturers offering VFDs which may be incorporated in the work include the following:
   1. ABB (ACH580 Series with electrolytic capacitors)
   2. Danfoss (FC102 Series with electrolytic capacitors)

1.4 WARRANTY

A. The VFD warranty shall be for 3 years from the date of start-up and shall include all parts, labor, travel time, and expenses.

1.5 SUBMITTALS

A. Submittals shall include the following information:
   1. Outline dimensions, conduit entry locations and weights, field connection and power wiring diagrams.
   2. OSHPD preapproval, seismic certification and installation requirements where applicable.
   3. Complete technical product description with complete list of options provided. Any portions of this specification not met must be clearly indicated or the Supplier and Contractor shall be liable to provide all additional components required to meet this entire specification.

PART 2 - PRODUCTS

2.1 VARIABLE FREQUENCY DRIVES

A. Each VFD shall provide full rated output from a line of ±10% of nominal voltage. The VFD shall continue to operate without faulting from a line of +30% to -35% of nominal voltage. VFDs shall be capable of continuous full load operation under the following environmental operating conditions:
   1. 5 to 104°F ambient temperature. Operation to 122°F shall be acceptable with a 10% reduction from VFD full load current.
   2. Altitude from 0 to 3300 feet above sea level. Operation to 6600 feet shall be allowed with a 10% reduction from VFD full load current.
   3. Humidity less than 95%, non-condensing.

B. VFDs shall have the following standard features:
   1. VFDs shall be constructed with electrolytic capacitors and dual DC chokes (no exceptions).
   2. VFDs shall incorporate an integral electrical disconnect with auxiliary contacts. The short circuit current rating (SSCR) of the integral disconnect switch shall match or exceed the SSCR of the source panel or distribution board. Coordinate with Division 26 for results of Specification Section 26 05 73.13 (Short-Circuit Studies) prior to ordering any VFD.
   3. VFDs 20 horsepower and larger shall include an additional AC line reactor (ABB Option E213, or approved equal). When the additional AC line reactor the location of the device and wiring shall be coordinated with the Architect/Engineer as part of the submittal process.
   4. All circuit boards shall be coated to protect against corrosion to meet IEC 60721-3c2.
   5. VFDs shall all have the same HMI/keypad with time clock built in. It shall be removable, capable of remote mounting, allow for uploading & downloading parameter settings, pre-programmed application macros to facilitate start-up have two user savable programs, it shall incorporate ‘bump-less transfer’ of speed reference when switching between ‘Hand’ and ‘Auto’ modes and have password protection.
   6. HMI/keypad to have Hand-Off-Auto modes, 2-4 Navigation keys, manual speed control, fault reset on it. Display shall be backlit, have a minimum of three lines, and messages shall use complete words (alphanumeric codes only are not acceptable.) Show load direction, speed, and reference or user set values in engineering units for submetering purposes (i.e., gph, kW, motor amps, frequency, speed, torque, etc.).
   7. The drive shall have the option to support a Bluetooth advanced control panel. The Bluetooth control panel shall be FCC and QDL (Qualified Design Listing) certified.
   8. VFDs shall include a coordinated AC transient surge protection system consisting of four metal oxide varistors (phase to phase & phase to ground), capacitor clamp, 1600 PIV Diode Bridge and chokes.
   9. VFDs shall have 3 to 5% impedance AC reactors or internal dual 5% DC chokes to reduce harmonics to the power line and as protection from AC line transients. VFD’s with only one DC choke shall have OEM add AC UL 508 listed and approved line reactors.
   10. VFDs shall automatically mitigate harmonics throughout the effective load range using Swinging chokes or other devices designed to lower harmonics when VFD is at partial loads. VFD’s using thin wall, small DC bus or metallic type capacitors Must add active harmonic filters to prevent high frequency harmonics from corrupting the electrical system.

11. When Active Front End (Ultra Low Harmonic) drives are specified on the schedule, they must meet the following characteristics:
    a. An IGBT based active front end shall be used for mitigation of low frequency harmonics. An LCL filter shall be installed in front of the IGBTs to remove high frequency harmonics.
    b. Limit current distortion to 3% total harmonic current distortion at full load, at the lugs of the drive.
    c. The drive shall provide full motor nameplate voltage while operating the motor at nameplate RPM. The output IGBTs must be modulating and in control of the motor during this 100% speed/load operating condition. The specified 3% current distortion and 1.0 displacement power factor shall be achievable during this operating condition.
    d. The hardware structure of the front end shall boost the DC bus voltage by 10% during low line conditions.
12. VFD's shall be CE marked and meet Standard EN 61800-3-5 for the first environment restricted level (Category C2).
13. VFD's shall be CE marked and meet Standard EN 61800-3-5 for the first environment restricted level (Category C2).
14. VFD's shall be able to have a distance from the VFD to the motor of at least 250 feet at the maximum carrier frequency complying with the drive manufacturer's installation, operating, and maintenance instructions, or provide a DV/DT filter for each VFD as necessary to protect the motors.
15. VFD's shall have a standardized control board, with all communications and I/O terminals on it, and standard building management system (BMS) communications protocols shall include Modbus RTU, Johnson Controls N2, and BACnet MS/TP. Diagnostic warning and fault information shall be transmittable over BMS, with remote fault reset when programmed. Communication options shall be available for Ethernet IP, BACnet IP, ControlNet, DeviceNet, EtherCAT, LonWorks, Modbus TCP, and Profibus.
16. VFDs shall have pass thru inputs and outputs. BMS can monitor/control VFD analog & digital I/O via communications independently of VFD functions or used for other devices/sensors.
17. VFDs shall have 250 ma of 24 VDC power for I/O and be capable of loop powering a transmitter.
18. Provide two programmable analog inputs of 0-10vdc or 4-20 ma.
19. Provide two programmable analog outputs of 0-20ma or 4-20 ma signals. Outputs proportionally programmable for: motor current, power, speed, torque, (kW) and other data.
20. Provide 6 programmable 24VDC digital inputs, able to operate normally or inverted.
21. Provide 3 programmable, Form-C relay outputs. Relay outputs shall be programmable on and off with time delay and adjustable hysteresis. Maximum switching current 8 amps at 24 VDC, and 0.4 amps at 250 VAC; Maximum voltage 300 VDC and 250 VAC; continuous RMS rating of 2 amps.
22. VFD heat-sink fans shall be variable speed or thermostatically control, and shall be replaceable without removing the VFD from the wall. Operation shall be based on the temperature and run command to the drive.
23. Drive Options: All optional features shall be UL listed by the VFD manufacturer as a complete assembly and shall carry a UL508 label.
24. Provide an option for non-powered programming via laptop and adapter.
25. When indicated on the drawings provide the optional Bluetooth Advanced Control Panel. The Bluetooth control panel shall be FCC and QDL (Qualified Design Listing) certified.
    a. A free app (iOS and Android) shall replicate the control panel on a mobile device or tablet. The control panel's programming and control functionality shall function on the device. Customizing text, such as AHU-1 end switch, shall be supported by the device's keyboard.
    b. Bluetooth connectivity shall allow uploading, downloading, and emailing of parameters.

c. Bluetooth connectivity shall include two pairing modes: Always discoverable with a fixed passcode, and manual discovery with a uniquely generated passcode every pairing.

C. VFDs shall have the following programmable adjustments:
1. Three programmable fully adjustable skip frequencies, from 0 to full speed.
2. VFDs shall include a programmable time delay for start/stop with keypad indication time delay on.
3. Two independent adjustable acceleration and deceleration ramps, with 1-1800 seconds adjustable time ramps.
4. VFDs shall include a motor flux optimization circuit to automatically reduce applied motor voltage to motor to optimize energy consumption and reduce audible motor noise.
5. VFDs shall provide a programmable loss-of-load (broken belt/coupling) option to signal the loss-of-load condition via a keypad warning, relay output, and/or over BMS.
6. VFDs shall have ‘Sleep’ and ‘Wake-Up’ functions to control the VFD from the process feedback signal.
7. VFDs shall have two PID controls built in for VFD or other uses. PID controllers shall have ability for ‘two zone’ control. PID setpoints shall be adjustable from the VFD keypad, analog inputs, or BMS.
8. If input speed reference or remote communication is lost, the VFD shall be programmable to indicate a stop and display fault, run at a programmable preset speed, hold the VFD speed based on the last good reference received, or go to a backup control system wired to the VFD. The VFD shall also be capable to issuing a warning locally and via BMS.
9. VFDs shall have programmable ability to automatically restart after overcurrent, over or under voltage, loss of input signal or protective trip as well as number of restarts and time between.
10. VFDs shall be capable of starting into a coasting load (flying start). Forward or reverse up to full speed and accelerate or decelerate to setpoint without tripping or component damage.
11. VFDs shall include a fireman’s override input that when activated shall operate in one of two modes: 1-5 fixed digital speeds ranging from 500Hz to -500Hz, or Real Time Continuous Control aka analog speed control in fireman’s override PID algorithm to automatically adjust motor speed based on override setpoint and feedback. This shall override all other inputs (analog/digital, communication, and all keypad commands), except customer defined safety run interlocks, and shall force the motor to run in one of the two modes. ‘Override Mode’ shall be displayed on the keypad. Upon removal of the override signal, the VFD shall resume normal operation, without the need to cycle the normal digital input run command. Also, shall be programmable with up to 5 speeds selected by inputs with an at speed indication and underload capability.

D. Micro VFDs shall have the following features and programmability:
1. Microdrive’s shall have HMI/keypad to have Hand-Off-Auto modes, manual speed control, fault reset on keypad, and the ability to program the VFD for all functions. Ability to save the VFD program is preferred.
2. Microdrive’s shall have the ability to run on single phase of power when derated 50%.
3. Microdrive’s shall have at least one analog input, and digital inputs and outputs built in when needed.
4. Microdrive’s when required shall have BMS communication protocols to include Modbus RTU; Johnson Controls N2, and BACnet MS/TP.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Installation shall be the responsibility of the Contractor. The Contractor shall install the drive in accordance with the recommendations of the VFD manufacturer as outlined in the VFD installation manual, NEC and local codes. The Contractor shall complete all wiring in accordance with the recommendations of the VFD manufacturer as outlined in the installation manual.

B. Power wiring shall be completed by the electrical contractor in accordance with NEC Section 430.122 wiring requirements based on the VFD input current.

C. For all VFD applications, the input and output cables to/from the VFD shall be run in separate metal conduits, or using shielded VFD cable. For multi-motor applications each VFD output shall have its own metal conduit or shielded VFD cable to/from the motor. Each motor shall have its own properly rated motor overload protection.

D. Input and output power wiring shall be segregated from low voltage analog, communication, control, and be UL listed for the appropriate voltage and be shielded cable. Installation shall be per the NEC and shall include adequate clearance between types.

3.2 START-UP

A. Factory start-up shall be provided for each VFD by a factory authorized service technician.

3.3 PRODUCT SUPPORT

A. Factory trained application engineering and service personnel that are thoroughly familiar with the VFD products offered shall be locally available at the installation location. A toll free 24 hour/365 day technical support phone line connected to factory support personnel located in the United States shall be available.

B. Training by a factory authorized technician shall include installation, programming, and operation instruction for each VFD.

C. The VFD supplier shall stock standard VFD’s and standard repair parts such that the Owner does not need to stock them.

END OF SECTION

SECTION 23 21 00 - HYDRONIC PIPING AND ACCESSORIES

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of hydronic piping and pumping systems specified in this section include the following:

Hydronic Piping, Valves, and Fittings
Heat Pump Loop Piping
Condensate Drain Piping
Snowmelt Piping Indoors
Pipe and Pipe Fitting Systems
Miscellaneous Piping

Hydronic Accessories
Air Separators
Expansion Tanks
Chemical Feeders
Miscellaneous Valves
Pump Suction Diffusers
Flexible Connections

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of hydronic piping products of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Acceptable Manufacturers: Subject to compliance with requirements, manufacturers offering pumping equipment which may be incorporated in the work include the following:

Taco
Bell and Gossett

C. UL Compliance: Provide electric components for pumps which are UL listed.

D. Codes and Standards:

1. ASME Compliance: Fabricate and install hydronic piping in accordance with ASME B31.9 (Code for Building Services Piping).
2. UMC Compliance: Fabricate and install hydronic piping in accordance with the Uniform Mechanical Code.

1.4 SUBMITTALS

A. As-Built Drawings: At project closeout, submit as-built drawings of installed hydronic pumps, piping, and hydronic specialties in accordance with all associated requirements.

B. Operation and Maintenance Data
   1. Submit operation and maintenance data and parts lists for hydronic piping materials and products. Include this data, product data, shop drawings, and as-built drawings in operating and maintenance manual in accordance with all associated requirements.
   2. Submit operation and maintenance data and parts lists for each type of pump, control, and accessory, including trouble-shooting maintenance guide. Include this data and product data in the operation and maintenance manual, in accordance with all associated requirements.

C. Product Data
   1. Submit manufacturers pump specifications, installation and start-up instructions, and current accurate pump characteristic performance curves with selection points clearly indicated. Pump efficiencies, as well as construction, will be taken into consideration.
   2. Submit manufacturer's technical product data and installation instructions for each type of hydronic specialty.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Provide piping materials and factory-fabricated piping products of sizes, types, pressure ratings, temperature ratings, and capacities as indicated. Provide materials and products complying with ASME B31.9 (Code for Building Services Piping) where applicable, base pressure rating on hydronic piping systems maximum design pressures or as specified. Provide sizes and types matching piping and equipment connections; provide fittings of materials which match pipe materials used in hydronic piping systems.

2.2 GENERAL PIPE AND PIPE FITTING REQUIREMENTS

A. General
   1. Provide pipe and tubing, joint type, grade, size, and weight indicated for each service, and complying with all governing regulations and industry standards.
   2. Remove scale, oxidation, slag, oil, grease, rust, dirt, and debris from inside and outside of pipe and fittings prior to assembly. Ream ends of pipe and tubes to remove burrs. Bevel plain ends of steel pipe.
   3. Cut all pipe threads using sharp dies. Tapered threads shall comply with ASME B1.20.1.

B. Steel Pipes and Pipe Fittings
   1. When Schedule 40 black steel pipe is specified in sizes 12” and larger the wall thickness shall be .375” to match the associated fitting thickness.
   2. Black Steel Pipe: ASTM A53, A106, or A120; except comply with ASTM A53 or A106 where close coiling or bending is required.
   3. Galvanized Steel Pipe: ASTM A53 or A120; except comply with ASTM A53 where close coiling or bending is required.
   4. Malleable Iron Threaded Fittings: ANSI B16.3; plain or galvanized to suit piping. For use above grade only, except where indicated otherwise.
   5. Malleable Iron Threaded Unions: ANSI B16.39; selected by the Contractor for proper piping fabrication and service requirements, including style, end connections, and metal-to-metal seats (iron, bronze, or brass), plain or galvanized as indicated.
   6. Forged Steel Socket Welding and Threaded Fittings: ANSI B16.11, except MSS SP-79 for threaded reducer inserts; rated to match schedule of connected pipe.
   7. Wrought Steel Butt-Welding Fittings: ANSI B16.9, except ANSI B16.28 for short radius elbows and returns; rated to match connected pipe.

8. Pipe Nipples: Fabricated from same pipe as used for connected pipe, except do not use less than Schedule 80 pipe where the length remaining unthreaded is less than 1-1/2 inches and where the pipe size is less than 1-1/2 inches. Do not thread nipples full length (no close nipples are allowed).

C. Copper Tube and Fittings
   1. Copper Tube: ASTM B88; Type L, hard drawn temper, except as otherwise indicated.
   2. Wrought Copper Solder Joint Fittings: ANSI B16.22.

D. Elbows
   1. All elbows in hydronic piping systems shall be long radius.
   2. Short radius elbows shall be utilized only where necessitated by space constraints. Such instances shall be submitted to the Engineer for review and approval.

E. Miscellaneous Piping Materials/Products
   1. General: Where applicable all pipe joining methods shall comply with the requirements of the ASME Boiler and Pressure Vessel Code.
   2. Welded Joints: Except as otherwise indicated, provide welding materials as determined by the Contractor to comply with all installation requirements and to comply with Section II, Part C, ASME Boiler and Pressure Vessel Code for welding materials.
   3. Soldered Joints: Construct joints in accordance with ASTM B828 or the Copper Development Association 'Copper Tube Handbook' using lead free solder complying with ASTM B32. Apply ASTM B813 water-flushable flux, to tube ends, unless otherwise indicated.
   4. Brazed Joints: Construct joints in accordance with American Welding Society 'Brazing Handbook' using a copper-phosphorus brazing filler metal complying with American Welding Society Section A5.8 and with the ASME Boiler and Pressure Vessel Code.
   5. Comply with SFA-5.8, Section II, ASME Boiler and Pressure Vessel Code for brazing filler metal materials.
   6. Gaskets for Flanged Joints: ANSI B16.21; full faced for cast iron flanges; raised face for steel flanges, unless otherwise indicated.

2.3 PIPE AND PIPE FITTING SYSTEMS

A. Heat Pump Loop Piping Indoors: ASTM A53 or ASTM A120 Schedule 40 black steel with standard weight, long radius, butt-welding fittings and 150 lb forged steel, weld-neck type flanges. Connections to threaded equipment, valves, etc. shall be made with 150 lb cast iron, threaded fittings. Piping 2 inches and smaller shall have 150 lb screwed, cast iron fittings. Slip-on flanges will be permitted where space is limited with prior written approval by the Architect/Engineer. All slip-on flanges shall be back-welded.
   1. At the Contractor's option heat pump loop piping 2" and under may be copper tube; ASTM B88 Type L, hard drawn temper, with wrought copper fittings and brazed joints.

B. Snowmelt Piping Indoors: ASTM A53 or ASTM A120 Schedule 40 black steel with standard weight, long radius, butt-welding fittings and 150 lb forged steel, weld-neck type flanges. Connections to threaded equipment, valves, etc. shall be made with 150 lb cast iron, threaded fittings. Piping 2 inches and smaller shall have 150 lb screwed, cast iron fittings. Slip-on flanges will be permitted where space is limited with prior written approval by the Architect/Engineer. All slip-on flanges shall be back-welded.
   1. At the Contractor's option piping 2" and under may be copper tube; ASTM B88 Type L, hard drawn temper, with wrought copper fittings and brazed joints.

C. Relief Valve Discharge Piping: Same as specified for cooling coil condensate drain piping, except that plugged fittings will not be required.

D. Water and Drain Connections to Equipment or to Stubs by Plumbing Contractor: Schedule 40 steel pipe with 150 lb malleable iron fittings. Provide dielectric unions if connections are to copper lines. Pipe and fittings shall be black or galvanized steel as required to match piping to which connected.

E. Air Vent Discharge Piping: Type L hard copper tubing with wrought copper solder joint fittings and 95 percent tin, 5 percent antimony solder.

2.4 HYDRONIC ACCESSORIES

A. Air and Dirt Separators

1. In-Line Air and Dirt Separators: Provide in-line air and dirt separators of size and capacity as indicated on the drawings. Tank shall be constructed of carbon steel and pressure rated for 125 psi at 375°F in compliance with ASME Boiler and Pressure Vessel Code Section VIII. Air and dirt separators shall include an integral magnetic dirt filter.
2. Available Manufacturers: Subject to compliance with requirements, manufacturers offering air and dirt separators which may be incorporated in the work include the following, or approved equal:
   Taco Model 4900-ADM-125
   Thrush
   Spirotherm

B. Expansion Tanks

1. Replaceable bladder type. Shell and heads shall be of carbon steel welded construction in accordance with ASME Section VIII for 125 psi working pressure. Provide full volume flexible butyl rubber bladder, bottom system connection, air charging fitting, drain connection, lifting eye, and base ring for vertical mounting. Factory pre-charge as indicated on drawings.
2. Install a ball valve with lockshield at all expansion tanks. Ball valves with lockshield shall be Crane Model D171, or approved equal.
3. Available Manufacturers: Subject to compliance with requirements, manufacturers offering expansion tanks which may be incorporated in the work include the following, or approved equal:
   Taco
   Elbi

C. Chemical Feeders (See Specification Section 232500 - Chemical Treatment).

D. Propylene Glycol Feed Systems (See Specification Section 232500 - Chemical Treatment).

E. Basic Hydronic Valves

1. Provide valves complying with Section 230500 (Basic Materials and Methods for HVAC) and in accordance with the following listing.

a.	Shutoff Valves:	
	3 inch and smaller:	Ball Valves
	4 inch and larger:	Butterfly Valves
b.	Sectional Valves:	
	3 inch and smaller:	Ball Valves
	4 inch and larger:	Butterfly Valves
c.	Drain Valves:	
	3 inch and smaller:	Ball Valves
	4 inch and larger:	Butterfly Valves
d.	Check Valves (All Sizes):	Non-Slam Swing Check Valves
e.	Balance Valves (All Sizes):	Fixed Port Venturi Valves
f.	Air Vent Valves:	Manual or Automatic with Ball Type Isolation Valve

F. Pressure Compensating Flow Limiting Valves
   1. Provide pressure compensating flow limiting valves where shown on the drawings. Valve shall provide shutoff, measurement, and flow limiting functions.
   2. Valves 2 inch and smaller shall be all brass construction with one male thread end with a brass ball valve, and one union end. Pro Hydronic Specialties Model AFLB, or approved equal.
   3. Valves 3 inch and larger shall be ductile iron construction with flanged ends, and a ductile iron butterfly valve with aluminum bronze disc and stainless steel stem. Pro Hydronic Specialties Model AFLWF, or approved equal.
   4. Valves shall have a removable stainless steel flow cartridge and a stainless steel spring.
   5. Valves shall be rated for a minimum of 300 psi at 250°F, shall have a flow control accuracy of 5%, and shall have a control range of between 2 and 60 psi.
   6. Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to the following, or approved equal:
      Pro Hydronic Specialties
      IMI Flow Design
      Bell and Gossett

G. Pump Suction Diffusers
   1. Provide suction diffusers of size and capacity required for pump connections.
   2. Construction: Cast iron body with removable strainer and fine mesh flow straightener.
   3. Available Manufacturers: Subject to compliance with requirements, manufacturers offering pump suction diffusers which may be incorporated in the work include the following, or approved equal:
      Taco
      Bell and Gossett
      Armstrong

H. Flexible Connections (Pumps)
   1. Provide flexible connections between 9 & 14 inches long where indicated on the drawings and/or as required to accommodate movement or vibration of the piping system.
   2. Flexible connections shall be all stainless steel with carbon steel flanges. Flexible connections shall be rated for no less than 160 psi working pressure at 70°F. Flexible connections shall be Twin City Hose Model TCHS, or approved equal.

I. Flexible Connections (Fluid Coolers, etc.)
   1. Provide flexible connections between 9 & 14 inches long where indicated on the drawings and/or as required to accommodate movement or vibration of the piping system.
   2. Flexible connections shall be all stainless steel with carbon steel flanges. Flexible connections shall be rated for no less than 160 psi working pressure at 70°F. Flexible connections shall be Twin City Hose Model TCHS, or approved equal.

J. Flexible Connections (Heat Pumps, Motorized Equipment)
   1. Provide 18 inch long flexible connections where indicated on the drawings and/or as required to accommodate movement or vibration of the piping system.
   2. Flexible connections shall be all stainless steel with carbon steel ends. Flexible connections shall be rated for no less than 370 psi working pressure at 70°F. Flexible connections shall be Twin City Hose Model HPH, or approved equal.

K. Wye Strainers

1. Provide wye strainers of size and capacity as indicated on the drawings. Strainers shall be constructed of epoxy painted cast iron or ductile iron, shall be ANSI Class 125, rated for 200 psi at 150°F, with pressure tappings to allow for assessment of strainer pressure drop. Wye strainers shall be constructed of stainless steel with .015" openings (40 mesh).
2. Available Manufacturers: Subject to compliance with requirements, manufacturers offering wye strainers which may be incorporated in the work include the following, or approved equal:

   Titan Flow Control Model YS-58-CI
   Zurn Wilkins Model FSC

L. Basket or Specialty Strainers

1. Provide basket strainers of size and capacity as indicated on the drawings. Strainers shall be Thompson Strainer Model MLS with Model PDA2 pressure differential alarm package and auto purge, constructed of Type 304 stainless steel, and rated for 150 psi at 150°F. Strainer screen shall be constructed of heavy duty stainless steel (.006 inch wire diameter) with .007" openings (80 mesh). Pressure drop at the design flow shall be 1.0 psi or less.
2. Available Manufacturers: Subject to compliance with requirements, manufacturers offering basket strainers which may be incorporated in the work include the following, or approved equal:

   Miller Leaman Thompson Strainer Model MLS

   Titan Flow Control Model BS-25F-CI

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which hydronic piping systems and specialties are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF PIPING

A. The drawings, details, and diagrams indicate the general location and arrangement of the piping systems. The indicated piping locations and arrangements were utilized to determine appropriate pipe sizes and to calculate piping friction loss, expansion, system volume, pump sizes, and for other design considerations. Install piping as indicated unless deviations to the layout are identified and approved as part of the Contractor's shop drawings or submittals.

B. Install pipes and pipe fittings in accordance with recognized industry practices which will achieve permanently leak-proof piping systems, capable of performing each indicated service without piping failure.

C. Install each pipe run with minimum joints and couplings but with adequate and accessible unions for disassembly and maintenance/replacement of valves and equipment. Reduce sizes where indicated by use of reducing fittings. Align piping accurately at connections, within 1/16 inch misalignment tolerance.

D. Comply with ANSI B31 Code for Pressure Piping.

E. Locate piping runs, except as otherwise indicated, vertically and horizontally (pitched to drain), avoiding diagonal runs wherever possible. Orient horizontal runs parallel with walls and column lines. Locate runs as shown or described in drawings, diagrams, details, and notations. If not otherwise indicated, run piping in the shortest route which does not obstruct usable space or block access for servicing the building and the equipment.

F. Hold piping close to walls, overhead construction, columns, and other structural and permanent enclosure elements of the building; limit clearance to ½ inch where furring is shown for enclosure or concealment of piping; locate insulated piping for one inch clearance outside insulation.

G. Wherever possible in finished and occupied spaces, conceal piping from view by locating in column enclosures, in hollow wall construction, or above suspended ceilings; do not encase horizontal runs in solid partitions, except as indicated.

H. Electrical Equipment Spaces: Do not run piping through transformer vaults or other electrical or electronic equipment spaces and enclosures unless unavoidable. Install a drip pan under piping that must be run through electrical spaces and in all other locations indicated on the drawings.

I. Should structural difficulties or work of other contractors prevent the routing of pipes or the setting of equipment at the points shown on the drawings, the necessary deviations therefrom, as determined by the Contractor, with the Architect/Engineer's review and acceptance, will be allowed but must be made without additional cost to the Owner.

J. Inspect each piece of pipe and each fitting to see that there is no defective workmanship on pipe or obstructions in pipes and fittings.

K. Install exposed polished or enameled connections from fixtures or equipment with special care, showing no tool marks or threads at fittings.

L. Cap or plug openings in pipe and fittings immediately to exclude all dirt until fixtures are installed or final connections made.

M. Use reducing fittings where any change in pipe size occurs. Bushings shall not be used.

N. Condensate Drain Piping: Run piping with downward pitch as indicated, without pockets.

O. Grade water circulating piping used for space heating and/or cooling up to high points at the rate of 1/4 inch in 10 feet in the direction of flow with returns grading down at same rate. Air vent valves specified hereinafter shall be installed at high points. Changes in pipe sizes shall be made with eccentric reducers flat on top.

P. Couplings shall not be used except where required pipe runs between fittings are longer than a standard length of the type of pipe being used and except where their use is specifically reviewed by the Architect/Engineer.

Q. Conceal piping in finished portions of building, above the floor line, except where otherwise shown or noted. Cutting of walls and floors shall be held to the minimum possible to secure the proper installation.

R. Install piping subject to expansion or contraction in a manner permitting strains to be evenly distributed and alleviated by expansion loops installed as required.

S. Sleeves for branches through walls from adjacent mains shall be of sufficient size to allow for free side motion of covered pipe in sleeve.

3.3 INSTALLATION OF HANGERS AND SUPPORTS FOR PIPING SYSTEMS

A. See Specification Section 230530 (Hangers and Supports for HVAC Piping, Ductwork, and Equipment). Where special hanging or support of ductwork or piping is detailed or shown on the drawings, the drawings shall be followed.

3.4 INSTALLATION OF VALVES

A. All valves shall be installed in locations that are reasonably accessible without the use of a ladder unless otherwise indicated on the drawings (such as in the case of valves equipped with chain operators).

B. Drain Valves: Install at each mechanical equipment item located to completely drain equipment for service or repair. Install at base of each riser, at base of each rise or drop, and elsewhere as indicated or required to completely drain each piping system

C. Check Valves: Install on the discharge side of each pump and elsewhere as indicated.

3.5 INSTALLATION OF HYDRONIC ACCESSORIES

A. Balance Valves: Install balance valves on each hydronic terminal and elsewhere as indicated. After hydronic system balancing has been completed, mark each balance valve with stripe of yellow lacquer across body and stop plate to permanently mark final balanced position.

B. Manual Vent Valves: Install manual vent valves on each hydronic terminal at the highest point and on each hydronic piping drop in the direction of flow for mains, branches, runouts, and elsewhere as indicated on the drawings.

C. Automatic Vent Valves: Install automatic vent valves at the top of each hydronic riser and elsewhere as indicated on the drawings. Install a shutoff valve between each riser and vent valve, pipe the outlet to a suitable plumbing drain or as indicated on the drawings.

D. In-Line Air Separators:

1. Route piping to expansion tank with ¼ inch per foot upward slope towards tank.
2. Install drain valve on all air separators.

E. Bladder Type Expansion Tanks: Install diaphragm type expansion tanks on floor as indicated, in accordance with manufacturer's instructions. Vent and purge air from hydronic system and charge tank with proper air charge as indicated on the drawings. Coordinate the charge pressure with the fill pressure to ensure flow to highest coil in system.

F. Chemical Feeders: Install in upright position with top of funnel not more than 48 inches above finished floor. Install balance valve in pump discharge line to allow for adjustment of the desired flow out of the chemical feeder. Pipe drain to nearest plumbing drain or as indicated.

G. Pressure Reducing Valves: Install for each heat exchanger as indicated and in accordance with manufacturer's installation instructions.

3.6 TESTING OF PIPING

A. Test piping in accordance with the following schedule. There shall be no loss in pressure and no visible leaks after a minimum duration of four hours at the test pressures indicated.

System Tested	Test Pressure	Test With
Chilled Water Piping Heating Water Piping (250°F & Under) Heat Pump Loop Water Piping	150 psi at rough-in and 100 psi after equipment connection	Water

3.7 FLUSHING, CLEANING, AND TREATING HYDRONIC PIPING SYSTEMS AND EQUIPMENT

A. System Preparation

1. The piping system shall be complete prior to flushing, cleaning, and treating.
2. Place all manual valves, pressure regulating valves, and control valves in the open position during flushing and cleaning so that circulation through the entire system is accomplished.
3. Provide temporary pumps when indicated on the drawings and/or when necessary to protect the new pumps from contamination/debris in an existing piping system.

B. Flushing, Cleaning, and Treatment Sequence

1. The flushing, cleaning, and treatment procedures shall be scheduled in advance with the Engineer, Owner, and Commissioning Agent to allow for observation/witnessing as deemed appropriate. See Section 232500 (Chemical Treatment) for chemical treatment requirements.

2. On projects with distribution to/from a ground source bore field, the ground loop piping shall be flushed and cleaned prior to connecting the ground loop to the piping inside the building. See Specification Section 239920 (Ground Loop Flushing and Purging) for additional requirements.
3. Initial Flush
   a. 1st Filling: Completely fill the entire system with fresh water and circulate at approximately 5 feet per second (velocity in the main piping) for a minimum of 4 hours.
   b. The initial flush shall be sufficient to remove all contaminants such as cuttings, filings, loose rust and scale, welding and soldering residue and debris.
   c. 2nd Filling: Drain the entire system and refill with fresh water.
4. Cleaning Flush
   1. Add a concentrated chemical cleaner to the piping system. Cleaner shall be a solution consisting of 2 lbs trisodium phosphate for each 1,000 lbs of water contained in the system. Test the solution for proper concentration and document the results.
   2. Circulate the trisodium phosphate solution at approximately 5 feet per second (velocity in the main piping) for a minimum of 2 hours.
   3. Completely drain the entire system.
5. 3rd Filling: Refill the entire system with fresh water. With the circulation pump(s) running, open drain(s) as far downstream as possible from the fill point. Ensure that the make-up water is sufficient to keep up with the draining to maintain a full system.
   a. Blow down all strainers, dead legs, and low points in the system.
   b. Continue to flush the system in this manner until the drain water is of the same clarity as the make-up water and testing reveals no further traces of cleaning solution (flush for a minimum of 1 hour). Document the results.
   c. Following the fresh water flush, drain the entire system.
   d. Remove, clean, and reinstall all strainer screens, and then fill and treat the entire system. Log photos of the before and after condition of all strainer screens in the system and submit the photos to the Engineer and Owner.

3.8 EQUIPMENT CONNECTIONS

A. Connect hydronic piping system to mechanical equipment as indicated, and comply with equipment manufacturer's instructions where not otherwise indicated. Install shutoff valve and union on supply and return; drain valve on drain connection.

3.9 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in satisfactory operating condition.

3.10 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.11 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 21 10 - COPPER PIPING WITH PRESS FITTINGS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

B. Section 232100 (Hydronic Piping and Accessories) is hereby made a part of this section.

1.2 REFERENCE STANDARDS

A. ASME B16.51 - Copper and Copper Alloy Press-Connect Pressure Fittings

B. ASTM B75 - Standard Specification for Seamless Copper Tube

C. ASTM B88 - Standard Specification for Seamless Copper Water Tube

D. ASTM F3226 - Standard Specification for Metallic Press-Connect Fittings for Piping & Tubing

E. IAPMO PS 117 - Press and Nail Connections

F. ASTM E 84 - Standard Test Method for Surface Burning Characteristics of Building Materials

1.3 SEISMIC COMPLIANCE

A. All press fittings shall have seismic certification complying with IBC Section 1705.13.2/3. Certification shall be in accordance with the ICC Evaluation Service Seismic Certification (AC156), or approved equal.

1.4 QUALITY ASSURANCE

A. Installer Qualifications

1. Installers shall attend a manufacturer’s installation training class and be certified as having been trained and qualified to join piping with press-connect fittings. On-site training and credentialing by a manufacturer’s representative is acceptable.
2. Installers shall be qualified, trained, and certified in the installation of press-connect fittings.
3. Press-connect fittings shall be installed using proper tools, actuators, jaws, and rings as approved by the manufacturer.

1.5 WARRANTY

A. The warranty period for Viega ProPress fittings shall be 50 years from the date of installation, and shall cover any labor and material costs caused by failure of a properly installed fitting.

1.6 SUBMITTALS

A. Submittals shall include information indicating all press fittings, all press tools, and copies of the training certifications for all individuals that are planned to install press fittings on the project.

PART 2 - PRODUCTS

2.1 GENERAL

A. Copper piping with press fittings shall be utilized only when and where specifically identified on the drawings and shall be limited to a maximum pipe size of 2 inches.

2.2 VIEGA PROPRESS PIPE AND FITTINGS

A. Viega ProPress Copper and Cast Copper Alloy Press-Connect Fittings
   1. Viega Press-Connect Fittings are approved for use with copper tubing conforming to ASTM B88 or B75. See Specification Section 232100 (Hydronic Piping and Accessories) for acceptable pipe materials.
   2. Conform to ASME B16.51, ASTM F3226, IAPMO PS-117, NSF 61, and NSF 372. Copper alloy fittings shall be zero lead silicon bronze alloy C87710 (cast) or C88700 (machined). Bismuth bronze or yellow brass fittings are not acceptable.
   3. Peroxidically cured EPDM elastomeric sealing element rated to 300 psi with a temperature range of 0°F thru 250°F. Sealing element shall be uniform in size/thickness and shall be free from manufactured deformities or indentations.
   4. Press-Connect fittings shall have the 'Viega Smart Connect' feature integral to the fitting body to detect unpressed fittings during the testing process.
   5. Provide color coded markings on exterior of fitting for readily identifying/inspecting sealing element type.
   6. Approved Fitting Manufacturer: Viega, or approved equal.

B. Approved Tool Manufacturers for Installation of Press-Connect Fittings
   1. Viega, Milwaukee, and/or Rigid.

PART 3 - EXECUTION

3.1 INSTALLATION REQUIREMENTS

A. Join copper tube and press-connect fittings with tools recommended by the fitting manufacturer. The manufacturer's installation instructions shall be strictly adhered to.
   1. All connections shall bear full insertion marks on the tubing.
   2. Special attention shall be given to the required two step pressure test.
   3. Perform an initial 'Viega Smart Connect' test for unpressed fitting detection per the manufacturer's installation manual.
   4. The installer shall use an indelible marker to place their initials on the copper pipe immediately adjacent to each completed press fitting, prior to any insulation being installed.
   5. Training certificates for any individual installing press fittings shall be available on site for review by the Engineer and/or Owner.

3.2 TESTING OF PIPING

A. Test piping at completion of roughing in, in accordance with the following schedule, and show no loss in pressure or visible leaks after a minimum duration of four hours at the test pressures indicated.

TEST SCHEDULE

Systems Tested

Chilled Water Piping

Heating Water Piping (250°F and under)

Heat Pump Loop Water Piping

Test Pressure	Test Medium
150 psi at rough-in	Water
100 psi after equipment connection	Water

3.3 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in satisfactory operating condition.

END OF SECTION

SECTION 23 21 20 - PRE-INSULATED UNDERGROUND HOT WATER PIPING (POLYPROPYLENE)

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Buried piping with thermal pipe insulation as indicated on the drawings and herein.

B. Miscellaneous incidental labor and materials required to complete the installation of field applied exterior insulation on the entire piping system.

1.3 QUALITY ASSURANCE

A. Piping and insulation manufacturers must be firms regularly engaged in the manufacture of the specified piping and insulation products of size and type required, and whose product has been in satisfactory use in similar service for not less than 10 years.

B. The installing Contractor must have at least 3 years of successful installation experience on projects with underground piping systems.

C. Provide the services of a manufacturer-trained representative for two site visits. The first shall include pre-installation training and installation training immediately prior to beginning initial pipe burial. The second visit shall be to observe the installed piping system prior to burial and during pressure testing. Provide a written report to the Owner and Engineer identifying the results of each site visit, observations made, and a summary of the training provided.

1.4 MANUFACTURER'S WARRANTY

A. The piping system manufacturer shall warrant all pipe and fittings for a minimum of 25 years to be free of defects in materials and workmanship. Insurance shall be provided by a third party world-wide insurance company. The piping system warranty shall cover labor and material costs for repairing and/or replacing defective materials. Such costs shall include costs for repairing incidental damage, and financial losses due to the expense of repair or removal of damage or personal injury caused by failure of the piping system due to defects in materials or workmanship.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver insulation, associated adhesives, form work, and supplementary steel to the project site in manufacturer's containers with manufacturer's stamp or label clearly shown.

B. Protect piping, insulation, packaging, and associated components against sun, dirt, water, and chemical damage.

PART 2 - PRODUCTS

2.1 POLYPROPYLENE PIPING BELOW GRADE

A. Subject to compliance with requirements, manufacturers offering piping products which may be incorporated in the work include the following, or approved equal:

Aquatechnik
Aquatherm
Niron

B. Provide pipe and fittings based on the following listing as applicable to the associated system temperature and pressure ratings indicated on the drawings. The ratings listed below are based on a 25 year lifetime and a 1.25 safety factor. Fittings shall have equal to or greater wall thickness, temperature, and pressure rating as the specified piping.

SDR-11 PP-RCT (available in pipe sizes 1" through 16")
Rated for 116 psi at 180°F
Rated for 140 psi at 160°F

C. Field service shall be provided by a certified manufacturer's representative or company field service technician. The representative/technician shall be available at the job a minimum of two days (or more if appropriate for the job size) to check unloading, storing, and handling of piping, piping installation, pressure testing, field joint insulation, and backfilling techniques.

D. Polypropylene Pipe and Fittings
   1. Piping shall be manufactured from a polypropylene random co-polymer, PP-RCT resin meeting the short term properties and long term strength and pressure requirements of ASTM F2389. The piping shall contain no rework or recycled materials and shall be manufactured only from virgin resins. All piping shall be made using a three layer extrusion process.
   2. Domestic hot and cold water piping shall comply with the requirements of ASTM F2389.
   3. Domestic hot water piping shall be specifically manufactured to restrict thermal expansion (containing a fiber or faser layer).
   4. All fittings shall be socket fusion type.
   5. All fittings and components shall have a wall thickness and pressure rating equal to or greater than the operating pressure of the overall system that they are connected to.
   6. All fittings through 10" diameter shall be injection molded, unless otherwise approved in writing as a 'custom fitting' and shall be manufactured from a high quality polypropylene random co-polymer, PP-R Super 80 SDR5 resin meeting the short term properties and long term strength requirements of ASTM F2389. The fittings shall contain no rework or recycled materials and shall be manufactured only from virgin resins. All fittings shall be certified as complying with ASTM F2389.
   7. Fittings larger than 10" diameter shall be fabricated using the same piping material furnished for the piping application and complying with ASTM F2389.
   8. Any PP-RCT piping installed inside a building shall be wrapped or insulated to comply with the flame and smoke spread ratings listed in ASTM E84.

E. Insulation for Polypropylene Pipe and Fittings
   1. Pre-insulated pipe shall be a complete system of factory pre-insulated polypropylene piping for the specified service.
   2. Insulation thickness for all pipe sizes shall comply with the requirements of International Energy Conservation Code Section C403.11.3 (including footnote 'c' related to buried piping).
   3. Insulation shall be polyurethane foam either spray applied or injected with one shot into the annular space between the carrier pipe and jacket. Insulation shall be rigid 90-95% closed cell polyurethane, with 2.0 to 3.0 pounds per cubic foot density, a coefficient of thermal conductivity (k-Factor) of 0.16, and shall conform to ASTM C591.
   4. Jacketing material shall be either schedule 40 PVC or extruded, black, high density polyethylene (HDPE) having a minimum wall thickness of 100 mils for jacket sizes less than or equal to 12", and 125 mils for jacket sizes larger than 12".
   5. Buried valves shall be insulated with removable and reusable insulating jackets (See Specification Section 230700-2.15B (Removable Pump Insulating Jackets).

PART 3 - EXECUTION

3.1 PIPING INSTALLATION

A. The drawings, schematics, details, and diagrams indicate the general location and arrangement of piping systems. Indicate piping locations and arrangements if such were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to the layout are noted and approved on the Contractor's shop drawings.

B. Installers shall be trained and certified to install the piping per the manufacturer's guidelines.

C. Remove any standing water in the bottom of the trench.

D. Do not backfill piping trench until field quality control testing has been completed and the results have been approved.

E. Pipe trench shall have a minimum of 6" of sand or pea gravel placed above, below, and on both sides of the pre-insulated piping.

F. Install piping at uniform grade of 0.2 percent. Install drains (consisting of a tee fitting, 3/4" ball valve, and short 3/4" threaded nipple with cap) at all low points and elsewhere as required for complete system drainage. Install manual air vents at all high points.

G. All components shall have a pressure rating equal to or greater than the system operating pressure.

H. Install polypropylene piping free of sags and/or bends.

I. Thrust blocks are not required for polypropylene piping.

J. Expansion loops are not required for direct buried underground polypropylene piping.

3.2 FIELD QUALITY CONTROL

A. While still accessible all piping shall be pressure and leak tested to the manufacturer's standards. Tests shall be carried out using water, compressed air, or a mixture of the two. The test pressure shall be as indicated in the pressure and leak testing procedures published by the manufacturer. Any leaks detected shall be repaired at the Contractor's expense by removing the leaking part and replacing with new parts welded per the pipe manufacturer's guidelines. See manufacturer's literature for additional details and forms.

B. Prepare test and inspection reports and deliver the reports to the Architect/Engineer, the Owner, and the Manufacturer as required to obtain the product warranty. Provide warranty documents to the Owner.

3.3 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 21 80 - SNOW AND ICE MELT PIPING AND ACCESSORIES

PART 1 - GENERAL

1.1 SUMMARY

A. Snow and ice melting systems (SIM), where shown on the drawings and equipment schedules, shall be hydronic, and shall include the following:
   1. Crosslinked polyethylene (PEX) piping.
   2. Distribution manifold(s) with balancing and flow control valves where required.
   3. Pipe-to-manifold compression nut fittings.
   4. Pipe fasteners as approved by the manufacturer of the PEX piping.
   5. Controls.
   6. Field supervision and engineering as required for the complete and proper function of the entire system.

1.2 STANDARDS AND REFERENCES

A. Publications listed here are part of this specification to the extent they are referenced. Where no specific edition of the standard or publication is identified, the current edition shall apply.

B. American Society for Testing and Materials
   1. ASTM E84: Standard Test Method for the Surface Burning Characteristics of Building Materials.
   2. ASTM F876: Standard Specification for Crosslinked Polyethylene (PEX) Tubing.
   3. ASTM F877: Standard Specification for Crosslinked Polyethylene (PEX) Plastic Hot and Cold Water Distribution Systems.
   4. ASSE 1061: Potable Water Brass Push-Fit Fittings.
   5. ASTM F1807: Metal Insert Fitting Assembled with Copper Crimp Rings.
   6. ASTM F1960: Cold Expansion Fittings, Metal and Polymer, with PEX Reinforcing Rings.
   7. ASTM F2080: Cold Expansion Fitting with Metal Compression Sleeve.
   8. ASTM F2098: Stainless Steel Clamps with ASTM F1807 Brass Insert Fittings.
   9. ASTM F2159: Plastic Insert Fittings Assembled with Copper Crimp Rings.
   10. ASTM F3347: Metal Insert Fitting with Stainless Steel Press Sleeve.
   11. ASTM F3348: Polymer Insert Fitting with Stainless Steel Press Sleeve.

C. Canadian Standards Association
   1. CSA B137.5: Crosslinked Polyethylene (PEX) Tubing Systems for Pressure Applications.
   2. CSA B214: Installation Code for Hydronic Heating Systems.

D. International Organization for Standardization
   1. ISO 9001: Quality Management Systems - Requirements.

E. Underwriters Laboratories of Canada
   1. CAN/ULC S102.2: Surface Burning Characteristics of Flooring, Floor Covering and Miscellaneous Materials.
   2. CAN/ULC S101: Standard Methods of Fire Endurance Tests of Building Construction and Materials.

F. Plastic Pipe Institute
   1. PPI TR-3: Policies and Procedures for Developing Hydrostatic Design Basis (HDB), Pressure Design Basis (PDB), Strength Design Basis (SDB), and Minimum Required Strength (MRS) Ratings for Thermoplastic Piping Materials or Pipe.

1.3 DEFINITIONS

A. Crosslinked polyethylene, commonly abbreviated PEX, is made from high density polyethylene (HDPE). Crosslinking is accomplished during manufacturing. Crosslinking enhances the physical & mechanical properties of the polymer. The high temperature properties are improved. Chemical resistance is enhanced by resisting dissolution. Low temperature properties are also improved; its impact and tensile strength, scratch resistance, and resistance to brittle fracture are enhanced.

B. The PEX piping shall be crosslinked polyethylene tubing that is outside-diameter-controlled, made in standard thermoplastic tubing dimension ratios, and pressure rated for water at three temperatures. This specification covers one PEX tubing material in one standard dimension ratio, having pressure ratings for water at various temperatures. The pressure ratings decrease as the temperature increases. PEX tubing shall be made from polyethylene compounds which have been crosslinked by peroxides, azo or silane compounds in extrusion, by electron beam after extrusion, or by other means such that the tubing meets the specified performance requirements. The following tests shall be performed: dimension and tolerance testing; density testing; sustained pressure testing; burst pressure testing; environmental stress cracking testing; degree of crosslinking testing; stabilizer functionality testing; and oxidative stability testing in potable chlorinated water applications.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's Technical Manual, submittal forms, catalog cuts, brochures, specifications, and installation instructions. Submit data in sufficient detail to indicate compliance with the contract documents.
   1. Submit manufacturer's instructions for installation.
   2. Submit data for equipment, fittings, fasteners, and associated items necessary for the installation of the piping and manifolds.

B. Submit computer generated SIM system design indicating heat flux, pipe sizing, spacing, flow rates and temperatures. SIM design calculations shall be performed on pipe manufacturer’s software.

C. Drawings: Provide plans drawn to scale for all installation areas.
   1. Indicate dimensions, descriptions of materials, general construction, component connections, anchorage methods, and installation procedures.
   2. Indicate design, schematic layout of system, including equipment, critical dimensions, and piping/slab penetration details as well as details for protecting exposed PEX piping.

D. Certification
   1. Submit independent certification results for the piping systems from an accredited independent testing laboratory.
   2. The design shall be approved by a professional appropriately licensed in the jurisdiction where the installation will take place, as being complete and accurate.
   3. Fittings shall be third party certified to applicable referenced standards as part of the manufacturer’s PEX piping system, with independent listings from NSF, CSA and ICC, as applicable.

E. Maintenance Instructions: Submit instructions for finished product maintenance.

1.5 QUALITY ASSURANCE

A. System manufacturer must be a company specializing in the work of this section with a minimum of 5 years documented experience.

B. Pipe shall be manufactured in a facility where the quality management system is ISO 9001 certified.

C. Crosslinked polyethylene (PEX) pipe shall conform and be certified to ASTM F876, F877, and CSA B137.5, and shall have the PPI TR-3 listing. Pipes with an oxygen diffusion barrier shall conform to the requirements for oxygen permeability (DIN 4726).

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver and store piping and equipment in shipping containers with labeling in place. Pipe shall be kept in original shipping boxes until required for installation.

B. Store piping and equipment in a safe, dry, enclosed, under cover, and well ventilated area.
   1. Do not expose pipe to ultraviolet light beyond the exposure limits recommended by manufacturer.
   2. Protect piping and manifolds from entry of contaminating materials. Install suitable plugs in open pipe ends until installation.
   3. Where possible, connect pipes to assembled manifolds to eliminate the possibility of contaminants and cross connections.
   4. Piping shall not be dragged across the ground or other surfaces, and shall be stored on a flat surface with no sharp edges.

C. Protect materials from damage by other trades.

D. Pipe shall be protected from oil, grease, paint, direct sunlight, and other elements as recommended by manufacturer.

1.7 WARRANTY

A. Provide manufacturer's standard written warranty.
   1. To repairing or replacing the defective product in question or providing a refund of the defective product’s purchase price.
   2. The radiant heating pipe manufacturer shall warrant the crosslinked polyethylene piping to be free from defects in material and workmanship for a period of 25 years.
   3. Cold expansion compression sleeve fittings shall be warranted to be free from defects in material and workmanship for a period of 25 years.
   4. All manifolds, distribution headers, thermostats, and actuators shall be warranted to be free from defects in material and workmanship for a period of 2 years starting at completion of successful pressurized water tests immediately following system installation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Acceptable Manufacturers: Subject to compliance with requirements, manufacturers offering products which may be incorporated in the work include the following, or approved equal:

   Rehau
   Uponor
   Viega

2.2 PIPING

A. Snow and ice melt system pipe shall be high density crosslinked polyethylene (PEX). Pipe shall conform to ASTM F876, ASTM F877, and CSA B137.5.

B. Pipe shall be rated for continuous operation of 100 psi pressure at 180°F temperature and 80 psi pressure at 200°F.

C. When required, pipe shall have a co-extruded oxygen diffusion barrier capable of limiting oxygen diffusion through the pipe to less than 0.32 mg/m^2/day at 104°F water temperature in accordance with DIN 4726.

D. Bend Radius: The minimum bend radius for cold bending of the pipe shall be not less than 5 times the outside diameter. Bends with a radius less than 5 times the outside diameter shall require the use of a bending template as supplied by the pipe manufacturer, and/or hot air.

E. Pipe shall have a flame spread index and smoke developed index complying with ASTM E84.

F. Fittings shall be third party certified to the standards listed in Section 1.2 (Standards and References), as applicable.

G. Compression nut manifold fittings shall be manufactured of brass with a barbed insert and a reusable split compression ring.

H. Compression sleeve fittings shall be manufactured of brass and shall be approved by the piping manufacturer to be part of a proven cataloged system.

I. Fittings embedded within the thermal mass or encased behind walls or ceilings shall be protected from external environmental conditions.

J. For indoor piping, see specification section 23 21 00 Hydronic Piping and Accessories.

2.3 MANIFOLDS

A. Material: Distribution manifolds shall be manufactured of brass or copper and be supplied by the piping manufacturer as a proven cataloged part of the manufacturer's system.

B. Brass manifolds shall be produced from extruded brass round pipe with tapped holes for connections, and be pre-assembled by the manufacturer. 100% of manifolds used shall have been air tested by the manufacturer with no indication of leaks.

C. Balancing Manifolds

1. Where required by design, brass balancing manifolds shall be equipped with integral visual flow gauges, circuit balancing and flow control valves, isolation valves with integral thermometer housings, and air vent/fill ports.
2. Each circuit valve shall be supplied with a manual actuating handle for filling/purging operation.

D. Copper Manifolds

1. Copper manifolds shall be manufactured from Type L copper.
2. Copper and/or brass outlets shall be high temperature brazed (lead free) into headers.

2.4 INSULATION

A. Snow and ice melt piping shall be installed with a minimum of R-10 insulation directly beneath the piping, and a 15 mil vapor barrier directly below the insulation.

B. Insulation shall extend a minimum of 12 inches on all sides of each pipe.

C. Insulation for non-traffic rated areas shall be 2” thick Owens Corning Foamular NGX-400, or approved equal, with a compressive strength of 40 psi in accordance with ASTM D2863. Insulation shall have a minimum thermal resistance of R-5.0 per inch at 75°F.

D. Insulation for traffic rated areas shall be 2” thick Owens Corning Foamular NGX-1000, or approved equal, with a compressive strength of 100 psi in accordance with ASTM D2863. Insulation shall have a minimum thermal resistance of R-5.0 per inch at 75°F.

2.5 CONTROLS

A. Automatic SIM Detector and Melting Controls

1. SIM control shall use low voltage devices to monitor outdoor ambient, slab, fluid supply and/or return temperatures, as well as an automatic snow and ice detector to detect moisture in the SIM zone.
2. The SIM controller shall have a BACnet connection interface capability.
3. SIM control shall be capable of maintaining a set temperature in a SIM slab or thermal mass, with adjustable settings for idle and melting mode.
4. Connection to output devices shall be per the manufacturer’s installation instructions for the SIM control system, as part of a proven cataloged system.

PART 3 - EXECUTION

3.1 ACCEPTABLE INSTALLERS

A. As a minimum, installation shall be performed by qualified laborers trained by the manufacturer in the procedures of PEX SIM systems and appropriately licensed for the local jurisdiction.

B. Examine areas and conditions under which the work of this section will be performed. Correct conditions detrimental to timely and proper completion of Work. Do not proceed until all unsatisfactory conditions are corrected.

C. Beginning of installation means acceptance of existing conditions.

3.2 PREPARATION

A. Coordinate with related trades and manufacturer’s recommendations with regard to installation in conjunction with the following:

1. Reinforcing wire mesh or rebar.
2. Precast or existing concrete subgrade.
3. Asphalt or other hot mix.
4. Patio pavers.
5. Preparation of space for manifold installation.
6. Mounting outdoors or in an unheated indoor environment.

3.3 INSTALLATION

A. Install in accordance with manufacturer's published installation manual, published guidelines, and final drawings.

B. Mount manifolds in the locations indicated. Manifolds shall be mounted as level as possible.

C. Route piping in an orderly manner, according to layout and spacing shown in final drawings.

D. At connections and fittings, use a plastic pipe cutter to ensure square and clean cuts, and join pipes immediately or cap ends of pipe to seal from contaminants. Where fittings are installed within the thermal mass, they shall be wrapped in chloride-free tape or sealed within a heat shrink material approved by the manufacturer.

E. Pipe shall be dispensed using a suitable uncoiling device. Remove twists prior to securing pipe. Pipe shall lie flat on an even plane. Finished grade of a thermal mass shall be a minimum of 3/4 inches above the top of PEX heating pipes. Fasten piping at no more than 3 foot intervals, being careful not to twist the pipe. In thin concrete slabs, secure piping every 2 feet. Use only fasteners supplied or approved by the manufacturer of the PEX pipe.

F. Piping that shall pass through expansion joints shall be covered in protective polyethylene convoluted sleeving (flexible conduit) extending 15 inches on each side of the joint. Sleeving shall be secured on pipe to prevent movement during installation of thermal mass.

G. Where piping exits the thermal mass, a protective conduit shall be placed around the pipe, with the conduit extending a minimum of 6 inches into the floor and exiting by a minimum of 6 inches. For penetrations at manifolds, use rigid PVC bend guides secured in place to prevent movement.

H. At the time of installation of each circuit of pipe, connect the pipe to the correct manifold outlet and record pipe length for balancing. If manifold is not installed, cap the end of the pipe and label the pipe's circuit numbers along with S for supply and R for return. Connect pipes to manifold as soon as possible and record circuit lengths. Circuits shall be labeled to indicate circuit length and serviced area.

I. The installer shall confirm minimum and maximum exposure temperatures for the substrate material (thermal mass) and shall ensure proper SIM operating temperatures.

3.4 FIELD QUALITY CONTROL

A. Filling, Testing & Balancing: Tests of hydronic heating systems shall comply with authorities having jurisdiction, and, where required, shall be witnessed by the building official.

B. Pressure gauges used shall show pressure increments of 1 psi and shall be located at or near the lowest points in the distribution system.

C. Air Test
   1. Charge the completed, yet unconcealed pipes with air at a minimum of 40 psi.
   2. Do not exceed 150 psi.
   3. Use liquid gas detector or soap solution to check for leakage at manifold connections.

D. Water Test
   1. Purge air from pipes.
   2. Charge the completed, yet unconcealed pipes with water.
   3. Take necessary precautions to prevent water from freezing.
   4. Check the system for leakage, especially at pipe joints.

E. Perform a preliminary pressure test pressurizing the system to the greater of 1.5 times the maximum operating pressure or 100 psi for 30 minutes.
   1. As the piping expands, restore pressure, first at 10 minutes into the test and again at 20 minutes.
   2. At the end of the 30 minute preliminary test, pressure shall not fall by more than 8 psi from the maximum, and there shall be no leakage.

F. After successfully performing the preliminary test, perform the main pressure test immediately.
   1. The main pressure test shall last 2 hours.
   2. The test pressure shall be restored and shall not fall more than 3 psi after 2 hours.
   3. No leakage shall be detected.

G. Pressure shall be maintained and monitored during installation of the thermal mass.
   1. If any leak is detected during installation of thermal mass, leak shall be found immediately and the area cleared for repair using manufacturer’s approved repair coupling.
   2. Retest before covering repair.

H. Complete inspections and furnish test reports supplied by the manufacturer of the system.

I. All low voltage equipment shall be tested. The following items shall be checked at a minimum:
   1. Inputs
   2. Outputs
   3. Sequence of Operation

3.5 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in satisfactory operating condition.

3.6 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.7 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 22 00 - HYDRONIC PUMPS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. This section includes various pump types and pump accessories.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications: Firms regularly engaged in manufacture of hydronic piping products of types, materials, and sizes required, whose products have been in satisfactory use in similar service for not less than 5 years.

B. Acceptable Manufacturers: Subject to compliance with requirements, manufacturers offering pumping equipment which may be incorporated in the work include the following, or approved equal:

Taco
Bell and Gossett
Grundfos

C. UL Compliance: Provide electric components for pumps which have been listed by Underwriters Laboratories.

D. Codes and Standards

1. ASME Compliance: Fabricate and install hydronic piping in accordance with ASME B31.9 (Code for Building Services Piping).
2. UMC Compliance: Fabricate and install hydronic piping in accordance with the Uniform Mechanical Code.

1.4 SUBMITTALS

A. As-Built Drawings: At project closeout, submit as-built drawings of installed hydronic pumps, piping, and hydronic specialties in accordance with all associated requirements.

B. Operation and Maintenance Data

1. Submit operation and maintenance data and parts lists for each type of pump, control, and accessory, including trouble-shooting maintenance guide. Include this data and product data in the operation and maintenance manual, in accordance with all associated requirements.

C. Product Data

1. Submit manufacturers pump specifications, installation and start-up instructions, and current accurate pump characteristic performance curves with selection points clearly indicated. Pump efficiencies, as well as construction, will be taken into consideration.
2. Submit manufacturer's technical product data and installation instructions for each type of hydronic specialty.

PART 2 - PRODUCTS

2.1 HYDRONIC PUMPS

A. General: Provide factory tested pumps, thoroughly cleaned, and painted with one coat of machinery enamel prior to shipment. Type, size, and capacity of each pump as listed in pump schedule. Provide pumps of same type by same manufacturer.

B. Motors (Open Drip Proof): Provide motors, which are non-overloading at any point on the pump curve, with built in overload protection on single phase motors. The scheduled motor horsepowers are evaluated minimums and larger motors shall be submitted and furnished if necessary to meet the non-overloading requirement. Pump motors shall be premium efficiency type as defined in NEMA MG1.

C. Vertical Split-Coupled Inline Pumps (VFD Compatible)

1. Pump capacities and characteristics shall be as identified on the plans and in the pump schedules. Pumps shall be Taco Model KS, or approved equal. Pumps shall be single stage end suction rear pull out design. The seal shall be serviceable without disturbing the piping connections.
2. Pump casing shall be constructed of ASTM A48 Class 30 cast iron. Pump casing/volute shall be rated for 250 psi working pressure. The pump flanges shall be matched to suit the working pressure of the associated piping components with either ANSI Class 125 flanges or ANSI Class 250 flanges.
3. The pump casing shall be drilled and tapped for gauge ports on both the suction and discharge connections and for a drain port at the bottom of the casing. The pump casing shall have an additional tapping on the discharge connection to allow for the installation of a seal flush line. The pump cover shall be drilled and tapped to accommodate a seal flush line which can be connected to the corresponding tapping on the discharge connection, or to an external source to facilitate cooling and flushing of the seal faces.
4. All casings shall be flanged. Threaded casings are not allowed unless extra unions and fittings are provided with the pump to allow servicing.
5. The pump shall have a factory installed vent/flush line to ensure removal of trapped air from the casing and provide mechanical seal cooling. The vent/flush line shall run from the seal chamber to the pump discharge.
6. The impeller shall be ASTM B584-836/875 bronze and shall be hydraulically balanced. The impeller shall be dynamically balanced to ANSI Grade G6.3 and shall be fitted to the shaft with a key. The impeller shall be cast by the hydraulically efficient lost foam technique to ensure repeatability of high quality.
7. The pump shall be manufactured with an ASTM A582 Type 416T or ASTM A582 Type 410T stainless steel shaft.
8. The pump shall be fitted with a single mechanical seal, with EPT elastomers and carbon/ceramic faces, rated up to 250°F. The seal must be capable of being flushed externally via a tapping in the pump cover adjacent to the seal cavity.
9. The pump shall be coupled via a high tensile aluminum split style coupling. The design must permit easy replacement of the mechanical shaft seal without removal of the motor. The motor mount must be designed to accept several different motor frame standards.
10. In order to both simplify and reduce the total cost of ownership, the manufacturer shall standardize on no more than three sizes of mechanical seals throughout the entire range of the family of pumps. The manufacturer shall not use multiple part numbers for the same part.

D. Close-Coupled In-Line Pumps (VFD Compatible)

1. Pump capacities and characteristics shall be as identified on the plans and in the pump schedule(s). Pumps shall be Taco Model KV, or approved equal. Pumps shall be centrifugal, overhung-impeller, close-coupled, in-line type, designed for installation with the pump and motor shafts mounted horizontally or vertically.
2. Pump casing shall be radially split, cast iron, with threaded gauge tappings at inlet and outlet, replaceable bronze wear rings, and companion-flange connections.
3. Pump impeller shall be Type 304 stainless steel or cast bronze**,** statically and dynamically balanced, keyed to shaft, and secured with a stainless steel locking cap screw. For pumps that are not variable frequency drive controlled, trim the impeller to match the specified performance.
4. Pump shaft sleeve shall be bronze.
5. Pump seal shall be a mechanical seal consisting of ceramic/EPT or silicon carbide/EPT Include water slinger on the shaft between the motor and the seal.
6. Seal Flushing: Flush, cool, and lubricate pump seal by directing pump discharge water to flow over the seal.
7. All pump suctions shall be fitted with a multi-function inlet suction diffuser fitting. The suction diffuser body and cover plate shall be ductile iron and be rated for 250 psi. The diffuser flanges shall be matched to suit the working pressure of the piping components; with either ANSI Class 125 flanges or ANSI Class 250 flanges.
8. The pump suction diffuser shall include the following components: full length stainless steel straightening vanes, permanent stainless steel strainer, disposable 16 mesh bronze startup strainer, blow-down ports, and metering ports. For pumps where a suction diffuser is not installed there shall be five pipe diameters of straight undisturbed flow entering the pump suction. Suction diffusers shall be a Taco Model SD, or approved equal.
9. Change start-up strainers to permanent strainers upon acceptance by the Owner and Engineer. Provide a blow-down valve on each strainer and terminate with hose thread fitting or extend blow-down piping to the nearest floor sink.
10. Motor shall be totally enclosed, fan cooled or open, drip proof as scheduled, and shall be NEMA premium efficiency as defined in NEMA MG1.

E. Close-Coupled In-Line Pumps (with EC Motor)

1. Pump capacities and characteristics shall be as identified on the plans and in the pump schedule(s). Pumps shall be Taco Viridian Series, Taco 1900E Series, Grundfos Model Magna3, or approved equal. Pumps shall be variable speed, EC Motor, in-line type, designed for installation with the pump mounted horizontally or vertically.
2. Pump casing shall be cast or ductile iron (stainless steel for potable water applications) with threaded gauge tappings at inlet and outlet.
3. Pump impeller shall be stainless steel or composite**,** statically and dynamically balanced, with a stainless steel shaft.
4. Pump shall include a digital display, 0-10 volt dc control input for the EC motor, and a status indicating light.

F. Pump Accessories and Installation

1. All pumps shall be fitted with suction and discharge isolation valves, flexible connections, and a check valve to prevent reverse flow.
2. Check valves 2-1/2” and larger shall be iron body, silent, vertical spring type, Nibco Model F-910, Titan Model CV-50-DI, or approved equal. Check valves 2” and smaller shall be bronze or brass body, silent, vertical spring type, Nibco Model T-480, Titan Model CV-20-BR, or approved equal.
3. All pumps shall be fitted with one 4-1/2” dial pressure gauge piped to the inlet and outlet pump flanges. The gauge shall be isolated from each flange via 1/4” ball valves. The gauge is intended to be used to read the differential across the pump.

4. The Contractor shall install pumps in accordance with the pump manufacturer’s written instructions. The Contractor shall level and align each pump.
5. Pumps shall not be run dry to check rotation.
6. Pipe connections to pumps shall be made in a manner so as not to exert any stress on the pump housing(s). If necessary to meet this requirement, provide additional pipe supports.

PART 3 - EXECUTION

3.1 INSTALLATION OF PUMPS

A. Install pumps where indicated, in accordance with manufacturer's published instructions, complying with recognized industry practices to ensure that pumps comply with requirements and serve intended purposes.

B. Provide access space around pumps for service as indicated, but in no case less than that recommended by manufacturer.

C. Install base-mounted pumps on minimum of 4 inch high concrete pad, with anchor bolts poured in place. Set and level pump; grout under pump base with non-shrink grout. Provide drain line to nearest floor drain or floor sink.

D. Install in-line pumps with support from overhead structure on each side of pump, or as indicated on the drawings.

E. Piping shall be supported from the building structure so as to prevent any strain on the pump casings. A final check for perfect alignment of the piping connections shall be made after pump has been secured to its base. Provide valves, accessories, gauges, supports, and flexible connections, as indicated on the drawings and in these specifications.

F. Install electrical devices furnished by the pump manufacturer but not specified to be factory mounted. Coordinate the pump manufacturer's wiring diagram submittal with the electrical subcontractor.

G. Verify that the electrical wiring installation is in accordance with the pump manufacturer's submittal and with the installation requirements listed in Division 26. Do not proceed with equipment startup until the wiring installation is complete and correct.

H. Check alignment, and where necessary, realign shafts of motors and pumps within the recommended tolerances provided by the manufacturer.

I. Lubricate pumps before startup. Startup procedures shall be conducted in accordance with the manufacturer's written instructions.

J. Pumps shall not be connected to piping before piping is thoroughly flushed and cleaned of all dirt and grit. After piping connections have been made, systems shall be filled before starting pumps. Pumps shall not be run dry under any circumstances.

K. For base-mounted, end-suction pumps, comply with the requirements in ANSI HI standards for alignment of pump and motor shaft. Add shims to the motor feet and bolt the motor to the base frame. Do not use grout between motor feet and base frame.

L. For base-mounted, end-suction pumps, after alignment is correct, tighten foundation bolts evenly, but not too firmly. Completely fill the baseplate with non-shrink, non-metallic grout while metal blocks and shims or wedges are in place. After the grout has cured, fully tighten the foundation bolts.

M. Training: Provide a minimum of 4 hours of training and orientation of the Owner’s operating staff in proper care and operation of equipment, systems, and controls.

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in satisfactory operating condition.

3.3 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.4 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 23 00 - HEAT TRACING FOR HVAC PIPING

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

1.2 SUMMARY

A. Types of heat tracing specified in this section include the following:

Self-regulating, parallel resistance heat tracing with capacity, design, and accessories as scheduled on the drawings.

1.3 SUBMITTALS

A. Provide the following for each type of product.
   1. Shop drawings for electric heating cable.
   2. Field quality control reports.
   3. Operation and maintenance data.

PART 2 - PRODUCTS

2.1 SELF-REGULATING, PARALLEL RESISTANCE HEATING CABLES

A. Manufacturer shall be as follows, or approved equal:

Raychem/nVent
Chromolox
Thermon

B. Comply with IEEE Standard 515.1 (Standard for the Testing, Design, Installation, and Maintenance of Electrical Resistance Trace Heating for Commercial Applications).

C. Heating Element: Raychem XL-Trace, pair of parallel No. 16 AWG, nickel-coated, stranded copper bus wires embedded in cross-linked conductive polymer core, which varies heat output in response to temperature along its length. Cable shall be capable of crossing over itself once without overheating.

D. Electrical Insulating Jacket: Flame-retardant polyolefin.

E. Cable Cover: Tinned-copper braid and polyolefin outer jacket with ultraviolet inhibitor.

F. Maximum Operating Temperature (Power On): 150°F.

G. Maximum Exposure Temperature (Power Off): 185°F.

H. Electrical components, devices, and accessories shall be listed and labeled as defined in NFPA 70 by a qualified testing agency, and marked for the intended location and application.

2.2 CONTROLS

A. Provide Raychem ‘ProtoNode’, or approved equal, and C910-485 and ACS-30 controllers, as required for a complete and functional system with a BACnet Interface.

B. Provide an outdoor air temperature sensor with a 40°F setpoint.

C. Provide a remote temperature sensor for applications that require pipe temperature sensing.

2.3 ACCESSORIES

A. Cable Installation Accessories (Provided by Heat Tracing Manufacturer): Fiberglass cloth adhesive tape, Rayclic-PC power connection, RayClic-S splice kits, RayClic-T tee kits, and Rayclic-E end seals. Also provide Rayclic-SB-04 mounting brackets for installations involving fluid temperatures above 150°F.

B. Warning Labels: Continuously printed 'Electrical Heat Tracing' vinyl labeling, 3 mil minimum thickness, with pressure sensitive, permanent, waterproof, self-adhesive back.

1. Markers on pipes with outside diameter including Insulation of less than 6 Inches shall be 3/4 inch minimum width.
2. Markers on pipes with outside diameter including Insulation of 6 Inches and larger shall be 1-1/2 inch minimum width.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Prior to covering any heat tracing with insulation, the Engineer shall be given advance notice to allow for a field observation to be scheduled/conducted while the heat tracing is exposed.

B. Install electric heating cable across expansion joints according to manufacturer's written instructions; use slack cable to allow movement without damage to cable

C. Install electric heating cables after piping has been tested and before insulation is installed.

D. Install electric heating cables according to IEEE Standard 515.1 (Standard for the Testing, Design, Installation, and Maintenance of Electrical Resistance Trace Heating for Commercial Applications).

E. Install insulation over piping with electric heating cables according to Specification Section 230700 (HVAC Systems Insulation).

F. Terminate heat trace cables with waterproof, factory-assembled, non-heating leads with connectors at one end, and seal the opposite end water-tight.

G. Install warning tape on piping insulation where piping is equipped with electric heating cables.

H. Set all field adjustable switches and circuit breaker trip ranges.

I. Ground equipment according to the requirements listed in Division 26.

J. Connect wiring according to the requirements listed in Division 26.

3.2 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:

1. Perform tests after cable installation but before application of coverings such as insulation, wall, or ceiling construction, or concrete.
2. Test cables for electrical continuity and insulation integrity before energizing.
3. Test cables to verify rating and power input. Energize and measure voltage and current simultaneously.

B. Repeat tests for continuity, insulation resistance, and input power after applying thermal insulation on pipe mounted cables.

C. Cables will be considered defective if they do not pass the listed tests and inspections.

D. Prepare and submit test and inspection reports.

E. Remove and replace damaged heat tracing cables.

END OF SECTION

SECTION 23 24 00 - REFRIGERANT PIPING AND ACCESSORIES

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Refrigerant piping and accessories as indicated on the drawings and as specified herein.

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for refrigerant piping systems.

1.4 QUALITY ASSURANCE

A. Flammable refrigerant piping systems shall be installed and tested in strict accordance with ASHRAE Standard 15, including Sections 9.12 (Refrigerant Systems Installation) and 9.13 (Refrigerant Systems Testing).

B. For all flammable refrigerant systems containing 55 lbs or more of refrigerant, the installing contractor shall submit a certificate to the Architect/Engineer and the Owner verifying that the required strength testing and leakage testing has been successfully performed as described in ASHRAE Standard 15 Section 9.13 (Refrigerant Systems Testing).

PART 2 - PRODUCTS

2.1 REFRIGERANT PIPING REQUIREMENTS

A. Refrigerant Piping: Type ACR-L hard drawn copper refrigerant tubing with wrought copper solder joint fittings. All joints shall be brazed. Soft drawn copper line sets are not acceptable.

B. Piping Components: The following refrigerant piping components shall be provided.

1. Condensing Unit Service Valves (if not provided integral to the condensing unit by the condensing unit manufacturer (Emerson BV Series, Henry 907 Series, or approved equal).
2. Sight Glass (Emerson HMI Series, Henry MI Series, or approved equal). Sight glasses are not required on mini-split heat pumps and variable refrigerant systems).
3. Filter-Drier (Emerson EK Series, Henry SDM Series, or approved equal). Filter-driers are not required on mini-split heat pumps and variable refrigerant systems).

2.2 REFRIGERANT PIPING INSULATION

A. See Specification Section 230700 (HVAC Insulation).

PART 3 - EXECUTION

3.1 INSTALLATION OF REFRIGERANT PIPING

A. Furnish and install all interconnecting refrigerant piping as shown and/or required. Piping shall be sized in accordance with the equipment manufacturer's recommendations. Pitch suction piping down in the direction of flow.

B. Test all refrigerant piping for leaks with an electronic leak detector.

C. Seal and flash all roof and wall penetrations. Provide metal or plastic pipe shields between insulated refrigerant piping and hangers.

D. Install refrigerant piping and refrigerant-containing components in accordance with ASHRAE Standard 15 and ASME B31.5
   1. Install piping as short as possible, with a minimum number of joints, elbows, and fittings.
   2. Install piping with adequate clearance between pipe and adjacent walls and hangers to allow for service and inspection. Space piping, including insulation, to provide 1 inch minimum clearance between adjacent piping or other surface. Use pipe sleeves through walls, floors, and ceilings, sized to permit installation of pipes with full thickness insulation.
   3. Install condensing unit isolation valves whenever they are not included integral to the condensing unit.
   4. Locate and orient valves to permit proper operation and access for maintenance of packing, seat and disc. Generally, locate valve stems in overhead piping in horizontal position. Provide a union adjacent to one end of all threaded end valves. Control valves usually require reducers to connect to pipe sizes shown on the drawing.
   5. Use copper tubing in protective conduit when installed below ground.
   6. Install hangers and supports per ASME B31.5 and the refrigerant piping manufacturer's recommendations.

E. Joint Construction
   1. Brazed Joints: Comply with AWS Brazing Handbook and with filler materials complying with AWS A5.8/A5.8M.
   2. Use Type BcuP copper-phosphorus alloy for joining copper socket fittings with copper tubing.
   3. Use Type BAg cadmium-free silver alloy for joining copper with bronze or steel.
   4. Swab fittings and valves with manufacturer's recommended cleaning fluid to remove oil and other compounds prior to installation.
   5. Pass nitrogen gas through the copper piping to prevent oxidation as each joint is brazed. Cap the system with a reusable plug after each brazing operation to retain the nitrogen and prevent entrance of air and moisture.

F. Protect refrigerant system during construction against entrance of foreign matter, dirt, and moisture; having open ends of piping and connections to compressors, condensers, evaporators and other equipment tightly capped until assembly.

G. Pipe refrigerant relief valve discharge to outdoors for systems containing more than 100 lbs of refrigerant.

3.2 REFRIGERANT SYSTEM PRESSURE TESTING, EVACUATION, AND CHARGING

A. Refrigerant system pressure testing, evacuation, and charging procedures shall be performed in the presence of the Owner's representative and/or the Engineer after the refrigerant piping system installation is complete.

B. Prior to evacuation and charging, the refrigerant system shall be pressure tested with nitrogen per the equipment manufacturer’s written recommendations for test pressure(s). Pressure testing shall be conducted when the ambient temperature is relatively stable and shall hold for a minimum of 4 hours without a drop in pressure.

C. Utilize properly sized vacuum pump(s) for refrigerant system evacuation. The refrigerant system compressor shall not be utilized to evacuate the system, nor operated at any time prior to completing the specified triple evacuation procedure. Conduct evacuation and charging procedures at ambient temperatures of 60°F or above whenever practical. If ambient temperatures are consistently below 60°F, contact the Owner and/or the Engineer immediately for approval to proceed or for alternative direction.

D. The first evacuation shall be to 1,000 microns, holding at 1,000 microns for a minimum of two hours. Break the vacuum with either nitrogen or refrigerant.

E. The second evacuation shall be to 750 microns, holding at 750 microns for a minimum of two hours. Break the vacuum with either nitrogen or refrigerant.

F. The third evacuation shall be to 500 microns, holding at 500 microns for a minimum of two hours. Break the vacuum with either nitrogen or refrigerant.

G. After testing, fully charge each system with refrigerant and then conduct a leak test of the entire system with an electronic leak detector.

3.3 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 25 00 - CHEMICAL TREATMENT

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 GENERAL

A. All water treatment equipment, chemicals, test equipment, start-up service, and warranty period service shall be provided by one of the following water treatment specialists, or approved equal:

San Joaquin Chemicals
Chemtex Corporation
Garratt Callahan
Global Water Technology

B. The Contractor as referred to in this section of the specifications is generally intended to mean the mechanical contractor; however, work identified herein to be completed by the mechanical contractor may be assigned to and/or completed by the water treatment specialist.

1.3 INITIAL SYSTEM CLEANING

A. The entire initial system cleaning process (including removal, cleaning, and replacement of strainers) shall be witnessed by the Owner's designated representative. Any portion of the process that is not witnessed by the Owner's designated representative will need to be repeated. The water treatment specialist shall be on site to supervise and monitor the initial system cleaning procedures for each system. Also see Specification Section 232100-3.7 (Cleaning of Hydronic Piping Systems and Equipment).

B. The Contractor shall coordinate with the temperature control contractor to arrange for all heating and/or cooling coil control valves to be fully open during the initial system cleaning process and also shall coordinate with the temperature control contractor to arrange for the various valves in the central plant to be positioned/alternated such that all portions of the piping system are thoroughly flushed and cleaned.

C. At the conclusion of the initial system cleaning process the Contractor shall remove, clean, and replace each strainer in the piping system(s).

D. During the HVAC Systems Commissioning the Contractor shall remove strainers as directed by the Owner to demonstrate that the system is completely clean (less than 10% blockage on all strainers) and free of scale or other contamination. The Contractor shall also remove strainers as directed by the Owner during the last month of the warranty period to demonstrate that the system and strainers are still completely clean (less than 10% blockage on all strainers). Should the water system(s) and/or the strainers be found contaminated or dirty during either of the afore-mentioned observations, the Contractor shall clean the system(s) and strainers and re-treat the water system(s) as required until they are accepted as clean and properly treated.

1.4 OPERATING AND MAINTENANCE (O&M) MANUALS & INSTRUCTIONS

A. On-site startup, service, and instruction shall be provided for each chemical treatment system by the water treatment specialist. Startup of chemical treatment system and ongoing chemical treatment of each system shall commence within 24 hours of the time that the system is started.

B. Provide operation and maintenance manuals with initial dosage rates, ongoing dosage recommendations, and operation and maintenance instructions.

C. The Contractor shall provide a minimum of seven days written advance notice of the proposed day and time for the operation and maintenance instructions for the Owner's representatives.

D. Furnish and install an appropriately sized wall-mounted shelf in the central plant to allow for storage of the operating and maintenance manual, test kit, and monthly treatment reports. Provide fixed bookends on the shelf to prevent the manual(s) and test kit from sliding off of the shelf ends.

1.5 CHEMICAL TREATMENT SERVICE

A. During the first year warranty period, and during the period of time that the equipment is operational prior to commencement of the warranty period, the water treatment specialist shall provide complete chemical treatment service. The service shall include all required chemicals and a minimum of quarterly site visits to test and adjust the water treatment. The warranty period shall commence on the date that the Notice of Substantial Completion is executed by the Owner. The water treatment specialist shall also provide chemical treatment for a second year following the initial year of warranty service.

B. The water treatment specialist shall provide written reports of the activities performed and test results/water analyses for each visit. One copy of each report shall be left in an appropriate plastic folder at the chemical treatment equipment area on site.

C. At the end of the warranty period the treated equipment and piping systems shall be in as-new condition or the Contractor shall provide the required cleaning, service, repair, and/or replacement of any components that are not in as-new condition. The Contractor shall meet with the Owner's representative(s) during the last month of the warranty period so that the Owner's representative(s) can verify the condition of the equipment, piping systems, and strainers along with the Contractor.

1.6 ADDITIONAL TESTING AND REPORTING

A. For closed loop hydronic systems provide written copies of water quality test reports to the Architect/Engineer at the following milestones as noted:
   1. Sample of raw make-up tap water, prior to commencing any construction activity.
   2. Sample of water in existing hydronic systems scheduled to be modified or replaced, prior to commencing of any construction activity.
   3. Sample of water in new hydronic systems, after installation and initial system flushing, prior to the pipe cleaning phase.
   4. Sample of water in new hydronic systems at completion of the pipe cleaning phase, prior to treatment.
   5. Sample of water in new hydronic systems, after the initial chemical treatment phase.
   6. Sample of water in new hydronic systems, at project substantial completion.
   7. Sample of raw make-up tap water, at project substantial completion.
   8. Sample of water in new hydronic system, monthly after project substantial completion, for the duration of the warranty period.

PART 2 - PRODUCTS

2.1 GENERAL

A. Add a sufficient supply of a liquid oil dispersant/surfactant for initial cleaning of each piping system.

B. Provide a two year supply of chemicals for each closed loop piping system (heating water, chilled water, and heat pump water systems).

C. Note that the supply of chemicals and the two year service period are in addition to the chemicals and service required during start-up and check-out of the systems prior to commencement of the warranty period.

2.2 COOLING TOWER CLOSED LOOP SYSTEM CHEMICAL TREATMENT

A. Furnish and install a 10 gallon chemical bypass feeder, rated and stamped for a maximum working pressure of 200 psi at 375˚F. Feeder shall be Elbi Model DB-10-200V with Model PFWH-20 strainer assembly, or approved equal. Install feeder in a valved bypass arrangement around the circulating pump(s). Provide a valved drain connection which shall be piped to the nearest floor drain. All piping shall be 1" diameter Type 'L' copper.

B. Each pot feeder shall incorporate a removable 20 micron pleated filter. Provide a minimum of three filters to be used in succession until all contaminants have been removed from the system. Provide another three filters for future use by the Owner.

C. Add an appropriate corrosion inhibitor to the recommended level of concentration that is appropriate for the equipment connected to the chilled water system. Furnish the Owner with an appropriate test kit that can be utilized to evaluate proper treatment levels in between visits by the water treatment specialist. The chemical treatment specialist shall provide submittals that include the type of chemical(s) that will be added to the system and the concentration that will be placed and maintained in the system.

2.3 HEAT PUMP WATER SYSTEM CHEMICAL TREATMENT

A. Furnish and install a 12 gallon chemical bypass feeder, rated and stamped for a maximum working pressure of 200 psi at 375˚F. Feeder shall be Elbi Model DB-10-200V with Model PFWH-20 strainer assembly, or approved equal. Install feeder in a valved bypass arrangement around the circulating pump(s). Provide a valved drain connection which shall be piped to the nearest floor drain. All piping shall be 1" diameter Type 'L' copper.

B. Each pot feeder shall incorporate a removable 20 micron pleated filter. Provide a minimum of three filters to be used in succession until all contaminants have been removed from the system. Provide another three filters for future use by the Owner.

C. Add an appropriate corrosion inhibitor to the recommended level of concentration that is appropriate for the equipment connected to the heat pump water system. Furnish the Owner with an appropriate test kit that can be utilized to evaluate proper treatment levels in between visits by the water treatment specialist. The chemical treatment specialist shall provide submittals that include the type of chemical(s) that will be added to the system and the concentration that will be placed and maintained in the system.

2.4 EVAPORATIVE COOLING EQUIPMENT CHEMICAL TREATMENT

A. Provide five nylon mesh chemical treatment cylinders for each make-up air unit evaporative cooling section. One cylinder shall be placed in the evaporative cooler sump (adjacent to the fill valve) and the remaining four cylinders shall be turned over to the Owner for future use. Chemical treatment cylinders shall contain an NSF-certified, slow dissolving, combination scale and corrosion inhibitor. Chemical treatment cylinders shall be Nu-Calgon Evap-Treat Model 4173-06, or approved equal.

B. The mechanical contractor (or the test and balance contractor) shall adjust the bleed rate on each evaporative cooling section to approximately 0.5 ounces/minute for each 1,000 cfm of unit capacity. The required bleed rate shall be confirmed with the Owner and the Engineer prior to testing/adjusting. Note that the continuous bleed is in addition to the drain/dump cycle(s) listed in the sequence of operation.

PART 3 - EXECUTION

3.1 COOLING TOWER PASSIVATION

A. Prior to and during startup the chemical treatment contractor shall be present to ensure that the upper wetted surfaces of the cooling tower (galvanized steel) undergo the passivation process described in the cooling tower manufacturer's written installation instructions.

3.2 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.3 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, and tools, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 31 00 - HVAC DUCTWORK

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of ductwork specified in this section include the following:

Sheet Metal Ductwork
Flexible Ductwork
Internally Lined Ductwork
Externally Insulated Ductwork
Kitchen Exhaust Ductwork
Clothes Dryer Exhaust Ductwork

1.3 QUALITY ASSURANCE

A. Installer: A firm with at least three years of successful installation experience on projects similar to that required for this work.

B. SMACNA Compliance: Comply with applicable portions of Sheet Metal and Air Conditioning Contractor's National Association (SMACNA) recommendations for all work in this section.

C. ASHRAE Standards: Comply with applicable portions of American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE) recommendations for all work in this section.

D. NFPA Standards: Comply with applicable portions of ANSI/NFPA Standard 90A (Standard for the Installation of Air Conditioning and Ventilating Systems) and ANSI/NFPA 90B (Standard for the Installation of Warm Air Heating and Air Conditioning Systems) for all work in this section.

E. NAIMA Standards: Comply with all applicable portions of the North American Insulation Manufacturers Association (NAIMA) standards for all related work in this section.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's specifications on manufactured products and factory fabricated ductwork used for the work of this section.

B. As-Built Drawings: At project closeout, submit as-built drawings of installed ductwork, duct accessories, outlets, and inlets.

PART 2 - PRODUCTS

2.1 GENERAL

A. Fabricate all ductwork using a commercial grade of galvanized steel complying with the SMACNA HVAC Duct Construction Standards (latest edition) for the specified duct pressure class.

B. Fabricate ductwork with all accessories installed during fabrication to the greatest extent possible. Refer to Specification Section 233110 (HVAC Ductwork Accessories) for accessory requirements.

C. See Specification Section 230700 (HVAC Insulation) for additional related requirements.

D. All ductwork shall be constructed and sealed in accordance with the requirements of the Sheet Metal and Air Conditioning Contractor's National Association (SMACNA) unless indicated otherwise herein.

E. Construct and seal all ductwork in accordance with the pressure related to the equipment or system to which it is connected unless indicated otherwise herein. See Section 3.1 of this specification for additional requirements and clarification.

F. Wherever ductwork is to be exposed to view in occupied spaces, provide materials which are free from visual imperfections including pitting, seam marks, roller marks, oil canning, stains and discolorations, and other imperfections, including those which would impair painting.

G. Wherever ductwork is to be exposed to view in occupied spaces or is indicated to be painted, that ductwork shall be fabricated using a commercial grade of phosphatized, galvannealed, or bonderized sheet metal that is specifically formulated for painting.

H. Duct fittings shall be constructed to match the adjoining ductwork and to comply with all duct requirements applicable to fittings. See 'Typical Branch Ducts' details on the drawings for acceptable fitting types.

I. Turning Vanes in Rectangular Duct Elbows: Turning vanes shall be provided in all rectangular duct elbows unless indicated otherwise on the drawings, such as in return air transfer ducts, where turning vanes shall not be installed. All turning vanes shall be SMACNA 'Large' (R=4.5"/SP=3.25"). Turning vanes in low pressure ducts (2.0" w.c. or less) with duct widths 30 inches and smaller shall be single thickness. Turning vanes in low pressure ducts (2.0" w.c. or less) with duct widths 32 inches and larger shall be double thickness.

J. Except as otherwise indicated, or where a reaction between dissimilar metals might occur, provide hot-dipped galvanized steel fasteners, anchors, rods, straps, trim, and angles for support of all ductwork. Utilize Unistrut channel supports and hangers as appropriate for larger duct sizes. Penetrating ductwork with screws shall be avoided to the greatest extent possible. Wherever screws are required to penetrate ductwork the penetrations shall be sealed air and water tight.

2.2 TWO INCH PRESSURE CLASS DUCTWORK

A. Rectangular ductwork shall be fabricated using a commercial grade of galvanized steel complying with the SMACNA HVAC Duct Construction Standards (latest edition) for the specified duct pressure class. Ductwork and fitting gauges shall be in accordance with Chapter 2 of the SMACNA HVAC Duct Construction Standards (latest edition).

B. Round ductwork shall be spiral lock seam round and/or oval duct and fittings.

2.3 ROUND DUCTWORK

A. Round Ductwork: Provide spiral lock seam prefabricated duct, constructed and sealed for 4 inch pressure class. The requirement for spiral lock seam round ducts also applies to 2 inch pressure class round ductwork. Longitudinal seam round ductwork is not acceptable.

Available Manufacturers: Subject to compliance with requirements, manufacturers offering factory fabricated ductwork which may be incorporated in the work include the following, or approved equal:

Manufacturer

McGill Airflow Uni-Seal
Semco
OmniDuct
Air Handling Systems

B. Spiral lock seam prefabricated factory-built round and oval duct and fittings shall be used wherever possible. Shop fabricated ducts shall be used only where rectangular shaped ducts are shown on the drawings or where transitions and special fittings cannot be prefabricated by the factory.

C. Optional Shop Fabricated Ductwork and Fittings: As an alternative to factory fabricated ductwork the Contractor may shop fabricate the spiral seam ductwork provided that certification is submitted and approved indicating that the shop fabricated ductwork and fittings are equal to that specified for factory fabricated ductwork and fittings.

D. Shop-fabricate ductwork in 4, 8, 10, or 12 foot lengths, unless otherwise indicated or required, to complete duct runs. Pre-assemble ductwork in the shop to the greatest extent possible, so as to minimize field assembly of systems. Disassemble systems only to the extent necessary for shipping and handling. Match and mark duct sections for reassembly and for a coordinated installation.

E. Round Fittings: The following round duct fittings shall be used, in accordance with what is depicted on the drawings.

1. All round fittings shall be full bodied type.
2. Round elbows shall be constructed with a 1.5 radius to diameter (R/D) ratio.
3. Round elbows shall be segmented/gored type, constructed in accordance with the current SMACNA Duct Construction Standards. Adjustable elbows are not acceptable.
4. Low loss conical tees, conical laterals, reducing tees, and 90° crosses.
5. Reducers and increasers shall be constructed for a maximum angle of 30 degrees.
6. Spin-in and/or tap-type fittings that require field cuts into the ductwork are not acceptable.
7. No exceptions will be allowed on the listed fitting requirements.

F. Concealed Round Ductwork: Construct of galvanized sheet steel complying with ANSI/ASTM A653, in conformance with the listed manufacturing method, and in the listed minimum duct and fitting gauge.

Diameter	Minimum Duct Gauge	Minimum Fitting Gauge	Manufacturing Method
3" to 14"	28	28	Spiral Lockseam
16" to 24"	26	26	Spiral Lockseam
26" to 42"	24	24	Spiral Lockseam

G. Exposed Round Ductwork: Construct of galvanized sheet steel complying with ANSI/ASTM A653, in conformance with the listed manufacturing method, and in the listed minimum gauge.

Diameter	Minimum Duct Gauge	Minimum Fitting Gauge	Manufacturing Method
3" to 14"	26	26	Spiral Lockseam
16" to 24"	24	24	Spiral Lockseam
26" to 42"	22	22	Spiral Lockseam

H. Identification of Exposed Round Ductwork and Fittings: To allow for field verification of the appropriate gauge material, round duct and fitting factory labels shall be visible from the floor such that they can be observed prior to insulating.

2.4 HANGERS AND SUPPORTS FOR DUCTWORK

A. See Section 230530 (Hangers and Supports for HVAC Systems)

2.5 SEISMIC BRACING FOR DUCTWORK

A. See Section 230540 (Seismic Bracing for HVAC Systems)

2.6 DUCTWORK INSULATION

A. All 2 inch pressure class rectangular and round supply, return, and outside air ductwork shall be externally insulated unless specifically indicated otherwise in these specifications or on the drawings. See Specification Section 230700 (HVAC Insulation) for associated requirements.

B. Internal Duct Liner Insulation (When Specified Below and/or Indicated on the Drawings)
   1. Provide internal duct liner for the following, unless indicated otherwise on the drawings:
      a. The first 5 feet of rectangular ductwork downstream of each rooftop unit.
      b. The first 5 feet of rectangular supply and return ductwork downstream of each heat pump.
      c. Rectangular transfer air ducts.
      d. Rectangular ductwork that is exposed in a mechanical room, mezzanine area, or other space and is less than 8'-0" above finished floor.
      e. Rectangular ductwork elsewhere as noted on the drawings.
   2. Internal duct liner shall be 1-1/2" thick Johns Manville Linacoustic R-300, or approved equal, with an insulating value of R-6.3 and a 25/50 flame and smoke rating in accordance with ASTM E84. Internal duct liner shall be adhered with an approved adhesive that complies with ASTM C916. All exposed edges shall be covered with Johns Manville SuperSeal Edge Treatment, in strict accordance with the insulation manufacturer's written instructions.
   3. Additionally secure duct liner with weld pins or with Duro-Dyne PBH Dynastick Fasteners adhered with Duro-Dyne PBACZVOC Dynastick Adhesive. Weld pins or fasteners shall be placed on 18" centers and within 6 inches of insulation edges and seams.
   4. Cut and secure internal duct liner in strict accordance with the duct liner manufacturer's written application instructions.
   5. Adjust duct sizes to accommodate liner thickness to provide the net internal duct dimensions shown on the drawings.

2.7 MISCELLANEOUS DUCTWORK MATERIALS

A. Provide miscellaneous materials and products of types and sizes indicated, unless otherwise indicated. Provide per the requirements listed in the latest SMACNA manuals, including proper connection of ductwork and equipment.

B. Duct Joints: Join and seal prefabricated, factory built ducts, fittings, and couplings in strict accordance with duct manufacturer's instructions. Install duct sealers, pop rivets, or sheet metal screws, canvas, and lagging adhesive on each joint. Duct sealer shall be fire retardant. Sheet metal screws for joints shall be minimum #10 size galvanized.

2.8 SEALANTS

A. Duct sealant shall be water-based, non-fibrated, and fire resistive with a UL 181B listing for use on low, medium, and high pressure ductwork. Sealant VOC levels shall also meet all federal, state, and local requirements and be classified with mildew resistance per ASTM G21 with 0 growth rating.

B. Sealant shall be rated for up to 10" w.g. and shall be installed in strict accordance with the manufacturer's written instructions. Pressure sensitive tapes are not acceptable.

C. Subject to compliance with requirements, manufacturers offering sealants which may be incorporated in the work include the following:

   Design Polymerics DP-1010
   Hardcast Iron-Grip 601
   Foster 32-19
   Childers CP-146

2.9 DUCT ACCESS PANELS

A. Provide access panel sections in prefabricated, factory-built ducts for access to fire dampers, control equipment, etc. as specified in Specification Section 233110 (HVAC Ductwork Accessories). Access panel size shall be duct diameter wide by duct diameter high for all ducts under 24 inches. Ducts over 24 inches in diameter shall have 24 inch by 18 inch access panels. Minimum access panel size shall be 6 inch by 6 inch.

2.10 FLEXIBLE DUCTS

A. Flexible ducts may be used in concealed areas where detailed and as specified.

B. Flexible ducts shall consist of an exterior reinforced laminated vapor barrier, 2 inch thick fiberglass insulation (R-6), encapsulated spring steel wire helix, and impervious, smooth, non-perforated interior vinyl liner. Each individual length of flexible duct shall include factory fabricated steel connection collars. Flexible ducts shall be UL approved and tested and shall meet Class 1 requirements of NFPA 90A.

C. Flexible ducts from rigid runouts to diffusers and registers shall be Thermaflex M-KE, or approved equal, with a maximum length of 5 feet.

D. Comply with all applicable portions of the Air Duct Council Flexible Duct Performance and Installation Standards.

2.11 CLOTHES DRYER EXHAUST DUCTWORK

A. Provide aluminum ducts sized as indicated on the drawings. Provide wall cap with backdraft damper at exterior wall where indicated on the drawings. Exhaust ducts shall be connected without using screws or other fastening means that extend inside the duct.

2.12 KITCHEN EXHAUST DUCTWORK

A. All exhaust ductwork and fittings serving kitchen hoods shall be Type 316L stainless steel with welded joints and shall be constructed for 2 inch or 4 inch pressure class as appropriate for the associated equipment and duct arrangement.

B. All control dampers in stainless steel ductwork shall be constructed of stainless steel and shall have flanged connections.

PART 3 - EXECUTION

3.1 INSTALLATION OF DUCTWORK

A. Assemble and install ductwork to achieve air tight and noiseless (no objectionable noise) systems capable of performing each indicated service.

B. Install each run with minimum of joints. Align ductwork accurately at connections within 1/8 inch misalignment tolerance and with internal surfaces smooth. Support ducts rigidly with suitable ties, braces, hangers, and anchors of type which will hold ducts true to shape and to prevent buckling.

C. Install concrete inserts for support of ductwork in coordination with formwork as required to avoid delays in work.

D. Where rectangular ducts pass through interior partitions, masonry walls, and exterior walls, conceal space between construction opening and duct or duct-plus-insulation with sheet metal flanges of same gauge as duct. Overlap opening on four sides by at least 1-1/2 inches.

E. Where spiral ducts pass through interior partitions, masonry walls, and exterior walls, conceal space between construction opening and duct or duct-plus-insulation with 6” (approx.) conical escutcheons. Overlap opening on all sides by at least 1-1/2 inches.

F. Support ductwork and piping in a manner complying with Section 230530 (Hangers and Supports for HVAC Piping and Equipment). Where special hanging of ductwork or piping is detailed or shown on drawings, the drawings shall be followed.

G. Duct hangers used in areas where a specialty architectural ceiling or floor occurs shall be compatible for use with that system. See architectural and structural drawings for locations.

H. Seal all ductwork to the seal class required in the following table, and using the methods prescribed in the SMACNA HVAC Air Duct Leakage Test Manual, latest edition.

Duct Class	Up to 2" w.g.	3" w.g.	4" thru 10" w.g. or exposed to weather
Seal Class	C	B	A
Sealing	Transverse Joints Only	Transverse Joints and Seams	Joints, Seams, and all Applicable Wall Penetrations
Leakage Class			
Rectangular Metal	16	8	4
Round Metal	8	4	2

1. Sealant shall be applied 3 inches wide and at 32 mil wet film thickness.
2. For ducts greater than 2" pressure class, or exposed to weather, a first layer of sealant shall be applied to an 18 mil thickness, with scrim applied over the sealant, and then another 18 mil thickness of sealant shall be applied over the scrim.

3.2 INSTALLATION OF FLEXIBLE DUCTWORK

A. Provide supports at or near the mid-length point using 2 inch wide 28 gauge steel hanger collars attached to the structure with an approved duct hanger. Installation shall eliminate sharp radius turns, offsets, or kinks.

B. Bends in flexible ductwork shall be kept to a minimum. The minimum bend radius shall be 1.5 times the duct diameter with no bends greater than 45 degrees. This specifications and any applicable drawings or details shall be strictly adhered to.

C. Each length of flexible duct shall be provided with steel connection collars.

D. Make connections to rigid duct and equipment with draw bands and sealer, and then apply duct tape over outside of sheath.

3.3 CLEANING AND PROTECTION

A. Clean ductwork internally, unit by unit as it is installed, of any dust and debris. Clean external surfaces of foreign substances which might cause corrosive deterioration of metal or where ductwork is to be painted.

B. Strip protective paper from stainless steel ductwork surfaces, and repair finish wherever it has been damaged.

C. Temporary Closure: At ends of ducts which are not connected to equipment or air distribution devices at the time of ductwork installation, provide temporary closure using polyethylene film or other covering which will prevent entrance of dust and debris until the time that connections are to be completed.

3.4 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, and tools, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 31 10 - HVAC DUCTWORK ACCESSORIES

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of ductwork accessories specified in this section include volume dampers, control dampers, fire-smoke dampers, turning vanes, duct hardware, duct access doors, flexible connections, and backdraft dampers.

1.3 QUALITY ASSURANCE

A. SMACNA Compliance: Comply with applicable portions of Sheet Metal and Air Conditioning Contractor's National Association (SMACNA) HVAC Duct Construction Standards (Metal and Flexible) latest edition, for all work in this section.

B. ASHRAE Standards: Comply with American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE) recommendations, latest edition, for all work in this section.

C. NFPA Compliance: Comply with ANSI/NFPA 90A (Standard for the Installation of Air Conditioning and Ventilating Systems) and ANSI/NFPA 90B (Standard for the Installation of Warm Air Heating and Air Conditioning Systems).

D. Compliance: Construct, test, install and label fire dampers and fire doors in accordance with Underwriters Laboratories (UL) Standard 555 (Fire Dampers and Ceiling Dampers).

E. Dampers shall be warranted against manufacturing defects for a period of 5 years.

F. Dampers shall be tested, rated and labeled in accordance with the latest requirements of UL 555 (Fire Dampers) and UL 555S (Smoke Dampers).

G. Damper pressure drop ratings shall be based on tests and procedures performed in accordance with AMCA 500.

H. Damper pressure drop ratings shall be based on tests and procedures performed in accordance with AMCA 500 and certified in accordance with AMCA 500D.

1.5 SUBMITTALS

A. Product Data: Submit manufacturer's product data for each type of ductwork accessory, including dimensions, capacities, and materials of construction, and installation instructions.

B. Fire-Smoke Dampers: Submit complete installation instructions for all types of fire damper to be used on this project, as part of main submittal.

PART 2 - PRODUCTS

2.1 TURNING VANES

A. Fabricated Turning Vanes: Provide fabricated turning vanes and vane runners, constructed in accordance with SMACNA HVAC Duct Construction Standards, latest edition

B. Turning Vanes in Rectangular Duct Elbows: Turning vanes shall be provided in all rectangular duct elbows unless indicated otherwise on the drawings (such as in return air transfer ducts). All turning vanes shall be double wall style. Turning vanes shall be SMACNA ‘Large’ (R=4.5”/SP=3.25”) for duct widths 14 inches and larger and shall be SMACNA ‘Small’ (R=2.0”/SP=1.5”) for duct widths 12 inches and smaller.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering turning vanes which may be incorporated in the work include the following:

Anemostat
Airsan Corporation

2.2 DUCT HARDWARE

A. Provide duct hardware manufactured by one manufacturer for all items on project for the following:

1. Test Holes: Provide in ductwork at fan inlet and outlet and elsewhere as required. Plastic test plugs may only be used on low pressure ductwork (2” w.g. or less). Test holes installed in medium pressure ductwork (above 2” w.g.) and at outdoor equipment shall be covered with Ventlok Model 699 covers, or approved equal.
2. Quadrant Locks: Provide for each damper quadrant lock device on one end of shaft and end-bearing plate on other end. Provide extended quadrant locks and extended bearing plates for externally insulated ductwork.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering duct hardware which may be incorporated in the work include the following:

Ventfabrics
Ventlok by Ventfabrics

2.3 DUCT ACCESS DOORS

A. Provide airtight access doors in ducts and plenums for cleaning and repairs of fire dampers, control devices, etc. and where shown on the drawings. Access door size shall be duct width by duct height for all ducts under 24 inches. Minimum access door size shall be 8 inches by 8 inches. Ducts over 24 inches in diameter shall have 24 inch by 18 inch access doors.

B. Access doors shall be rated for the associated duct pressure (positive or negative).

C. Access doors in supply air and return air ducts shall be insulated as required to provide a minimum R-6.0 rating. Insulation shall be 25/50 rated in accordance with ASTM E84. Access doors in supply air and return air ducts shall be Ductmate Model FD, or approved equal.

D. Access doors in low pressure ductwork (3.0” w.c. and below) shall be hinged with cam latches, and a perimeter gasket.

E. Access doors in medium pressure ductwork (4.0” w.c. and above) shall be constructed with cam latches and a perimeter gasket.

F. Access doors in stainless steel ductwork shall be constructed of stainless steel.

G. Access doors in grease exhaust ducts shall be UL listed, shall be Ductmate Ultimate, or approved equal.

H. Access doors shall be permanently identified on the exterior by a permanent label with letters not less than 1/2 inch in height reading 'Fire-Smoke Damper' or as otherwise appropriate.

I. Available Manufacturers: Subject to compliance with requirements, manufacturers offering duct access doors which may be incorporated in the work include the following, or approved equal:

Ductmate
Best Access Doors
United McGill

2.4 FLEXIBLE CONNECTIONS

A. Furnish and install flexible connections at following locations:

At supply connection on all motorized heating and cooling equipment.

At return connection on all motorized heating and cooling equipment.

At duct connection on all exhaust fans.

Elsewhere as shown on the drawings.

B. Flexible connections are not required for curb-mounted or roof-mounted exhaust fans.

C. Flexible duct connections shall be preassembled flexible connectors constructed of coated glass fabric applied in accordance with manufacturer's recommendations. Width of flexible connections shall be sufficient to allow minimum of 2 inches of free space between two metal collars to be connected. Install sheet metal band completely around duct or fan outlet, at end of flexible connection. Fasten with metal screws through band and coated glass fabric. Space screws approximately 3 inches apart. Coated glass fabric shall be equal to Ventfabrics Ventglas with neoprene coating for use inside building and Ventlon with hypalon coating when exposed to weather.

D. Available Manufacturers: Subject to compliance with requirements, manufacturers offering flexible connections which may be incorporated in the work include the following:

Ventfabrics
Thermaflex

2.5 MANUAL VOLUME DAMPERS, CONTROL DAMPERS, AND BACKDRAFT DAMPERS

A. Manual Dampers: Provide dampers of single-blade type or multi-blade type constructed in accordance with SMACNA (HVAC Duct Construction Standards), latest edition. Round dampers shall be Greenheck Model MBDR-50, or approved equal. Rectangular dampers shall be Greenheck Model MBD-15, or approved equal. Shop-fabricated dampers are not acceptable.

B. Concealed Damper Actuators: Where dampers are installed above non-accessible ceilings and are not served by access doors, provide extension cables and concealed ceiling mounted damper regulators. Damper regulator shall be Young Regulator Model 270-896, or approved equal.

C. Remote Powered Balancing Dampers: Where indicated on the drawings, provide remote powered balancing dampers complete with motorized damper, connecting cable, wall plate with ports, and battery powered remote control device. Dampers shall be Greenheck Model RBDR-50, Pottorff Model RD-10R, or approved equal.

D. Control Dampers: Provide dampers with low leakage opposed blades, frame and blades constructed of 16 gauge galvanized steel, suitable for electric actuators.

E. Backdraft Dampers: Provide dampers with parallel blades, constructed of 16 gauge aluminum; provide 1/2 inch diameter ball bearings, 1/2 inch diameter steel axles spaced on 9 inch centers. Construct frame of 2" x ½" x 1/8" thick steel channel for face areas 25 sf and under; and 4" x 1-1/4" x 16 gauge channel for face areas over 25 sf. Provide galvanized steel finish on frame with aluminum touch-up.

F. Available Manufacturers: Subject to compliance with requirements, manufacturers offering dampers which may be incorporated in the work include the following:

Greenheck
Ruskin
Air Balance

2.6 COMBINATION FIRE-SMOKE DAMPERS

A. General

1. Fire smoke dampers shall be activated by temperature, smoke, or both. Temperature activation shall occur when the fusible link melts. Smoke activation shall occur when the area smoke detector or duct smoke detector indicates a smoke condition. See drawings for where duct smoke detectors are required. When required, duct smoke detectors shall be installed within 5 feet of the fire-smoke damper in a reasonably accessible location. The entire installation shall comply with IBC Section 717.3.3.

B. Classification/Ratings

1. Both UL555 and UL555S Classified, rated as a 1-1/2 hour fire damper and as a Leakage Class I smoke damper.
2. Elevated Temperature Rating: 350ºF
3. Airflow Rating: 4,000 fpm
4. Differential Pressure Rating: 4 inches w.c.

C. Construction

1. Frame: Hat-shaped channel, roll-formed, galvanized steel with interlocking gusseted corners. Low profile geometry and 20 gauge top and bottom frame members on damper sizes less than 17 inches high to maximize free area.
2. Blades: 14 gauge galvanized steel with airfoil blades.
3. Blade Seals: Silicone rubber mechanically secured to blade.
4. Jamb Seals: Flexible stainless steel compression type.
5. Axles: Minimum 1/2" diameter zinc plated steel.
6. Bearings: Stainless steel sleeve type rotating in polished extruded holes in the frame.
7. Linkage: Non-adjustable and concealed in the damper frame.
8. Fire Closure Device: Reusable/Resettable link.

D. Fire Closure Temperature:

1. The fire-smoke damper shall be equipped with a factory installed heat responsive device rated to close the damper when the temperature at the damper reaches 165°F.

E. Fire Alarm Panel Interface

1. All wiring from the fire alarm panel to the combination fire-smoke damper shall be furnished and installed by Division 26.

F. Actuator:

1. Electrical: 120 Volt, two-position, fail closed.
2. Mounting: External (Outside of Duct).

G. Required Options
   1. Provide a remote test switch with open/closed indication. Test switch shall be installed in a reasonably accessible location for service/maintenance personnel.
   2. Provide dual contacts to allow monitoring by both the fire alarm panel and the direct digital control system.
   3. Provide a factory sleeve with breakaway duct connections.
   4. Provide a factory access door.

H. Available Manufacturers: Subject to compliance with requirements, manufacturers offering fire-smoke dampers which may be incorporated in the work include the following, or approved equal:

   Greenheck Model FSD-311
   Ruskin Model FSD-60

2.7 DUCT SMOKE DETECTORS

A. Duct smoke detectors hsall be installed at the locations shown on the drawings, as listed in the equipment schedules, and as described herein.

B. Duct smoke detectors shall be furnished by Division 26. Installation of the duct smoke detectors and wiring between duct smoke detectors and the associated mechanical equipment shall be Division 23. Electrical power to duct smoke detectors and wiring to the fire alarm control panel shall be by Division 26

C. It is the mechanical contractor’s responsibility to ensure that their bid includes a complete installation that is coordinated with the duct smoke detectors, equipment, and applicable code requirements.

D. Duct smoke detectors shall be installed in conformance with Uniform Mechanical Code Section 608. Equipment that has a scheduled airflow in excess of 2,000 cfm shall have a duct smoke detector installed in both the supply air and return air.

E. Equipment that has a scheduled airflow in excess of 15,000 cfm and serves multiple floors of a building shall have duct smoke detectors installed in the return air duct where the return air exits each floor of the building (prior to the main return air riser) in addition to the supply air duct smoke detector(s) specified in this section.

F. In cases where there are no Division 26 plans and specifications, duct smoke detectors shall be furnished and installed by Division 23. Such smoke detectors shall be manufactured by Edwards, Notifier, or approved equal. On projects where the duct smoke detectors will be connected to an existing fire alarm system, the new duct detectors shall match the existing system manufacturer’s devices. Duct detectors shall include dual auxiliary contacts for interface with the fire alarm system and the direct digital control system (when applicable).

PART 3 - EXECUTION

3.1 INSTALLATION OF DUCT ACCESSORIES

A. Install duct accessories in accordance with the manufacturer's installation instructions, with applicable portions of details of construction as shown in the SMACNA Standards, and in accordance with recognized industry practices as necessary to ensure that the products serve the intended function.

B. Install turning vanes in square and/or rectangular 90 degree elbows in supply and exhaust air systems and elsewhere as indicated.

C. Install access doors to open against system air pressure, with latches operable from either side, except on the outside only where the duct is too small for a person to enter.

D. Coordinate with other work as necessary to interface installation of duct accessories properly with other work.

E. Field Quality Control: Operate installed duct accessories to demonstrate compliance with requirements. Test for air leakage while system is operating. Repair or replace faulty accessories as required to obtain proper operation and leak-proof performance.

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to the Architect/Engineer. At completion, carefully clean and adjust equipment, fixtures, and trim installed as part of this work. Leave systems and equipment in satisfactory operating condition.

3.3 INSPECTION OF FIRE-SMOKE DAMPERS

A. Upon completion of this work all fire-smoke dampers shall be tested by the installing contractor in the presence of the local fire department. Provide spare fusible links as required to complete testing to the complete satisfaction of the local fire department.

3.4 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.5 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 34 00 - HVAC FANS AND HOODS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of fans, hoods, and curbs specified in this section include the following:
In-Line Centrifugal Fans
Kitchen Exhaust Fans
Exhaust Hoods
Roof Mounted Intake/Relief Hoods
Pre-Fabricated Seismic Roof Curbs
Destratification Fans

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of material listed in this section.

B. Operation and Maintenance Data: Submit operation and maintenance data and replacement material lists for each type of material listed in this section. Include this data and product data in the operation and maintenance manual.

PART 2 - PRODUCTS

2.1 CEILING EXHAUST FANS

A. Provide ceiling fans of type, size, and capacity as scheduled on the drawings, and as specified herein. Fans shall be Greenheck CSP-A, Greenheck SP-AP, or approved equal, with factory furnished speed control.

B. Fans shall be tested and rated in accordance with ASHRAE Standards. Provide with AMCA Certified Ratings Seal for both air flow and sound.

C. Motor Type: Provide open drip-proof (ODP) motor for Greenheck Model CSP-A. Motor shall be permanently lubricated sleeve bearing type, mounted on vibration isolators, suitable for speed control. Provide electrically commutated (EC) motor for Greenheck Model SP-AP with factory furnished speed control.

D. Electrical: Provide factory-wired non-fusible type disconnect switch at motor in fan housing. Provide thermal overload protection in fan motor. Provide conduit chase within unit for electrical connection.

E. Available Manufacturers: Subject to compliance with requirements, manufacturers offering ceiling exhaust fans which may be incorporated in the work include the following, or approved equal:
Greenheck
PennBarry
Cook

2.2 IN-LINE CENTRIFUGAL FANS

A. Provide direct drive in-line fans of sizes and arrangement as indicated, and of capacities and having accessories as scheduled. Fans shall be Greenheck SQ, or approved equal.

B. Ratings: Test and rate fans in accordance with ASHRAE Standards. Provide with AMCA Certified Ratings Seal for both air flow and sound.

C. Fan Units: Provide factory-assembled and tested fan units consisting of housing, wheel, fan shaft, bearings, and fan drive. Clean, condition, and prime paint sheet metal parts prior to final assembly. Apply final coat of enamel to exterior surfaces after assembly.

D. Wheels: Balance wheels statically and dynamically near operating speed.

E. Backdraft Damper: Provide a factory-furnished, field-installed backdraft damper at each in-line exhaust fan.

F. Bearings: Provide sealed, pillow block type bearings, rated for a minimum life of 200,000 hours.

G. Motors: Provide open drip-proof motors with ball or sleeve bearings. Provide split phase or capacitor start motors for fractional horsepower, with resilient base. Provide induction motors for integral horsepower, with rigid base. Provide non-fusible type disconnect switch for all 120 volt fans. Where scheduled, provide Greenheck Vari-Green EC motor with factory furnished speed control.

H. Drives: Where scheduled provide V-belt drives selected for a 1.5 service factor. Provide adjustable pitch sheave selected for midpoint at design conditions.

I. Available Manufacturers: Subject to compliance with requirements, manufacturers offering in-line centrifugal fans which may be incorporated in the work include the following, or approved equal:

Greenheck
PennBarry
Cook

2.3 KITCHEN EXHAUST FANS

A. General: Provide centrifugal type fans, curb mounted, of type, size, and capacity as scheduled on the drawings, and as specified herein. Fans shall be Greenheck Cube, or approved equal.

B. Ratings: Test and rate fans in accordance with ASHRAE standards. Provide with AMCA Certified Rating Seal for air flow and sound.

C. Type: Centrifugal fan, up-blast type, direct drive or belt drive as scheduled. Provide capacitor-start, induction-run type motor for belt drive fans.

D. Electrical: Provide a factory-wired non-fusible type disconnect switch at the motor in the fan housing. Provide thermal overload protection in fan motor. Provide conduit chase within unit for electrical connection.

E. Provide grease hood exhaust fans with ventilated curbs, grease trough and drain fittings, and other accessories as required by code. Curb height shall be as indicated on the drawings and shall accommodate the roof slope. Curb shall be hinged style, suitable for cleaning the lower housing, fan impeller, and ductwork. When a kitchen exhaust hood is scheduled on the drawings, the associated make-up air unit and exhaust fan shall be provided by the same manufacturer (to ensure control interface compatibility).

F. Available Manufacturers: Subject to compliance with requirements, manufacturers offering kitchen exhaust fans which may be incorporated in the work include the following, or approved equal:

Greenheck
PennBarry
Cook

2.4 EXHAUST HOODS

A. Hoods shall be constructed of a minimum of 18 gauge 400 series stainless steel. Hoods shall be constructed using the standing seam method for optimum strength and with a Performance Enhancing Lip (PEL) to improve capture efficiency by turning air back into the hood. All seams, joints, and penetrations of the hood enclosure shall be welded and/or liquid tight. Lighter material gauges, alternate material types, and alternate finishes are not acceptable.

B. Provide vapor-proof, UL listed LED light fixtures (restrictions may apply) which shall be pre-wired to a junction box situated at the top of the hood for field connection. Wiring shall conform to the requirements of NFPA 70.

C. Canopy hoods shall be built in accordance with the NFPA 96, the UMC, and shall bear the NSF Seal of Approval.

D. Available manufacturers: Subject to compliance with requirements, manufacturers offering exhaust hoods which may be incorporated in the work include the following, or approved equal:
Greenheck
PennBarry

2.5 ROOF MOUNTED INTAKE AND RELIEF HOODS

A. Provide hoods, curb mounted, of size noted on drawings and as specified herein. Hood style and manufacturer shall match the centrifugal roof exhaust fans. Intake hoods shall be Greenheck Model GRSI, or approved equal.

B. Relief hoods shall be Greenheck Model GRSR with backdraft damper, or approved equal.

C. Bird Screens: Provide removable bird screens, 1/2” mesh 16 gauge aluminum or brass wire.

D. Provide backdraft damper in the neck of each relief air hood (not required on hoods serving inline fans that are equipped with integral backdraft dampers).

E. Available Manufacturers: Subject to compliance with requirements, manufacturers offering intake and relief hoods which may be incorporated in the work include the following, or approved equal:
Greenheck
PennBarry
Cook

2.6 PRE-FABRICATED SEISMIC ROOF CURBS

A. See Specification Section 230500 (Basic Materials and Methods for HVAC).

2.7 DESTRATIFICATION FANS (HIGH VOLUME LOW SPEED FANS)

A. Provide high volume low speed fans of type, size, and capacity as scheduled on the drawings, and as specified herein. Fans shall be Big Ass Fan or approved equal. Furnish with standard controller with 0-10V control. Electrical disconnect shall be placed in a location accessible without the use of a ladder.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering high volume low speed fans which may be incorporated in the work include the following, or approved equal:
Big Ass Fans
Greenheck
Accurex

PART 3 - EXECUTION

3.1 GENERAL

A. Install fans and ventilators where indicated, in accordance with equipment manufacturer's installation instructions, and with recognized industry practices, to ensure that equipment complies with requirements and serves intended purposes.

B. Provide motors so that they cannot be overloaded above nameplate rating throughout the full speed range of the adjustable pitch driving sheave.

C. Fan wheels shall be balanced statically and dynamically near operating speed.

D. Provide drives and guards conforming to the requirements hereinbefore specified.

E. Fan construction, speed, noise level, tip speeds, outlet velocities, and efficiencies will be taken into consideration in assessment of all fans that are submitted.

3.2 ROOF CURBS

A. Furnish roof curbs to the roofing installer for installation.

3.3 ELECTRICAL CONNECTIONS

A. Ensure air distribution equipment is wired properly, with rotation in direction indicated and intended for proper performance.

3.4 CARE AND CLEANING

A. Repair or replace broken, damaged or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Owner’s representative. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.5 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.6 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like and leave the premises clean, neat and orderly.

END OF SECTION

SECTION 23 35 00 - AIR FILTERS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 SUBMITTALS

A. Product Data: Submit manufacturer's product data for each type of air filter, including dimensions, thickness, capacity, and materials of construction.

1.3 CERTIFICATIONS

A. The filter manufacturing facility shall be certified to comply with ISO 9001:2015. Filters shall be listed by Underwriters Laboratories as UL Class 900.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering air filters which may be incorporated in the work include the following, or approved equal:
Camfil
American Air Filter

2.2 MERV 9A PLEATED AIR FILTERS (2” & 4” THICK)

A. General
1. Air filters shall be medium efficiency ASHRAE panel filter type, of size, thickness, and quantity as scheduled on the drawings. Filters shall be Camfil 30/30 Dual 9, or approved equal.
2. The filter manufacturer shall have evidence of facility certification to ISO 9001:2015.

B. Construction
1. Filters shall be configured into high capacity pleat densities of 15 pleats per linear foot for 2” thick filters, and 11 pleats per linear foot for 4” thick filters. Filter enclosing frame shall be constructed of a 24 point high wet-strength beverage board that is bonded to the media shall provide a rigid and durable enclosure. Filters shall have a welded wire grid, spot-welded on centers, and treated for corrosion resistance, shall be bonded to the downstream side of the media to maintain the radial pleat and prevent media oscillation
2. Filters shall have charged synthetic media, lofted to a uniform depth, and formed into a uniform radial pleat.

C. Performance
1. The filter shall have a Minimum Efficiency Reporting Value (MERV) rating of 9 when evaluated under ASHRAE Standard 52.2. Additionally, filters shall have a MERV-A rating of 9 when tested per Appendix J of the same standard.
2. The filter shall have a performance rating of ePM10 - 55% when evaluated in accordance with ISO Filter Testing Standard16890.
3. The initial resistance to airflow for 2 inch thick filters shall not exceed 0.28” w.c. at 500 fpm, and 0.20” w.c. at 400 fpm.
4. The initial resistance to airflow for 4 inch thick filters shall not exceed 0.25” w.c. at 500 fpm, and 0.17” w.c. at 400 fpm.
5. The recommended filter change-out resistance is 1.0” w.c.

2.3 MERV 13 PLEATED AIR FILTERS (2” & 4” THICK)

A. General

1. Air filters shall be medium efficiency ASHRAE panel filter type, of size, thickness, and quantity as scheduled on the drawings. Filters shall be Camfil AP-Thirteen, or approved equal.

B. Construction

1. Filters shall be configured into high capacity pleat densities of 15 pleats per linear foot for 2” thick filters, and 11 pleats per linear foot for 4” thick filters. Filter enclosing frame shall be constructed of a 24 point high wet-strength beverage board that is bonded to the media shall provide a rigid and durable enclosure. Filters shall have a welded wire grid, spot-welded on centers, and treated for corrosion resistance, shall be bonded to the downstream side of the media to maintain the radial pleat and prevent media oscillation
2. Filters shall have charged synthetic media, lofted to a uniform depth, and formed into a uniform radial pleat.

C. Performance

1. The filter shall have a Minimum Efficiency Reporting Value (MERV) rating of 13 when evaluated under ASHRAE Standard 52.2.
2. The initial resistance to airflow for 2 inch thick filters shall not exceed 0.38” w.c. at 500 fpm, and 0.30” w.c. at 400 fpm.
3. The initial resistance to airflow for 4 inch thick filters shall not exceed 0.33” w.c. at 500 fpm, and 0.25” w.c. at 400 fpm.
4. The recommended filter change-out resistance is 1.0” w.c.

END OF SECTION

SECTION 23 37 00 - AIR OUTLETS AND INLETS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED:

A. This section includes specifications and requirements for air outlets and inlets.

1.3 QUALITY ASSURANCE

A. SMACNA Compliance: Comply with applicable portions of Sheet Metal and Air Conditioning Contractor's National Association (SMACNA) HVAC Duct Construction Standards (Metal and Flexible), latest edition, for all work in this section.

B. ASHRAE Standards: Comply with American Society of Heating, Refrigerating, and Air Conditioning Engineers (ASHRAE) recommendations, latest edition, for all work in this section.

C. NFPA Compliance: Comply with ANSI/NFPA 90A ‘Standard for the Installation of Air Conditioning and Ventilating Systems’, and ANSI/NFPA 90B ‘Standard for the Installation of Warm Air Heating and Air Conditioning Systems’.

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's product data for each type of ductwork accessory, including dimensions, capacities, and materials of construction, and installation instructions.

PART 2 - PRODUCTS

2.1 AIR OUTLETS AND INLETS

A. See air distribution schedule on the drawings for outlet and inlet types.

B. Grilles, registers, and diffusers shall be selected and guaranteed by the manufacturer to operate without objectionable noise or draft.

C. Furnish and install sponge rubber gaskets between grilles and grounds of finished surfaces. Wood grounds will be furnished by others. Metal grounds shall be furnished by the Contractor. Sidewall grilles and registers shall be provided with a dull/flat prime coat finish, unless noted otherwise. All supply diffusers, registers, and grilles located at ceilings shall have factory-applied bone white finish, unless indicated otherwise on the drawings.

D. Paint visible ductwork behind grilles, registers, and diffusers flat black.

E. General: Except as otherwise indicated, provide manufacturer's standard ceiling air diffusers where shown of size, shape, capacity, and type indicated; constructed of materials and components as indicated and as required for a complete installation. Provide diffusers with border styles that are compatible with adjacent ceiling systems and that are specifically manufactured to fit into ceiling modules with accurate fit and adequate support. Refer to the architectural drawings and specifications for types of ceiling systems which will contain each type of ceiling air diffuser and/or grille.

F. Allowable Manufacturers: Subject to compliance with requirements, manufacturers offering air outlets and inlets which may be incorporated in the work include the following:

Price
Krueger
Titus

PART 3 - EXECUTION

3.1 INSTALLATION OF AIR OUTLETS AND INLETS

A. Install outlets and inlets in accordance with manufacturer's written instructions and in accordance with recognized industry practices to ensure that products serve intended functions.

B. Locate ceiling air diffusers, registers, and grilles as indicated on reflected ceiling plans. Unless otherwise indicated, locate units in the center of acoustical ceiling modules.

C. Examine areas and conditions under which outlets and inlets are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

D. Ceiling mounted air terminals or services shall be positively attached to the ceiling suspension main runners or to cross runners with the same carrying capacity as the main runners.

E. Air terminals or services weighing not more than 56 pounds shall have two 12 gauge hangers connected from the air terminal or service to the structure above. These wires may be slack.

F. Air terminals or services weighing more than 56 pounds shall be supported directly from the structure above using submitted and approved hangers.

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment, fixtures, and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.3 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.4 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 50 00 - CONDENSING BOILERS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 SUMMARY

A. This Section includes packaged, factory fabricated and assembled, gas-fired, fire-tube condensing boilers, trim, and accessories for heating hot water systems.

1.3 SUBMITTALS

A. Product Data: Include performance data, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: For boilers, boiler trim, and accessories.

1. Include plans, elevations, sections, details, and attachments to other work.
2. Wiring Diagrams: Power, signal, and control wiring.

C. Source quality control test reports: Indicate and interpret test results for compliance with performance requirements before shipping.

D. Field quality control test reports: Indicate and interpret test results for compliance with performance requirements.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: Provide operation and maintenance data for boilers, to include emergency procedures, operation, and maintenance requirements.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authority having jurisdiction, and marked for intended use.

B. ASME Compliance: Fabricate and label boilers to comply with the ASME Boiler and Pressure Vessel Code.

C. ASHRAE/IESNA 90.1 Compliance: Boilers shall have minimum efficiency according to ‘Gas and Oil Fired Boilers - Minimum Efficiency Requirements’.

D. AHRI Compliance: Boilers shall be AHRI listed and shall meet the minimum efficiency specified under AHRI BTS-2000 as defined by the Department of Energy in 10 CFR Part 431.

E. ANSI Compliance: Boilers shall be compliant with ANSI Z21.13 test standards.

F. CSA Compliant: Boilers shall be compliant with CSA certification requirements.

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor bolt inserts into concrete bases.

1.7 WARRANTY

A. Standard Warranty: The boilers shall include the manufacturer's standard form warranty in which the manufacturer agrees to repair or replace components of boilers that fail in materials or workmanship within the specified warranty period. Warranty period for fire tube condensing boilers shall be as follows:

1. The heat exchanger, pressure vessel, and condensation collection basin shall carry a 10 year limited warranty against defects in materials or workmanship.
2. The heat exchanger/pressure vessel shall be warranted against thermal shock for the lifetime of the boiler.
3. The burner and O_2 sensor shall carry a 5 year warranty against defects in materials or workmanship from the date of shipment.
4. All other components shall carry a one year warranty from date of boiler startup or 18 months from shipment if startup cannot be successfully conducted.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering boilers which may be incorporated in the work include the following, or approved equal:

Lochinvar Crest Hellcat (with O_2 Trim)
Cleaver Brooks ClearFire (with O_2 Trim)

2.2 CONSTRUCTION

A. Description: The boiler shall be natural gas fired, fully condensing, and fire tube design. The boiler shall be factory fabricated, factory assembled, and factory tested, fire tube condensing boiler with heat exchanger sealed pressure tight, built on a steel base; including insulated jacket' flue gas vent and combustion air intake connections, water supply, return, and condensate drain connections, and controls.

B. Heat Exchanger: The heater exchanger shall bear the ASME H stamp for 160 psi working pressure and shall be National Board listed. The heat exchanger shall be constructed of fully welded 316L stainless steel and fire tube design. Fire tube shall be of wave fire tube design and capable of transferring 30,000 to 40,000 Btu's per tube. The heat exchanger shall be designed for single pass water flow to limit the water side pressure drop. There shall be no banding material, bolts, gaskets or O-rings in the heat exchanger design. Cast iron, aluminum, or condensing copper tube boilers are not acceptable.

C. Condensate Collection Basin: Fully welded 316L stainless steel.

D. Intake Filter and Dirty Filter Switch: The boiler shall include an intake air filter with a factory installed air pressure switch. The pressure switch will alert the end user on the screen of the boiler when the intake filter is dirty and needs to be changed.

E. Pressure Vessel: The pressure vessel shall be constructed in accordance with the ASME Section IV pressure vessel code. The pressure vessel shall be designed for single pass water flow to limit the water side pressure drop. The water side pressure drop shall not exceed 6.0 feet (2.6 psi) when operating at a 30°F ΔT.

F. The boiler shall be equipped with combustion technology featuring real time O_2 trim. This technology shall adjust the fuel/air ratio via 3 independent methods (air damper, gas damper, and fan speed). The initial settings shall be implemented during startup and commissioning. The O_2 sensor shall be manufactured by a major automotive supplier. The O_2 sensor shall have a self-diagnosis feature that indicates should any failure occur. The O_2 sensor shall be located in the combustion chamber. The adjustments shall be in real time during operation, continuous throughout the entire modulation range, and be displayed via a gauge on both the boiler touchscreen and the communication interface.

G. The pressure vessel shall contain a volume of water no less than the following:

Boiler Model	Boiler Input Capacity	Water Content
FCB 1500	1500 mbh	94 gallons

H. Burner: Natural gas, forced draft, single burner pre-mix design with an upper and lower chamber supplied by individual combustion systems. The burner shall be high temperature stainless steel with a woven Fecralloy outer covering to provide modulating firing rates. The burner shall be capable of the stated gas train turndown without loss of combustion efficiency. The burner shall have an independent laboratory rating for Oxides of Nitrogen (NOx) to meet requirements of South Coast Air Quality Management District (SCAQMD) compliant with Rule 1146.2, San Diego Air Control Pollution District compliant with Regulation 69.2.1, and Bay Area Quality Management District compliant with Regulation 9, Rule 7.

I. Blower: The boiler shall be equipped with a pulse width modulating blower system to precisely control the fuel/air mixture to provide modulating boiler firing rates for maximum efficiency. The burner firing sequence of operation shall include pre-purge, firing, modulation, and post-purge operation. Motors shall comply with the requirements listed in Section 230500 (Basic Materials and Methods for HVAC).

J. Gas Train: The boiler shall be supplied with two gas valves designed with negative pressure regulation and shall be capable of the following minimum turndowns:

Boiler Model	Boiler Input Capacity	Turndown	Minimum Input
FCB 1500	1500 mbh	25:1	60 mbh

K. Ignition: Spark ignition with 100 percent main valve shutoff with electronic flame supervision.

L. High Altitude: The boiler shall operate at altitudes up to 4,500 feet above sea level without additional parts or adjustments. High altitude operation shall be certified at a minimum of 4,500 feet above sea level by a third party organization. High altitude boilers shall be certified from 3,000 to 12,000 feet above sea level.

M. The boilers shall carry a CSA certification for high altitude operation up to 12,000 feet. High altitude operation shall be third party certified and be conducted in an ISO 17025 recognized laboratory; boilers without this high altitude certification are not acceptable.

N. Casing
   1. Jacket: Heavy gauge primed and painted steel jacket with snap-in closures.
   2. Control Compartment Enclosures: NEMA 250, Type 1A.
   3. Insulation: Minimum 1/2 inch thick, mineral fiber insulation, surrounding the boiler heat exchanger.
   4. Combustion Air Connections: Inlet and vent duct collars.

O. Characteristics and Capacities
   1. Heating Medium: Hot water.
   2. Design Water Pressure Rating: 160 psi working pressure.

2.3 TRIM AND ACCESSORIES

A. Safety Relief Valve: Furnish ASME rated 50 psi relief valve, unless otherwise indicated on drawings. Fully enclosed steel spring with adjustable pressure range and positive shutoff; factory set and sealed.

B. Pressure Gauge: Minimum 3-1/2 inch diameter. Gauge shall have normal operating pressure about 50 percent of full range.

C. Drain Valves: Minimum 3/4 inch valve or nozzle size with hose end connection.

D. Condensate Neutralization Kit: provide a factory-supplied condensate trap with condensate trip sensor, and high capacity condensate receiver, pre-filled with an appropriate neutralizing medium. Provide 40 lbs of spare neutralization media for future use by the Owner.

2.4 CONTROLS

A. Boiler controls shall feature a standard, factory installed 8” LCD screen display with the following standard features:

1. Variable Speed Boiler Pump Control: Boiler may be programmed to send a 0-10 VDC output signal to an ECM or VFD boiler pump to maintain a designed temperature rise across the heat exchanger. The boiler shall be able to operate in this mode with a minimum temperature rise of 20°F and a maximum temperature rise of 60°F. Project specific temperature rise shall be as listed on the drawings.
2. Password Security: Boiler shall have a different password security code for the user and the installer to access adjustable parameters.
3. Outdoor air reset: The boiler shall calculate the setpoint using a field installed, factory supplied outdoor sensor and an adjustable reset curve.
4. Pump exercise: The boiler shall energize any pump it controls for an adjustable time (initially 5 minutes) if the associated pump has been off for a time period of 24 hours.
5. Ramp delay: The boiler shall have the capability to be programmed to limit the firing rate based on six limits steps and six time intervals. The boiler shall be configured at the project site for a 5 minute delay per each 20% modulation rise up to 100% (adjustable) to further mitigate unnecessary burner cycles.
6. Boost function: The boiler may be programmed to automatically increase the setpoint a fixed number of degrees (adjustable by installer) if the setpoint has been continuously active for a set period of time (time adjustable by installer). This process will continue until the space heating demand ends.
7. Domestic hot water priority: When applicable, the boiler shall make the domestic hot water call for heat a priority over any space heating call and adjust the boiler setpoint to the domestic hot water boiler setpoint.
8. Domestic hot water modulation limiting: When applicable the boiler shall be programmed to limit the maximum domestic hot water firing rate to match the input rating of the indirect tank coil.
9. Domestic hot water night setback: When applicable the boiler may be programmed to reduce the domestic hot water tank setpoint during a certain time of the day.
10. PC port connection: The boiler shall have a PC port allowing the connection of PC boiler software.
11. Time clock: The boiler shall have an internal time clock with the ability to time and date stamp lock-out codes and maintain records of runtime.
12. Service reminder: The boiler shall have the ability to display a yellow colored service notification screen based upon months of installation, hours of operation, and number of boiler cycles. All notifications shall be adjustable by the installer.
13. Multiple pump control: The boiler shall have the ability to control the boiler pump, system pump, and the domestic hot water pump if desired.

14. Anti-cycling control: Boiler shall have the ability to set a time delay after a heating demand is satisfied allowing the boiler to block a new call for heat. The boiler shall display an anti-cycling blocking on the screen until the time has elapsed or the water temperature drops below the anti-cycling differential parameter. The anti-cycling control parameter shall be adjustable and shall be set initially to 5 minutes.
15. Night setback: the boiler shall be capable of being programmed to reduce the space heating temperature setpoint during a certain time of the day.
16. Freeze protection: The boiler shall turn on the boiler and system pumps when the boiler water temperature falls below 45°F. When the boiler water temperature falls below 37°F the boiler shall automatically turn on. Boiler and pumps shall turn off when the boiler water temperature rises above 43°F.
17. Isolation valve control: When required on the drawings, the boiler shall have the ability to control a 2-way motorized control valve. The boiler shall also be able to force a fixed number of valves to always be energized regardless of the number of boilers that are firing.
18. BMS integration with 0-10V DC input: Control shall allow an option to enable and control setpoint temperature or control firing rate by sending the boiler a 0-10V input signal.
19. Data logging: The boiler shall have non-volatile data logging memory including the last 10 lockouts, hours running, and ignition attempts, all viewable on the boiler screen.

B. The boiler shall have a built in cascade controller to sequence and rotate lead boiler to ensure equal runtime while maintaining modulation of up to 8 boilers of different btu inputs without utilization of an external controller. The factory installed, internal cascade controller shall include each of the following:
   1. Lead lag.
   2. Efficiency optimization: The control module shall allow multiple boilers to fire at the minimum firing rate in lieu of lead/lag operation.
   3. Front end loading.
   4. Boiler Rotation: The control module shall change the lead boiler every hour for the first 24 hours after initializing the cascade and after that the lead will be changed every 24 hours.

C. Boiler operating controls shall include the following devices and features:
   1. Setpoint Adjustment: Setpoints shall be adjustable.
   2. Operating Pressure Control: Factory-wired and mounted to cycle burner.
   3. Sequence of Operation: Factory-installed controller to modulate burner firing rate to maintain system water temperature in response to call for heat.
   4. Sequence of Operation: Electric, factory-fabricated and factory-installed panel shall be capable of controlling burner firing rate to reset supply water temperature inversely with outside air temperature.

D. Burner Operating Controls: To maintain safe operating conditions, burner safety controls limit burner operation.
   1. High Temperature Limit: Automatic and manual reset stops burner if operating conditions rise above maximum boiler design temperature. Limit switch to be manually reset on the control interface.
   2. Low Water Cutoff Switch: Electronic probe shall prevent burner operation on low water. Cutoff switch shall be manually reset on the control interface.
   3. Blocked Inlet Safety Switch: Manual reset pressure switch field mounted on boiler combustion-air inlet.
   4. High and Low Gas Pressure Switches: Pressure switches shall prevent burner operation on low or high gas pressure. Pressure switches to be manually reset on the control interface.

5. Blocked Drain Switch: Blocked drain switch shall prevent burner operation when tripped. Switch to be manually reset on the control interface.
6. Low Air Pressure Switch: Pressure switches shall prevent burner operation on low air pressure. Switch shall be manually reset on the control interface.
7. Audible Alarm: Factory-mounted on control panel with silence switch; shall sound an alarm for any lockout condition.

E. Building Automation System Interface: Provide factory-installed BACnet MSTP gateway interface to enable the building automation system to monitor, control, and display boiler status and alarms.

2.5 ELECTRICAL POWER

A. Controllers, Electrical Devices, and Wiring: Electrical devices and connections shall be as specified in Division 26.

B. Single Point Field Power Connection: Factory-installed and factory-wired switches, motor controllers, transformers, and other electrical devices necessary shall provide for a single point field power connection to the boiler.

C. Electrical characteristics shall be as indicated on the drawings.

2.6 VENTING AND COMBUSTION AIR

A. See Specification Section 235100 (Condensing Gas-Fired Equipment Vents).

B. Venting and combustion air intake piping shall be installed per the approved venting method shown in the vent manufacturer's installation and operation manual as appropriate to conform with the arrangement shown on the drawings.

C. Refer to the equipment manufacturer's installation and operation manual for detailed venting instructions and approved vent manufacturers.

D. Combustion air intake piping length shall not exceed 100 total equivalent feet.

2.7 SOURCE QUALITY CONTROL

A. Burner and Hydrostatic Test: Factory-adjust the burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions, carbon monoxide in flue gas, and to achieve the design combustion efficiency. Perform hydrostatic testing.

B. Test and inspect factory-assembled boilers, before shipping, according to the ASME Boiler and Pressure Vessel Code.

C. The Owner shall be allowed access to source quality control testing of boilers if so desired.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before boiler installation, examine rough-in for concrete equipment bases, anchor bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations. Final boiler locations indicated on the drawings are approximate. Determine the exact locations before rough-in of piping and electrical connections.

B. Examine mechanical spaces for suitable conditions where boilers will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 BOILER INSTALLATION

A. Install boilers level on concrete bases. Concrete base shall be as specified in 230500 (Basic Materials and Methods for HVAC).

B. Install gas-fired boilers according to NFPA 54.

C. Assemble and install boiler trim.

D. Install electrical devices furnished with boiler but not specified to be factory mounted.

E. Install control wiring to field mounted electrical devices.

3.3 CONNECTIONS

A. Install piping adjacent to boiler to allow service and maintenance.

B. Install piping from equipment drain connection to nearest floor drain. Piping shall be at least full size of connection.

C. Connect gas piping to boiler gas train inlet with union. Piping shall be at least full size of equipment connection. Provide a reducer if required.

D. Connect hot water piping to supply and return boiler tappings with shutoff valve and union or flange at each connection.

E. Install piping from safety relief valves to nearest floor drain.

F. Boiler Venting: Install flue venting kit and combustion air intake as indicated on the drawings.

G. Ground equipment according to the requirements listed in Division 26.

H. Connect wiring according to the requirements listed in Division 26.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory trained and authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing. Perform tests and inspections and prepare associated test reports.

B. Tests and Inspections
   1. Perform installation and startup checks according to manufacturer's written instructions. Complete startup form included with boiler and provided to Owner and manufacturer.
   2. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
   3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion efficiency.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
      a. Check and adjust initial operating setpoints and high and low limit safety setpoints of fuel supply, water level and water temperature.
      b. Set field adjustable switches and circuit breaker trip ranges as indicated.

C. Occupancy Adjustments: When requested, within 12 months of the date of substantial completion, provide on-site assistance in adjusting the system to suit actual occupied conditions. Provide up to two visits to the project site for this purpose.

D. Performance Tests
   1. Engage a factory trained and authorized service representative to inspect component assemblies and equipment installations, including connections, and to conduct performance testing.
   2. Boilers shall comply with performance requirements indicated, as determined by field performance tests. Adjust, modify, or replace equipment to comply.
   3. Perform field performance tests to determine capacity and efficiency of the boilers.
   4. Repeat tests until results comply with requirements indicated.
   5. Provide analysis equipment required to determine performance.
   6. Provide temporary equipment and system modifications necessary to dissipate the heat produced during tests if building systems are not adequate.
   7. Notify Architect/Engineer in advance of proposed test dates.
   8. Perform a combustion analysis after installation and adjust gas valve per the installation and operations manual and note results in startup report.
   9. Document test results in a report and submit to Architect/Engineer.

3.5 FACTORY AUTHORIZED STARTUP AND TRAINING

A. Engage a factory trained and authorized service representative for boiler startup and to train the Owner's maintenance personnel to adjust, operate, and maintain the boilers.

END OF SECTION

SECTION 23 50 10 - CONDENSING BOILERS (399 - 999 MBH)

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

1.2 SUMMARY

A. This Section includes packaged, factory fabricated and assembled, gas-fired, fire-tube condensing boilers, trim, and accessories for heating hot water systems.

1.3 SUBMITTALS

A. Product Data: Include performance data, operating characteristics, furnished specialties, and accessories.

B. Shop Drawings: For boilers, boiler trim, and accessories.

1. Include plans, elevations, sections, details, and attachments to other work.
2. Wiring Diagrams: Power, signal, and control wiring.

C. Source quality control test reports: Indicate and interpret test results for compliance with performance requirements before shipping.

D. Field quality control test reports: Indicate and interpret test results for compliance with performance requirements.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: Provide operation and maintenance data for boilers, to include emergency procedures, operation, and maintenance requirements.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authority having jurisdiction, and marked for intended use.

B. ASME Compliance: Fabricate and label boilers to comply with the ASME Boiler and Pressure Vessel Code.

C. ASHRAE/IESNA 90.1 Compliance: Boilers shall have minimum efficiency according to ‘Gas and Oil Fired Boilers - Minimum Efficiency Requirements’.

D. AHRI Compliance: Boilers shall be AHRI listed and shall meet the minimum efficiency specified under AHRI BTS-2000 as defined by the Department of Energy in 10 CFR Part 431.

E. ANSI Compliance: Boilers shall be compliant with ANSI Z21.13 test standards.

F. CSA Compliant: Boilers shall be compliant with CSA certification requirements.

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor bolt inserts into concrete bases.

1.7 WARRANTY

A. Standard Warranty: The boilers shall include the manufacturer's standard form warranty in which the manufacturer agrees to repair or replace components of boilers that fail in materials or workmanship within the specified warranty period. Warranty period for fire tube condensing boilers shall be as follows:

1. The heat exchanger, pressure vessel, and condensation collection basin shall carry a 10 year limited warranty against defects in materials or workmanship.
2. The heat exchanger/pressure vessel shall be warranted against thermal shock for the lifetime of the boiler.
3. The burner and O_2 sensor shall carry a 5 year warranty against defects in materials or workmanship from the date of shipment.
4. All other components shall carry a one year warranty from date of boiler startup or 18 months from shipment if startup cannot be successfully conducted.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering boilers which may be incorporated in the work include the following, or approved equal:

Lochinvar Model FTX
Cleaver Brooks ClearFire CE

2.2 CONSTRUCTION

A. Description: The boiler shall be natural gas fired, fully condensing, fire tube design. The boiler shall be factory fabricated, factory assembled, and factory tested, fire tube condensing boiler with heat exchanger sealed pressure tight, built on a steel base; including insulated jacket' flue gas vent and combustion air intake connections, water supply, return, and condensate drain connections, and controls.

B. The boiler shall be constructed with a heavy gauge steel jacket assembly, primed and painted on both sides. The combustion chamber shall be sealed and completely enclosed, independent of the outer jacket assembly, so that integrity of the outer jacket does not affect a proper seal. A burner/flame observation port shall be provided for observing the burner flame and combustion chamber. The boiler (FTX 1000 only) shall be supplied with an integrated air filter to filter the combustion air prior to entering the burner.

C. Heat Exchanger: The heater exchanger shall bear the ASME H stamp for 160 psi working pressure and shall be National Board listed. The heat exchanger shall be constructed of fully welded stainless steel and fire tube design. The heat exchanger shall be designed for single pass water flow to limit the water side pressure drop. There shall be no banding material, bolts, gaskets or O-rings in the heat exchanger design. Cast iron, aluminum, or condensing copper tube boilers are not acceptable.

D. Condensate Collection Basin: Fully welded stainless steel.

E. Pressure Vessel: The pressure vessel shall be constructed in accordance with the ASME Section IV pressure vessel code. The pressure vessel shall be designed for single pass water flow to limit the water side pressure drop. The water side pressure drop shall not exceed 2.2 psi when operating at 75 gpm.

F. The pressure vessel shall contain a volume of water no less than the following:

Boiler Model	Boiler Input Capacity	Water Content
FTX 400	399.9 mbh	13.2 gallons

G. Burner: The burner shall be a pre-mix design constructed of high temperature stainless steel with a woven Fecralloy outer covering to provide smooth operation at all modulating firing rates. The boiler shall be supplied with a negative pressure regulation gas valve and be equipped with a pulse width modulation blower system to precisely control the fuel/air mixture to the burner. The boiler shall operate in a safe condition with gas supply pressures as low as 4 inches of water column. The burner flame shall be ignited by direct spark ignition with flame monitoring via a flame sensor.

H. Gas Train: The boiler shall be capable of the following minimum turndowns:

Boiler Model	Boiler Input Capacity	Turndown	Minimum Input
FTX 400	40 mbh	10:1	399.9 mbh

I. Ignition: Spark ignition with 100 percent main valve shutoff with electronic flame supervision.

J. High Altitude: The boiler shall operate at altitudes up to 4,500 feet above sea level without additional parts or adjustments.

K. High altitude operation shall be certified at a minimum of 4,500 feet above sea level by a third party organization. High altitude boilers shall be certified from 3,000 to 12,000 feet above sea level.

L. The boiler shall carry a CSA certification for high altitude operation up to 12,000 feet. High altitude operation shall be third party certified and be conducted in an ISO 17025 recognized laboratory; boilers without this high altitude certification are not acceptable.

2.3 TRIM AND ACCESSORIES

A. Safety Relief Valve: Furnish ASME rated 50 psi relief valve, unless otherwise indicated on drawings. Fully enclosed steel spring with adjustable pressure range and positive shutoff; factory set and sealed.

B. Pressure Gauge: Minimum 3-1/2 inch diameter. Gauge shall have normal operating pressure about 50 percent of full range.

C. Drain Valves: Minimum 3/4 inch valve or nozzle size with hose end connection.

D. Condensate Neutralization Kit: provide a factory-supplied condensate trap with condensate trip sensor, and high capacity condensate receiver, pre-filled with an appropriate neutralizing medium. Provide 40 lbs of spare neutralization media for future use by the Owner.

2.4 CONTROLS

A. Boiler controls shall feature a standard, factory installed 7” LCD screen display with the following standard features:

1. Variable Speed Boiler Pump Control: Boiler may be programmed to send a 0-10 VDC output signal to an ECM or VFD boiler pump to maintain a designed temperature rise across the heat exchanger. The boiler shall be able to operate in this mode with a minimum temperature rise of 20°F and a maximum temperature rise of 60°F. Project specific temperature rise shall be as listed on the drawings.
2. Password Security: Boiler shall have a different password security code for the user and the installer to access adjustable parameters.
3. Outdoor air reset: The boiler shall calculate the setpoint using a field installed, factory supplied outdoor sensor and an adjustable reset curve.
4. Pump exercise: The boiler shall energize any pump it controls for an adjustable time (initially 5 minutes) if the associated pump has been off for a time period of 24 hours.
5. Ramp delay: The boiler shall have the capability to be programmed to limit the firing rate based on six limits steps and six time intervals. The boiler shall be configured at the project site for a 5 minute delay per each 20% modulation rise up to 100% (adjustable) to further mitigate unnecessary burner cycles.

6. Boost function: The boiler may be programmed to automatically increase the setpoint a fixed number of degrees (adjustable by installer) if the setpoint has been continuously active for a set period of time (time adjustable by installer). This process will continue until the space heating demand ends.
7. Domestic hot water priority: When applicable, the boiler shall make the domestic hot water call for heat a priority over any space heating call and adjust the boiler setpoint to the domestic hot water boiler setpoint.
8. Domestic hot water modulation limiting: When applicable the boiler shall be programmed to limit the maximum domestic hot water firing rate to match the input rating of the indirect tank coil.
9. Domestic hot water night setback: When applicable the boiler may be programmed to reduce the domestic hot water tank setpoint during a certain time of the day.
10. PC port connection: The boiler shall have a PC port allowing the connection of PC boiler software.
11. Time clock: The boiler shall have an internal time clock with the ability to time and date stamp lock-out codes and maintain records of runtime.
12. Service reminder: The boiler shall have the ability to display a yellow colored service notification screen based upon months of installation, hours of operation, and number of boiler cycles. All notifications shall be adjustable by the installer.
13. Multiple pump control: The boiler shall have the ability to control the boiler pump, system pump, and the domestic hot water pump if desired.
14. Anti-cycling control: Boiler shall have the ability to set a time delay after a heating demand is satisfied allowing the boiler to block a new call for heat. The boiler shall display an anti-cycling blocking on the screen until the time has elapsed or the water temperature drops below the anti-cycling differential parameter. The anti-cycling control parameter shall be adjustable and shall be set initially to 5 minutes.
15. Night setback: the boiler shall be capable of being programmed to reduce the space heating temperature setpoint during a certain time of the day.
16. Freeze protection: The boiler shall turn on the boiler and system pumps when the boiler water temperature falls below 45°F. When the boiler water temperature falls below 37°F the boiler shall automatically turn on. Boiler and pumps shall turn off when the boiler water temperature rises above 43°F.
17. Isolation valve control: When required on the drawings, the boiler shall have the ability to control a 2-way motorized control valve. The boiler shall also be able to force a fixed number of valves to always be energized regardless of the number of boilers that are firing.
18. BMS integration with 0-10V DC input: Control shall allow an option to enable and control setpoint temperature or control firing rate by sending the boiler a 0-10V input signal.
19. Data logging: The boiler shall have non-volatile data logging memory including the last 10 lockouts, hours running, and ignition attempts, all viewable on the boiler screen.

B. The boiler shall have a built in cascade controller to sequence and rotate the lead boiler to ensure equal runtime while maintaining modulation of up to 8 boilers of different btu inputs without utilization of an external controller. The factory installed, internal cascade controller shall include each of the following:
   1. Lead lag.
   2. Efficiency optimization: The control module shall allow multiple boilers to fire at the minimum firing rate in lieu of lead/lag operation.
   3. Front end loading.
   4. Boiler Rotation: The control module shall change the lead boiler every hour for the first 24 hours after initializing the cascade and after that the lead will be changed every 24 hours.

C. Boiler operating controls shall include the following devices and features:
   1. Setpoint Adjustment: Setpoints shall be adjustable.
   2. Operating Pressure Control: Factory-wired and mounted to cycle burner.
   3. Sequence of Operation: Factory-installed controller to modulate burner firing rate to maintain system water temperature in response to call for heat.
   4. Sequence of Operation: Electric, factory-fabricated and factory-installed panel shall be capable of controlling burner firing rate to reset supply water temperature inversely with outside air temperature.

D. Burner Operating Controls: To maintain safe operating conditions, burner safety controls limit burner operation.
   1. High Temperature Limit: Automatic and manual reset stops burner if operating conditions rise above maximum boiler design temperature. Limit switch to be manually reset on the control interface.
   2. Low Water Cutoff Switch: Electronic probe shall prevent burner operation on low water. Cutoff switch shall be manually reset on the control interface.
   3. Blocked Inlet Safety Switch: Manual reset pressure switch field mounted on boiler combustion-air inlet.
   4. High and Low Gas Pressure Switches: Pressure switches shall prevent burner operation on low or high gas pressure. Pressure switches to be manually reset on the control interface.
   5. Blocked Drain Switch: Blocked drain switch shall prevent burner operation when tripped. Switch to be manually reset on the control interface.
   6. Low Air Pressure Switch: Pressure switches shall prevent burner operation on low air pressure. Switch shall be manually reset on the control interface.
   7. Audible Alarm: Factory-mounted on control panel with silence switch; shall sound an alarm for any lockout condition.

E. Building Automation System Interface: Provide factory-installed BACnet MSTP gateway interface to enable the building automation system to monitor, control, and display boiler status and alarms.

2.5 ELECTRICAL POWER

A. Controllers, Electrical Devices, and Wiring: Electrical devices and connections shall be as specified in Division 26.

B. Single Point Field Power Connection: Factory-installed and factory-wired switches, motor controllers, transformers, and other electrical devices necessary shall provide for a single point field power connection to the boiler.

C. Electrical characteristics shall be as indicated on the drawings.

2.6 VENTING AND COMBUSTION AIR

A. See Specification Section 235100 (Condensing Gas-Fired Equipment Vents).

B. Venting and combustion air intake piping shall be installed per the approved venting method shown in the vent manufacturer’s installation and operation manual as appropriate to conform with the arrangement shown on the drawings.

C. Refer to the equipment manufacturer’s installation and operation manual for detailed venting instructions and approved vent manufacturers.

D. Combustion air intake piping length shall not exceed 100 total equivalent feet.

2.7 SOURCE QUALITY CONTROL

A. Burner and Hydrostatic Test: Factory-adjust the burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions, carbon monoxide in flue gas, and to achieve the design combustion efficiency. Perform hydrostatic testing.

B. Test and inspect factory-assembled boilers, before shipping, according to the ASME Boiler and Pressure Vessel Code.

C. The Owner shall be allowed access to source quality control testing of boilers if so desired.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Before boiler installation, examine rough-in for concrete equipment bases, anchor bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting boiler performance, maintenance, and operations. Final boiler locations indicated on the drawings are approximate. Determine the exact locations before rough-in of piping and electrical connections.

B. Examine mechanical spaces for suitable conditions where boilers will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 BOILER INSTALLATION

A. Install boilers level on concrete bases. Concrete base shall be as specified in 230500 (Basic Materials and Methods for HVAC).

B. Install gas-fired boilers according to NFPA 54.

C. Assemble and install boiler trim.

D. Install electrical devices furnished with boiler but not specified to be factory mounted.

E. Install control wiring to field mounted electrical devices.

3.3 CONNECTIONS

A. Install piping adjacent to boiler to allow service and maintenance.

B. Install piping from equipment drain connection to nearest floor drain. Piping shall be at least full size of connection.

C. Connect gas piping to boiler gas train inlet with union. Piping shall be at least full size of equipment connection. Provide a reducer if required.

D. Connect hot water piping to supply and return boiler tappings with shutoff valve and union or flange at each connection.

E. Install piping from safety relief valves to nearest floor drain.

F. Boiler Venting: Install flue venting kit and combustion air intake as indicated on the drawings.

G. Ground equipment according to the requirements listed in Division 26.

H. Connect wiring according to the requirements listed in Division 26.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory trained and authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing. Perform tests and inspections and prepare associated test reports.

B. Tests and Inspections
   1. Perform installation and startup checks according to manufacturer's written instructions. Complete startup form included with boiler and provided to Owner and manufacturer.
   2. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.
   3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion efficiency.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
      a. Check and adjust initial operating setpoints and high and low limit safety setpoints of fuel supply, water level and water temperature.
      b. Set field adjustable switches and circuit breaker trip ranges as indicated.

C. Occupancy Adjustments: When requested, within 12 months of the date of substantial completion, provide on-site assistance in adjusting the system to suit actual occupied conditions. Provide up to two visits to the project site for this purpose.

D. Performance Tests
   1. Engage a factory trained and authorized service representative to inspect component assemblies and equipment installations, including connections, and to conduct performance testing.
   2. Boilers shall comply with performance requirements indicated, as determined by field performance tests. Adjust, modify, or replace equipment to comply.
   3. Perform field performance tests to determine capacity and efficiency of the boilers.
   4. Repeat tests until results comply with requirements indicated.
   5. Provide analysis equipment required to determine performance.
   6. Provide temporary equipment and system modifications necessary to dissipate the heat produced during tests if building systems are not adequate.
   7. Notify Architect/Engineer in advance of proposed test dates.
   8. Perform a combustion analysis after installation and adjust gas valve per the installation and operations manual and note results in startup report.
   9. Document test results in a report and submit to Architect/Engineer.

3.5 FACTORY AUTHORIZED STARTUP AND TRAINING

A. Engage a factory trained and authorized service representative for boiler startup and to train the Owner's maintenance personnel to adjust, operate, and maintain the boilers.

END OF SECTION

SECTION 23 51 00 - CONDENSING GAS-FIRED EQUIPMENT VENTS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 SUMMARY

A. This section includes vent and combustion air materials and requirements for condensing type gas-fired equipment installed indoors. Such equipment includes condensing type boilers, water heaters, unit heaters, duct heaters, furnaces, etc.

1.3 SUBMITTALS

A. Product Data: Include product data, temperature ratings, and furnished accessories.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.

1.4 QUALITY ASSURANCE

A. Vent materials shall be listed in accordance with UL 1738.

1.5 COORDINATION

A. All venting and combustion air provisions shall comply with the installation requirements of the equipment manufacturer.

PART 2 - PRODUCTS

2.1 VENT AND COMBUSTION AIR MATERIALS AND INSTALLATION

A. General: Vent and combustion air intake piping shall be installed per an approved venting method shown in the vent manufacturer's installation manual as appropriate to conform to the arrangement shown on the drawings.

B. Vents

1. All vents shall be installed with clearance to combustibles that conforms to the equipment and vent manufacturer's UL listing.
2. Vent materials shall be UL 1738 listed, sealed Category IV, stainless steel. Vents shall comply with the direct vent requirements listed in the vent manufacturer's installation instructions.
3. Vent sections that are installed in a mechanical room or other areas exposed to occupants shall be double wall (for personnel safety purposes).
4. Vent sections that are enclosed or concealed may be single wall.

C. Combustion Air Intakes

1. Combustion air intake piping shall be one of the following:
   a. 28 gauge minimum spiral lockseam galvanized duct.
   b. Polypropylene that is 25/50 rated per ASTM E84. Acceptable products include DuraVent PolyPro, InnoFlue, or approved equal. Provide all necessary adapters, fittings, gaskets, etc. as required for a complete installation.

END OF SECTION

SECTION 23 65 20 - INDUCED DRAFT CLOSED CIRCUIT FLUID COOLERS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

1.2 WORK INCLUDED

A. This section includes design, performance criteria, controls, and installation requirements for induced draft closed circuit fluid coolers.

1.3 SUBMITTALS

A. Product Data: Provide Include rated capacities, pressure drop, performance curves with selected points indicated, furnished specialties, and accessories.

B. Shop Drawings: Provide a complete set of manufacturer's drawings of evaporative equipment assemblies, control panels, sections and elevations, and unit isolation. Include the following:

1. Assembled unit dimensions.
2. Weight and load distribution.
3. Required clearances for maintenance and operation.
4. Sizes and locations of piping and wiring connections.
5. Provide wiring diagrams for power, signal, and control wiring. Diagrams shall differentiate between manufacturer-installed and field-installed wiring.

C. Operation and Maintenance Data: Provide an operation and maintenance manual.

1.4 QUALITY ASSURANCE

A. The thermal performance of each unit shall be guaranteed to provide the capacity scheduled on the drawings.

B. Unit sound performance ratings shall be tested in accordance with CTI Certification Standard ATC-128. Sound ratings shall not exceed the specified ratings.

C. The unit shall meet or exceed energy efficiency listed in ASHRAE Standard 90.1.

1.5 WARRANTY

A. Submit a written warranty executed by the manufacturer, agreeing to repair or replace components of the unit that fail in materials and workmanship within the specified warranty period.

1. Fan Motor and Drive System: The warranty period shall be 2 years from the date of unit shipment from the factory and shall include fan motors, fans, bearings, mechanical support, sheaves, bushings and belts.
2. The entire unit, including the heat transfer coil, shall have a comprehensive 2 year warranty against defects in materials and workmanship from the date of startup, not to exceed 18 months from the date of unit shipment from the factory.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, closed circuit fluid coolers manufacturers shall be as follows, or approved equal:

EVAPCO Model ECO-ATWB

2.2 GENERAL

A. Fluid cooler configuration, dimensions, thermal performance, and accessories shall be as scheduled on the drawings and as specified herein.

2.3 IBC COMPLIANCE

A. The structure of the fluid cooler shall be designed, analyzed, and constructed in accordance with the wind and seismic load requirements of the following:

2018 IBC, ASCE/SEI 7-05, ASCE/SEI 7-10, ASCE/SEI 7-16, NFPA 5000.
For Importance Factor (IP) = 1.0, SDS = 1.6 (@ z/h = 0), and P = 288 psf.

2.4 COMPONENTS

A. Description: Factory assembled and tested, induced draft counter flow closed circuit fluid cooler, complete with fan, coil, louvers, accessories, and rigging supports.

B. Materials of Construction

1. All cold water basin components including vertical supports, air inlet louver frames and panels up to rigging seam shall be constructed of Type 304 stainless steel. All factory cold water basin seams shall be welded for water tight construction. Type 300 stainless steel will not be acceptable as equivalent to Type 304 stainless steel.
2. The upper casing, channels, and angle supports shall be constructed of heavy gauge mill hot-dip galvanized steel. Fan cowl and guard shall be constructed of galvanized steel. All galvanized steel shall be coated with a minimum of 2.35 ounces of zinc per square foot of surface area (achieving a G-235 hot-dip galvanized steel designation). During fabrication, all galvanized steel panel edges shall be coated with a 95% pure zinc-rich compound.
3. All evaporative cooling equipment utilizing galvanized construction requires initial passivation to maximize the service life of the equipment. The site's water treatment vendor shall be contacted several weeks prior to adding any water to the system to provide a passivation plan and instructions.

C. Fan(s)

1. Fan(s) shall be high efficiency axial propeller type, using a high strength die cast aluminum hub and fiberglass reinforced polypropylene wide chord blades. Each fan shall be statically balanced and installed in a closely fitted cowl with venturi air inlet for maximum fan efficiency.

D. Drift Eliminators

1. Drift eliminators shall be constructed entirely of Polyvinyl Chloride (PVC) in easily handled sections. Design shall incorporate three changes in air direction and limit the water carryover to a maximum of 0.001% of the recirculating water rate. Drift eliminators shall be self-extinguishing, have a flame spread of less than 25 under ASTM E84, and shall be resistant to rot, decay and biological attack.

E. Water Distribution System

1. Spray nozzles shall be zero-maintenance precision molded ABS with large 1-1/4" diameter orifice threaded into branch piping with internal sludge ring to eliminate clogging. Spray header, branches, and riser shall be Schedule 40 Polyvinyl Chloride (PVC) for corrosion resistance.

F. Heat Transfer Media

1. Heat transfer coil shall be elliptical tubes of prime surface steel, encased in steel framework with entire assembly hot-dip galvanized after fabrication. All coil rows shall feature extended surface fins designed with sloping tubes for liquid drainage. Coil shall have design pressure of 300 psi and shall be in compliance with ASME/ANSI B31.5, Refrigeration Piping and Heat Transfer Components. The coil assembly shall be strength tested in accordance with ASME/ANSI B31.5 and subsequently leak tested using air under water.

G. Pump

1. The unit shall have EISA close-coupled centrifugal pump with mechanical seal. The pump shall be installed in a vertical position so that water will drain from the pump when the cold water basin is emptied. Pump motor shall be totally enclosed with protective canopy for outdoor operation.

H. Bleed-Off Provision

1. The unit shall have a water bleed line with a factory-furnished manually adjustable valve.

I. Air Inlet Louvers

1. The air inlet louvers shall be constructed from UV inhibited Polyvinyl Chloride (PVC) and incorporate a framed interlocking design that allows for easy removal of air inlet louvers for access to the entire basin area for maintenance. The air inlet louvers shall have a minimum of two changes in air direction and shall be of a non-planar design to prevent splash-out and block direct sunlight and debris from entering the basin. Air inlet louvers shall be self-extinguishing, have a flame spread of less than 25 per ASTM E84, and shall be resistant to rot, decay, and biological attack.

J. Make-Up Float Valve Assembly

1. The make-up float assembly shall be a mechanical brass valve with an adjustable plastic float.

K. Pan Strainer

1. Pan Strainer(s) shall be all Type 304 Stainless Steel construction with large area removable perforated screens.

L. Pipe Connection Type

1. Any connections that are grooved or beveled for welding shall conform to standard groove specifications.

2.5 MOTORS AND DRIVES

A. Fan Motor

1. Fan motor(s) shall be totally enclosed, ball bearing type electric motor(s) suitable for moist air service. Motor(s) shall be premium efficiency, Class F insulated, 1.15 service factor design. Motors shall be inverter rated per NEMA MG1 Part 31.4.4.2 and suitable for variable torque applications and constant torque speed range with properly sized and adjusted variable frequency drives.

2. Fan motor(s) shall include strip-type space heaters with separate leads brought to the motor conduit box.

B. Fan Drive

1. The fan drive shall be multi-groove, solid back V-belt type with QD tapered bushings designed for 150% of the motor nameplate power. The belt material shall be neoprene reinforced with polyester cord and specifically designed for evaporative equipment service. Fan sheave shall be aluminum alloy construction. Belt adjustment shall be accomplished from the exterior of the unit.

C. Fan Shaft

1. The fan shaft shall be solid, ground, and polished steel. Exposed surface shall be coated with a rust preventative.

D. Fan Shaft Bearings

1. Fan Shaft Bearings shall be heavy duty, self-aligning ball type bearings with extended lubrication lines to grease fittings located on the access door frame. Bearings shall be designed for a minimum L-10 life of 100,000 hours.

2.6 MAINTENANCE ACCESS

A. Fan Section

1. The circular access door shall be located in the fan section for fan drive and water distribution system access. A swing-away motor cover shall be hinged for motor access.

B. Basin Section

1. Framed removable louver panels shall be located on two sides of the unit for pan and sump access.

2.7 ACCESSORIES

A. Basin Heater Package

1. The cold water basin shall be fitted with copper element, electric immersion heater(s) with a separate thermostat and low water protection device. Heaters shall be selected to maintain 40°F pan water at a -20°F ambient temperature.

2. The electric immersion heater package shall include a factory-supplied NEMA 4x enclosure containing magnetic contactor(s) with a 120 volt control circuit and a main power disconnect. The control package shall be field-wired by the mechanical contractor.

B. Sump Sweeper Piping

1. The cold water basin shall be fitted with schedule 40 PVC sump sweeper piping to facilitate basin cleaning. The system shall contain one inlet connection and one outlet connection per basin.

C. Chemical Treatment

1. Factory mounted Smart Shield factory mounted solid chemistr cold water basin water treatment package with Evapco Conductivity Controller, factory mounted feeder, bio control feeder, overflow and blowdown connection

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install per manufacturer’s documentation, shop drawings, and submittal documents.

B. Align cooling towers on foundations or mounting rails as specified on the drawings.

C. Arrange piping to ensure ease of service and maintenance.

D. Coordinate electrical installation with the electrical contractor.

E. Coordinate controls and BMS interface with the temperature control contractor.

F. Provide all material required for a fully operational and functional cooling tower.

3.2 FACTORY STARTUP AND TRAININGProvide a factory trained and authorized service representative for cooling tower startup and for training the Owner's maintenance personnel to adjust, operate, and maintain the cooling tower(s).

B. Prior to and during startup the chemical treatment contractor shall be present to ensure that the upper wetted surfaces of the cooling tower (galvanized steel) undergo the passivation process described in the cooling tower manufacturer’s written installation and operation instructions.

3.3 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.4 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.5 CLEANING

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 66 00 - SIDESTREAM WATER FILTERS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. This section includes construction and installation requirements for automatic cooling tower sidestream water filter units.

1.3 DEFINITIONS

A. EEPROM: Electrically erasable, programmable, read-only memory.

B. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 volts or for remote control, signaling power-limited circuits.

C. TSS: Total suspended solids.

D. TDS: Total dissolved solids.

1.4 GENERAL REQUIREMENTS

A The filtration system manufacturer shall include all necessary components for a fully functional skid-mounted self-cleaning disc filter system.

1.5 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for the sidestream filtration unit.

B. Shop Drawings: Provide shop drawings for the sump filtration unit showing equipment dimensions, service and maintenance space required, and piping connections to associated equipment. Include plans, elevations, sections, details, and attachments to other work. Submittal package shall also include the following:

1. Wiring Diagrams: Provide diagrams for electrical power and control wiring.
2. General assembly drawing with an itemized parts breakdown.
3. Filter pumps curve(s).
4. Cut sheets on major components.
5. A complete set of comprehensive operation and maintenance instructions.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following, or approved equal:

Miller-Leaman (Turbo Disc Series)
Puroflux (200 Series)
Arkal (SK Series)

2.2 COOLING TOWER SUMP FILTRATION UNIT

A. General

1. Furnish all materials necessary for the operation of the sidestream automatic disc filter system, including all valves for automatic operation, flow and backwash pump, backwash controller, and all related accessories as hereinafter specified and as necessary to perform the intended functions and achieve a fully integrated and operational filtration system.
2. These specifications are intended to provide a general description of what is required, but do not cover all details, which will vary in accordance with the requirements of the specific equipment application.
3. Furnish sidestream skid-mounted filter systems as scheduled on the drawings. Filter system shall have the capability of initiating a backwash cycle based on differential pressure, elapsed time, or a manual backwash. The skid mounted automatic filter system shall consist of an appropriate number of disc filter housings (pods) and the inlet and outlet manifolds shall be sized to accommodate the specified filtration flow rate. All manifolds shall be Type 304 stainless steel. Plastic manifolds will not be acceptable. Filter control valves shall be pneumatically actuated double-acting type with a reinforced corrosion resistant polymeric body. Hydraulic actuation will not be acceptable.
4. The filter system and all ancillary equipment, valves, and controls required for automatic operation of the filter system shall be mounted on a Type 304 stainless steel skid assembly.
5. The filter system shall include a factory installed line size pre-filtration wye strainer (with 1/8” perforations) placed immediately upstream of the automatic filter system to protect the filtration unit from larger debris.

B. Qualifications

1. To ensure unity of responsibility, the complete filter system and associated controls shall be furnished and coordinated by filter manufacturer. The contractor shall assume full responsibility for the satisfactory installation of the filter system as specified and directed by manufacturer.
2. The equipment covered by this specification shall be of proven ability as manufactured by a competent organization having substantial experience in the production of such filtration equipment. The filters furnished shall be designed, constructed and installed in accordance with the best practice and methods, and shall operate satisfactory when installed.
3. All equipment furnished under these specifications shall be new and unused and shall be the standard product of manufacturers having a successful record of manufacturing and servicing the equipment and system specified herein for a minimum of ten years.

C. Filter Operation

1. All equipment shall be designed for continuous service. In side-stream installations, isolation valves in field piping on the filter inlet and outlet shall be acceptable. Isolation valves shall be located in proximity to the filter and shall be accessible without the need for a ladder.
2. Furnish an automatic filter with a 150 psi stainless steel flanged outlet connection, complete with 3-dimensional polypropylene disc media (filtering down to 50 microns and smaller).
3. The filter system self-cleaning cycle shall be selectable to be initiated based on elapsed time, differential pressure, or operator (manual) pushbutton.
4. Acceptable operating conditions shall be as follows:
   a. Operating water temperature between 35°F and 120°F
   b. Operating water pressure between 15 psi and 125 psi

D. Filter Construction

1. The filter system shall consist of filter housings (pods) connected to the inlet, outlet and back wash manifolds via the 3-way filter control valves. Filter housings shall be fiberglass reinforced injection molded polyamide with EPDM internal seals. System shall be fully assembled at the factory using Victaulic couplings.
2. Filter disc cartridges shall be comprised of a compressed column of vertically stacked injection molded polypropylene 3 dimensional discs.
3. Each individual disc shall be 5.125 inches minimum outside diameter.
4. Each disc cartridge shall have a minimum overall filtration surface area of 228 square inches.
5. Intrinsic to the design, during filtration mode, filter shall incorporate a fluid spinning turbine mechanism inside filter housing at the base of each disc cartridge, generating a centrifugal effect. This centrifugal effect shall spin heavier particles (i.e., sediment) to the outer wall of filter housing, away from the disc stack located in the inner portion of housing. The purpose of the centrifugal action is to minimize loading of the disc media; therefore, minimizing backwash frequency, ultimately minimizing overall backwash water volume.

E. AirAssisted Backwash and Reservoir

1. The filter system shall include a reservoir tank that during the filter cycle will fill with filtered water to be stored and used for backwash. When backwash is initiated, compressed air will force the stored water from the reservoir into the filter pod.
2. Pressure transducers shall be installed on the filter inlet and outlet manifolds and integrate with the backwash controller, to initiate a backwash cycle based on a preset, field adjustable differential pressure setpoint.
3. Filter system shall be furnished with an air-override feature, enabling compressed air to be injected into the top of the filter housings during a backwash cycle, thereby facilitating evacuation of dirty water from filter housings prior to backwash and to minimize backwash water volume.
4. Filter housings shall sequentially backwash, accomplished by 3-way pneumatically actuated diaphragm backwash valves installed on the inlet side of the filter housing. Actuation of 3-way backwash valves is controlled by solenoid valves furnished with system. Backwash water flow direction shall be from the inside of the of the disc media to the outside. During backwash, the disc media is decompressed causing disc media to be free floating. Simultaneously with the decompressing of the disc media, clean water from the reservoir is introduced from the inner diameter of the disc stack. The backwash spray is introduced tangentially to the disc media, causing a high velocity spinning action of the disc media.
5. The backwash spray shall be applied via 4 rigid backwash columns/posts (which include 2.0 mm spray nozzles in each column) focusing the spray at fixed indexed heights uniformly throughout the disc stack.
6. The backwash manifold of the filter system shall be a 2” NPT connection. The Contractor shall furnish 2” piping from the filter flush manifold to the nearest floor drain.
7. The backwash volume shall not exceed 7 gallons.

8. Backwash Controller
   a. The filter manufacturer shall furnish the backwash control system.
   b. The controller shall consist of a Maxim Model M8 controller equipped with sufficient memory and I/O's, to control all critical functions of filter operation, including monitoring the differential pressure switch and controlling valve operation.
   c. The filter controller shall be programmed to be capable of automatically controlling and monitoring the filter system. Provide real-time system status on a back-lighted LCD display including the following:
      1) Inlet pressure, outlet pressure, differential pressure.
      2) Elapsed time since the last backwash with displayed initiation means for the most recent backwash (e.g. elapsed time, differential pressure, or operator-initiated backwash).
      3) Adjustable back wash dwell time, duration, and air-override time.
      4) Trip and lifetime backwash counter (including a trip reset).
      5) Additional I/O's.
      6) Output Voltage (24VDC).
   d. High voltage components (pump motors) shall be contained in a separate NEMA 4x enclosure and shall be UL listed. All low voltage components shall also be contained in a separate NEMA 4x enclosure (non UL listed).
   e. The controller shall include an auto-resetting surge suppression device.
   f. To facilitate the potential for future upgrades the controller shall include an EEPROM chip (an electrically erasable programmable read-only memory chip).

F. Compressed Air
   1. The air compressor shall be furnished as an integral component of the filtration system.
   2. The filtration system shall be furnished with sufficient quantities of pneumatic solenoids for distributing air to actuate backwash valves and provide air for air-override feature during the sequential backwash sequence.

G. Product Storage and Handling
   1. The filtration system shall be properly protected so that no damage or deterioration will occur during a prolonged delay from the time of shipment until installation is complete and the equipment is ready for startup and operation.

H. Installation and Operating Instructions
   1. Installation shall be in accordance with the manufacturer's written instructions and recommendations.
   2. Operation and maintenance manuals shall be furnished in accordance with these specifications. The manuals shall be prepared specific to this installation and shall include all required drawings and descriptions that are required to instruct operation and maintenance personnel that may be unfamiliar with such equipment.

I. Warranty
   1. In order to ensure proper performance and compatibility, all equipment supplied within the intent of this specification shall be warranted by the same supplier.
   2. The filter manufacturer shall warrant the automatic filter system against defects in workmanship and materials for one year from the date of startup and acceptance by the Owner.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall install the filter equipment on a concrete base, level and plumb. Maintain the manufacturer's recommended clearances. Units shall be arranged so that the controls and devices that require servicing are readily accessible.

B. The Contractor shall make all required piping and electrical connections to the filter equipment.

3.2 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Report all results in writing.

B. Perform tests and inspections and prepare test reports. Engage a factory authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections

1. Inspect field-assembled components and equipment installation, including piping and electrical connections.
2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational.
3. Place the filtration unit into operation and calibrate the controls during the preliminary phases of startup of the associated systems.
4. Do not put piping into operation until it is tested and satisfactory test results are achieved.
5. Cap and subject the associated piping to a static water pressure of 50 psig above the operating pressure, without exceeding the pressure rating of piping system materials. Isolate the test source and allow the test pressure to stand for four hours. Leaks and loss in test pressure constitute defects. Repair leaks and defects with new materials and retest piping until no leaks exist.
6. Remove and replace any malfunctioning units and retest as specified above.

3.3 FACTORY AUTHORIZED STARTUP AND TRAINING

A. Provide a factory trained and authorized representative for startup supervision and for training the Owner's maintenance personnel to adjust, operate, and maintain the filtration system(s).

3.4 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.5 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.6 CLEANING

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 67 00 - PLATE AND FRAME HEAT EXCHANGERS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. This section includes design, performance criteria, and installation requirements for plate and frame heat exchangers.

1.3 SUBMITTALS

A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for plate and frame heat exchangers.

B. Shop Drawings: Provide shop drawings for each heat exchanger showing equipment dimensions, service and maintenance space required, and piping connections. Include plans, elevations, sections, and details, as appropriate.

C. The submittal package shall also include the following:

1. General assembly drawing including an itemized parts breakdown.
2. A complete set of comprehensive operation and maintenance instructions.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following, or approved equal:

Sondex
Danfoss
Alfa Laval
Bell and Gossett

2.2 PLATE AND FRAME HEAT EXCHANGER DESIGN AND CONSTRUCTION

A. General: Plate and frame type heat exchangers shall be furnished complete with gasketed plates supported in a frame with vertical and horizontal supports. Provide piping connections for each fluid stream on the same fixed end, permitting the heat exchanger to be opened for inspection, cleaning, replacement, or for the addition of plates without removing the plates. Multi-pass design will not be allowed. Plate gap shall be 2.0 mm minimum.

B. AHRI Certification: Plate heat exchangers shall be certified according to AHRI Standard 400. If the heat exchanger is not AHRI certified, then the manufacturer shall provide an independent third party field performance test using the mapped ratings, limits, and tolerances of AHRI Standard 400 to verify the specified performance. Any and all costs associated with correcting a non-performing heat exchanger to meet the performance requirements shall be the responsibility of the supplier. Any costs associated with the field performance test shall be included in the price of the heat exchanger.

C. Construction
   1. Plates
      a. Plates shall be individually field replaceable Type 304 stainless steel, herringbone pattern, channel corrugated plates.
      b. Plates to be provided with an alignment design, preferably an interlocking mechanism pressed into each plate, which interlocks with the adjacent plate, providing a precise plate-to-plate alignment, to ensure proper sealing of the plate pack.
   2. Gaskets
      a. Gaskets shall be of glue-free design and suitable for the system fluids indicated on the drawings, and shall be Nitrile Butadiene Rubber (NBR), also termed Buna-N.
      b. The gaskets shall be designed in a pattern on each plate to distribute flow to alternating plate flow channels to create 100% counterflow between the mediums.
      c. Diagonal flow will not be permitted.
      d. Relief grooves vented to the exterior of the unit shall be provided in gaskets at internal seals to indicate seal failure and cross contamination.
      e. Glued gasket design will not be allowed.
   3. Frame
      a. The heat exchanger frame shall be constructed using either SA516-70 material.
      b. Entire frame shall be bolted together to allow unit to be field assembled, welded frames are not permitted.
      c. The unit cover plates shall be of sufficient thickness for the design pressure and shall have no welded reinforcements or stiffeners.
   4. Carrying Bar and Supports
      a. The plate carrying and guiding bar shall be carbon steel/aluminum up to an 8 inch connection size.
      b. Above 8 inch connection size the surfaces of the carrying and guide bars that come into contact with the plates shall be Type 304 stainless steel.
   5. Connections
      a. Piping connections 2.5” diameter and larger shall be studded port design.
      b. Piping connection less than 2.5” diameter shall be NPT.
   6. Port Strainers
      a. Provide insertion type port strainers for both the cold and warm water ports on the heat exchanger. Port strainers shall be Type 316 stainless steel with 2.0 mm mesh openings.
   7. Standard Painting: The frame shall be primed using a high grade epoxy primer and shall be finish painted using a high solids urethane coating.
   8. Warranty: The manufacturer shall warrant the heat exchanger against defects in workmanship and materials for one year from the date of startup and acceptance by the Owner.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The Contractor shall install the heat exchanger on a concrete base, level and plumb, maintaining the manufacturer's recommended service clearances.

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.3 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.4 CLEANING

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 75 00 - WATER SOURCE HEAT PUMPS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 SUMMARY

A. Furnish and install water source heat pumps with capacities and characteristics as listed on the drawings and in these specifications.

1.3 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and identified with labels describing contents.
   1. Three sets of spare filters for each unit.
   2. One set of spare fan belts.

1.4 WARRANTY

A. The unit manufacturer shall provide a 5 year parts only warranty against defects in material and workmanship on all parts.

B. The Contractor shall provide a 5 year labor warranty.

C. The warranty period shall commence upon acceptance of the operational units by the Owner.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

Available Manufacturers: Subject to compliance with requirements, the Basis of Design Manufacturer offering water source heat pumps which may be incorporated in the work is as follows:
Daikin

Alternate Manufacturers that demonstrate compliance with requirements.

2.2 GENERAL

A. Furnish and install water source heat pumps as indicated on the drawings. Equipment shall be completely assembled, piped, and internally wired. Capacities and characteristics shall be as listed in the schedule on the drawings and in these specifications.

B. Units shall be supplied completely factory assembled, piped, internally wired, fully charged with R-32 or R-454B refrigerant. Units shall be horizontal or vertical type and capable of operating over an entering water temperature range from 55°F to 110°F on heat pump loop models, and 20° to 110°F on ground loop (geothermal) models. All equipment shall be AHRI rated and certified in accordance with AHRI Standard 920 and shall be tested, investigated, and determined to comply with the requirements of the applicable standards for Heating and Cooling Equipment (UL-60335-2-40 Version 2 for the United States, and CAN/CSA-C22.2 No. 60335-2-40 Version 2 for Canada. Each unit shall be ETL Listed. Each unit shall be run tested at the factory.

2.3 CASING AND CABINET

A. Unit cabinet shall be fabricated from heavy gauge G-60 galvanized sheet metal. Interior surfaces shall be lined with 1/2 inch, 1-1/2 lb dual density coated fiberglass insulation. All insulation shall have the edges sealed or tucked in order to prevent introduction of fibers into the discharge air. Standard cabinet insulation shall meet NFPA 90A/90B requirements, air erosion and mold growth limits of UL 181, fungi resistance complying with ASTM G21 and/or ASTM C1338, and bacterial resistance per ASTM G22. All insulation shall have a flame spread rating of less than 25 and a smoke developed rating of less than 50 per ASTM E84..

B. Cabinets shall have separate openings and knockouts for entrance of line voltage and low voltage control wiring. Supply and return water connections shall be FPT fittings and shall be securely mounted flush to the cabinet corner post allowing for connection to a flexible hose without the use of a back-up wrench.

C. Units shall include three access panels, two for the compressor compartment, and one for the blower compartment. Units shall have an insulated panel separating the blower compartment from the compressor compartment.

D. Required Option: Compressor Sound Reduction Package
   1. 1 inch thick dual layer insulation on entire unit (Unit Sizes 007 - 019).
   2. 1 inch thick dual layer insulation in the air handling section (Unit Sizes 024 - 070), 1/2 inch thick dual density fiberglass insulation in the compressor section, and compressor sound blanket (Unit Sizes 024 - 070).

E. Required Option: Water Pressure Differential Switch (Factory Installed and Wired)

2.4 REFRIGERANT CIRCUIT

A. Units shall have a R-32 or R-454B sealed refrigerant circuit, which includes a rotary or scroll compressor, an aluminum lanced fin and rifled copper tube refrigerant-to-air heat exchanger, thermostatic expansion valve, reversing valve, and a coaxial tube-in-tube refrigerant-to-water heat exchanger. The airside coil shall be rated at 600 psi working pressure. The coaxial coil shall be made of a copper inner tube and a painted steel outer tube and be rated at 500 psi working pressure on the waterside and 600 psi working pressure on the refrigerant side. The compressor shall have thermal overload protection.

B. The compressor shall have a dual level vibration isolation system. The compressor shall be mounted on vibration isolation grommets to a heavy gauge compressor mounting plate, which shall then be isolated from the cabinet base to minimize vibration transfer.

C. Safety controls shall include a minimum of 3 safety devices; high refrigerant pressure switch, low refrigerant pressure switch, and a low refrigerant suction temperature sensor. The low refrigerant suction temperature sensor shall provide freeze protection for the water coil and the air coil. Refrigerant gauge access fittings shall be factory installed on the high and low pressure refrigerant lines to facilitate field service. Activation of any safety device shall prevent the compressor from operating via a microprocessor lockout circuit. The lockout circuit shall be resettable at the thermostat or at the unit disconnect switch.

D. *Required Option:* Cupro-Nickel Refrigerant-to-Water Heat Exchanger. Refrigerant-to-water heat exchanger shall be of copper-nickel inner water tube and steel refrigerant outer tube design, rated for a 600 psi working refrigerant pressure and a 450 psi working water pressure. Water lines shall also be of cupro-nickel construction.

2.5 FAN AND MOTOR ASSEMBLY

A. The fan motor shall be permanently lubricated, variable speed, constant cfm, electronically commutated. Field adjustable cfm settings shall be accomplished from a 4 position switch in the control box. The constant cfm EC motor shall have the ability to reduce the cfm as the space temperature approaches the room temperature setpoint. Units with 460 volt/3 phase power require a 4th neutral wire.

2.6 ELECTRICAL AND CONTROLS

A. A control box shall be located within the unit compressor compartment and shall contain a 50VA or 75VA transformer, 24 volt activated, 2 pole compressor contactor, terminal block for thermostat wiring and solid state controller for complete unit operation. Electro-mechanical operation is not acceptable. Units shall be name-plated for use with time delay fuses or circuit breakers. Unit controls shall be 24 volt and provide heating or cooling as required by the remote thermostat/sensor.

B. Units shall have a microprocessor based control system. The unit control logic shall be capable of communication over a BACnet communications network. The BACnet communication module shall be capable of supporting full MSTP BACnet implementation. The microprocessor shall also support communications with the MicroTech Smart-Source controller. The physical interface to a BACnet BMS network shall be through an industry standard RS-485 transceiver capable of existing on an RS-485 network of up to 64 nodes. The unit controller shall be factory programmed and tested with all the logic required to monitor and control heating and cooling operation. The controller sets the unit mode of operation, monitors water and air temperatures, and can communicate fault conditions via a BACnet communications network. Units outfitted with MicroTech and BACnet Communication modules include return air, discharge air and leaving water temperature sensors. Space temperature sensor options include a setpoint adjustment, tenant override button, and the capability of substituting the return air sensor with a wall mounted room temperature sensor.

C. Each communicating unit controller performs the following unit operations:
   1. Enable heating and cooling to maintain space temperature set point at the room sensor.
   2. Enable fan and compressor operation.
   3. Monitor all safety controls.
   4. Monitor discharge and return air temperature.
   5. Monitor leaving water temperature.
   6. Relay status of all vital unit functions.
   7. Support optional control outputs.

D. If there are no current alarm conditions, a green LED on the annunciator board shall indicate the occupied unit operating mode. If an alarm condition exists, the MicroTech Smart-Source unit controller shall send the fault condition to the LED annunciator to assist in troubleshooting.

2.7 PIPING

A. Supply and return water connections shall be FPT copper fittings fixed to the corner post, which eliminate the need for backup pipe wrenches. With vertical units, the condensate connection shall be a 3/4 inch PVC socket with an internally trapped hose that can be routed to the front or side corner post locations.

2.8 HANGER KIT (HORIZONTAL UNITS ONLY - FOR FIELD INSTALLATION)

A. The hanger kit shall consist of galvanized steel brackets, bolts, lock washers, and isolators and shall be designed to fasten to the unit bottom panel for suspension from 3/8 inch threaded rods. Brackets shall not inhibit filter removal in any way.

PART 3 - EXECUTION

3.1 HEAT PUMP INSTALLATION

A. Install heat pumps in the locations and arrangements indicated on the drawings.

3.2 CARE AND CLEANING

A. Repair or replace broken, damaged or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Owner's representative. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.3 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.4 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like and leave the premises clean, neat and orderly.

END OF SECTION

SECTION 23 81 00 - OUTDOOR MAKE-UP AIR UNITS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 ACTION SUBMITTALS

A. Product Data: For each type and configuration of outdoor make-up air unit.

B. LEED Submittals:

1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 (Systems and Equipment).

C. Shop Drawings: For each type and configuration of outdoor make-up air unit.

1. Include plans, elevations, sections, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.

1.3 SUBMITTALS

A. Sample warranty.

B. Seismic qualification certificate for roof curb.

1.4 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

1.5 QUALITY ASSURANCE

A. Comply with NFPA 70.

B. ASHRAE Compliance: Comply with the applicable requirements listed in ASHRAE 62.1, Section 5 (Systems and Equipment) and Section 7 (Construction and Startup).

C. ASHRAE Compliance: Comply with the applicable requirements listed in ASHRAE 90.1 Section 6 (Heating, Ventilating, and Air Conditioning).

1.6 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and identified with labels describing contents.

1. Three sets of spare filters for each unit.
2. One set of spare fan belts.

1.7 WARRANTY

A. The manufacturer shall repair or replace any components of the outdoor make-up air units that fail in materials or workmanship within the one year warranty period. The manufacturer shall provide a 5 year extended warranty for the heat exchanger.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Provide make-up air units as manufactured by one of the following, or approved equal:
Greenheck
CaptiveAire
RuppAir
Reznor

2.2 CONSTRUCTION

A. The unit with integral heating and cooling shall be fully assembled at the factory and consist of an insulated metal cabinet, with bird screen, evaporative cooling module, motorized intake damper, motorized recirculating damper where specified, supply air low limit sensor, sensors, seismic curb assembly, service receptacle, filter assembly for intake air, supply air blower assembly, and an electrical control center. All specified components and internal accessories shall be factory installed and tested and prepared for single-point line voltage connection.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 CABINET

A. Materials: Formed double wall insulated metal cabinet fabricated to permit access to internal components for maintenance.

1. Outside casing: Factory painted baked enamel finish (sand color), 18 gauge, galvanized (G90) steel meeting ASTM A653 for components that do not receive a painted finish. Pre-painted components supplied by the factory shall have polyester urethane paint on 18 gauge G60 galvaneal steel. Base rail shall be 12 gauge, galvanized (G90) steel.

2. Internal assemblies: 24 gauge, galvanized (G90) steel except for motor supports which shall be minimum 14 gauge galvanized (G90) steel.

B. Cabinet Insulation: Comply with NFPA 90A and 90B and erosion requirements of UL 181.

1. Materials: Fiberglass insulation. If insulation other than fiberglass is used, it must also meet the Fire Hazard Classification shown below.

a. Thickness: 1 inch.

b. Fire Hazard Classification: Maximum flame spread of 25 and smoke developed of 50, when tested in accordance with ASTM C411.

c. Location and application: Full interior coverage of entire cabinet to include insulated walls and roof of unit shall be semi-rigid type and installed between inner and outer shells of all cabinet exterior components.

C. Access panels: Unit shall be equipped with hinged access panels to provide easy access to all major components. Access panels shall be fabricated of 18 gauge galvanized G90 steel. Removable access panels shall incorporate a formed drip edge.

D. Blower assembly: Blower assembly shall consist of a direct drive electric motor and a double width, double inlet forward curved blower. Assembly shall be mounted on heavy gauge galvanized rails and further mounted on minimum 1.125” thick neoprene vibration isolators.

E. Control panel/connections: Unit shall have an electrical control center where all high and low voltage connections are made. Control center shall be constructed to permit a single-point high voltage power supply connection.

F. Evaporative Cooling Module: Media holder and sump pan shall be fabricated of stainless steel and shall include 12” thick GLASdek evaporative media. Gutter and sump shall be sized to supply the system with enough water to operate at its maximum flow rate and not overflow when the system is shut down. Cooling module shall be equipped with a circulating pump.

G. Fill and drain valves are to be provided by the temperature control contractor (see sequence of operation).

H. Motorized Intake Dampers: Motorized damper of low leakage type shall be factory installed.

I. Motorized Recirculating Air Damper (when applicable): Designed to permit 100% recirculation of return air shall be factory installed. Damper shall be controlled by external 2-10 Vdc signal.

J. Seismic curb shall be provided.

K. Service receptacle: 120 volt GFCI service outlet shall be factory provided and installed by the Contractor in a location designated by the Engineer.

2.4 BLOWER

A. Blower Section Construction: Belt drive motor and blower shall be assembled onto a minimum 14 gauge galvanized steel platform and must have neoprene vibration isolation devices, minimum of 1-1/8 inches thick.

B. Blower Assemblies: Shall be statically and dynamically balanced and designed for continuous operation at maximum rated fan speed and horsepower.

C. Centrifugal Blower Housing: Formed and reinforced steel panels to make curved scroll housing with shaped cutoff.

D. Forward Curved Fan Wheels: Galvanized or aluminum construction with inlet flange and shallow blades curved forward in direction of airflow, mechanically attached to shaft with set screws.

E. Blower Section Motor Source Quality Control: Blower performance shall be factory tested for flow rate, pressure, power, air density, rotation speed and efficiency. Ratings are to be established in accordance with AMCA 210 ‘Laboratory Methods of Testing Fans for Rating’.

2.5 MOTORS

A. Blower motors shall be NEMA Premium. Compliance with EPAct minimum energy efficiency standards for single speed ODP and TE enclosures is not acceptable. Motors shall be heavy duty, permanently lubricated type, and shall be furnished for the specified voltage, phase, and enclosure type. Drives shall be sized for a minimum of 150% of driven horsepower and pulleys shall be fully machined cast type, keyed, and fully secured to the fan wheel and motor shafts. Electric motors shall be supplied with an adjustable drive pulley.

B. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors.

C. Also see Specification Section 230500 (Basic Materials and Methods for HVAC).

2.6 UNIT CONTROLS

A. The unit shall be constructed such that it can function as a stand-alone heating and cooling system controlled by the direct digital control system.

B. Control Devices:

1. Remote Thermostat: By temperature control contractor (see sequence of operation).
2. Smoke detectors, located in supply air, shall stop fans when the presence of smoke is detected.
3. Supply Air Temperature Control: Operates gas valve to maintain discharge air temperature with factory mounted sensor in blower outlet.
4. Burner Control: Two or four steps of control using one or two burner sections in series.

2.7 FILTERS

A. Units shall have 2" thick MERV 8 disposable pleated filters located in the outdoor air intake that shall be accessible from the exterior of the unit.

2.8 DAMPERS

A. Outdoor Air Damper: Galvanized-steel, opposed-blade dampers with vinyl blade seals and stainless steel jamb seals, having a maximum leakage of 10 cfm/sf. of damper area, at a differential pressure of 2 inches w.g. The damper operator shall be direct coupled, electronic, with spring return or fully modulating as required by the sequence of operation.

2.9 DIRECT EVAPORATIVE COOLING

A. Provide a direct evaporative cooling section equipped with 12” thick GLASdek media.

B. Provide a water filter for each evaporative cooler. Water filters shall be Axiom Model SPF-10, or approved equal.

C. See Specification Section 232500 (Chemical Treatment) for required chemicals.

2.10 INDIRECT FIRED NATURAL GAS BURNER

A. Description: Factory assembled, piped, and wired, complying with ANSI Z21.47 ‘Gas-Fired Central Furnaces’ and with NFPA 54 ‘National Fuel Gas Code’.

1. CSA Approval: Designed and certified by and bearing the CSA label.
2. Burners: Stainless steel.
3. Gas Control Valve: Modulating.
4. Fuel: Natural Gas.
5. Minimum Combustion Efficiency: 80 percent.
6. Ignition: Electronically controlled electric spark with flame sensor.
7. High Altitude Model: For 4500 ft elevation.

B. Venting: Gravity vented.

C. Combustion Air Intake: Separate combustion air intake and vent terminal assembly.

D. Heat Exchanger: Four pass tubular heat exchanger, constructed of Type 409 stainless steel. Heat exchanger tubes shall be installed on the vest plate by means of swaged assembly (welded connections are not acceptable). Heat exchanger tubes shall be supported by a minimum of two fabricated assemblies that support the tubes and also permit expansion and contraction of the tubes. Heat exchanger shall be encased in a weather-tight metal housing with intake air vents. Provide a large metal lift-off or hinged door to provide easy access to the enclosed vest plate, control circuitry, gas train, burner assembly, and exhaust blower.

E. Heat Exchanger Drain Pan: Stainless steel.

F. Safety Controls:
   1. Vent Flow Verification: Differential pressure switch to verify open vent.
   2. Control Transformer: 24 volt.
   3. High Limit: Thermal switch or fuse to stop burner.
   4. Gas Train: Regulated, redundant, 24 volt gas valve assembly containing a pilot solenoid valve, electronic modulating temperature control valve, pilot filter, pressure regulator, pilot shutoff, and manual shutoff, all in one body.
   5. Purge-period timer shall automatically delay burner ignition and bypass low limit control.
   6. Gas Manifold: Safety switches and controls complying with ANSI standards and with FM Global.
   7. Airflow Proving Switch: Differential pressure switch to sense adequate airflow before energizing pilot.
   8. Automatic Reset High Limit Control Device: Stops burner and closes main gas valve if the high-limit temperature is exceeded.
   9. Safety Lockout Switch: Locks out ignition sequence if burner fails to light after three tries. Controls are reset manually by turning the unit off and then back on.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Unit Support: Install heating and ventilating unit level on structural curbs. Coordinate wall penetrations and flashings with wall construction. Secure units to structural support with anchor bolts.

B. Adjust initial temperature setpoints, and set field adjustable switches and circuit breaker trip ranges as indicated.

3.2 CONNECTIONS

A. The drawings indicate general arrangement of piping, fittings, and specialties.

B. Gas Piping: Comply with requirements in 221600 (Facility Natural Gas Systems). Connect gas piping with shutoff valve and union and with sufficient clearance for burner removal and service. Make final connections of gas piping to unit with corrugated, stainless-steel tubing flexible connectors complying with ANSI LC 1/CSA 6.26 equipment connections.

C. Drains: Comply with the requirements in Division 22 for traps and accessories on piping connections to condensate drain pans under condensing heat exchangers.

D. Where installing piping adjacent to heating and ventilating units, allow space for service and maintenance.

E. Duct Connections: Connect supply and return ducts to indirect-fired heating and ventilating units with flexible duct connectors. Comply with requirements in Section 233300 (HVAC Ductwork Accessories) for flexible duct connectors.

F. Ground equipment in accordance with the requirements listed in Division 26.

G. Connect wiring equipment in accordance with the requirements listed in Division 26.

3.3 FIELD QUALITY CONTROL

A. Perform start-up tests and operational verification with the assistance of a factory authorized service representative.

B. Prepare test and inspection reports.

3.4 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.5 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.6 CLEANING

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 86 00 - SPLIT SYSTEM HEAT PUMPS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC Systems) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of units specified in this section include the following:

Split System Heat Pumps

1.3 EXTRA MATERIALS

A. Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and identified with labels describing contents.

1. Three sets of spare air filters for each unit.

1.4 QUALITY ASSURANCE

A. ARI Compliance: Coil ratings shall be in conformance with the requirements of ARI Standard 410 (Forced-Circulation Air Cooling and Air Heating Coils).

B. Units shall be rated in accordance with Air Conditioning, Heating and Refrigeration Institute (AHRI) Standard 240 and bear the AHRI Certification label.

C. A dry air holding charge shall be provided in the indoor section.

D. The installing contractor shall have a minimum of 5 years of installation experience with the manufacturer’s product.

E. System startup supervision shall be provided by the equipment manufacturer’s representative or by an authorized representative that has been factory trained in system setup and operation.

F. Warranty: The units shall have a manufacturer’s parts and defects warranty for a period 5 years from the date of startup. The compressor shall have an extended warranty of 10 years from the date of startup. If, during this period, any part should fail to function properly due to defects in workmanship or material, it shall be replaced or repaired at the discretion of the manufacturer. This warranty does not include labor.

1.5 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of equipment and material listed in this section.

PART 2 - PRODUCTS

2.1 SPLIT SYSTEM HEAT PUMPS

A. General: Provide split system heat pumps having capacities, cabinet sizes, electrical characteristics, and accessories as scheduled on the drawings.

B. Capacity: Units shall be capable of heating at 0°F ambient and cooling at 100°F ambient with the capacities scheduled on the drawings. Units shall be capable of operating (at somewhat reduced capacities) at ambient air temperatures between -5°F and 115°F.

C. Outdoor Units
   1. The outdoor units shall have a thermally fused powder coated finish. The outdoor unit shall be completely factory assembled, piped, and wired. Each unit shall be run tested at the factory.
   2. Outdoor unit shall have a sound rating no higher than 55 dB(A).
   3. Outdoor unit cabinets and mounting systems shall have a thermally fused polyester powder coat finish that meets the ASTM D3451-06 Standard.
   4. Outdoor units shall have a direct drive fan and the motor shall have permanently lubricated bearings.
   5. The outdoor unit shall be provided with manufacturer supplied wind baffles (if required to achieve the specified performance).
   6. The outdoor unit shall be provided with a manufacturer supplied 20 gauge hot dipped galvanized snow/hail guard.
   7. Coil fins shall have a factory-applied corrosion resistant coating.
   8. The compressor shall be equipped with thermal overload protection.
   9. Units shall be equipped with a base pan heater to protect the coil against ice build-up during prolonged winter operation. The base pan heater shall activate only if the compressor is operating in heating mode at an outdoor temperature of 36°F or below.
   10. Units shall be 208 Volt, 1 phase, and shall have a local electrical disconnect.

D. Indoor Units
   1. The wall mounted indoor units shall be factory assembled, wired, and run tested. Contained within the unit shall be all factory wiring, piping, electronic modulating linear expansion device, control circuit board, and fan motor. The unit shall have a self-diagnostic function, a 3 minute time delay mechanism, an auto restart function, and a test run switch.
   2. Multi-directional drain and refrigerant piping offering 4 directions for refrigerant piping and 2 directions for draining are required.
   3. An integral, motorized, multi-position, horizontal air sweep vane shall provide for uniform air distribution, both up and down. The vane(s) shall have selectable positions plus ‘Auto’ (control position based upon mode). The microprocessor shall automatically determine the vane angle to provide the optimum room temperature distribution) and vane swing (continuously moves up and down). In ‘Off’ mode the horizontal vane shall return to the closed position.
   4. The indoor unit shall include an ‘Auto’ fan setting capable of maximizing energy efficiency by adjusting the fan speed based on the difference between controller setpoint and room temperature. The indoor fan shall be capable of a minimum of 4 manual speed settings plus Auto.
   5. Return air shall be filtered by means of 2 easily removable, washable filters, and electrostatic anti-allergy enzyme filters.
   6. A sloped, corrosion resistant condensate pan with drain shall be provided under the coil. Provide a factory-installed unit-powered condensate pump inside the cabinet. A sloped, corrosion resistant condensate pan with drain shall be provided under the coil. A drain pan level switch, designed to connect to the control board, shall be provided and installed in the condensate pan to prevent condensate from overflowing.
   7. Indoor unit electrical power shall be 208 Volt, 1 phase, and shall be powered by the outdoor unit.
   8. The unit shall not have supplemental electric heat elements.

E. Controls: Provide wall-mounted, back-lit controllers, capable of system run/stop, operating mode selection (cool, auto, fan, heat), adjusting space temperature, fan speed, and air distribution, and displaying return air and indoor coil temperatures.

F. Available Manufacturers: Subject to compliance with requirements, manufacturers offering split system air conditioning units which may be incorporated in the work include the following, or approved equal:

Mitsubishi/Trane
LG
Daikin

2.2 REFRIGERANT PIPING

A. See Specification Section 232400 (Refrigerant Piping and Accessories).

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Contractor.

3.2 ELECTRICAL WIRING

A. Install electrical devices furnished by the manufacturer but not specified to be factory mounted. Furnish a copy of the manufacturer's wiring diagram to the electrical contractor.

B. Route electrical power and control wiring in separate conduits.

3.3 REFRIGERANT PIPING INSTALLATION, TESTING, EVACUATION, AND CHARGING

A. See Specification Section 232400 (Refrigerant Piping and Accessories).

3.4 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect. At completion, carefully clean and adjust equipment, fixtures, and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.5 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.6 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 23 89 00 - ELECTRIC HEATERS

PART 1 - GENERAL

1.1 CONDITIONS OF THE CONTRACT

A. Sections 230000 (Heating, Ventilating, and Air Conditioning) and 230500 (Basic Materials and Methods for HVAC) are hereby made a part of this section.

1.2 WORK INCLUDED

A. Types of units specified in this section include the following:

Electric Wall Heaters
Electric Unit Heaters

1.3 SUBMITTALS

A. Product Data: Submit manufacturer's technical product data and installation instructions for each type of material listed in this section.

PART 2 - PRODUCTS

2.1 ELECTRIC WALL HEATERS

A. Provide electric wall heaters in locations as indicated and with capacities, style, and accessories as scheduled. Electric wall heaters shall be UL listed.

B. Cabinet: Heavy gauge galvanized steel with beige enamel finish.

C. Heating Element: Steel sheath with aluminum fins.

D. Thermostat: Built-in and adjustable between 40°F and 70°F.

E. Available Manufacturers: Subject to compliance with requirements, manufacturers offering electric wall heaters which may be incorporated in the work include the following, or equal:

Q-Mark
Modine

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which terminal units are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in a manner acceptable to the Contractor.

3.2 ELECTRICAL WIRING

A. Install electrical devices furnished by the manufacturer but not specified to be factory mounted. Furnish a copy of the manufacturer's wiring diagram to the electrical contractor.

3.3 CARE AND CLEANING

A. Repair or replace broken, damaged, or otherwise defective parts, materials, and work. Leave entire work in condition satisfactory to Architect/Engineer. At completion, carefully clean and adjust equipment, fixtures, and trim installed as part of this work. Leave systems and equipment in a satisfactory operating condition.

3.4 OPERATION TEST

A. Test each piece of equipment to show that it will operate in accordance with the indicated requirements.

3.5 CLEANING UP

A. Upon completion of the Work remove materials, equipment, apparatus, tools, and the like, and leave the premises clean, neat, and orderly.

END OF SECTION

SECTION 26 00 01 – ELECTRICAL GENERAL PROVISIONS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. The Drawings and General provisions of the Contract including the "General Conditions", "Supplementary Conditions", and "General Requirements" of the Contract as written and referred to here are adopted and made part of Division 26.

B. The Contract Agreement, Bidding documents, and all Addenda issued prior to Contract Agreement execution form a part of these specifications and apply to all Contracts or Subcontracts relating to the electrical systems.

1.2 SUMMARY

A. The work under this Division shall consist of all labor, materials, equipment, services and related accessories, etc., necessary and required to complete all work as shown or inferred on the Drawings and in the Specifications (Contract Documents).

B. Provide fixed electrical equipment, except where specifically noted otherwise.

C. Provide portable electrical equipment for the complete system(s).

D. Provide equipment and/or wiring normally furnished or required for complete electrical systems but not specifically specified on the drawings and/or in specifications, as though specified by both.

E. All equipment and wiring shall be new, except where specifically shown or specified otherwise.

F. Provide flexible electrical conduit and conductors having a slack, 90-degree bend or loop in any plane between connections at all vibration isolated equipment and the first attachment to building structure or cabinets, panels or boxes mounted thereon.

1.3 WORK INCLUDED IN THIS DIVISION

A. Electrical work includes, but is not limited to
1. Arranging and coordinating with utility services required as shown or specified.
2. Installation of all utility conduit and infrastructure.
3. Removal or relocation of electrical services and electrical work located on or crossing through project property, above or below grade, obstructing construction of project or conflicting with completed project or any applicable code.
4. Provide meters, switchboards, panelboards, circuit breakers, power outlets, convenience outlets, switches, and/or other equipment forming part of system.
5. Complete lighting system.
6. Complete communication system.
7. Complete Audio/Visual system.
8. Connection of all appliances and equipment including Owner furnished equipment.
9. Complete grounding system.
10. Complete temporary facilities for construction power.
11. Complete fire alarm system.

1.4 WORK NOT INCLUDED IN THIS DIVISION (REFER TO OTHER DIVISIONS OF THESE SPECIFICATIONS)

A. Flashing of conduits into roofs and outside walls. Inform General Contractor of number and size of roof penetrations prior to bidding.

B. Furring of building structure or finishes for conduit and equipment.

C. Finish painting of conduit and equipment except for factory applied prime or finish painting specified for equipment, fixtures, devices or materials furnished under this section.

D. Installation of motors except where specifically noted. See Division 23.

E. Control wiring for mechanical systems, except where specifically indicated to be provided by Electrical Contractor. See Division 23.

1.5 RELATED WORK SPECIFIED ELSEWHERE

A. Classification of Excavation: Division 02 – Site work.

B. Concrete Work: Division 03.

C. Painting: Division 09.

D. Firestopping and Sealants: Division 07.

A. 2018 International Building Code (IBC) Published by the International Code Council (ICC).

B. 2017 National Electrical Code (NEC) published by the National Fire Protection Association (NFPA)

C. 2018 International Fire Code (IFC) published by the International Code Council.

D. National Fire Codes (NFPA Standards) published by the National Fire Protection Association (NFPA) as referenced in the 2018 International Fire Code.

E. 2018 International Energy Conservation Code (IECC) published by the International Code Council. ASHRAE/IESNA Standard 90.1 is incorporated by reference.

F. All applicable provisions of the Nevada Revised Statutes (NRS) and the Nevada Administrative Code (NAC), including those listed below.

G. The most current regulations of the State Fire Marshal, Nevada Department of Public Safety, Carson City, Nevada (NAC Chapter 477, State Fire Marshal).

H. The most current edition of the Americans with Disabilities Act (ADA) published by the United States Department of Justice including the Americans with Disabilities Act Accessibility Guidelines (ADAAG)

I. Other codes, regulations, and standards referenced in the body of this document.

J. Local codes and ordinances do not apply to projects constructed on state-owned land, except for zoning requirements pursuant to Nevada Revised Statutes Section 278.580.

K. Northern Nevada ICC 2018 Adopted Amendments.

1.8 DEFINITIONS

Provide:	Furnish, install, connect and test until complete.
Wire:	Furnish all necessary wiring, connect and test until complete.
Install:	Furnish, set in place, wire and test until complete.
Work:	Materials completely installed, connected, and tested until complete.
AWG:	American Wire Gage.
Equal:	Acceptable equal as determined by the Engineer.

1.9 REQUIREMENTS OF REGULATORY AGENCIES

A. Obtain and pay for all permits and inspections required for the work. Comply with all ordinances pertaining to work described herein. Pay all expenses arising from the procurement of these certificates and include in the base contract price.

B. Install work under this Division per drawings, specifications, latest adopted edition of the National Electrical Code, (NFPA-70) including local amendments and interpretations, Local adopted Building Codes, and any special codes having jurisdiction over specific portions of work within complete installation. In event of conflict, install work per most stringent code requirements determined by Engineer. This does not relieve the Contractor from furnishing and installing work shown or specified which may exceed the requirements of such ordinances, laws, regulations and codes.

C. All materials, products, devices, fixtures, forms or types of construction included in this project shall meet or exceed the published requirements of National Electrical Code (NEC), American National Standards Institute (ANSI), Institute of Electrical and Electronics Engineers (IEEE) and National Electrical Manufacturers Associations (NEMA). All equipment shall bear the Underwriter's Laboratories (UL) label or equivalent from approved independent testing laboratory.

D. Arrange, pay fees for and complete work to pass required tests by agencies having authority over work. Deliver to Engineer copies of the Certificates of Inspection and approval issued by authorities and provide original copy of each certificate to Owner.

E. When required by law or regulations, the governmental agency having jurisdiction for inspections shall be given reasonable notice and opportunity to inspect the work. Any work that is enclosed or covered up before such inspection and test shall be uncovered at the Contractor's expense; after it has been inspected, the Contractor shall restore the work to its original condition at his own expense.

1.10 INSURANCE

A. The Contractor shall procure and maintain, at his expense, such insurance as required by law and/or specified in the General Conditions.

1.11 DRAWINGS AND SPECIFICATIONS

A. Drawings and specifications are complementary. Work called for by one is binding as if called for by both. Any discrepancies between drawings and specifications shall be brought to the attention of the Engineer for clarification during the bidding period. No allowance shall subsequently be made to the Contractor by reason of his failure to have brought said discrepancies to the attention of the Consultant during the bidding period or by reason of any error on the Contractor's part.

B. Drawings are schematic and diagrammatic in nature. Drawings show general run of circuits and approximate location of equipment. The contractor shall review drawings of all trades to assure coordination prior to placement of work. Right is reserved to change location of equipment and devices, and routing of conduits within 10 feet, without extra cost to Owner (prior to rough-in).

C. Use dimensions in figures, shop drawings, etc. and actual site measurements in preference to scaled dimensions. Do not scale drawings for exact sizes or locations – use dimensioned details or actual field conditions. Verify item mounting heights as required by project conditions prior to rough-in.

D. The architectural drawings shall take precedence over all other drawings in matters of dimensions. Discrepancies between different drawings or between drawings and specifications, or regulations and codes governing the installation shall be brought to the attention of the Engineer in writing for determination.

E. Layout equipment as shown on drawings as close as possible. Verify access requirements for equipment actually furnished, and adjust layout to comply with NEC 110. Right is reserved to change layout within 10 feet without additional cost (prior to rough-in).

F. All devices, light fixtures, etc. located in ceiling tiles shall be located in the center of the ceiling tile UNLESS specifically noted or approved to do otherwise.

G. The Contractor is responsible to field measure and confirm the mounting heights and location of electrical equipment with respect to counters, doorways, and other architectural, mechanical or structural work. Do not scale distances off the electrical drawings: Use actual building dimensions.

H. Execution of Contract is evidence that Contractor has examined all existing conditions, drawings and specifications related to work, and is informed to extent and character of work. Later claims for labor and materials required due to difficulties encountered, which could have been foreseen had examination been made, will not be recognized.

I. All work called for in this Section of the plans and specifications shall be performed under this Section, regardless of whether such work may also have been called for in other Section(s). Discrepancies in or conflicts among the various parts of the contract drawings shall not relieve Contractor of his obligation to perform.

J. No attempt has been made to establish the required sections or splits of equipment relative to the size of access into the space, building, etc. Contractor shall establish all said splits, sections, etc. necessary to install equipment complete without undue disassembly of equipment or demolition of building parts at site of work.

K. Charges for extra work are not allowed unless work is authorized by written order from the Owner's Representative approving charges for work.

L. Check all door swings so light switches are not located behind doors. Relocate switches as required with the Engineer's review.

M. Elevators: The location of switches, GFCI receptacles, lights, telephone outlets, disconnect switches, fire alarm devices, etc., in elevator pits, shafts, equipment rooms shall be located as required by the Elevator Shop Drawings and applicable codes. Coordinate size and type of all electrical devices with Elevator Contractor prior to purchase of equipment.

1.12 SEISMIC QUALIFICATIONS & REQUIREMENTS

A. Equipment Seismic Qualification

Major equipment and components shall be suitable for and certified to meet all applicable seismic requirements of the California Building Code (CBC) through zone 4 application. Guidelines for the installation consistent with these requirements shall be provided by the manufacturer and be based upon testing of representative equipment. The test response spectrum shall be based upon a 5% minimum damping factor, CBC: a peak of 2.15g's and a ZPA of 0.86g's applied at the base of the equipment. The tests shall fully envelop this response spectrum for all equipment natural frequencies up to at least 35 Hz.

B. Structural Design Requirements
1. Include in the bid, hiring of a structural engineer, registered in the state of Nevada, to provide calculations and details for equipment pads and mounting and bracing of all major equipment. Attach equipment according to those calculations.
2. Major equipment and components include:
   a) Conduit racks and supports.
   b) Transformers.
   c) Panelboards.
   d) Service and Distribution switchboards.
3. Equipment anchoring and bracing shall be designed to conform to IBC 2018 and NRS 341.143.

C. See Spec Section 26 05 30 Seismic Protection for Electrical Equipment.

PART 2 - PRODUCTS

2.1 MATERIALS

A. All material shall be new, and have a UL label where available. If UL label is not available, material shall be manufactured in accordance with applicable NEMA, IEEE and Federal Standards. Use UL labeled components in assemblies that do not have overall UL label. All equipment shall comply with the terms “listed and labeled” as defined in the NEC 70, Article 100. Submit letter stating compliance with these requirements.

B. Utilize one of the manufacturers listed to furnish all of the major equipment (i.e., transformers, bus duct, switchgear, circuit breakers, etc.) required for this project.

C. In all cases, there is one basis of design manufacturer or product for each item of equipment or product shown on the drawings and/or specified herein. These products are identified by name and model number on the drawings and/or in the specifications. Alternative manufacturers and products are also listed; however their inclusion as an alternative manufacturer or product does not cause them to be the basis of design. If an alternative manufacturer and/or product is desired to be used by the Contractor, it will be considered a substitution. Substitutions will be interpreted to be all manufacturers or products other than the basis of design. Only one request for substitution will be considered for each item of material or equipment. No substitutions will be considered thereafter. After a substitution request is reviewed and is found to be unacceptable the Architect/Engineer reserves the right to require the originally specified equipment or product at no additional cost to the Owner.

D. In any case where the Contractor intends to utilize a listed or unlisted acceptable equipment manufacturer that is not the basis of design as listed on the drawings and in the specifications, it is the Contractor’s responsibility to confirm prior to bidding that all ductwork, piping, controls, electrical power, conduit, service clearances, space requirements, and structural requirements match those of the basis of design equipment. Costs for any revisions necessary to accommodate the ductwork, piping, controls, electrical power, conduit, service clearances, space requirements, and structural requirements for the alternative equipment are the responsibility of the Contractor and shall be included in the Contractor’s bid, this includes any costs associated with re-design or necessary calculations by the project Architect or Engineers. No extra cost will be allowed for failure to allow for accommodations related to the alternative equipment in the Contractor’s bid.

E. Submit to the Architect/Engineer for review, within a reasonable time after award of Contract and in ample time to avoid delay of construction, shop drawings or submittals on all items of equipment and materials, including all substitutions. Also see Division 1 for additional related requirements.

F. If the Contractor desires to make a substitution, he shall submit complete information or catalog data to show equality of equipment or material offered to that specified. No substitutions will be allowed unless requested and reviewed in writing. The Architect/Engineer will review and take appropriate action on shop drawings, product data, samples, and other submittals as required by the contract documents. Such review shall be only for general conformance with the design concept and general compliance with the information given in the contract documents. The review shall not include review of quantities, dimensions, weights or gauges, fabrication processes, construction methods, coordination with the work of other trades, or construction safety precautions, all of which are the sole responsibility of the Contractor. Review of a specific

item shall not indicate acceptance of an assembly of which the item is a component. The Architect/Engineer shall not be required to review and shall not be responsible for any deviations from the Contract Documents not clearly noted by the Contractor, nor shall the Architect/Engineer be required to review partial submissions or those for which submissions for correlated items have not been received. The Architect/Engineer reserves the right to require the originally specified item at no additional cost to the Owner.

G. Installation of reviewed substitutions is the Contractor's responsibility. Any changes required for installation of reviewed substituted equipment must be made without additional cost to the Owner. Review by the Architect/Engineer of the substituted equipment and/or the dimensioned drawings does not waive the requirements stated herein.

2.2 COMPARABLE PRODUCTS

A. Conditions for Consideration: Engineer will consider Contractor's request for comparable product when the following conditions are satisfied. If the following conditions are not satisfied, Engineer may return requests without action, except to record noncompliance with these requirements:
   1. Evidence that the proposed product does not require revisions to the Contract Documents, that it is consistent with the Contract Documents and will produce the indicated results, and that it is compatible with other portions of the Work.
   2. Detailed comparison of significant qualities of proposed product with those named in the Specifications. Significant qualities include attributes such as performance, weight, size, durability, visual effect, and specific features and requirements indicated.
   3. Evidence that proposed product provides specified warranty.
   4. List of similar installations for completed projects with project names and addresses and names and addresses of engineers and owners, if requested.
   5. Samples, if requested.

PART 3 - EXECUTION

3.1 VISIT TO SITE

A. Visit site, and survey existing conditions affecting work prior to bid. Include necessary materials and labor to accomplish the electrical work, including relocation of existing services and utilities on building site in bid. No consideration shall be given to future claims due to existing conditions. Any discrepancies or interference's shall be reported immediately to the Engineer.

3.2 WORKMANSHIP

A. All work performed shall be first class work in every aspect. The work shall be performed by mechanics skilled in their respective trades, who shall at all times be under the supervision of competent persons. All work shall be installed to comply with NECA's "Standard of Installation."

B. Work under this Division shall be first class with emphasis on neatness and workmanship. All work shall be installed square and plumb and concealed where possible. Work that is deficient, defective, poorly laid out, not perfectly aligned, or that is not consistent with the requirements generally accepted in the trade for "first class work" will not be acceptable.

C. In addition to the materials specified elsewhere, furnish and install all other miscellaneous items necessary for the completion of the work to the extent that all systems are complete and operative.

D. All work under this Section shall be performed in cooperation with the work performed under all other Sections of the Specifications for the Project in order to avoid interference with other work and to secure the proper installation of all work. Refer the Drawings and Specifications covering

the work to be performed under all Sections, so that the relation and extent of the work of this Section with respect to the work of all other Sections is understood. Give right of way to raceways and piping systems installed at a required slope.

E. Install work using competent mechanics, under supervision of foreman, all duly certified by local authorities. The installation shall be subject to the Engineer's observation, and final acceptance. The Engineer may reject unsuitable work.

F. Conduit systems must be complete prior to installation of wiring.

3.3 CHANGE ORDERS

A. Additional work may be required on the project which is outside the scope of the contract. Such additional work will be described in Supplemental Instructions and/or Clarifications, to be estimated and priced by the Contractor, and accepted by the Owner, prior to commencing work. Proposals shall include a list of quantities of all material being used with unit costs broken down into material and labor costs per unit, along with quotations from suppliers for equipment/devices/components.

B. Material costs and labor units shall not exceed the latest edition of RS Means Electrical Cost Data.

C. See the General Conditions of the Specifications for acceptable charges.

3.4 GUARANTEE

A. Furnish the Owner a written guarantee, stating that if workmanship and/or material executed under this Division is proven defective within one (1) year after final acceptance by the Owner, such defects and other work damaged will be repaired and/or replaced. Submit with Operations and Maintenance Manuals.

B. Obtain from the various manufacturers or vendors guarantees or warranties for their particular equipment or components, and deliver them to the Owner. All guarantees and warranties provided shall be referenced to this project.

C. In event that systems are placed in operation in several phases at the Owner's request, guarantee will begin on date each system or item of equipment is accepted for service by the Owner. Provide O&M manuals for all equipment when equipment is accepted for service by the Owner.

D. All guarantees and warranties shall include labor and material at the site of installation for the duration of the guarantee period.

3.5 OBSERVATIONS OF WORK AND DEMONSTRATION OF OPERATION (ACCEPTANCE)

A. At all observations of work, open panel covers, junction box covers, pull box covers, device covers, and other equipment with removable plates for observation. Provide sufficient personnel to expedite cover removal and replacement.

B. Contractor to demonstrate operation of new equipment and/or systems to satisfaction of Owner/Engineer. Contractor to have manufacturer available for demonstration of equipment and/or systems where requested by Owner/Engineer. Furnish affidavit signed by Owner's representative indicating that demonstration of operation has been performed.

3.6 COOPERATION AND COORDINATION

A. Carefully coordinate work with other contractors and subcontractors. Refer conflicts between trades to Engineer. Provide necessary information to other trades for such coordination. Such information shall include Shop Drawings, Product Data and all other required data. There shall be no additional cost to the owner for any post-bid changes made to the electrical design and/or construction that are generated by changes to the basis-of-design equipment of any discipline. This includes changes made by substituted, alternate or comparable products regardless of manufacturer.

B. Provide a system erection/coordination drawing showing electrical, HVAC, plumbing and architectural for installation in congested areas. Drawings shall be in plan view for work above the ceilings and also sections shall be provided showing the elevations of conduit racks and routing and the coordination with mechanical piping and ductwork.

C. Whenever such information is not provided in a timely manner or whenever such information is incorrect, this contractor shall bear all costs for providing or correcting affected work of related trades with no change to the Contract Price or Construction Schedule.

D. Work to be installed as progress of project will allow. Schedule of work determined by General Contractor, Owner, and/or Architect/Engineer.

3.7 COORDINATION OF UTILITY SERVICES

A. Drawings indicate proposed service layouts. The Contractor shall provide and install all concrete structures, pads, pullboxes, vaults, trenching, raceways, protective bollards, etc., as required per NV Energy standards.

3.8 HVAC CONTROL WIRING

A. Control Wiring including low voltage and line voltage interlock wiring will be furnished and installed under Division 23, except where specifically shown otherwise. Carefully coordinate power and control wiring interface.

B. This Contractor shall obtain from Division 23 all wiring diagrams associated with the HVAC work and furnish all power and 120V control wiring, disconnects and starters for equipment not already packaged with these items. All wiring and conduit associated with the HVAC Temperature Control System is included under Division 23. Wiring and conduit shall comply with Division 26. All electrical work associated with the HVAC system shall be done under the supervision of Division 23.

3.9 STARTERS

A. Separately mounted starters are furnished and installed under Division 26 unless specifically shown otherwise. All power wiring, fuses, thermal overloads, and disconnect switches and connection of all motors is under this division. Provide the proper feeders and connections as recommended by the manufacturer of the equipment. See Spec Section 26 29 13 Enclosed Controllers.

3.10 PROTECTING

A. Provide warning lights, bracing, shoring, rails, guards and covers necessary to prevent damage or injury. All persons working around electrical equipment shall have electrical shock and flash protection per OSHA 1910.301-309 & 331-335.

B. Do not leave exposed or unprotected, electrical items carrying current. Protect visitors and workers from exposure to contact with electrically energized surfaces, parts, etc. in accordance with OSHA standards.

3.11 DELIVERY, STORAGE AND HANDLING

A. Deliver equipment and materials to job site in original, unopened, labeled container. Products shall be properly identified with names, model numbers, types, grades, compliance labels and other information needed for identification. Store to prevent damage and injury. Store materials to prevent corroding. Store finished materials and equipment to prevent staining and discoloring. Store materials affected by condensation in warm dry areas. Provide heaters. Contractor shall verify the availability of on site storage space, if no on site storage space is available then the contractor shall cover the cost for off site storage. Materials stored at the project site that becomes soiled with construction dirt, concrete, or moisture shall be removed from the site and replaced with new. Do not install soiled material.

B. Protect work and materials from damage by weather, entrance of water or dirt. Cap and mark conduit during installation.

C. Avoid damage to materials and equipment in place. Repair, or remove and replace damaged work and materials.

D. Protection and safekeeping of products stored on premises is responsibility of Contractor supplying products.

E. Schedule of deliveries and unloading to prevent traffic congestion blocking of access or interference with work. Arrange deliveries to avoid larger accumulations of materials than can be suitably stored at site.

F. Install equipment per manufacturer's recommendations. Conflicts between contract documents and these recommendations shall be referred to Engineer for remedy.

G. Electrical or electronic equipment that has been damaged, exposed to weather or is, in the opinion of the Engineer or Architect, otherwise unsuitable because of improper fabrication, storage or installation shall be removed and replaced by this Contractor at his expense.

3.12 ANCHORS

A. Provide anchors for all equipment, raceways, hangers, etc. to safely support weight of item involved plus 100% for dead loads. Live loads shall be considered in addition to dead loads.

B. Anchors to consist of expansion type devices similar to "Redhead" or lead expansion anchors. Plastic anchors are not acceptable.

C. Use preset anchor steel inserts in concrete slabs. Provide preset anchor size and type for anticipated or specified rod/bolt size and live/dead load.

3.13 CLEANING AND PAINTING

A. Clean equipment furnished in this Division after completion of work. Clean wipe the interior of all conduit, pullboxes, junction boxes, outlet boxes, and panelboard backboxes, soiled with dirt and debris prior to installation of wiring.

B. Touch-up or re-paint damaged painted finishes as determined by the Engineer.

C. Remove debris, packing cartons, scrap, etc., from site daily.

3.14 SPARE PARTS

A. Where spare parts are specified in the Technical Sections, furnish spare parts to Owner with itemized receipt. Contractor is responsible to deliver parts and have receipt signed by Owner's representative. Turn over receipt with as-built documents.

3.15 HOUSEKEEPING PADS

A. Furnish 2500 # concrete pads, 4” high (interior locations) or 6” high (exterior locations) unless otherwise noted, for all freestanding equipment, i.e.: switchboards, panels, control panels, motor control centers, transformers, etc. Pads shall have 1" x 45° chamfered edges, and shall extend 2” to 4" beyond equipment mountings.

3.16 TRAINING

A. Training for operation and maintenance of new systems or modifications to existing systems is specified in Technical sections. Contractor shall submit with record documents an itemized receipt signed by Owner’s representative that all specified training has been received.

3.17 ACCESS PANELS

A. The contractor shall furnish all access panels for walls, partitions, etc., and shall give access panel to the General Contractor for installation at locations as directed by the Electrical Contractor. It shall be the responsibility of the Electrical Contractor that access panels are provided for access to all boxes, bus joints, equipment, etc., which may be concealed by building construction to comply with the NEC and NFPA. Access panels shall be installed so as not to interfere with lighting arrangements.

3.18 CONDUIT ROUTING

A. All penetrations through slab-on-grade and concrete-filled metal decks to be sealed watertight. See Section 07 92 00 – Joint Sealants.

END OF SECTION 26 00 01

SECTION 26 00 02 – ELECTRICAL SUBMITTALS

PART 1 – GENERAL

1.1 DESCRIPTION OF SUBMITTAL CATEGORIES

A. The required submittals are defined below and specified in each section.
1. Requests for substitutions are written requests to use materials, equipment, etc., different from that specified.
2. Shop Drawings include fabrication, layout, wiring diagrams, erection, setting, coordination, drawings and diagrams and performance data.
3. Samples are units of work, materials or equipment items, showing the workmanship, pattern, trim and similar qualities proposed.
4. Manufacturer's Data is standard printed product information concerning the standard portions of the manufacturer's products.
5. Certifications are written statements, executed specifically for the project application by an authorized officer of the contracting firm, manufacturer, or other firm as designated, certifying to compliance with the specified requirements.
6. Test Reports are specific reports prepared by independent testing laboratories, showing the results of specified testing.
7. Industry Standards are printed copies of the current standards in the industry.
8. Manufacturer's Product Warranties are manufacturer's standard printed commitment in reference to a specific product and normal application, stating that certain acts of restitution will be performed by the manufacturer if the product fails under certain conditions and times limits.
9. Operating Instructions are the written instructions by the manufacturer, fabricator or installer of equipment or systems, detailing the procedures to be followed by the Owner’s in operation, control and shut-down.
10. Maintenance Manuals are the compiled information provided for the Owner’s maintenance of each system of operating equipment.
11. Maintenance Materials (spare parts) are extra stock of parts or materials for the Owner's initial use in maintaining the equipment and systems in operation.
12. Record Drawings are accurate representations of the installed systems and wiring as recorded on a daily “as-installed” basis.
13. Guarantees are signed commitments to the Owner that certain acts of restitution will be performed if certain portions of work fail within certain conditions and time limits.
14. Product Data includes manufacturer's data pertaining to the products, materials and equipment of the work.
15. Method of Procedures are detailed sequences of work required during interruption of service and/or connection to energized parts of systems requiring special sequences or protections.
16. Training – Materials and sign-off of completion.
17. Identification nomenclature – See section 26 05 53.

PART 2 – PRODUCTS

2.1 PROPOSED MATERIAL MANUFACTURERS

A. Submit to Consultant within 30 days after award of contract a complete list of proposed material manufacturers. List does not preclude submission of shop drawings. Acceptance of manufacturer on list does not constitute acceptance of specific material or equipment. If shop drawings are submitted with non approved substitutions, the contractor will pay the expense incurred by the consultant to review the shop drawings of any re-submittal.

PART 3 – EXECUTION

3.1 SUBSTITUTIONS

A. See General Conditions of the specifications for information regarding substitutions. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples if requested by Engineer are provided. Alternate products shall meet or exceed design criteria.

3.2 SUBMITTAL FORM AND PROCEDURES

A. Shop and Erection Drawings
1. Submit shop drawings for material and equipment furnished under Division 26 of specifications, to Consultant for review within 30 days after award of contract. Shop drawings shall be submitted on timely basis to allow adequate lead time for review, re-submission if necessary, manufacture and delivery to allow access of material to project at correct time based on schedule established by Consultant/Contractor. Provide index with thumb tabs collated with Table of Contents for sections. Include complete descriptive data with dimensions, operating data and weight for each item of equipment. Carefully examine shop drawings to assure compliance with drawings and specifications prior to submittal to Consultant. **Shop drawings and submittals shall bear the stamp of approval of the Electrical Contractor as evidence that they have checked the drawings.** Drawing submitted without this stamp of approval will not be considered and will be returned for proper re-submission. All shop drawings shall be submitted as a single one time complete package. Partial packages shall not be reviewed.
2. Submit format per general project conditions.
3. **Clearly mark each shop drawing item to correspond to drawings and specifications. Any drawings not clearly marked will be rejected.**
4. Review of shop drawings does not relieve Contractor of responsibility for errors and omissions in shop drawings. Contractor is responsible for dimensions and sizes of equipment. Inform Engineer in writing of equipment differing from that specified.

B. "Record" Drawings
1. One complete set of prints will be furnished to the Contractor to indicate actual location of conduit systems, outlets, and equipment. Keep set of prints on job and record day to day changes to Contract drawings with red pencil. Provide “Record" drawings as specified in the General Conditions or Division 01 of the specifications at the completion of job.

C. Maintenance Materials
1. Submit a list of all warranties and guarantees.
2. Submit with final close out documents a signed receipt for all maintenance materials (spare parts) specified. See Technical Sections for required materials.

D. Product Warranties and Guarantees
1. Submit fully executed Product Warranties and Contractor Guarantees to the Owner with final close out documents.

E. Maintenance Manuals
1. Submit to Consultant data prepared by manufacturer for each item and/or device of electrical equipment furnished in this contract completely describing and identifying equipment. Data to include serial numbers, catalog/model numbers, parts lists, description of operation, final shop drawings, wiring diagrams, all electrical ratings, set-up and maintenance procedures and other literature required for maintenance of equipment. See Technical Sections for other required information.

Summary of Project Closeout Items for Owner

2. Certificates of inspection and approval from authorities having jurisdiction.
3. Executed Guarantees and Product Warranties.
4. “Record” drawings.
5. Final shop drawings.
6. Final Erection drawings.
7. Receipt for maintenance materials (spare parts).
7. Maintenance manuals.
8. Receipt for keys.
9. Completed test reports.
10. Signed off observation and punch lists.
11. Lien waivers.

3.3 SPECIFIC SUBMITTAL REQUIREMENTS

A. Shop drawings shall include, but not be limited to the following:

1. Shall be drawn to accurate scale except where diagrammatic representations are specifically indicated.
2. Shall show clearance dimensions of critical locations and show dimensions of spaces required for operation and maintenance of equipment.
3. Shall show conduit and conductor connections and other service connections.
4. Shall show interfaces with other work including structural support.
5. Shall include complete descriptive data, with dimensions, operating data and weight.
6. Shall indicate deviation from the contract documents.
7. Shall explain deviations.
8. Shall show short circuit current ratings for all electrical equipment.
9. Shall show how deviations coordinate with portions of the work, currently or previously submitted.

B. Review of shop drawings shall not relieve Contractor of responsibility for errors or omissions in shop drawings. Any equipment that will not fit into space shown on drawings shall be called to the attention of the Engineer in writing.

C. Samples: Submit samples where requested by Engineer. Engineer’s review of sample submittals

1. Shall be limited to general type, pattern and finish.
2. Shall not include testing and inspection of the submitted samples.
3. Shall not indicate complete compliance with specified requirements. Complete compliance with specifications is the exclusive responsibility of the Contractor.

D. Manufacturer's Data

1. Where pre-printed data covers more than one distinct item, mark copy to *clearly* indicate which item is to be provided.
2. Contractor shall delete portions of data not applicable.
3. Contractor shall mark data showing portion of operating range required for project application.
4. Elaboration of standard data describing a non-standard product shall be processed as a shop drawing.
5. For each product Contractor shall include the following information summarized into a single sheet document for each product
    a) Manufacturer's production specifications including catalog/model number.
    b) Manufacturer’s Serial Number.
    c) Installation or fabrication instructions.
    d) Source of supply.
    e) Sizes, weights, speeds and operating capacities.
    f) All electrical ratings, including temperature rating of terminals.
    g) Conduit and wire connection sizes and locations.
    h) All thermal ratings.

i) Statements of compliance with required standard and governing regulations.
j) Cooling requirements and makeup and/or ventilating air requirements.
k) Performance data, where applicable.
l) All sound ratings.
m) Other information needed to confirm compliance.
n) Manufacturers recommended parts list.
o) Other information required by Technical Sections.

E. Source Codes: Provide Source Code in both electronic and paper format and Source Code Licenses for all equipment that is computer driven. Provide Development licenses so Source Code can be examined, modified, and maintained. These Development Licenses, along with all software licenses shall become property of the Owner. At the discretion of the owner, third parties will be allowed to use the software as necessary, for the life of the work in this project. No encryption or other obfuscation will be allowed.

F. Certifications: Contractor shall submit with notarized execution.

G. Test Reports: Submit notarized test reports signed and dated by firm performing test.

H. Manufacturer's Product Warranties: Contractor shall submit product warranties in accordance with the technical sections. Where published warranty includes deviation from required warranty, product is disqualified from use on project, unless manufacturer issues a specific project warranty.

I. Operating Instructions required
1. Submit manufacturer's operating instructions for each item of electrical equipment.
2. Submit supplement with additional project application instructions where necessary.
3. Submit specific operating instructions for each electrical system that involves multiple items of equipment.
4. Submit instructions for charging, start-up, control or sequencing of operation, phase or seasonal variations, shut-down, safety and similar operations.
5. All operating instructions shall be typewritten in completely explained and easily understood English language.

J. Maintenance Manual Requirements
1. Provide emergency instructions including addresses and telephone numbers for service sources.
2. Provide regular system maintenance procedures.
3. Indicate proper use of tools and accessories.
4. Provide wiring and control diagram for each system.
5. Provide manufacturer's data for each operational item in each system.
6. Provide source code submittal for all software controlled equipment.
7. Provide manufacturer's product warranties, and guarantee relating to the system and equipment items in the system.
8. Provide Final Shop and Erection drawings relating to the system.
9. Bind each operating and maintenance manual in one or more vinyl-covered, 2” 3-ring binders, plus pocket-folders for folded drawings. Index with thumb tab collated with Table of Contents for sections. Mark the back spine and front cover of each binder with system identification and volume number.

K. Maintenance Materials: Deliver all materials to the Owner in fully identified containers or packages suitable for storage. Obtain receipt for all delivered materials signed by the Owner’s Representative.

L. Guarantees: Where indicated as "Certified", provide guarantee which, in addition to execution by an authorized officer of each guarantor, is attested to by the Secretary of each

guarantor and bears the corporate seal. Submit draft of each guarantee prior to execution.

END OF SECTION 26 00 02

SECTION 26 00 03 – TEMPORARY ELECTRICAL FACILITIES FOR CONSTRUCTION

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Furnish temporary electrical facilities to provide lighting and power for construction. Temporary power must be installed in accordance with the National Electrical Code, National Electrical Safety Code, local utility, local codes and authority having jurisdiction.

B. Coordinate temporary electrical facilities with other trades.

C. See General Conditions, Supplemental General Conditions and Spec Section 01 50 00, Temporary Facilities and Controls for additional information.

PART 2 – PRODUCTS

2.1 MATERIALS

A. General: Provide new or used materials and equipment suitable for intended use. Ensure safe, adequate performance of facilities in accordance with governing regulations. Used equipment shall be in good, safe working order.

PART 3 - EXECUTION

3.1 INSTALLATION AND OPERATION

A. Except for self-contained facilities, connect and terminate temporary electrical facilities at locations required for proper distribution.

B. Do not subject electrical facilities on either temporary work or temporary use of permanent work to excess demand or overload.

C. All conduit and wiring used for temporary purposes shall be routed as to not damage any permanent finish or surface within the building. All surfaces shall be patched and repaired to that of a new finish.

3.2 SERVICE CONNECTION

A. Obtain temporary service from NV Energy. Install service in conformance with NEC 230 and 590.

3.3 GROUNDING

A. Power service and distribution system shall be properly grounded in accordance with NEC requirements.

B. Ground the system neutral in accordance with NEC 250.

C. Provide feeders and branch circuits with ground wire sized per NEC 250-122**.**

3.4 POWER SYSTEM AND DISTRIBUTION

A. Provide required distribution and capacity of system. Over-current protection, fusible and/or circuit breakers sized per NEC.

B. For 120/240 volts, single-phase system; use 3-wire 120/240-volt feeders and branch circuits.

C. For 120/208 volt, 3 phase, 4-wire system; use 120/208 volt balanced single-phase 3-wire distribution or 120/208 volts, 3 phase, 4-wire distribution.

D. For 480 volt, 3 phase, 3-wire distribution system; use balanced 2-wire single phase or 3-wire, 3 phase feeders for step-down to 120/240 volt or 120/208 volt utilization.

E. For 277/480 volt distribution system; use balanced 2-wire single phase or 3 and 4-wire, 3 phase feeders for step-down to 120/240 volt or 120/208 volt utilization.

F. Step-down transformers inside building shall be dry-type construction; protect from weather and construction damage.

G. Use No. 12 wire for branch circuits less than 100 feet to last outlet, and No. 10 wire for circuits beyond 100 feet. Install branch circuits using NEC approved wiring methods.

H. Balance loads connected to 3 phase services within reasonable limits.

3.5 PLUG-IN RECEPTACLES

A. Use 20A, duplex, NEMA grounded type or as required for special equipment.

B. Branch circuits feeding receptacles shall be 20A or as required for special equipment.

C. Provide receptacles to be reached by 50-foot extension cord.

D. All receptacle circuits shall be protected by dynamic type ground-fault circuit interrupters, which automatically disconnect circuit when leakage current of 4-6MA is detected.

E. Receptacles shall not be placed on the same circuit with temporary lighting.

3.6 TEMPORARY LUMINARIES

A. Provide luminaries approved by NEC for temporary construction wiring.

B. Lamps shall be rough service incandescent 150 watt to 300 watt equipped with guards to protect from contact and damage (sizes as directed).

3.7 LAMPS AND REPLACEMENTS

A. Provide lamps.

B. Replace burned out lamps to maintain required lighting levels throughout the duration of the project.

3.8 INSTALLATION OF CIRCUITS

A. Install required lighting and receptacle circuits along a route least objectionable to construction work as determined by Contractor. Protect circuits where exposed to damage.

3.9 PERMANENT WIRING SYSTEM

A. Do not use permanent wiring for construction without specific acceptance of the Owner. Before using permanent wiring for temporary service, submit a list of uses to the Owner. The Owner may refuse use of permanent equipment for temporary service. Use of permanent equipment prior to Substantial Completion shall not affect warranty period.

3.10 REMOVAL AND RESTORATION

A. Temporary wiring shall be removed immediately upon completion of construction or purpose for which the wiring was installed. Repair or replace work damaged by temporary electrical facilities. Clean and restore permanent electrical system used to provide temporary services to condition of new and unused work. Patch and seal all penetrations.
   1. Electrical work installed as temporary facilities, upon removal, remains property of Installer.
   2. Replace lamps of permanent light fixtures used for temporary lighting that have burned out or are noticeable dim. All permanently installed fixtures in the construction area lamps shall be removed and cleaned.
   3. Where temporary use of lamps exceeds 50 percent of lamp life, replace lamps.

B. At Substantial Completion, clean permanent electrical work used as temporary facilities. Remove debris accumulated in electrical spaces.

END OF SECTION 26 00 03

SECTION 26 05 03 – EQUIPMENT WIRING CONNECTIONS

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes electrical connections to equipment.

B. Related Sections:
   1. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.
   2. Section 26 05 33 - Raceway and Boxes for Electrical Systems.

1.2 REFERENCES

A. National Electrical Manufacturers Association:
   1. NEMA WD 1 - General Requirements for Wiring Devices.
   2. NEMA WD 6 - Wiring Devices-Dimensional Requirements.

1.3 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Product Data: Submit wiring device manufacturer’s catalog information showing dimensions, configurations, and construction.

C. Manufacturer's installation instructions.

1.4 CLOSEOUT SUBMITTALS

A. General Conditions: Submittal procedures.

B. Project Record Documents: Record actual locations, sizes, and configurations of equipment connections.

1.5 COORDINATION

A. General Conditions: Coordination and project conditions.

B. Obtain and review shop drawings, product data, manufacturer’s wiring diagrams, and manufacturer's instructions for equipment furnished under other sections.

C. Determine connection locations and requirements.

D. Sequence rough-in of electrical connections to coordinate with installation of equipment.

E. Sequence electrical connections to coordinate with start-up of equipment.

PART 2 - PRODUCTS

2.1 CORD AND PLUGS

A. Attachment Plug Construction: Conform to NEMA WD 1.

B. Configuration: NEMA WD 6; match receptacle configuration at outlet furnished for equipment.

C. Cord Construction: Type SO multiconductor flexible cord with identified equipment grounding conductor, suitable for use in damp locations.

D. Size: Suitable for connected load of equipment, length of cord, and rating of branch circuit overcurrent protection.

PART 3 – EXECUTION

3.1 EXAMINATION

A. General Conditions: Coordination and project conditions.

B. Verify equipment is ready for electrical connection, for wiring, and to be energized.

3.2 INSTALLATION

A. Make electrical connections.

B. Make conduit connections to equipment using flexible conduit. Use liquidtight flexible conduit with watertight connectors in damp or wet locations and to motors.

C. Connect heat producing equipment using wire and cable with insulation suitable for temperatures encountered.

D. Install receptacle outlet to accommodate connection with attachment plug.

E. Install cord and cap for field-supplied attachment plug.

F. Install suitable strain-relief clamps and fittings for cord connections at outlet boxes and equipment connection boxes.

G. Install disconnect switches, controllers, control stations, and control devices to complete equipment wiring requirements.

H. Install terminal block jumpers to complete equipment wiring requirements.

I. Install interconnecting conduit and wiring between devices and equipment to complete equipment wiring requirements.

J. Coolers and Freezers: Cut and seal conduit openings in freezer and cooler walls, floor, and ceilings.

3.3 ADJUSTING

A. Cooperate with utilization equipment installers and field service personnel during checkout and starting of equipment to allow testing and balancing and other startup operations. Provide personnel to operate electrical system and checkout wiring connection components and configurations.

END OF SECTION 26 05 03

SECTION 26 05 19 – LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes building wire and cable and wiring connectors and connections.

B. Related Sections:
1. Section 26 05 53 - Identification for Electrical Systems: Product requirements for wire identification.
2. Section 31 20 00 - Trenching: Execution requirements for trenching required by this section.
3. Section 31 20 00 - Fill: Requirements for backfill to be placed by this section.

1.2 REFERENCES

A. International Electrical Testing Association:
1. NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

B. National Fire Protection Association:
1. NFPA 70 - National Electrical Code.
2. NFPA 262 - Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.

C. Underwriters Laboratories, Inc.:
1. UL 1277 - Standard for Safety for Electrical Power and Control Tray Cables with Optional Optical-Fiber Members.

1.3 SYSTEM DESCRIPTION

A. Product Requirements: Provide products as follows:
1. Solid conductor for feeders and branch circuits 12 AWG and smaller.
2. Stranded conductors for feeders and branch circuits 10 AWG and larger.
3. Stranded conductors for control circuits.
4. Conductor not smaller than 12 AWG for power and lighting circuits.
5. Conductor not smaller than 16 AWG for control circuits.
6. Increase wire size in branch circuits to limit voltage drop to a maximum of 3 percent. See section 3.3-V for receptacle and lighting branch circuits. Utilize loads shown in panel schedules for all other load types to maintain maximum 3% voltage drop.

B. Wiring Methods: Provide the following wiring methods:
1. All Locations Unless Noted Otherwise: Use only building wire, Type THHN/THWN or XHHW insulation, in raceway.

1.4 DESIGN REQUIREMENTS

A. Conductor sizes are based on copper, aluminum conductors are not acceptable.

1.5 SUBMITTALS

A. General Conditions: Requirements for submittals.

B. Product Data: Submit for building wire.

C. Design Data: Indicate voltage drop and ampacity calculations for aluminum conductors substituted for copper conductors.

D. Test Reports: Indicate procedures and values obtained.

1.6 CLOSEOUT SUBMITTALS

A. General Conditions: Requirements for submittals.

B. Project Record Documents: Record actual locations of components and circuits.

1.7 QUALITY ASSURANCE

A. Provide wiring materials located in plenums with peak optical density not greater than 0.5, average optical density not greater than 0.15, and flame spread not greater than 5 feet (1.5 m) when tested in accordance with NFPA 262.

B. Maintain one copy of each document on site.

1.8 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

1.9 FIELD MEASUREMENTS

A. Verify field measurements are as indicated on Drawings.

1.10 COORDINATION

A. General Conditions: Requirements for coordination.

B. Where wire and cable destination is indicated and routing is not shown, determine routing and lengths required.

C. Wire and cable routing indicated is approximate unless dimensioned.

PART 2 - PRODUCTS

2.1 BUILDING WIRE

A. Product Description: Single conductor insulated wire.

B. Conductor: Copper.

C. Insulation Voltage Rating: 600 volts.

D. Insulation Temperature Rating: 90 degrees C.

E. Insulation Material: Thermoplastic.

2.2 ARMORED CABLE

A. Type AC Cable may not be used on this project.

2.3 METAL CLAD CABLE

A. Type MC Cable may not be used on this project and is strictly prohibited.

2.4 CONNECTORS AND SPLICES

A. Provide UL-listed factory-fabricated wiring connectors of size, ampacity rating, material, type and class for application and for service indicated. Select connectors to comply with Project's installation requirements and as specified in Part 3 "Applications" of this Article.

B. For Conductors #10 AWG and Smaller: Wire and cable connectors shall be solderless, twist on, 600 volts, 105°C., shall comply with UL 486A/C standards. Connectors coded for easy selection compatible with wiring to be spliced. Install connectors as recommended by manufacturer. Use proper crimping tool where crimp sleeves are used.
1. Acceptable Connector Manufacturers
    a) 3M- "Scotchlock"
    b) Buchanan - "B Cap"
    c) Thomas & Betts - "Stak-On"
    d) Ideal - "Wing Nuts"

C. Compression Splices: Splice conductors #8 and larger with solid copper barrel, type fittings applied with an appropriate hydraulic tool. Splices used only where approved. Splice fittings: Burndy "Hydent". Insulate splices with 600 volt, 105°C, "heat shrink", "cold shrink" covers, or taped insulation consisting of rubber, friction and vinyl tapes applied per manufacturer for 600 volt, 105°C covering to 150 percent of installation rating of conductor.
1. Acceptable Splice and Tape Manufacturers
    a) Burndy
    b) Thomas & Betts
    c) Ilsco
    d) Anderson
    e) Blackburn
    f) Oz/Gedney

D. Connectors and/or Terminations for Conductors #6 AWG and larger: Tin plated, 98% copper, dual crimp long barrel compression lugs with two bolt holes, insulated with molded covers to accommodate 1/2" bolts. Apply with hydraulic tool recommended by manufacturer.
1. Acceptable Manufacturers and Products
    a) O-Z Gedney
    b) Burndy Engineering Company "Hylugs"
    c) Thomas and Betts, "Color Keyed"
    d) Anderson

E. Use pulling lubricant which will not be detrimental to insulation of conductors indicated by published user information.
1. Acceptable Manufacturers of Lubricant
    a) Ideal Industries
    b) Panduit Corp.
    c) OZ/Gedney
    d) Plymouth/Bishop
    e) American Polywater Corp.
    f) Thomas & Betts

F. Insulate all live joints to 600 volts with strip rubber, friction tape, and electrical vinyl tape installed in accordance with manufacturers recommendations.
   1. Acceptable Tape Manufacturers
      a) 3M
      b) Plymouth

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Coordination and project conditions.

B. Verify interior of building has been protected from weather.

C. Verify mechanical work likely to damage wire and cable has been completed.

D. Verify raceway installation is complete and supported.

3.2 PREPARATION

A. Completely and thoroughly swab raceway before installing wire.

3.3 INSTALLATION

A. Route wire and cable to meet Project conditions.

B. Neatly train and lace wiring inside boxes, equipment, and panelboards.

C. Identify and color code wire and cable under provisions of Section 260553. Identify each conductor with its circuit number or other designation indicated.

D. Install wiring complete with connections to equipment.

E. There may be cases where circuit or feeder conductor sizes are too large or too small to fit into the lugs normally supplied with the power distribution equipment or end-use equipment, due to circumstances such as increasing conductor sizes to offset voltage drop, unusual breaker frame sizes, type of conductors used, etc. In such cases provide appropriate factory lug kits for affected equipment if recommended by manufacturer; elsewhere provide insulated butt-splices with tails sized to fit respective lugs.

F. Install wiring so conductors are not in tension in completed system.

G. Form wiring neatly and group in circuit. Tie grouped conductors with nylon ties, T&B "Tyrap" or approved equivalent.

H. Each conduit run shall be run complete end to end before conductors are installed.

I. Use pulling lubricant to decrease pulling tension for all feeder cables, and all difficult cable pulls of any type or size. Pull all conductors into raceway at the same time.

J. Provide cable supports, at locations required by NEC and/or as shown. Supports with malleable screwed conduit fitting and non-conductive wedges drilled for the size conductors installed. Provide supports rated for all types of insulation and all voltage. Cable supports shall

be O.Z./Gedney type "R" or accepted equivalent. Furnish pullbox, sized per NEC for each cable support.

K. Bond circuit ground wires where installed to all devices, equipment, outlet and junction boxes, and grounding bushings (where provided) with a full size conductor and lugged type connection.

L. Securely fasten non-ferrous identifying tapes, pressure sensitive labels or engraved nameplates to all cables, feeders and power cables exposed in vaults, inside pull boxes, exposed in manholes, exposed in switchboard, termination compartments, etc

M. Join and terminate copper conductors individually. Do not mix voltages in the same raceway.

N. Provide lugs where not furnished as part of equipment - furnish as specified above, to connect all conductors.

O. Furnish lugs for conductors #1/0 and larger with two bolt tongue or accepted equivalent single bolt tongue with anti-turn devices.

P. Mark all branch circuit conductors at panel terminations including neutrals with pressure sensitive numbers to correspond to circuit numbers connected. See Section 260553 for labels.

Q. Connect circuits and feeders as shown on drawings. Drawings are diagrammatic and do not show every detail required in the wiring system. Detail wiring accomplished per NEC.

R. All conductors making up parallel feeders to be same size, same type, and same insulation, all cut same length. Bond each group of conductors making up a phase or neutral at both ends in an approved manner. Parallel conductors shall not be run in the same raceway.

S. DO NOT COMBINE CIRCUITS into more than three circuits per homerun unless specifically approved by the Consultant.

T. Neutral conductors shall not be used for equipment grounding.

U. Circuitry shall not be run in elevator shafts and hoistways.

V. Provide a separate neutral and grounding conductor for all GFI circuits or GFI devices to ensure an adequate ground-fault return path.

W. Conductors for receptacle and lighting circuits shall be installed in accordance with the following conditions:

1. Maximum one-way circuit length in feet for 90°C copper conductors with unity power factor to first device on circuit. Assumed 1920VA/120V and 4432VA/277V loading per circuit.

   a. 120V – Single Phase
      1) #12AWG – 53’
      2) #10AWG – 88’
      3) #8AWG – 138’
      4) #6 AWG – 223’

   b) 277V – Single Phase
      1) #12AWG – 123’
      2) #10AWG – 205’

3) #8AWG – 319’
4) #6AWG – 515’

Alternative wire sizing: Where loads shown on panel schedules are less than 80% of the breaker rating per branch circuit, contractor may perform calculations demonstrating less than 3% voltage drop and modify wire size accordingly.

X. Panelboards may not be used as raceways.

Y. Install crimp on fork terminals for device terminations. Do not place bare stranded conductors directly under screws.

Z. Install terminal lugs on ends of 600-volt wires unless lugs are furnished on connected device, such as circuit breakers.

AA. Size lugs in accordance with manufacturer’s recommendations terminating wire sizes. Install 2-hole type lugs to connect wires 4 AWG and larger to copper bus bars.

BB. For terminal lugs fastened together such as on motors, transformers, and other apparatus, or when space between studs is small enough that lugs can turn and touch each other, insulate for dielectric strength of 2-1/2 times normal potential of circuit.

CC. Clean conductor surfaces before installing lugs and connectors.

DD. Make splices, taps, and terminations to carry full ampacity of conductors with no perceptible temperature rise.

3.4 WIRE COLOR

A. General:
1. For wire sizes 10 AWG and smaller, install wire colors in accordance with the following:
   a. Black and red for single phase circuits at 120/240 volts.
   b. Black, red, and blue for circuits at 120/208 volts single or three phase.
   c. Orange, brown, and yellow for circuits at 277/480 volts single or three phase.
2. For wire sizes 8 AWG and larger, identify wire with colored tape at terminals, splices and boxes. Colors are as follows:
   a. Black and red for single phase circuits at 120/240 volts.
   b. Black, red, and blue for circuits at 120/208 volts single or three phase.
   c. Orange, brown, and yellow for circuits at 277/480 volts single or three phase.

B. Neutral Conductors: White. When two or more neutrals are located in one conduit, individually identify each with proper circuit number.

C. Branch Circuit Conductors: Install three or four wire home runs with each phase uniquely color coded.

D. Feeder Circuit Conductors: Uniquely color code each phase.

E. Ground Conductors:
1. For 6 AWG and smaller: Green.
2. For 4 AWG and larger: Identify with green tape at both ends and visible points including junction boxes.

3.5 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Inspect and test in accordance with NETA ATS, except Section 4.

C. Perform inspections and tests listed in NETA ATS, Section 7.3.1.

END OF SECTION 26 05 19

SECTION 26 05 26 – GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
1. Rod electrodes.
2. Wire.
3. Grounding well components.
4. Mechanical connectors.
5. Exothermic connections.

B. Related Sections:
1. Section 03 20 00 - Concrete Reinforcing: Bonding or welding bars when reinforcing steel is used for electrodes.

1.2 REFERENCES

A. Institute of Electrical and Electronics Engineers:
1. IEEE 142 - Recommended Practice for Grounding of Industrial and Commercial Power Systems.
2. IEEE 1100 - Recommended Practice for Powering and Grounding Electronic Equipment.

B. International Electrical Testing Association:
1. NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

C. National Fire Protection Association:
1. NFPA 70 - National Electrical Code.

1.3 SYSTEM DESCRIPTION

A. Grounding systems use the following elements as grounding electrodes:

1. Metal underground water pipe.
2. Metal building frame.
3. Concrete-encased electrode.
4. Rod electrode.

1.4 PERFORMANCE REQUIREMENTS

A. Grounding System Resistance: 5 ohms maximum.

1.5 SUBMITTALS

A. General Conditions: Requirements for submittals.

B. Product Data: Submit data on grounding electrodes and connections.

C. Test Reports: Indicate overall resistance to ground and resistance of each electrode.

D. Manufacturer's Installation Instructions: Submit for active electrodes.

E. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

1.6 CLOSEOUT SUBMITTALS

A. General Conditions: Requirements for submittals.

B. Project Record Documents: Record actual locations of components and grounding electrodes.

1.7 QUALITY ASSURANCE

A. Provide grounding materials conforming to requirements of NEC, IEEE 142, and UL labeled.

B. Maintain one copy of each document on site.

1.8 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three years documented experience.

B. Installer: Company specializing in performing work of this section with minimum three years documented experience.

1.9 PRE-INSTALLATION MEETINGS

A. General Conditions: Pre-installation meeting.

B. Convene minimum one week prior to commencing work of this section.

1.10 DELIVERY, STORAGE, AND HANDLING

A. General Conditions: Requirements for transporting, handling, storing, and protecting products.

B. Accept materials on site in original factory packaging, labeled with manufacturer's identification.

C. Protect from weather and construction traffic, dirt, water, chemical, and mechanical damage, by storing in original packaging.

D. Do not deliver items to project before time of installation. Limit shipment of bulk and multiple-use materials to quantities needed for immediate installation.

1.11 COORDINATION

A. General Conditions: Requirements for coordination.

B. Complete grounding and bonding of building reinforcing steel prior concrete placement.

PART 2 - PRODUCTS

2.1 ROD ELECTRODES

A. Product Description:
   1. Material: Copper-clad steel.
   2. Diameter: 3/4 inch (19 mm).
   3. Length: 10 feet (2.4 m).

B. Connector: Connector for exothermic welded connection.

2.2 WIRE

A. Material: Stranded copper.

B. Foundation Electrodes: As shown on drawings.

C. Grounding Electrode Conductor: Copper conductor bare.

D. Bonding Conductor: Copper conductor bare.

2.3 GROUNDING WELL COMPONENTS

A. Well Pipe: 8 inches NPS (DN200) by 18 inches (600 mm) long concrete pipe with belled end.

B. Well Cover: Cast iron with legend "GROUND" embossed on cover.

2.4 MECHANICAL CONNECTORS

A. Description: Bronze connectors, suitable for grounding and bonding applications, in configurations required for particular installation. Where connection is made to domestic water with a bonding connector, contractor shall remove all paint/tape at connection point to adequately expose bare copper for a proper bonding connection.

2.5 EXOTHERMIC CONNECTIONS

A. Product Description: Exothermic materials, accessories, and tools for preparing and making permanent field connections between grounding system components.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Verification of existing conditions before starting work.

B. Verify final backfill and compaction has been completed before driving rod electrodes.

3.2 PREPARATION

A. Remove paint, rust, mill oils, surface contaminants at connection points.

3.3 EXISTING WORK

A. Modify existing grounding system to maintain continuity to accommodate renovations.

B. Extend existing grounding system using materials and methods as specified.

3.4 INSTALLATION

A. Install in accordance with IEEE 142.

B. Install grounding and bonding conductors concealed from view.

C. Install grounding well pipe with cover at each rod location. Install well pipe top flush with finished grade.

D. Install grounding electrode conductor and connect to reinforcing steel in foundation footing as indicated on Drawings. Electrically bond steel together.

E. Bond together metal siding not attached to grounded structure; bond to ground.

F. Equipment Grounding Conductor: Install separate, insulated conductor within each feeder and branch circuit raceway. Terminate each end on suitable lug, bus, or bushing.

G. Install continuous grounding using underground cold water system and building steel as grounding electrode. Where water piping is not available, install artificial station ground by means of driven rods or buried electrodes.

H. Permanently ground entire light and power system in accordance with NEC, including service equipment, distribution panels, lighting panelboards, switch and starter enclosures, motor frames, grounding type receptacles, and other exposed non-current carrying metal parts of electrical equipment.

I. Accomplish grounding of electrical system by using insulated grounding conductor installed with feeders and branch circuit conductors in conduits. Size grounding conductors in accordance with NEC. Install from grounding bus of serving panel to ground bus of served panel, grounding screw of receptacles, lighting fixture housing, light switch outlet boxes or metal enclosures of service equipment. Ground conduits by means of grounding bushings on terminations at panelboards with installed number 12 conductor to grounding bus.

J. Grounding electrical system using continuous metal raceway system enclosing circuit conductors in accordance with NEC.

K. Permanently attach equipment and grounding conductors prior to energizing equipment.

3.5 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Inspect and test in accordance with NETA ATS, except Section 4.

C. Grounding and Bonding: Perform inspections and tests listed in NETA ATS, Section 7.13.

D. Perform ground resistance testing in accordance with IEEE 142.

E. Perform continuity testing in accordance with IEEE 142.

F. When improper grounding is found on receptacles, check receptacles in entire project and correct. Perform retest.

END OF SECTION 260526

SECTION 26 05 29 – HANGERS, SUPPORTS AND FIRESTOPPING FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.1 SUMMARY

A. Section Includes:
1. Conduit supports.
2. Formed steel channel.
3. Spring steel clips.
4. Sleeves.
5. Mechanical sleeve seals.
6. Firestopping relating to electrical work.
7. Firestopping accessories.
8. Equipment bases and supports.

1.2 REFERENCES

A. ASTM International:
1. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
2. ASTM E119 - Standard Test Methods for Fire Tests of Building Construction and Materials.
3. ASTM E814 - Standard Test Method for Fire Tests of Through-Penetration Fire Stops.
4. ASTM E1966 - Standard Test Method for Fire-Resistive Joint Systems.

B. FM Global:

2. UL 723 - Tests for Surface Burning Characteristics of Building Materials.
3. UL 1479 - Fire Tests of Through-Penetration Firestops.
4. UL 2079 - Tests for Fire Resistance of Building Joint Systems.
5. UL - Fire Resistance Directory.

E. Intertek Testing Services (Warnock Hersey Listed):
1. WH - Certification Listings.

1.3 DEFINITIONS

A. Firestopping (Through-Penetration Protection System): Sealing or stuffing material or assembly placed in spaces between and penetrations through building materials to arrest movement of fire, smoke, heat, and hot gases through fire rated construction.

1.4 SYSTEM DESCRIPTION

A. Firestopping Materials: ASTM E119, ASTM E814, UL 263, UL 1479, to achieve fire ratings of adjacent construction. In accordance with Design Numbers.

B. Surface Burning: UL 723 with maximum flame spread / smoke developed rating of 25/450.

C. Firestop interruptions to fire rated assemblies, materials, and components.

1.5 PERFORMANCE REQUIREMENTS

A. Firestopping: Conform to UL for fire resistance ratings and surface burning characteristics.

1.6 SUBMITTALS

A. General Conditions: Requirements for submittals.

B. Shop Drawings: Indicate system layout with location and detail of trapeze hangers.

C. Product Data:
1. Hangers and Supports: Submit manufacturers catalog data including load capacity.
2. Firestopping: Submit data on product characteristics, performance and limitation criteria.

D. Firestopping Schedule: Submit schedule of opening locations and sizes, penetrating items, and required listed design numbers to seal openings to maintain fire resistance rating of adjacent assembly.

E. Design Data: Indicate load carrying capacity of trapeze hangers and hangers and supports.

F. Manufacturer's Installation Instructions:
1. Hangers and Supports: Submit special procedures and assembly of components.
2. Firestopping: Submit preparation and installation instructions.

G. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

H. Engineering Judgements: For conditions not covered by UL or WH listed designs, submit judgements by licensed professional engineer suitable for presentation to authority having jurisdiction for acceptance as meeting code fire protection requirements.

1.7 QUALITY ASSURANCE

A. Through Penetration Firestopping of Fire Rated Assemblies: UL 1479 or ASTM E814 with 0.10 inch water gage (24.9 Pa) minimum positive pressure differential to achieve fire F-Ratings and temperature T-Ratings as indicated on Drawings, but not less than 1-hour.
1. Wall Penetrations: Fire F-Ratings as indicated on Drawings, but not less than 1-hour.

2. Floor and Roof Penetrations: Fire F-Ratings and temperature T-Ratings as indicated on Drawings, but not less than 1-hour.
a. Floor Penetrations Within Wall Cavities: T-Rating is not required.

B. Through Penetration Firestopping of Non-Fire Rated Floor and Roof Assemblies: Materials to resist free passage of flame and products of combustion.
1. Noncombustible Penetrating Items: Noncombustible materials for penetrating items connecting maximum of three stories.
2. Penetrating Items: Materials approved by authorities having jurisdiction for penetrating items connecting maximum of two stories.

C. Fire Resistant Joints in Fire Rated Floor, Roof, and Wall Assemblies: ASTM E1966 or UL 2079 to achieve fire resistant rating as indicated on Drawings for assembly in which joint is installed.

D. Fire Resistant Joints Between Floor Slabs and Exterior Walls: ASTM E119 with 0.10-inch water gage (24.9 Pa) minimum positive pressure differential to achieve fire resistant rating as indicated on Drawings for floor assembly.

E. Surface Burning Characteristics: 25/450 flame spread/smoke developed index when tested in accordance with ASTM E84.

1.8 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three years documented experience.

B. Installer: Company specializing in performing work of this section with minimum three years documented experience approved by manufacturer.

1.9 PRE-INSTALLATION MEETINGS

A. General Conditions: Pre-installation meeting.

B. Convene minimum one week prior to commencing work of this section.

1.10 DELIVERY, STORAGE, AND HANDLING

A. General Conditions: Requirements for transporting, handling, storing, and protecting products.

B. Accept materials on site in original factory packaging, labeled with manufacturer's identification.

C. Protect from weather and construction traffic, dirt, water, chemical, and mechanical damage, by storing in original packaging.

1.11 ENVIRONMENTAL REQUIREMENTS

A. General Conditions: Environmental conditions affecting products on site.

B. Do not apply firestopping materials when temperature of substrate material and ambient air is below 60 degrees F (15 degrees C).

C. Maintain this minimum temperature before, during, and for minimum 3 days after installation of firestopping materials.

D. Provide ventilation in areas to receive solvent cured materials.

PART 2 – PRODUCTS

2.1 CONDUIT SUPPORTS

A. Hanger Rods: Threaded high tensile strength galvanized carbon steel with free running threads.

B. Beam Clamps: Malleable Iron, with tapered hole in base and back to accept either bolt or hanger rod. Set screw: hardened steel.

C. Conduit clamps for trapeze hangers: Galvanized steel, notched to fit trapeze with single bolt to tighten.

D. Conduit clamps - general purpose: One hole malleable iron for surface mounted conduits.

2.2 FORMED STEEL CHANNEL

A. Product Description: Galvanized 12 gage (2.8 mm) thick steel. With holes 1-1/2 inches (38 mm) on center.

2.3 SPRING STEEL CLIPS

A. Product Description: Mounting hole and screw closure.

2.4 SLEEVES

A. Furnish materials in accordance with project standards.

B. Sleeves Through Non-fire Rated Floors: 18 gage (1.2 mm) thick galvanized steel.

C. Sleeves for Through Non-fire Rated Beams, Walls, Footings, and Potentially Wet Floors: Steel pipe or 18 mm thick galvanized steel.

D. Sleeves for Through Fire Rated and Fire Resistive Floors and Walls, and Fire Proofing: Prefabricated fire rated sleeves including seals, UL listed.

E. Fire-stopping Insulation: Glass fiber type, non-combustible.

2.5 MECHANICAL SLEEVE SEALS

A. Product Description: Modular mechanical type, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between object and sleeve, connected with bolts and pressure plates causing rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.

2.6 FIRESTOPPING

A. Manufacturers:
1. Dow Corning Corp.
2. 3M fire Protection Products.
3. Specified Technology, Inc.
4. Substitutions: General Conditions

B. Product Description: Different types of products by multiple manufacturers are acceptable as required to meet specified system description and performance requirements; provide only one type for each similar application.

1. Silicone Firestopping Elastomeric Firestopping: Single component silicone elastomeric compound and compatible silicone sealant.
2. Foam Firestopping Compounds: Single component foam compound.
3. Formulated Firestopping Compound of Incombustible Fibers: Formulated compound mixed with incombustible non-asbestos fibers.
4. Fiber Stuffing and Sealant Firestopping: Composite of mineral fiber stuffing insulation with silicone elastomer for smoke stopping.

5. Mechanical Firestopping Device with Fillers: Mechanical device with incombustible fillers and silicone elastomer, covered with sheet stainless steel jacket, joined with collars, penetration sealed with flanged stops.
6. Intumescent Firestopping: Intumescent putty compound which expands on exposure to surface heat gain.
7. Firestop Pillows: Formed mineral fiber pillows.

C. Color: Dark gray.

2.7 FIRESTOPPING ACCESSORIES

A. Primer: Type recommended by firestopping manufacturer for specific substrate surfaces and suitable for required fire ratings.

B. Installation Accessories: Provide clips, collars, fasteners, temporary stops or dams, and other devices required to position and retain materials in place.

C. General:
1. Furnish UL listed products.
2. Select products with rating not less than rating of wall or floor being penetrated.

D. Non-Rated Surfaces:
1. Stamped steel, chrome plated, hinged, split ring escutcheons or floor plates or ceiling plates for covering openings in occupied areas where conduit is exposed.
2. For exterior wall openings below grade, furnish modular mechanical type seal consisting of interlocking synthetic rubber links shaped to continuously fill annular space between conduit and cored opening or water-stop type wall sleeve.

PART 3 – EXECUTION

3.1 EXAMINATION

A. General Conditions: Verification of existing conditions before starting work.

B. Verify openings are ready to receive sleeves.

C. Verify openings are ready to receive firestopping.

3.2 PREPARATION

A. Clean substrate surfaces of dirt, dust, grease, oil, loose material, or other matter affecting bond of firestopping material.

B. Remove incompatible materials affecting bond.

C. Obtain permission from Architect/Engineer before using powder-actuated anchors.

D. Do not drill or cut structural members.

3.3 INSTALLATION - HANGERS AND SUPPORTS

A. Anchors and Fasteners:

1. Concrete Structural Elements: Provide precast inserts, expansion anchors, and preset inserts.
2. Steel Structural Elements: Provide beam clamps, spring steel clips, steel ramset fasteners, and welded fasteners.
3. Concrete Surfaces: Provide self-drilling anchors and expansion anchors.
4. Hollow Masonry, Plaster, and Gypsum Board Partitions: Provide toggle bolts and hollow wall fasteners.
5. Solid Masonry Walls: Provide expansion anchors and preset inserts.
6. Sheet Metal: Provide sheet metal screws.
7. Wood Elements: Provide wood screws.

B. Inserts:
1. Install inserts for placement in concrete forms.
2. Install inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
3. Provide hooked rod to concrete reinforcement section for inserts carrying pipe over 4 inches (100 mm).
4. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.
5. Where inserts are omitted, drill through concrete slab from below and provide through-bolt with recessed square steel plate and nut flush with top of slab.

C. Install conduit and raceway support and spacing in accordance with NEC.

D. Do not fasten supports to pipes, ducts, mechanical equipment, or conduit.

E. Install multiple conduit runs on common hangers.

F. Supports:
1. Fabricate supports from structural steel or formed steel channel. Install hexagon head bolts to present neat appearance with adequate strength and rigidity. Install spring lock washers under nuts.
2. Install surface mounted cabinets and panelboards with minimum of four anchors.
3. In wet and damp locations install steel channel supports to stand cabinets and panelboards
1 inch (25 mm) off wall.
4. Support vertical conduit at every floor.

G. Support EMT within twelve inches of each outlet, junction box, cabinet or fitting and every eight-foot thereafter. Combination box/conduit hangers are not allowed.
1. Acceptable Individual conduit hanger manufacturers
a. Appleton
b. Minerallac
c. OZ Mfr. Co.
d. Erico-Products
e. Steel City
f. Thomas & Betts

H. Support for multiple conduit runs shall consist of trapeze type hangers as required. Galvanized bolts or rods shall be 3/8” minimum diameter and anchored to structure. Provide support system clamp for each conduit on hangers. Support systems shall utilize 1-5/8” x 1-5/8” x 12 gage multi-purpose steel channels, complete with all necessary hardware, clamps, etc. all channel hardware shall be galvanized and/or plated to prevent corrosion. Channel sizes and quantity, and number of support rods shall be increased to support increased weights. Design each assembly to carry the combined weight of conduit and wire, assembly itself plus 100 pounds. Provide space for 25 percent additional conduit of the same size.

I. 1. Acceptable Manufacturers of channel support Systems
   a. B-Line
   b. Kindorf
   c. Superstrut
   d. Unistrut

I. All hangars for electrical items (conduit, boxes, fixtures and all other related equipment) where an "Epic Deck" system occurs shall be compatible for use with this system, "Epic Deck" is by Epic Metals Corporation. See Architectural and Structural drawings for locations. Do not install any conduit directly attached to any roof system, including the 'Epic Deck'.

3.4 INSTALLATION - FIRESTOPPING

A. Install material at fire rated construction perimeters and openings containing penetrating sleeves, piping, ductwork, conduit and other items, requiring firestopping.

B. Apply primer where recommended by manufacturer for type of firestopping material and substrate involved, and as required for compliance with required fire ratings.

C. Apply firestopping material in sufficient thickness to achieve required fire and smoke rating, to uniform density and texture.

D. Place foamed material in layers to ensure homogenous density, filling cavities and spaces. Place sealant to completely seal junctions with adjacent dissimilar materials.

E. Fire Rated Surface:
   1. Seal opening at floor, wall, partition, ceiling, and roof as follows:
      a. Install sleeve through opening and extending beyond minimum of 1 inch (25 mm) on both sides of building element.
      b. Size sleeve allowing minimum of 1 inch (25 mm) void between sleeve and building element.
      c. Pack void with backing material.
      d. Seal ends of sleeve with UL listed fire resistive silicone compound to meet fire rating of structure penetrated.
   2. Where cable tray, conduit, wireway, and cable penetrates fire rated surface, install firestopping product in accordance with manufacturer's instructions.

F. Non-Rated Surfaces:
   1. Seal opening through non-fire rated wall, partition, floor, ceiling and roof opening as follows:
      a. Install sleeve through opening and extending beyond minimum of 1 inch (25 mm) on both sides of building element.
      b. Size sleeve allowing minimum of 1 inch (25 mm) void between sleeve and building element.
      c. Install type of firestopping material recommended by manufacturer.
   2. Install floor plates or ceiling plates where conduit, penetrates non-fire rated surfaces in occupied spaces. Occupied spaces include rooms with finished ceilings and where penetration occurs below finished ceiling.
   3. Exterior wall openings below grade: Assemble rubber links of mechanical seal to size of conduit and tighten in place, in accordance with manufacturer's instructions.
   4. Interior partitions: Seal pipe penetrations at computer rooms and data rooms. Apply sealant to both sides of penetration to completely fill annular space between sleeve and conduit.

3.5 INSTALLATION - EQUIPMENT BASES AND SUPPORTS

A. Provide housekeeping pads of concrete, minimum 3-1/2 inches (87 mm) thick and extending 4 inches (150 mm) beyond supported equipment. Refer to Section 03 30 00.

B. Using templates furnished with equipment, install anchor bolts, and accessories for mounting and anchoring equipment.

C. Construct supports of steel members. Brace and fasten with flanges bolted to structure.

3.6 INSTALLATION - SLEEVES

A. Exterior watertight entries: Seal with adjustable interlocking rubber links.

B. Conduit penetrations not required to be watertight: Sleeve and fill with silicon foam.

C. Set sleeves in position in forms. Provide reinforcing around sleeves.

D. Size sleeves large enough to allow for movement due to expansion and contraction. Provide for continuous insulation wrapping.

E. Extend sleeves through floors 1 inch above finished floor level. Caulk sleeves.

F. Where conduit or raceway penetrates floor, ceiling, or wall, close off space between conduit or raceway and adjacent work with fire stopping insulation and caulk airtight. Provide close fitting metal collar or escutcheon covers at both sides of penetration.

G. Install chrome plated steel escutcheons at finished surfaces.

3.7 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Inspect installed firestopping for compliance with specifications and submitted schedule.

3.8 CLEANING

A. General Conditions: Requirements for cleaning.

B. Clean adjacent surfaces of firestopping materials.

3.9 PROTECTION OF FINISHED WORK

A. General Conditions: Requirements for protecting finished Work.

B. Protect adjacent surfaces from damage by material installation.

END OF SECTION 26 05 29

SECTION 26 05 30 – SEISMIC PROTECTION FOR ELECTRICAL EQUIPMENT

PART 1 – GENERAL

1.1 SUMMARY

A. Structural design and calculations for major equipment anchoring, conduit support, and bracing details.

1.2 RELATED SECTIONS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

1.3 REFERENCES

A. International Building Code, 2018

1.4 CODE INFORMATION

A. This project is subject to the seismic bracing requirements of the International Building Code, 2018 edition. The following criteria are applicable to this project.

1. See Sheet S001 Design Criteria for requirements.

B. It is recommended that the contractor enlist the services of a qualified seismic bracing vendor/supplier. Provide bracing for identified equipment and system.

C. Resistance to lateral forces induced by earthquakes shall not be accomplished with consideration of friction resulting from gravity loads. The following companies are listed as resources for the Contractor to consider for obtaining competent assistance regarding the seismic bracing of mechanical piping and equipment. Since seismic constraint is not a common mechanical or electrical requirement for projects and considering that the requirements are specific and include technical expertise, this information may be helpful.

1. Amber Booth
2. Cooper B-Line
3. Mason Industries
4. Tolco (Division of Nibco)

1.5 SUBMITTALS

A. Shop Drawings: Detail drawings along with catalog cuts, templates, and erection and installation details, as appropriate, for the items listed. Submittals shall be complete in detail; shall indicate thickness, type, grade, class of metal, and dimensions; and shall show construction details, reinforcement, anchorage, and installation with relation to the building construction. Seismic Bracing Submittals shall be sent with associated equipment prior to installation of any equipment.

1. Lighting Fixtures in Buildings.

2. Equipment Requirements.

B. Product Data:

1. Copies of the design calculations with the detail drawings. Calculations shall be stamped by a registered engineer in the State of Nevada and shall verify the capability of structural members to which bracing are attached for carrying the load from the brace. Structural seismic calculations for equipment anchorage for major equipment shall be included.

2. Contractor Designed Bracing: Copies of the Design Calculations with the Drawings. Calculations shall be approved, certified, stamped and signed by a Registered Professional Engineer. Calculations shall verify the capability of structural members to which bracing are attached for carrying the load from the brace.

C. Include Seismic Certification for major equipment.

1. Light Fixtures.
2. Transformers.
3. Switchboards.
4. Panelboards.

1.6 QUALIFICATION

A. The manufacturer of the assembly shall be the manufacturer of the major components within the assembly.

B. For the equipment specified herein, the manufacturer shall be ISO 9001 or 9002 certified.

C. The manufacturer of this equipment shall have produced similar electrical equipment for a minimum period of five years. When requested by the engineer, an acceptable list of installations with similar equipment shall be provided demonstrating compliance with this requirement.

D. Provide Seismic qualified equipment as follows:
The equipment and major components shall be suitable for and certified by actual seismic testing to meet all applicable seismic requirements of the 2018 International Building Code (IBC) Site Classification D. The site coefficients Fa=1.0, and spectral response accelerations of Ss=1.999g, S1=0.649g are used. The test response spectrum shall be based upon a 5% damping factor, and a peak (Sds) of at least 1.05g's (3-12 Hz) applied at the base of the equipment in the horizontal direction. The forces in the vertical direction shall be at least 66% of those in the horizontal direction. The tests shall cover a frequency range from 1 to 100Hz. Guidelines for the installation consistent with these requirements shall be provided by the equipment manufacturer and based upon testing of representative equipment. Equipment certification acceptance criteria shall be based upon the ability for the equipment to be returned to service immediately after a seismic event within the above requirements without the need for repairs.

1.7 SYSTEM DESCRIPTION

A. The requirements for seismic protection measures described in this section shall be applied to the electrical equipment and systems listed below.

B. Electrical Equipment: Electrical equipment shall include the following items to the extent required on the Drawings or in other sections of these specifications:

1. Light Fixtures.
2. Transformers.
3. Switchboards.
4. Panelboards.
5. Cable Tray.

C. Electrical Systems: The following electrical systems shall be seismically protected in accordance with this specification: Lighting, power, security, communications and fire alarm.

D. Conduits Requiring No Special Seismic Restraints: Seismic restraints may be omitted from electrical conduit less than 2-1/2 inches trade size. All other interior conduit, shall be seismically protected as specified.

1.8 EQUIPMENT REQUIREMENTS

A. Rigidly Mounted Equipment: Constructed and assembled to withstand the seismic forces in accordance with IBC 2018. Each item of rigid electrical equipment shall be entirely located and rigidly attached on one side only of a building expansion joint. Piping, electrical conduit, etc., which cross the expansion joint shall be provided with flexible joints that are capable of accommodating displacements equal to the full width if the joint in both orthogonal directions.

PART 2 – PRODUCTS

2.1 LIGHTING FIXTURE SUPPORTS

A. Lighting fixtures and supports shall conform to UL 1570, UL 1571, UL1572, UL1573 or UL1574 as applicable.

PART 3 – EXECUTION

3.1 SWAY BRACES FOR CONDUIT

A. Sway bracing materials shall consist of rods, plates, angles, etc.

3.2 LIGHTING FIXTURES IN BUILDINGS

A. Pendant Fixtures: Per manufacturer’s mounting requirements and details on plans.

1. Pendent fixtures shall be attached to structure with a mounting system designed to support 1.4 times the weight of the fixture both vertically and laterally. The connection to structure shall allow a 360-degree range of motion in the horizontal plane (ball and socket).

B. Ceiling Attached Fixtures:

1. Recessed LED Fixtures: Recessed individual or continuous- row mounted fixtures shall be supported by a seismic-resistant suspended ceiling support system built in

accordance with the ASTM E 580. Recessed lighting fixtures not over 56 pounds in weight may be supported by and attached directly to the ceiling seismic design. Fixture accessories, including louvers, diffusers, and lenses shall have lock or screw attachments.

2. Surface-Mounted LED Fixtures: Surface-mounted LED individual or continuous-row fixtures shall be attached to a seismic-restraint ceiling support system built in accordance with ASTM E 580.

C. Assembly Mounted on Outlet Box: A supporting assembly, that is intended to be mounted on an outlet box, shall be designed to accommodate mounting features on 4-inch boxes, plaster rings, and fixture studs.

D. Wall-Mounted Emergency Light Unit: Attachments for wall-mounted emergency light units shall be designed and secured for the worst expected seismic disturbance at the site.

3.3 ANCHOR BOLTS

A. Cast-In-Place: Floor or pad mounted equipment shall use cast-in-place anchor bolts or Hilti HDA anchors as indicated. One nut shall be provided on each bolt. Anchor bolts shall conform to ASTM F 1554, Grade 36. Anchor bolts shall have an embedded straight length equal to at least 12 times nominal diameter of the bolt. Anchor bolts that exceed the normal depth of equipment foundation piers or pads shall either extend into concrete floor or the foundation shall be increased in depth to accommodate bolt lengths.

B. Expansion or Chemically Bonded Anchors: Expansion or chemically bonded anchors shall not be used unless test data in accordance with ASTM E 488 has been provided verify the adequacy of the specific anchor and application. Expansion of chemically bonded anchors shall not be used to resist pull-out in overhead and wall installations.

3.4 RESILIENT VIBRATION ISOLATION DEVICES

A. Where the need for these devices is determined, based on the magnitude of the design seismic forces, selection of anchor bolts for vibration isolation devices and/or snubbers for equipment base and foundations shall follow the same procedure as in paragraph ANCHOR BOLTS, except that an equipment weight equal to three times the actual equipment weight shall be used.

3.5 SWAY BRACES FOR CONDUIT 2-1/2” TRADESIZE AND GREATER

A. Sway braces shall be provided to prevent movement of the conduits under seismic loading. Braces shall be provided in both the longitudinal and transverse directions, relative to the axis of the pipe. The bracing shall not interfere with thermal expansion requirements for the pipes as described in other sections of these specifications.

B. Transverse Sway Bracing: Install transverse sway bracing for steel and conduit. All runs (length of pipe between end joints) shall have a minimum of two transverse braces.

C. Longitudinal Sway Bracing: Longitudinal sway bracing shall be provided at 40 foot intervals unless otherwise indicated. All runs (length of conduit between end joints) shall have one longitudinal brace minimum. Branch lines, walls, or floors shall not be used as sway braces.

D. Vertical Runs: Run is defined as length of pipe between end joints. Vertical runs of conduit shall be braced at not more than 10-foot vertical intervals. Braces for vertical runs shall be above the center of gravity of the segment being braces. Sway braces shall not be used as sway braces.

E. Clamps and Hangers: Clamps or hangers in conduits shall be applied directly to conduit.

F. Anchor Rods, Angles, and Bars: Anchor rods, angles, and bars shall be bolted to either pipe clamps or pipe flanges at one end and cast-in-place concrete or masonry insert or clip angles bolted to the steel structure in the other end. Rods shall be solid metal or pipe as specified below. Anchor rods, angles, and bars shall not exceed lengths given in the tabulation below.

3.6 EQUIPMENT SWAY BRACING

A. Suspended Equipment: Equipment sway bracing shall be provided for items supported from overhead structural systems. Braces shall consist of angles, rods, bars, or pipes and secured at both ends with not less than ½-inch bolts. Sufficient braces shall be provided for equipment to resist a horizontal force equal to three times the weight of equipment without exceeding safe working stress of bracing components. Details of equipment bracing shall be submitted for acceptance. In lieu of bracing with vertical supports, these items may be supported and braced with hangers inclined at 45 degrees directed up and radially away from equipment and oriented symmetrically in 90-degree intervals on the horizontal plane, bisecting the angles of each corner of the equipment, provided that supporting members are properly sized to support operating weight of equipment when hangers are inclined at a 45-degree angle.

B. Floor or Pad Mounted Equipment:

1. Shear Resistance: Floor mounted equipment shall be bolted to the floor. Requirements for the number and installation of bolts to resist shear forces shall be in accordance with paragraph ANCHOR BOLTS.

2. Overturning Resistance: The ratio of the overturning moment from seismic forces to the resisting moment due to gravity loads shall be used to determine if overturning forces need to be considered in the sizing of anchor bolts. Calculations shall be provided to verify the adequacy of the anchor bolts for combined shear and overturning.

END OF SECTION 26 05 30

SECTION 26 05 33 – RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes conduit and tubing, surface raceways, wireways, outlet boxes, pull and junction boxes, and handholes.

B. Related Sections:
1. Section 26 05 03 - Equipment Wiring Connections.
2. Section 26 05 26 - Grounding and Bonding for Electrical Systems.
3. Section 26 05 29 - Hangers and Supports for Electrical Systems.
4. Section 26 05 53 - Identification for Electrical Systems.
5. Section 26 27 16 - Electrical Cabinets and Enclosures.
6. Section 26 27 26 - Wiring Devices.
7. Section 27 05 33 - Conduits and Backboxes for Communications Systems.
8. Section 27 05 36 - Cable Trays for Communications Systems.
9. Section 28 05 28 - Conduits and Backboxes for Electronic Safety and Security.

1.2 REFERENCES

2. NEMA FB 1 - Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit and Cable Assemblies.
3. NEMA OS 1 - Sheet Steel Outlet Boxes, Device Boxes, Covers, and Box Supports.
4. NEMA OS 2 - Nonmetallic Outlet Boxes, Device Boxes, Covers, and Box Supports.
5. NEMA RN 1 - Polyvinyl Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit.
6. NEMA TC 2 - Electrical Polyvinyl Chloride (PVC) Tubing and Conduit.
7. NEMA TC 3 - PVC Fittings for Use with Rigid PVC Conduit and Tubing.

1.3 SYSTEM DESCRIPTION

A. Raceway and boxes located as indicated on Drawings, and at other locations required for splices, taps, wire pulling, equipment connections, and compliance with regulatory requirements. Raceway and boxes are shown in approximate locations unless dimensioned. Provide raceway to complete wiring system. Exposed junction/pull boxes are not acceptable in finished areas, pull/spare boxes shall be above ceilings and hidden from view. All pull boxes shall be accessible.

B. Underground: Provide schedule 40 PVC. Provide pre-cast concrete or nonmetallic handholes, vaults or manholes.

C. In or Under Slab on Grade: Under slab on grade provide PVC conduit. Minimum size ¾" conduit. Conduit not allowed to be run within slab on grade.

D. Outdoor Locations, Above Grade: Provide electrical metallic tubing. Where exposed to physical damage and heavy moisture (including roof tops) use rigid steel conduit. Provide cast metal or nonmetallic outlet, pull, and junction boxes.

E. In or Under Slab on Grade: Under slab on grade provide PVC conduit. Minimum size ¾" conduit. Do not group/bundle conduits under vapor barrier. Conduits under the building slab shall be dispersed in congested areas. Routing shall be reviewed by Structural Engineer prior to vapor barrier installation. Where conduits cross under the slab, they shall be separated by base/soil material acceptable to Structural Engineer. Conduit not allowed to be run within slab on grade.

F. Interior Wet Locations: Provide rigid steel conduit. Provide cast metal outlet, junction, and pull boxes. Provide flush mounting outlet box in finished areas.

G. Concealed Dry Locations: Provide electrical metallic tubing. Provide sheet-metal boxes. Provide flush mounting outlet box in finished areas. Provide hinged enclosure for large pull boxes.

H. Exposed Dry Locations: Provide electrical metallic tubing, except where exposed to physical damage; provide rigid steel conduit. Provide sheet-metal boxes. Provide flush mounting outlet box in finished areas. Provide hinged enclosure for large pull boxes. Exposed conduit in finished areas not acceptable. Exposed conduit shall be kept to a minimum in all cases, and approved by the owner prior to rough-in or installation in areas where exposed conduit will be installed by the Contractor.

1.4 DESIGN REQUIREMENTS

A. Minimum Raceway Size: 1/2inch (13mm) unless otherwise specified. Comply with NEC for minimum size conduit and installation requirements. Minimum size 1/2 inch diameter for branch circuits, minimum size 3/4 inch diameter for homeruns. Minimum size for PVC conduit shall be 3/4 inch in diameter. Conduits shall be installed complete end-to-end prior to installing conductors.

1.5 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Product Data: Submit for the following:
1. Flexible metal conduit.
2. Liquidtight flexible metal conduit.
3. Nonmetallic conduit.
4. Raceway fittings.
5. Conduit bodies.
6. Surface raceway.
7. Wireway.
8. Pull and junction boxes.
9. Handholes.

C. Manufacturer's Installation Instructions: Submit application conditions and limitations of use stipulated by Product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, and installation of Product.

1.6 CLOSEOUT SUBMITTALS

A. General Conditions: Closeout procedures.

B. Project Record Documents:
1. Record actual routing of conduits 2” and larger.
2. Record actual locations and mounting heights of outlet, pull, and junction boxes.

1.7 DELIVERY, STORAGE, AND HANDLING

A. General Conditions: Product storage and handling requirements.

B. Protect conduit from corrosion and entrance of debris by storing above grade. Provide appropriate covering.

C. Protect PVC conduit from sunlight.

1.8 COORDINATION

A. General Conditions: Coordination and project conditions.

B. Coordinate installation of outlet boxes for equipment connected under Section 26 05 03.

C. Coordinate mounting heights, orientation and locations of outlets mounted above counters, benches, and backsplashes.

PART 2 - PRODUCTS

2.1 METAL CONDUIT

A. Rigid Steel Conduit: ANSI C80.1.

B. Intermediate Metal Conduit (IMC): Rigid steel.

C. Fittings and Conduit Bodies: NEMA FB 1; all steel fittings. Threadless fittings shall not be used.

D. Terminate rigid conduit in dry locations with two steel locknuts, one inside, one outside of the cabinet, junction box or outlet box and an insulated bushing. Bushings shall be malleable iron or steel with smooth insulating ring molded into edge of bushing to prevent damage to cable. Insulated bushings shall be 150 degree C self extinguishing thermoplastic. Provide grounding bushings on 1 ½ inch conduit and larger. Construction of bushings shall be similar to steel bushings described above except provide lugs for grounding connection.

E. Where conduits are installed underground, the threaded joints shall be sealed with a conductive joint sealing compound.

2.2 PVC COATED METAL CONDUIT

A. Product Description: NEMA RN 1; rigid steel conduit with external PVC coating, 40 mil (0.05 mm) thick.

B. Fittings and Conduit Bodies: NEMA FB 1; steel fittings with external PVC coating to match conduit.

2.3 FLEXIBLE METAL CONDUIT

A. Product Description: Interlocked steel construction.

B. Fittings: NEMA FB 1.

C. Connectors and fittings galvanized steel, threadless type with insulated throats, U.L. approved for grounding means.

2.4 LIQUIDTIGHT FLEXIBLE METAL CONDUIT

A. Product Description: Interlocked steel construction with PVC jacket.

B. Fittings: NEMA FB 1.

C. Fitting Assembly – Sealing type, with steel gland, nylon ring and ground cone inside locknut. All fittings with insulated throat, U.L. approved for grounding means.

2.5 ELECTRICAL METALLIC TUBING (EMT)

A. Product Description: ANSI C80.3; galvanized tubing.

B. Fittings and Conduit Bodies: NEMA FB 1; use insulated throat galvanized steel, rain tight, compression or set screw type. Compression type must be used in all medical facilities and in damp locations. Provide grounding bushing on 1¼ inch and larger. **Zinc alloy and similar soft metal castings are not allowed.**

2.6 NONMETALLIC CONDUIT

A. Product Description: NEMA TC 2; Schedule 40 PVC. Minimum sizes shall be 3/4 inch by diameter.

B. Fittings and Conduit Bodies: NEMA TC 3.

C. Fittings same material as conduit and installed with watertight joint compound recommended by manufacturer.

2.7 WIREWAY

A. Product Description: NEMA Type 1, General purpose, Oiltight and dust-tight. NEMA Type 3R, raintight type wireway as required to meet project conditions. Open top assembly.

B. Knockouts: NEMA Type 1, Manufacturer's standard. NEMA Type 3R – none.

C. Size: As indicated on Drawings.

D. Cover: NEMA Type 1 – removable hinged cover latches with captive screws. NEMA Type 3R – removable cover with quick release latches and full gaskets.

E. Connector: Slip-in.

F. Fittings: Lay-in type with removable top, bottom, and side; captive screws.

G. Finish: Rust inhibiting primer coating with gray enamel finish.

2.8 OUTLET BOXES

A. Sheet Metal Outlet Boxes: NEMA OS 1, galvanized steel.
   1. Luminaire and Equipment Supporting Boxes: Rated for weight of equipment supported; furnish 1/2 inch (13 mm) male fixture studs where required.
   2. Concrete Ceiling Boxes: Concrete type.

B. Cast Boxes: NEMA FB 1, Type FD, cast feralloy. Furnish gasketed cover by box manufacturer.

C. Wall Plates for Finished Areas: As specified in Section 26 27 26.

D. Wall Plates for Unfinished Areas: Galvanized industrial raised rings suitable for device type.

E. Welded boxes are not acceptable.

2.9 PULL AND JUNCTION BOXES

A. Sheet Metal Boxes: NEMA OS 1, galvanized steel.

B. Hinged Enclosures: As specified in Section 26 27 16.

C. Surface Mounted Cast Metal Box: NEMA 250, Type 4; flat-flanged, surface mounted junction box:
   1. Material: Galvanized cast iron.
   2. Cover: Furnish with ground flange, neoprene gasket, and stainless steel cover screws.

D. Flush pull boxes installed in walls shall have oversized covers and be painted to match surface.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Coordination and project conditions.

B. Verify outlet locations and routing and termination locations of raceway prior to rough-in.

3.2 INSTALLATION

A. Ground and bond raceway and boxes in accordance with Section 26 05 26.

B. Fasten raceway and box supports to structure and finishes in accordance with Section 26 05 29.

C. Identify raceway and boxes in accordance with Section 26 05 53.

D. Arrange raceway and boxes to maintain headroom and present neat appearance.

3.3 INSTALLATION – RACEWAY

A. Electrical conduits shall be run concealed where building construction allows. Any exposed conduit shall be approved by the owner or architect prior to installation. Any exposed conduit, fittings, supports, etc shall be painted to match the surface on which they are installed.

B. Conduit within the roof deck assembly shall be installed in accordance with NEC 300.4(E) and (F). Utilize Galvanized Rigid Conduit (GRC), or Intermediate Metallic Conduit (IMC) with steel plates to protect junction boxes from roof insulation attachment anchors.

C. Raceway routing is shown in approximate locations unless dimensioned. Route to complete wiring system.

D. Arrange raceway supports to prevent misalignment during wiring installation.

E. Support raceway using coated steel or malleable iron straps, lay-in adjustable hangers, clevis hangers, and split hangers.

F. Group related raceway; support using conduit rack. Construct rack using steel channel specified in Section 26 05 29; provide space on each for 25 percent additional raceways.

G. Do not support raceway with wire or perforated pipe straps. Remove wire used for temporary supports

H. Do not attach raceway to ceiling support wires or other piping systems.

I. Construct wireway supports from steel channel specified in Section 26 05 29.

J. Route exposed raceway parallel and perpendicular to walls.

K. Route raceway installed above accessible ceilings parallel and perpendicular to walls.

L. Route conduit in and under slab from point-to-point.

M. Maintain clearance between raceway and piping for maintenance purposes.

N. Maintain 12 inch (300 mm) clearance between raceway and surfaces with temperatures exceeding 104 degrees F (40 degrees C).

O. Cut conduit square using saw or pipe cutter; de-burr cut ends.

P. Bring conduit to shoulder of fittings; fasten securely.

Q. Join nonmetallic conduit using cement as recommended by manufacturer. Wipe nonmetallic conduit dry and clean before joining. Apply full even coat of cement to entire area inserted in fitting. Allow joint to cure for minimum 20 minutes.

R. Install conduit hubs to fasten conduit to sheet metal boxes in damp and wet locations and to cast boxes.

S. Install no more than equivalent of three 90 degree bends (270 degrees total) between boxes. Install conduit bodies to make sharp changes in direction, as around beams. Use hydraulic one-shot bender to fabricate or factory elbows for bends in metal conduit larger than 2 inch (50 mm) size.

T. Avoid moisture traps; install junction box with drain fitting at low points in conduit system.

U. Install suitable pull string or cord in each empty raceway except sleeves and nipples.

V. Install suitable caps to protect installed conduit against entrance of dirt and moisture.

W. Surface Wireway: Install flat-head screws, clips, and straps to fasten raceway channel to surfaces; mount plumb and level. Install insulating bushings and inserts at connections to outlets and corner fittings.

X. Close ends and unused openings in wireway.

Y. Use rigid metal conduit or PVC coated rigid steel conduit on all through slab transitions. Use rigid metal conduit elbows 2-lap wrapped with 20mil 3M Scotch wrap or tape or PVC coated rigid steel conduit on all underground/underslab raceways 2 inches and larger.

Z. Exterior buried conduit shall be schedule 40 PVC with PVC coated RGS 90 degree bends.

AA. Use rigid steel conduit for all motor circuits where subject to physical damage.

BB. Intermediate grade metal conduit, (threaded only), may be used in lieu of rigid steel conduit where allowed by NEC.

CC. Use flexible steel conduit for:
1. Connection to vibrating equipment in dry locations between rigid conduit and connection box on equipment.
2. Final connections to equipment in dry locations.
3. Final connections to equipment requiring adjustments.
4. Final connections to recessed lighting fixtures from conduit system.
5. Connection to distribution transformers.
6. Maximum length 6’.

DD. Use Liquidtight flexible conduit in damp or wet locations for same circuit categories listed for flexible conduit above. Engineer will determine "damp or wet" locations if questionable.

EE. EMT shall not be installed underground and shall not be encased in concrete.

FF. Conduit must be installed high enough above lay in ceiling to permit removal of ceiling panels and light fixtures.

GG. In concrete slab on grade or elevated slabs: Conduit may penetrate slabs but will **NOT** be allowed to run in slabs on grade or elevated slabs.

HH. In accordance with NEC 300.4 conduit may not be run exposed across roof.

II. Due to the corrosive nature of the soil all metal conduit, couplings, elbows and fittings in contact with the soil or buried below grade shall be factory coated with PVC or two-lap wrapped with 20 mil 3M Scotchwrap with Pipe Primer applied as recommended by Manufacturer. Make underground conduit fittings watertight using conductive compound tape. Do not use split couplings and similar fittings underground and exposed to moisture.

JJ. Route underground conduits minimum 24" below grade.

KK. Paint conduit threads exposed to moisture with exterior grade, rust preventive silver paint after installation.

LL. Where conduit crosses expansion joints, install expansion type fittings with bonding jumper. Use expansion joint with lateral conduit movement of 4” or 8” as indicated. When both vertical and lateral movement is expected the joint shall be a 1” braided flexible coupling allowing both directional movements.

MM. Vibrating equipment and equipment requiring adjustment, i.e.: motors, transformers, etc: make final connections with flexible metal conduit.

NN. Isolate conduit connections to equipment on roof from roof penetration of conduit with short section of liquid-tight flexible conduit between roof penetration and equipment to prevent leak in roof penetration due to equipment vibration.

OO. Supports shall be installed in accordance with Seismic standards. Provide necessary side braces and swing joints as required. See Spec Section 26 05 30 Seismic Protection for Electrical Equipment.

PP. All conduit penetrations through or within CMU walls shall be rigid steel. Conduit run within CMU walls encased in concrete shall be PVC. All conduit penetrations (floors, walls, slab on grade, roofing) shall be made watertight with a joint sealant compound.

3.4 INSTALLATION - BOXES

A. Install wall mounted boxes at elevations to accommodate mounting heights as indicated on Drawings.

B. Adjust box location up to 10 feet prior to rough-in to accommodate intended purpose.

C. Orient boxes to accommodate wiring devices oriented as specified in Section 26 27 26.

D. Install pull boxes and junction boxes above accessible ceilings and in unfinished areas only.

E. In Accessible Ceiling Areas: Install outlet and junction boxes no more than 6 inches (150 mm) from ceiling access panel or from removable recessed luminaire.

F. Locate flush mounting box in masonry wall to require cutting of masonry unit corner only. Coordinate masonry cutting to achieve neat opening.

G. Do not install flush mounting box back-to-back in walls; install with minimum 6 inches (150 mm) separation (non-rated or acoustically rated). Install with minimum 24 inches (600 mm) separation in fire-rated walls.

H. Secure flush mounting box to interior wall and partition studs. Accurately position to allow for surface finish thickness.

I. Install stamped steel bridges to fasten flush mounting outlet box between studs.

J. Install flush mounting box without damaging wall insulation or reducing its effectiveness.

K. Install adjustable steel channel fasteners for hung ceiling outlet box.

L. Do not fasten boxes to ceiling support wires or other piping systems.

M. Support boxes independently of conduit.

N. Install gang box where more than one device is mounted together. Do not use sectional box.

O. Install gang box with plaster ring for single device outlets.

P. Seal boxes during construction to prevent entrance of construction debris.

Q. Paint wiring connections in ground mounted outlets or floor outlets in wet locations with “Scotchkote” and fill box with “Duxseal”.

R. Refer to structural details regarding installation of boxes and conduit within CMU walls and adjacent to openings. All boxes and conduit must maintain minimum spacing requirements per structural details.

3.5 INTERFACE WITH OTHER PRODUCTS

A. Install conduit to preserve fire resistance rating of partitions and other elements, using materials and methods in accordance with Section 07 84 00.

B. Route conduit through roof openings for piping and ductwork or through suitable roof jack with pitch pocket. Coordinate location with roofing installation specified.

C. Locate outlet boxes to allow luminaires positioned as indicated on Drawings.

D. Align adjacent wall mounted outlet boxes for switches, thermostats, and similar devices.

3.6 ADJUSTING

A. General Conditions: Testing, adjusting, and balancing.

B. Adjust flush-mounting outlets to make front flush with finished wall material.

C. Install knockout closures in unused openings in boxes.

3.7 CLEANING

A. General Conditions: Final cleaning.

B. Clean interior of boxes to remove dust, debris, and other material.

C. Clean exposed surfaces and restore finish.

END OF SECTION 26 05 33

SECTION 26 05 53 – ELECTRICAL IDENTIFICATION

PART 1 - GENERAL

1.1 SUMMARY

A. Provide and install required identification for the systems and equipment shown on the drawings and/or specified. The extent of identification is specified herein and in individual technical sections of work.

B. Coordinate with Consultant and Owner for proper equipment identification nomenclature. Nameplates must be approved by Consultant prior to ordering and installation.

C. Types of electrical identification include:
1. Conduit labeling.
2. Buried cable and conduit warnings.
3. Cable/conductor identification.
4. Operational instructions and warnings.
5. Danger signs.
6. Equipment/system identification labels and signs.
7. Device plate labeling.
8. Junction box labeling.

1.2 RELATED WORK

A. Painting of conduit and color-coded painting of conduit if required. See Division 9.

1.3 SUBMITTALS

A. Manufacturer's Data
1. Product specifications and installation instructions for each material and device.

B. Samples
1. Provide for each color, lettering style and other graphic representation.

C. Labels
1. Provide a list of labels with actual designations as they will be printed.

PART 2 - PRODUCTS

2.1 ELECTRICAL IDENTIFICATION MATERIAL

Conform to ANSI A13.1, Table 3 for minimum size of legend letters and minimum length of color field for each raceway or cable size. Use colors prescribed by ANSI A13.7, NFPA 70 and these specifications.

A. Color-Coded Conduit Markers
1. Manufacturer's standard preprinted, flexible or semi-rigid, permanent, plastic-sheet conduit markers, extending 360 degrees around conduits. Attach with adhesive, adhesive lap joint of marker, matching adhesive plastic tape at each end of marker, or pre-tensioned snap-on. Lettering to indicate voltage, function of conductors in conduit and shall be 8" minimum length (i.e. ac power, dc power, fire alarm).

B. Color-Coded Plastic Tape

1. Manufacturer's standard self-adhesive vinyl tape, minimum 3 mils thick by 1-1/2" wide.
2. Color: Orange.

C. Underground Plastic Line Marker
1. Manufacturer's standard permanent, bright-colored, continuous-printed plastic tape, for direct-burial service; minimum 4" wide x 4 mils thick. Printing to indicate type service of cable; with large (minimum 2-1/2") high letters.

D. Cable/Conductor Identification Bands
1. Manufacturer's standard vinyl self-adhesive self laminating cable/conductor markers, wrap-around type; pre-numbered plastic coated, or write-on type with clear plastic self-adhesive cover flap, lettered to show circuit identification. Similar to Panduit "Instacode" or accepted equivalent by T&B, or Tyton. Refer to Section 26 05 19 Low Voltage Electrical Power Conductors and Cables.

E. Self-Adhesive Plastic Signs
1. Manufacturer's standard, self-adhesive, pre-printed, flexible vinyl signs for operational instructions or warnings. Sizes suitable for application and visibility, with proper wording for application.
2. Color: Orange or Yellow with black lettering.

F. Danger Signs
1. Manufacturer's standard "DANGER" signs, baked enamel finish on 20 gage steel; standard red, black and white graphics; 14" x 10" unless 10" x 7" is largest which can be applied, or where larger size is needed for visibility use recognized explanation wording (as examples: HIGH VOLTAGE, KEEP AWAY, BURIED CABLE, DO NOT TOUCH SWITCH, DANGER-STARTS AUTOMATICALLY).

G. Engraved Signs (Nameplates)
1. Use 1/8" thick melamine plastic laminate, complying with FS LP-387, sizes as indicated, engrave with standard letter style of sizes and wording indicated (1/4" letters minimum).
2. Color: Black field with white letters for normal power service;
3. Fasteners: Self adhesive backing or double stick tape.

H. Permanent Polyester Tape:
1. Use Permanent Metalized Polyester Tapes for Industrial purposes that are resistant to oil, solvents and chemicals, these durable tapes adhere to all surface.
2. DYMO #18485, Black on Silver, 3/8” wide, or equivalent.

I. Lettering and Graphics
1. Coordinate names, abbreviations and other designations used with those shown or specified. Provide numbers, lettering, and wording as indicated or required for identification and operation/maintenance.

PART 3 - EXECUTION

3.1 APPLICATION AND INSTALLATION

A. General Installation Requirements
1. Install after completion of painting.
2. Comply with governing regulations and requests of governing authorities for identification of electrical work.

B. Conduit Identification

1 Use adhesive marking tape labels, Brother or Kroy labels 1" high x 12" long (min.), at 20 foot intervals to identify all conduits run exposed or located above accessible ceilings. Conduits located above non-accessible ceiling or in floors and walls shall be labeled within 3 feet of becoming accessible. Labels for multiple conduits shall be aligned. Use the following colors:
   a. Above 600 Volts: Conduit 2” and larger - Black letters on orange background indicating feeder identification and voltage. Feeders within walls: provide identification on wall surfaces directly external to the conduits. Alternate identification labels with "DANGER - HIGH VOLTAGE" warning signs of the same color.
   b. 600 Volt and Below Normal: Conduit 2” and larger - White letters on black background indicating feeder identification and voltage. Not required unless otherwise noted.
   c. 600 Volt and Below Emergency: All conduit - White or black letters on red background indicating feeder identification and voltage. Not required unless otherwise noted
   d. 600 Volt and Below UPS: All conduit - Black letters on yellow background indicating feeder identifications, circuit number and voltage. Not required unless otherwise noted
   e. Fire Alarm: All conduit shall be manufactured red.
   f. Temperature Control: White or black letters on blue background indicating "TEMP. CONTROL"
   g. Ground: All conduit - White or black letters on green background
   h. Network Fiber: All conduit - Black letters on white background indicating "NETWORK FIBER."
2. Where conduits enter or exit a panelboard, pull or junction box, switchboard, or other distribution equipment, conduit labels shall include circuit number in addition to feeder identification and voltage.
3. For overhead conduits, place identification such that it can be read standing on the floor below.

C. Underground Cable Identification
1. During back-filling of underground cable, install continuous underground marker, directly over buried line 6" to 8" below finished grade. Where multiple lines are buried in common trench not exceeding 24" width, install a single line marker. Install additional line markers for each increment of 24” width, i.e., 36” wide trench - 2 markers; 54” wide trench, 3 markers. Install multiple markers evenly spaced.
2. Install line marker for every buried ductbank and/or conduits 3" diameter or larger.
3. Electric Lines: Use red colored tape with lettering stating “CAUTION BURIED ELECTRIC LINE BELOW”.
4. Communication Lines: Use orange colored tape with lettering stating “CAUTION COMMUNICATION LINE BELOW”.

D. Operational Identification and Warnings
1. Provide operational signs for:
   a. Switchgear
   b. Large motor starters
   c. All rotating equipment

E. Danger Signs
1. Provide as required by codes.

F. Engraved Plastic Laminated Signs
1. Install on each major unit of electrical equipment in the building. Provide single line of text, 1/4" high lettering on 1" high sign (1-1/2" high where 2 lines required). Matching terminology and numbering as indicated in contract documents.

2. Provide signs for each unit of the following categories:
   a. Electrical cabinets and enclosures: Indicate cabinet designation, voltage, phase and feeder origin.
   b. Access panel/doors to electrical facilities: Indicate room name and use.
   c. Major electrical switchgear: Indicate equipment designation, voltage, phase and feeder origin.
   d. Electrical substations: Indicate equipment designation, voltage, phase and feeder origin.
   e. Safety switches, circuit breakers and portable engine disconnects: Indicate equipment designation, voltage, phase, feeder origin and circuit number.
   f. Transformers: Indicate transformer designation, voltages, phases, feeder origin, circuit number and equipment served.
   g. Feeder cables inside pull and junction boxes and inside all switchgear at terminals indicating source and destination: Fasten with nylon ties.
   h. All equipment furnished in this Division of the specifications: Indicate equipment designation, voltage, phase, feeder origin and circuit number.

G. Install signs where indicated or most visible. Secure with at least two cadmium-plated screws. Where substrate cannot receive screws, use industrial epoxy cement to secure signs. Self-adhesive or double stick tape is acceptable. Secure with cadmium plated screws on porous surfaces.

H. Identify all conduits installed for future use.

I. Junction, Pull and Connection boxes. Identification of systems and circuits shall indicate system voltage and identity of contained circuits on outside of box cover. Color code shall be same as conduits for pressure sensitive labels. Use self-adhesive marking tape labels at exposed locations and indelible black marker at concealed boxes. All fire alarm boxes shall have red covers. All temperature control boxes shall have blue covers.

J. Branch Circuit Conductors shall be identified in each junction box and pull box with wire markers as manufactured by T & B, Panduit, 3M or Ideal to indicate panel/circuit number.

K. Junction Boxes in branch circuit wiring shall be labeled with panel and circuit numbers. Junction boxes for special systems shall be labeled with system name and other identification as directed; for example, “fire alarm-zone 1”. Where boxes are installed flush mounted in finished areas or surface mounted in unfinished areas, labeling shall be with engraved plastic nameplate as specified herein. Where boxes are installed above accessible ceilings, labeling may be neat hand written lettering with indelible marker.

L. Device Plates – switches and receptacles. Identify the panelboard and branch circuit number from which served on the front of the device plate with Permanent Polyester Clear Tape with black letters. Locate all labels at the bottom of the plate in the same location throughout.

END OF SECTION 26 05 53

SECTION 26 05 73.13 - SHORT-CIRCUIT STUDIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Computer-based, fault-current study to determine minimum interrupting capacity of circuit protective devices.

B. Related Requirements:

1. Section 260573.16 "Coordination Studies" for overcurrent protective device coordination studies.
2. Section 260573.19 "Arc-Flash Hazard Analysis" for arc-flash studies.

1.2 STUDY SCOPE

1. Study shall encompass all portions of electrical distribution system from normal power source and/or standby sources up to and including breakers in service entrance switchboard, main breaker in sub-distribution panels, main breaker in each panelboard, etc.
2. For existing systems, the scope of the study must include the point where modifications are made and all upstream branches of the distribution system back to the service entrance utility point of connection, even if not being modified by this project.

1.3 DEFINITIONS

A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed and salvaged, or removed and reinstalled. Existing to remain items must remain functional throughout construction period.

B. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion of the circuit from the system.

D. SCCR: Short-circuit current rating.

E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

F. Single-Line Diagram: See "One-Line Diagram."

1.4 ACTION SUBMITTALS

A. Product Data:

1. For power system analysis software to be used for studies.

B. Short-Circuit Study Report:

1. Submit the following after approval of system protective devices submittals. Submittals must be in digital form.

a. Short-circuit study input data, including completed computer program input data sheets.
b. Submit study report for action prior to receiving final approval of distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Engineer for preliminary submittal of sufficient study data to ensure that selection of devices and associated characteristics is satisfactory.
c. Revised one-line diagram, reflecting field investigation results and results of short-circuit study or updates required based on data collected for the study.
d. Study report shall include documentation of all equipment data used in the short-circuit and equipment duty analysis.
e. Study shall include a detailed listing of any electrical equipment found to be underrated for the calculated fault duty.

C. Closeout Submittals:

1. Provide one (1) hard copy of the oneline diagram in a tube to be magnetically attached to the side of the service entrance.

2. Provide two (2) digital (CD or USB) copies of the study model in the native format for which it was created (SKM, EasyPower, ETAP). One shall be magnetically attached to the side of the service entrance and the other shall be given to the Owner.

1.5 INFORMATIONAL SUBMITTALS

A. Product Data:

1. Submit information on computer software program to be used for studies.

2. Product Certificates: For short-circuit study software, certifying compliance with IEEE 399.

B. Qualification Data:

1. For Power Systems Analysis Software.
2. For Power System Analysis Specialist.
3. For Power System Field Adjusting Agency.

1.6 CLOSEOUT SUBMITTALS

A. Final Report:
1. Final one-line diagram

2. Final short-circuit study report
3. Short-circuit data files

1.7 QUALITY ASSURANCE

A. Study must be performed using commercially developed and distributed software designed specifically for power system analysis.

B. Software algorithms must comply with requirements of standards and guides specified in this Section.

C. Manual calculations are unacceptable.
1. Power System Analysis Software Qualifications: Computer program shall be designed to perform ANSI and IEC based short-circuit studies or have a function, component, or add-on module designed to perform short-circuit studies.

D. Power Systems Analysis Specialist Qualifications: Professional Engineer licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this Professional Engineer.

E. Short-Circuit Study Certification: Short-Circuit Study Report shall be signed by Power Systems Analysis Specialist.

PART 2 - PRODUCTS

2.1 POWER SYSTEM ANALYSIS SOFTWARE

A. Comply with IEEE 399 and IEEE 551.

B. Analytical features of power systems analysis software program must have capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

C. Computer software program must be capable of plotting and diagramming time-current-characteristic curves as part of its output.

D. Computer program must be designed to perform short-circuit studies or have function, component, or add-on module designed to perform short-circuit studies.

E. Computer program must be developed under supervision of licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.

F. Manufacturers:
1. SKM Systems Analysis, Inc.
2. EasyPower, LLC
3. ETAP

2.2 SHORT-CIRCUIT STUDY REPORT CONTENTS

A. Executive summary of study findings.

B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of results.

C. One-line diagram of modeled power system, showing the following:

1. Protective device designations and ampere ratings.
2. Conductor types, sizes, and lengths.
3. Transformer kVA and voltage ratings.
4. Motor and generator designations and kVA ratings.
5. Switchgear, switchboard, motor-control center, and panelboard designations and ratings.
6. Derating factors and environmental conditions.
7. Any revisions to electrical equipment required by study.

D. Comments and recommendations for system improvements or revisions in written document, separate from one-line diagram.

E. Protective Device Evaluation:

1. Evaluate equipment and protective devices and compare to available short-circuit currents. Verify that equipment withstand ratings exceed available short-circuit current at equipment installation locations.
2. Tabulations of circuit breaker, fuse, and other protective device ratings versus calculated short-circuit duties.
3. For 600 V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
4. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in standards to 1/2-cycle symmetrical fault current.
5. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

F. Short-Circuit Study Input Data:

1. One-line diagram of system being studied.
2. Power sources available.
3. Manufacturer, model, and interrupting rating of protective devices.
4. Conductors.
5. Transformer data.

G. Short-Circuit Study Output Reports:

1. Low-Voltage Fault Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:

    a. Voltage.
    b. Calculated fault-current magnitude and angle.
    c. Fault-point X/R ratio.
    d. Equivalent impedance.

2. Momentary Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:

    a. Voltage.
    b. Calculated symmetrical fault-current magnitude and angle.

c. Fault-point X/R ratio.
d. Calculated asymmetrical fault currents:

1) Based on fault-point X/R ratio.
2) Based on calculated symmetrical value multiplied by 1.6.
3) Based on calculated symmetrical value multiplied by 2.7.

3. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:

a. Voltage.
b. Calculated symmetrical fault-current magnitude and angle.
c. Fault-point X/R ratio.
d. No AC Decrement (NACD) ratio.
e. Equivalent impedance.
f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on symmetrical basis.
g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on total basis.

PART 3 - EXECUTION

3.1 POWER SYSTEM DATA

A. Obtain data necessary for conduct of study.

1. Verify completeness of data supplied on one-line diagram. Call discrepancies to Engineer’s attention.
2. For equipment included as Work of this Project, use characteristics submitted under provisions of action submittals and information submittals for this Project.
3. For equipment that is existing to remain, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers in accordance with NFPA 70E.

B. Gather and tabulate required input data to support short-circuit study. Comply with requirements in Section 017839 "Project Record Documents" for recording circuit protective device characteristics. Record data on Record Document copy of one-line diagram. Comply with recommendations in IEEE 551 as to amount of detail that is required to be acquired in field. Field data gathering must be under direct supervision of the engineer in charge of performing the study and shall be by the engineer or its representative who holds NETA ETT Certified Technician Level III or NICET Electrical Power Testing Level III certification. Data include, but are not limited to, the following:

1. Product Data for Project's overcurrent protective devices involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
2. Obtain electrical power utility impedance at service.
3. Power sources and ties.
4. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
5. For reactors, provide manufacturer and model designation, voltage rating, and impedance.

6. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip, SCCR, current rating, and breaker settings.
7. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
8. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
9. Motor horsepower and NEMA MG 1 code letter designation.
10. Conductor sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).
11. Derating factors.

3.2 SHORT-CIRCUIT STUDY

A. Perform study following general study procedures contained in IEEE 399.

B. Calculate short-circuit currents according to IEEE 551.

C. Base study on device characteristics supplied by device manufacturer.

D. Begin short-circuit current analysis at service, extending down to system overcurrent protective devices as follows:

1. To normal system low-voltage load buses where fault current is 10 kA or less.
2. Exclude equipment supplied by single transformer smaller than 75 kVA.

E. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

F. Include ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and apply to low- and medium-voltage, three-phase ac systems. Also account for fault-current dc decrement to address asymmetrical requirements of interrupting equipment.

G. Calculate short-circuit momentary and interrupting duties for three-phase bolted fault and single line-to-ground fault at each equipment indicated on one-line diagram.

1. For grounded systems, provide bolted line-to-ground fault-current study for areas as defined for three-phase bolted fault short-circuit study.

H. Include in report identification of protective device applied outside its capacity.

END OF SECTION 26 05 73.13

SECTION 26 05 73.16 - COORDINATION STUDIES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Computer-based, overcurrent protective device coordination studies to determine overcurrent protective devices and to determine overcurrent protective device settings for selective tripping.

    a. Study results must be used to determine coordination of series-rated devices.

B. Related Requirements:

1. Section 260573.13 "Short-Circuit Studies" for fault-current studies.
2. Section 260573.19 "Arc-Flash Hazard Analysis" for arc-flash studies.

1.2 STUDY SCOPE

1. Study shall encompass all portions of electrical distribution system from normal power source and/or standby sources up to and including breakers in service entrance switchboard, main breaker in sub-distribution panels, main breaker in each panelboard, etc.
2. For existing systems, the scope of the study must include the point where modifications are made and all upstream branches of the distribution system back to the service entrance utility point of connection, even if not being modified by this project.

1.3 DEFINITIONS

A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled. Existing to remain items must remain functional throughout construction period.

B. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of electric circuit or system of circuits and the component devices or parts used therein.

C. Protective Device: A device that senses when abnormal current flow exists and then removes the affected portion of the circuit from the system.

D. SCCR: Short-circuit current rating.

E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

F. Single-Line Diagram: See "One-Line Diagram."

1.4 ACTION SUBMITTALS

A. Product Data:

1. For power system analysis software to be used for studies.

B. Coordination Study Report:

1. Submit the following after approval of system protective devices submittals. Submittals must be in digital form.

a. Coordination-study input data, including completed computer program input data sheets.
b. Study and equipment evaluation reports.
c. Submit study report for action prior to receiving final approval of distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that selection of devices and associated characteristics is satisfactory.
d. Revised one-line diagram, reflecting field investigation results and results of coordination study.

C. Closeout Submittals:

1. Provide one (1) hard copy of the oneline diagram in a tube to be magnetically attached to the side of the service entrance.

2. Provide two (2) digital (CD or USB) copies of the study model in the native format for which it was created (SKM, EasyPower, ETAP). One shall be magnetically attached to the side of the service entrance and the other shall be given to the Owner.

1.5 INFORMATIONAL SUBMITTALS

A. Product Certificates: For overcurrent protective device coordination study software, certifying compliance with IEEE 399.

B. Qualification Data:

1. For Power Systems Analysis Software.
2. For Power System Analysis Specialist.
3. For Power System Field Adjusting Agency.

1.6 QUALITY ASSURANCE

A. Studies must be performed using commercially developed and distributed software designed specifically for power system analysis.

B. Software algorithms must comply with requirements of standards and guides specified in this Section.

C. Manual calculations are unacceptable.

PART 2 - PRODUCTS

2.1 POWER SYSTEM ANALYSIS SOFTWARE

A. Comply with IEEE 242 and IEEE 399.

B. Analytical features of device coordination study computer software program must have capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

C. Computer software program must be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program must report device settings and ratings of overcurrent protective devices and must demonstrate selective coordination by computer-generated, time-current coordination plots.

1. Optional Features:

a. Arcing faults.
b. Simultaneous faults.
c. Explicit negative sequence.
d. Mutual coupling in zero sequence.

D. Computer program must be designed to perform coordination studies or have function, component, or add-on module designed to perform coordination studies.

E. Computer program must be developed under supervision of licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.

F. Manufacturers:
1. SKM Systems Analysis, Inc.
2. EasyPower, LLC
3. ETAP

2.2 COORDINATION STUDY REPORT CONTENTS

A. Executive summary of study findings.

B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of results.

C. One-line diagram of modeled power system, showing the following:

1. Protective device designations and ampere ratings.
2. Conductor types, sizes, and lengths.
3. Transformer kVA and voltage ratings.
4. Motor and generator designations and kVA ratings.
5. Switchgear, switchboard, motor-control center, and panelboard designations.
6. Revisions to electrical equipment required by study.
7. Study Input Data: As described in "Power System Data" Article.

a. Short-Circuit Study Output: As specified in "Short-Circuit Study Output Reports" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260573.13 "Short-Circuit Studies."

D. Protective Device Coordination Study:

1. Report recommended settings of protective devices, ready to be applied in field. Use manufacturer's data sheets for recording recommended setting of overcurrent protective devices when available.

    a. Phase and Ground Relays:

        1) Device tag.
        2) Relay current transformer ratio and tap, time dial, and instantaneous pickup value.
        3) Recommendations on improved relaying systems, if applicable.

    b. Circuit Breakers:

        1) Adjustable pickups and time delays (long time, short time, and ground).
        2) Adjustable time-current characteristic.
        3) Adjustable instantaneous pickup.
        4) Recommendations on improved trip systems, if applicable.

    c. Fuses: Show current rating, voltage, and class.

E. Time-Current Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for switching schemes and for emergency periods where power source is local generation. Show the following information:

1. Device tag and title, one-line diagram with legend identifying portion of system covered.
2. Terminate device characteristic curves at point reflecting maximum symmetrical or asymmetrical fault current to which device is exposed.
3. Identify device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.
4. Plot the following listed characteristic curves, as applicable:

    a. Power utility's overcurrent protective device.
    b. Medium-voltage equipment overcurrent relays.
    c. Medium- and low-voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands.
    d. Low-voltage equipment circuit-breaker trip devices, including manufacturer's tolerance bands.
    e. Transformer full-load current, magnetizing inrush current, and ANSI through-fault protection curves.
    f. Cables and conductors damage curves.
    g. Ground-fault protective devices.
    h. Motor-starting characteristics and motor damage points.
    i. Generator short-circuit decrement curve and generator damage point.
    j. Largest feeder circuit breaker in each motor-control center and panelboard.

5. Maintain selectivity for tripping currents caused by overloads.
6. Maintain maximum achievable selectivity for tripping currents caused by overloads on series-rated devices.
7. Provide adequate time margins between device characteristics such that selective operation is achieved.
8. Comments and recommendations for system improvements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance of the Work. Devices to be coordinated are indicated on Drawings.

1. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

3.2 POWER SYSTEM DATA

A. Obtain data necessary for conduct of overcurrent protective device study.

1. Verify completeness of data supplied in one-line diagram on Drawings. Call discrepancies to Architect's attention.
2. For equipment included as Work of this Project, use characteristics submitted under provisions of action submittals and information submittals for this Project.
3. For equipment that is existing to remain, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers. Qualifications of technicians and engineers must be in accordance with NFPA 70E.

B. Gather and tabulate required input data to support coordination study. List below is guide. Comply with recommendations in IEEE 551 for amount of detail required to be acquired in field. Field data gathering must be under direct supervision of the engineer in charge of performing the study and shall be by the engineer or its representative who holds NETA ETT Certified Technician Level III or NICET Electrical Power Testing Level III certification. Data include, but are not limited to, the following:

1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
2. Electrical power utility impedance at service.
3. Power sources and ties.
4. Short-circuit current at each system bus (three phase and line to ground).
5. Full-load current of loads.
6. Voltage level at each bus.
7. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
8. For reactors, provide manufacturer and model designation, voltage rating, and impedance.
9. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
10. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
11. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
12. Maximum demands from service meters.

13. Busway manufacturer and model designation, current rating, impedance, lengths, size, and conductor material.
14. Motor horsepower and NEMA MG 1 code letter designation.
15. Low-voltage cable sizes, lengths, number, conductor material, and conduit material (magnetic or nonmagnetic).
16. Medium-voltage cable sizes, lengths, conductor material, cable construction, metallic shield performance parameters, and conduit material (magnetic or nonmagnetic).
17. Data sheets to supplement electrical distribution system one-line diagram, cross-referenced with tag numbers on diagram, showing the following:

    a. Special load considerations, including starting inrush currents and frequent starting and stopping.
    b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
    c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
    d. Generator thermal-damage curve.
    e. Ratings, types, and settings of utility company's overcurrent protective devices.
    f. Special overcurrent protective device settings or types stipulated by utility company.
    g. Time-current-characteristic curves of devices indicated to be coordinated.
    h. Manufacturer, frame size, interrupting rating in amperes root mean square (rms) symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
    i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
    j. Switchgear, switchboards, motor-control centers, and panelboards ampacity, and SCCR in amperes rms symmetrical.
    k. Identify series-rated interrupting devices for condition where available fault current is greater than interrupting rating of downstream equipment. Obtain device data details to allow verification that series application of these devices complies with NFPA 70 and UL 489 requirements.

3.3 COORDINATION STUDY

A. Comply with IEEE 242 for calculating short-circuit currents and determining coordination time intervals.

B. Comply with IEEE 399 for general study procedures.

C. Base study on device characteristics supplied by device manufacturer.

D. Begin analysis at service, extending down to system overcurrent protective devices as follows:

    1. To normal system low-voltage load buses where fault current is 10 kA or less.

E. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

F. Transformer Primary Overcurrent Protective Devices:

    1. Device must not operate in response to the following:

a. Inrush current when first energized.
b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.

2. Device settings must protect transformers according to IEEE C57.12.00, for fault currents.

G. Motor Protection:

1. Select protection for low-voltage motors according to IEEE 242 and NFPA 70.
2. Select protection for motors served at voltages more than 600 V according to IEEE 620.

H. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and protection recommendations in IEEE 242. Demonstrate that equipment withstands maximum short-circuit current for time equivalent to tripping time of primary relay protection or total clearing time of fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.

I. Generator Protection: Select protection according to manufacturer's instructions and to IEEE 242.

J. Include ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and apply to low- and medium-voltage, three-phase ac systems. Also account for fault-current dc decrement, to address asymmetrical requirements of interrupting equipment.

K. Calculate short-circuit momentary and interrupting duties for three-phase bolted fault and single line-to-ground fault at each equipment indicated on one-line diagram.

1. For grounded systems, provide bolted line-to-ground fault-current study for areas as defined for three-phase bolted fault short-circuit study.

L. Protective Device Evaluation:

1. Evaluate equipment and protective devices and compare to short-circuit ratings.
2. Adequacy of switchgear, motor-control centers, and panelboard bus bars to withstand short-circuit stresses.
3. Application of series-rated devices must be recertified, complying with requirements in NFPA 70.
4. Include in report identification of protective device applied outside its capacity.

3.4 LOAD-FLOW AND VOLTAGE-DROP STUDY

A. Perform load-flow and voltage-drop study to determine steady-state loading profile of system. Analyze power system performance two times as follows:

1. Determine load flow and voltage drop based on full-load currents obtained in "Power System Data" Article.
2. Determine load flow and voltage drop based on 80 percent of design capacity of load buses.

3. Prepare load-flow and voltage-drop analysis and report to show power system components that are overloaded, or might become overloaded; show bus voltages that are less than as prescribed by NFPA 70.

3.5 MOTOR-STARTING STUDY

A. Perform motor-starting study to analyze transient effect of system's voltage profile during motor starting. Calculate significant motor-starting voltage profiles and analyze effects of motor starting on power system stability.

B. Prepare motor-starting study report, noting light flicker for limits proposed by IEEE 141 and voltage sags so as not to affect operation of other utilization equipment on system supplying motor.

3.6 FIELD ADJUSTING

A. Adjust relay and protective device settings according to recommended settings provided by coordination study. Field adjustments must be completed by engineering service division of equipment manufacturer under "Startup and Acceptance Testing" contract portion.

B. Make minor modifications to equipment as required to accomplish compliance with short-circuit and protective device coordination studies.

C. Testing and adjusting must be by qualified medium-voltage and low-voltage electrical testing and inspecting agency.

1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS & MTS. Certify compliance with test parameters. Perform NETA tests and inspections for adjustable overcurrent protective devices.

END OF SECTION 26 05 73.16

SECTION 26 05 73.19 - ARC-FLASH HAZARD ANALYSIS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Computer-based, arc-flash study to determine arc-flash hazard distance and incident energy to which personnel could be exposed during work on or near electrical equipment.

B. Related Requirements:

1. Section 260573.13 "Short-Circuit Studies" for fault-current studies.
2. Section 260573.16 "Coordination Studies" for overcurrent protective device coordination studies.

1.2 STUDY SCOPE

1. Study shall encompass all portions of electrical distribution system from normal power source and/or standby sources up to and including breakers in service entrance switchboard, main breaker in sub-distribution panels, main breaker in each panelboard, etc.
2. For existing systems, the scope of the study must include the point where modifications are made and all upstream branches of the distribution system back to the service entrance utility point of connection, even if not being modified by this project.

1.3 DEFINITIONS

A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

B. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.

D. p.u.: Per unit. The reference unit, established as a calculating convenience, for expressing all power system electrical parameters on a common reference base.

E. SCCR: Short-circuit current rating.

F. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

G. Single-Line Diagram: See "One-Line Diagram."

1.4 ACTION SUBMITTALS

A. Product Data:

1. For power system analysis software to be used for studies.

B. Study Submittals:

1. Submit the following after approval of system protective devices submittals. Submittals must be in digital form:

a. Arc-flash study input data, including completed computer program input data sheets.
b. Submit study report for action prior to receiving final approval of distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that selection of devices and associated characteristics is satisfactory.
c. Revised one-line diagram, reflecting field investigation results and results of arc-flash study.

C. Closeout Submittals:

1. Provide one (1) hard copy of the oneline diagram in a tube to be magnetically attached to the side of the service entrance.

2. Provide two (2) digital (CD or USB) copies of the study model in the native format for which it was created (SKM, EasyPower, ETAP). One shall be magnetically attached to the side of the service entrance and the other shall be given to the Owner.

1.5 INFORMATIONAL SUBMITTALS

A. Product Certificates: For arc-flash hazard analysis software, certifying compliance with IEEE 1584 and NFPA 70E.

1.6 QUALITY ASSURANCE

A. Study must be performed using commercially developed and distributed software designed specifically for power system analysis.

B. Software algorithms must comply with requirements of standards and guides specified in this Section.

C. Manual calculations are unacceptable.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE

A. Comply with IEEE 1584 and NFPA 70E.

B. Analytical features of device coordination study computer software program must have capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

C. Computer program must be designed to perform arc-flash analysis or have function, component, or add-on module designed to perform arc-flash analysis.

D. Computer program must be developed under supervision of licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.

E. Manufacturers:
1. SKM Systems Analysis, Inc.
2. EasyPower, LLC
3. ETAP

2.2 ARC-FLASH STUDY REPORT CONTENT

A. Executive summary of study findings.

B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of results.

C. One-line diagram, showing the following:

1. Protective device designations and ampere ratings.
2. Conductor types, sizes, and lengths.
3. Transformer kVA and voltage ratings, including derating factors and environmental conditions.
4. Motor and generator designations and kVA ratings.
5. Switchgear, switchboard, motor-control center, panelboard designations, and ratings.

D. Study Input Data: As described in "Power System Data" Article.

E. Short-Circuit Study Output Data: As specified in "Short-Circuit Study Output Reports" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260573.13 "Short-Circuit Studies."

F. Protective Device Coordination Study Report Contents: As specified in "Coordination Study Report Contents" Article in Section 260573.16 "Coordination Studies."

G. Arc-Flash Study Output Reports:

1. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each equipment location included in report:

a. Voltage.
b. Calculated symmetrical fault-current magnitude and angle.
c. Fault-point X/R ratio.
d. No AC Decrement (NACD) ratio.
e. Equivalent impedance.
f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on symmetrical basis.
g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on total basis.

H. Incident Energy and Flash Protection Boundary Calculations:

1. Arcing fault magnitude.
2. Protective device clearing time.
3. Duration of arc.
4. Arc-flash boundary.
5. Restricted approach boundary.
6. Limited approach boundary.
7. Working distance.
8. Incident energy.
9. Hazard risk category.
10. Recommendations for arc-flash energy reduction.

I. Fault study input data, case descriptions, and fault-current calculations including definition of terms and guide for interpretation of computer printout.

2.3 ARC-FLASH WARNING LABELS

A. Comply with requirements in Section 260553 "Identification for Electrical Systems" for self-adhesive equipment labels. Produce 3.5 by 5 inch (76 by 127 mm) self-adhesive equipment label for each work location included in analysis.

B. Label must have orange header with wording, "WARNING, ARC-FLASH HAZARD," and must include the following information taken directly from arc-flash hazard analysis:

1. Location designation.
2. Nominal voltage.
3. Protection boundaries.
    a. Arc-flash boundary.
    b. Restricted approach boundary.
    c. Limited approach boundary.
4. Arc flash PPE category.
5. Required minimum arc rating of PPE in Cal/cm squared.
6. Available incident energy.
7. Working distance.
8. Engineering report number, revision number, and issue date.

C. Labels must be machine printed, with no field-applied markings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine Project overcurrent protective device submittals. Proceed with arc-flash study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to arc-flash study may not be used in study.

3.2 ARC-FLASH HAZARD ANALYSIS

A. Comply with NFPA 70E and its Annex D for hazard analysis study.

B. Preparatory Studies: Perform Short-Circuit and Protective Device Coordination study studies prior to starting Arc-Flash Hazard Analysis.

1. Short-Circuit Study Output: As specified in "Short-Circuit Study Output Reports" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260573.13 "Short-Circuit Studies."
2. Coordination Study Report Contents: As specified in "Coordination Study Report Contents" Article in Section 260573.16 "Coordination Studies."

C. Calculate maximum and minimum contributions of fault-current size.

1. Maximum calculation must assume maximum contribution from utility and must assume motors to be operating under full-load conditions.
2. Calculate arc-flash energy at 85 percent of maximum short-circuit current in accordance with IEEE 1584 recommendations.
3. Calculate arc-flash energy with utility contribution at minimum and assume no motor contribution.

D. Calculate arc-flash protection boundary and incident energy at locations in electrical distribution system where personnel could perform work on energized parts.

E. Include medium- and low-voltage equipment locations, except equipment fed from transformers smaller than 75 kVA.

F. Calculate limited, restricted, and prohibited approach boundaries for each location.

G. Incident energy calculations must consider accumulation of energy over time when performing arc-flash calculations on buses with multiple sources. Iterative calculations must take into account changing current contributions, as sources are interrupted or decremented with time. Fault contribution from motors and generators must be decremented as follows:

1. Fault contribution from induction motors must not be considered beyond three to five cycles.
2. Fault contribution from synchronous motors and generators must be decayed to match actual decrement of each as closely as possible (for example, contributions from permanent magnet generators will typically decay from 10 p.u. to 3 p.u. after 10 cycles).

H. Arc-flash energy must generally be reported for maximum of line or load side of circuit breaker. However, arc-flash computation must be performed and reported for both line and load side of circuit breaker as follows:

1. When circuit breaker is in separate enclosure.
2. When line terminals of circuit breaker are separate from work location.

I. Base arc-flash calculations on actual overcurrent protective device clearing time. Cap maximum clearing time at two seconds based on IEEE 1584, Section B.1.2.

3.3 POWER SYSTEM DATA

A. Obtain data necessary for conduct of arc-flash hazard analysis.

1. Verify completeness of data supplied on one-line diagram on Drawings and under "Preparatory Studies" Paragraph in "Arc-Flash Hazard Analysis" Article. Call discrepancies to Architect's attention.

2. For new equipment, use characteristics from approved submittals under provisions of action submittals and information submittals for this Project.
3. For existing equipment, whether or not relocated, obtain required electrical distribution system data by field investigation and surveys conducted by qualified technicians and engineers.

A. Electrical Survey Data: Gather and tabulate the following input data to support study. Comply with recommendations in IEEE 1584 and NFPA 70E as to amount of detail that is required to be acquired in field. Field data gathering must be under direct supervision of the engineer in charge of performing the study and shall be by the engineer or its representative who holds NETA ETT Certified Technician Level III or NICET Electrical Power Testing Level III certification. Data include, but are not limited to, the following:

B. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
1. Obtain electrical power utility impedance or available short circuit current at service.
2. Power sources and ties.
3. Short-circuit current at each system bus (three phase and line to ground).
4. Full-load current of loads.
5. Voltage level at each bus.
6. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
7. For reactors, provide manufacturer and model designation, voltage rating and impedance.
8. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
9. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
10. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
11. Busway manufacturer and model designation, current rating, impedance, lengths, size, and conductor material.
12. Motor horsepower and NEMA MG 1 code letter designation.
13. Low-voltage conductor sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).
14. Medium-voltage conductor sizes, lengths, conductor material, conductor construction and metallic shield performance parameters, and conduit material (magnetic or nonmagnetic).

3.4 LABELING

A. Apply one arc-flash label on front cover of each section of equipment and on side or rear covers with accessible live parts and hinged doors or removable plates for each equipment included in study. Base arc-flash label data on highest values calculated at each location.

B. Each piece of equipment listed below not fed by single transformer smaller than 75 kVA must have arc-flash label applied to it:

1. Low-voltage switchgear.
2. Switchboards.
3. Panelboards.
4. Motor-control centers.
5. Low voltage transformers.

6. Safety switches.
7. Control panels.

C. Note on record Drawings location of equipment where personnel could be exposed to arc-flash hazard during their work.

1. Indicate arc-flash energy.
2. Indicate protection level required.

3.5 APPLICATION OF WARNING LABELS

A. Install arc-flash warning labels under direct supervision and control of qualified electrical professional engineer.

END OF SECTION 26 05 73.19

SECTION 26 08 10 - COMMISSIONING OF ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 RELATED WORK SPECIFIED ELSEWHERE

A. Division 01, Section 01 91 13, General Commissioning Requirements

B. All Division 26 Sections plus applicable Division 22 and 23 Sections.

1.3 REFERENCES

A. BCA - Building Commissioning Association.

B. National Fire Protection Association (NFPA)

C. IECC

1. International Energy Conservation Code (IECC) 2018 – Section C408: Maintenance Information and System Commissioning

D. NETA:

1. ANSI/NETA 2021 Standard for Acceptance Testing Specifications

1.4 DEFINITIONS

A. Basis of Design (BOD): The documentation of design criteria and assumptions for systems, components, and methods chosen to meet the Owner's Project Requirements and applicable regulatory requirements, standards, and guidelines. The document includes narrative descriptions of the systems to be commissioned. The BOD is prepared by the Design Professionals.

B. Building Automation System (BAS): The automated building system providing control and user interaction with select building systems, such as the HVAC, domestic hot water and lighting systems. Also, often referred to as building management system (BMS), energy management system (EMS), or an energy management and control system (EMCS).

C. Commissioning (Cx): A quality-focused process to verify and document that building systems are installed and perform as intended per the OPR, BOD and design documents.

D. Commissioning Authority (CxA): An independent entity hired directly by the Owner to lead, oversee and review the completion of the commissioning process and tasks. The CxA is not responsible for the design or construction of the project. The CxA is the authority on commissioning process, program elements and results, and assists the construction team with

coordinating and completing tasks. And reviews and witnesses the completion of the process and tasks using a sampling approach.

E. General Contractor (GC): The contractor directly contracted to the Owner with overall responsibility for the project construction and all commissioning activities described herein.

F. Functional Performance Test (FPT): A test of the dynamic function, operation and control of the equipment and systems to verify system performance to the fullest extent. Systems are tested under various operating modes and control sequences including failure modes. The FPTs are performed using manual (direct observation) or monitoring methods. The FPTs can include sequence of operation tests, verification tests, performance tests, integrated systems tests, and trend analysis (monitoring). FPTs are often referred to as acceptance testing.

G. HVAC: Heating, ventilation, air conditioning.

H. Installation Verification (IV): Field verification and documentation of proper installation of system equipment, assemblies, and components, per design documents, manufacturer guidelines and industry standards. The IV process is typically complete when systems are ready for startup or operation.

I. Owner's Project Requirements (OPR): A document describing the operational and functional requirements of a project, the expectations of how the facility will be used and operated, and the equipment and system expectations and requirements, as defined by the Owner. This document provides an explanation of the ideas, concepts, goals, success criteria, and supporting information for the project.

J. Pre-Functional Test (PFT): A test or check performed on a piece of equipment, system or controls before, during, or after the initial startup and operation, but prior to the FPT phase. The PFT is performed to confirm, verify and document the system equipment and individual components are working properly, are controlled properly and meeting applicable performance requirements and specifications. For electrical service and distribution systems, examples include applicable visual and mechanical inspections and tests per NETA standards performed prior to system FPTs. For lighting control systems, examples include lighting control system pre-functional checks and tests to confirm all lighting control sensor, wall switch, dimmer and device settings have been programmed, tested and adjusted for occupancy, vacancy, dimming, daylight harvest control functions, pre-programmed scenes, etc., per the design sequence of operation. And other pre-functional checks to confirm the sequences of operation for each room and the entire building have been fully programmed and tested, including any global (building wide) sequences and settings for time schedules, demand respond, etc.

K. Startup: Initial starting or activating of equipment usually performed by the Trade Contractor or the Manufacturer's authorized representative, including applicable PFTs during the startup process. For electrical systems, startup is often also referred to as energization.

L. Systems Manual: A manual that provides the operating staff the information needed to understand and optimally operate the commissioned systems. It expands upon the scope of traditional operating and maintenance documents and is compiled of multiple documents such as the final BOD, single line diagrams, and as-built controls drawings and sequences of operation.

M. TAB: Testing, Adjusting, and Balancing (TAB) work on the HVAC&R air and water systems to ensure design flow, pressure and temperature conditions are met. Performed by the TAB Trade Contractor.

N. Trade Contractor: A subcontractor who provides and installs specific building components and systems and/or provides certain services.

1.5 GENERAL COMMISSIONING DESCRIPTION

A. Commissioning is a quality-focused process for achieving, verifying and documenting that building systems are installed and perform functionally as intended according to the OPR, BOD, and the requirements of the design documents.

B. The work includes the completion and documentation of formal commissioning procedures by the GC, Trade Contractors, and the Manufacturer Representatives.

1. The GC and Trade Contractors shall provide the quality control for the installation, startup, checkout and testing of the systems. The commissioning process provides independent review and witnessing by the CxA (using a sampling approach) throughout the process and during qualitative functional performance testing, to observe and verify the implementation of the process, specific tasks and quality control efforts.
2. Refer to Section 01 91 13, General Commissioning Requirements for summary description of the general commissioning process and requirements.
3. The Trade Contractors and the Manufacturer Representatives shall be responsible for participation in the commissioning process as outlined in this specification and Section 01 91 13 General Commissioning Requirements.

C. Systems and equipment to be commissioned:

1. Electrical service and distribution systems, including emergency power and metering.
2. Emergency power systems, including generators, paralleling switchgear, load bank connection and temp generator connection switches, automatic transfer switches, annunciator panels, and any applicable load shedding controls, as applicable.
3. Central uninterruptible power supply (UPS) systems, including maintenance bypass switches and annunciator panels, as applicable.
4. Electric meters
5. Energy and water metering & sub-metering system (electric, gas & water).
6. Lighting controls, including daylighting controls.
7. Solar photovoltaic systems including inverters.

D. Systems and equipment not included in the commissioning are listed below. Commissioning of these systems may fall under the responsibility of the Contractor and/or the Authority Having Jurisdiction (AHJ) as noted in the specifications.

1. Process systems and equipment.
2. Electrical branch circuit wiring and receptacles.

3. Fire alarm and life safety system.
4. Telecommunications / IT systems.

1.6 COMMISSIONING TEAM

A. The Commissioning Team is comprised of the following:

1. Owner and Owner's Representatives
2. Commissioning Authority (CxA).
3. Design Professionals
4. General Contractor (GC)
5. Trade Contractors responsible for systems covered in this section include:
   a. Electrical Contractor
   b. Lighting Controls Contractor or Manufacturer's Representative (if applicable)
   c. Energy & Water Metering System Specialist or Manufacturer's Representative
   d. Third-party Electrical Systems Testing Agency (if applicable)
   e. BAS Contractor (if applicable)
6. Manufacturer Representatives supplying equipment, materials, components and controls for the systems to be commissioned.

1.7 COMMISSIONING PROCESS

A. Submittal Reviews by the CxA

1. The CxA will review pertinent Trade Contractor submittals for the appropriate systems in the commissioning scope, concurrently with the Design Team and will provide review comments to the Design Team.
2. The GC shall provide a submittal log to the CxA for referencing the requested submittals to be reviewed by the CxA (for which the GC shall issue to the CxA concurrently with the submission to the Design Team). Alternatively, the GC shall include the CxA on the distribution of all Trade Contractor submittals issued to the Design Team, for systems applicable to this specification.
3. The GC shall issue the requested submittals to the CxA for review at the same time they issue the submittals to the Design Team.
4. The CxA will also use the information from the submittals to develop commissioning forms and test procedures.

B. Cx Plan and Form/Procedure Development

1. The CxA prepares a Preliminary Cx Plan either during the project final design phase or early construction phase. The Cx Plan provides guidance in the execution of the commissioning process during construction.
2. Commissioning during construction begins with a kickoff meeting conducted by the CxA where the CxA reviews the commissioning process and responsibilities with the

appropriate team members. The CxA presents the Preliminary Cx Plan and discusses the project specific requirements.

3. The GC and Trade Contractors shall submit to the CxA, for review and approval, their "blank" forms and written procedures for completing all of the required Cx pre-functional tasks including IV, Startup, and PFTs prior to conducting any of these tasks. See Paragraph 1.9 for the submittal requirements for the contractor blank forms and procedures, including the content requirements. The project specific procedures and blank forms will be further described in the Cx Plan.

    a. IV forms are to provide field verification and documentation of proper installation of system equipment, assemblies, and components, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup forms.

        i. The IV forms are either supplied by the Trade Contractor and/or the Manufacturer and shall include all checklists and verification requirements from the Manufacturer's installation and operation manual (IOM).

        ii. The Trade Contractors are to verify equipment installation per the Manufacturer's guidelines and requirements, and thus are to use and complete any applicable equipment IV checklists contained in the Manufacturer's IOM, in addition to any IV forms used by the Trade Contractors to verify system, equipment and assembly installation per design and industry standards.

        iii. The Trade Contractor IV forms may also contain any applicable design or shop drawings, plans, details, or single line diagrams that will be field verified and signed off / checked by the Trade Contractor to document installation verification per design.

    b. The Startup forms and procedures are either supplied by the Manufacturer and/or installing Trade Contractor and shall be used to document the completion of the formal startup procedures and associated checks and verifications during the startup and initial operation. And shall include all required startup and checkout procedures from the Manufacturer's IOM.

        i. Where applicable, these forms shall include checks of the equipment internal / factory provided controls including sensors and control devices.

        ii. Where required per the design specifications, the startups shall be completed by the authorized Manufacturer's representative.

    c. PFT forms and procedures are Trade Contractor provided forms and written procedures used to document the completion and results for the various checks and tests performed before, during, or after startup.

        i. For electrical service and distribution systems, examples include applicable visual and mechanical inspections and electrical tests per ANSI/NETA.

        ii. For lighting systems, examples include occupancy sensor setting checks, individual sensor and switch tests, controls programming checks, etc.

4. The CxA may create Checklists to track the contractor submittals and CxA's review of the blank forms and procedures for IV, Startup, and PFTs.

5. The CxA reviews the blank forms and procedures for all IV, Startup and PFT tasks, and will issue any comments, which may include additions or changes to be made by the

Trade Contractor to the forms and procedures, and/or supplemental forms may be issued by the CxA, where appropriate, to improve the forms and commissioning process.

6. The CxA will develop FPT procedures and forms and provide the draft forms to the GC and Trade Contractors for review and comment.

C. Pre-Functional Activities and Tasks

1. Meetings will be conducted throughout construction with commissioning team members, as required, to plan, coordinate, and schedule commissioning activities, review documentation, and resolve Cx issues.
2. The Trade Contractors shall provide any factory test reports and results required per the design specifications for review by the CxA.
3. The Trade Contractors shall perform the IV, Startup and PFT tasks for all systems and equipment (no sampling allowed), unless the contract or design documents allow for sampling of the pre-functional tests (as example, if sampling were allowed for pre-functional HVAC system duct leakage tests).
4. In general, the GC and Trade Contractors are to complete the IV prior to Startups, but where appropriate and approved by the CxA, the IV and Startup can be combined into one task.
5. The Trade Contractors shall document the completion of the IV, Startup and PFT tasks on the IV, Startup, and PFT forms.
6. The GC shall submit all completed IV, Startup, and PFT forms to the CxA for review prior to conducting the FPTs.
7. The CxA will review the completed IV, Startup, and PFT forms. The CxA will also conduct various field observations and reviews of the installation including reviews of the completed IV forms, and may witness a sample of the Startup and PFT activities. Some witnessing of the PFT activities may be performed as back-checks conducted by the Trade Contractor with the CxA, after PFT forms are complete.
8. The Trade Contractor shall resolve any IV, Startup and PFT issues or results deemed unacceptable by the CxA.
9. The CxA may create Checklists to track the status and completion of the IV, IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

D. Functional Performance Testing

1. FPTs are to test the dynamic function, performance and control of the equipment and systems under various modes of operation. These tests verify the correct implementation of the sequences of operation and the system performance meets the design criteria. The FPTs are performed using manual (direct observation) or monitoring methods. FPTs include the following types of tests, where applicable:
    a. Sequence of Operation Tests
        i. Sequence of operation tests are witnessed by the CxA for each unique sequence of operation but may not necessarily be repeated across identical systems, equipment or spaces, if the contractor has verified the same programmed sequence of operation code (as tested) has been programmed across multiple

identical systems, equipment or spaces, based sample verification tests witnessed by the CxA.

ii. Testing certain critical or important sequences with a higher sample rate across identical systems, equipment or spaces, beyond the individual sequence of operation tests may be required and will be determined by the CxA.

b. Verification Tests.

i. Verification tests are often less detailed tests than the sequence of operation tests and are typically witnessed by the CxA at a higher sample rate.

ii. Examples of verification tests include: a) verifying time delays and settings of emergency power equipment (transfer switches, generators, etc.), b) verifying the settings and time schedules of the lighting controls, c) testing the function of individual room lighting control sensors, switches and devices.

c. Performance Tests.

i. Performance tests are to be performed after the sequence of operation and verifications tests, and are focused on testing and verifying performance.

ii. Examples include: a) measuring and testing indoor light level, and b) testing the performance of an emergency power generator using a load bank, to verify the power output for a prescribed startup condition, part and full load operating conditions, and transient load step conditions.

d. Integrated Systems Tests.

i. Integrated systems tests verify the operation and performance of multiple systems together operating in a coordinated, stable and efficient manner. Often the integrated systems tests are combined with the performance tests.

ii. An example is a whole building emergency power integrated systems tests, to test the combined operation of the transfer switches and emergency power generators, as well as the electrical service and distribution systems, lighting, etc., and other building systems during an actual loss of normal utility power and then upon return of normal power.

iii. Integrated systems tests may also be conducted via analysis of BAS or lighting control system trend data.

2. The CxA will develop FPT forms that contain:

a. Specific step-by-step procedures to execute the test in a clear, sequential and repeatable format, including any control system point value or setpoint overrides required to simulate a test condition or sequence mode.

b. The expected system response and acceptance criteria of proper performance with a Yes/No check box to allow for clearly marking whether or not proper performance of each part of the test was achieved.

c. A section for recording actual system response, notes and comments.

3. Execution of the FPTs:

a. Once the IV, Startup and PFT forms are complete, the Trade Contractors shall execute the FPTs, with the FPTs witnessed by the CxA, unless otherwise by the CxA.

b. The GC and Trade Contractors are responsible for ensuring all systems are installed, operating and performing per the requirements of the contract and design documents, and are ready for the FPTs.

c. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

d. A percent sampling approach may be used for executing the FPTs of identical systems and equipment. The approximate system sampling rates for the manual (direct observation) FPTs are defined in Part 3 of this specification and/or in the Cx Plan.

e. The acceptance criteria for the FPT sampling shall be zero, meaning, any FPTs that do not pass shall require the Trade Contractor to resolve the issue for all applicable systems and equipment (even those specifically not in the original sample) and new sample rates selected for a re-test executed by the Trade Contractor and witnessed by the CxA. The CxA shall deem the FPTs acceptable after all FPTs, including re-tests, have passed and resolution of all issues completed.

f. The CxA will document the results of all FPTs on the associated FPT forms created by the CxA, unless indicated otherwise on the FPTs.

g. The Cx Plan will define any required seasonal or deferred testing.

E. Cx Issues and Recommendations

1. Throughout the process, the CxA records Cx issues, observations and recommendations on the Cx Issues Log and distributes the Cx Issues Log to the team.

2. The Cx Issues Log requires contributions and input from each of the Cx team members and as such everyone on the Cx Team has a responsibility to update the log via the agreed upon mechanism.

3. The software program and format for the Cx Issues Log will be provided by the CxA or another software program and format may be used as approved by the CxA.

4. The GC and Trade Contractors shall correct the Cx issues and recheck or retest the system(s) without delay at no additional cost to the Owner.

5. The CxA will verify the completion of the issues and recommendations via onsite reviews or witnessed retests, documentation or photographs provided by the GC and Trade Contractors, or based on information and communications provided by the GC and Trade Contractors.

F. Training Verification

1. The GC shall submit a comprehensive Training Plan (with specific training agendas provided by the Trade Contractors) for review by the Design Professionals, CxA and Owner, prior to conducting any training.

2. The Training Plan shall meet the specific requirements in the contract documents and specifications for each applicable system to be commissioned and may include both operations and maintenance (O&M) staff training and building occupant training.

3. The GC shall coordinate with the Owner and/or Owner’s Representatives, as needed, regarding any specific requirements for occupant training.

4. The CxA will verify completion of the training by witnessing some training sessions and receiving a copy of all training class sign-in sheets and any training materials / handouts, to be provided by the GC or Trade Contractors.

G. Cx Report and Documentation

1. The CxA will develop an ongoing Cx plan, with assistance from the GC and Trade Contractors.
2. The CxA will complete the Commissioning Report and all associated documentation for the Owner with assistance from the GC and Trade Contractors.

H. Post-Occupancy Warranty Phase Commissioning

1. The CxA will report any identified operational or performance issues (identified by the building O&M staff or warranty phase Cx activities) to the GC via a Warranty Phase Cx Log for resolution by the GC and Trade Contractors during or prior to the end of the warranty period.
2. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.
3. The CxA may conduct onsite visits to review system operation and performance with the Owner's O&M team and/or may review system trend data during the Warranty Phase and will report any identified issues and recommendations from the trend analysis.
4. No later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy, the CxA will return to the facility to interview facility O&M staff, walk the facility and review systems operation and trend data where applicable. Key representatives from the GC and Trade Contractors shall attend a site walk-through and meeting, as determined by the CxA.

1.8 COMMISSIONING RESPONSIBILITIES

A. General

1. The Commissioning Team and all others involved in the commissioning process shall follow the Commissioning Plan, attend the commissioning kickoff meeting, and attend additional commissioning meetings as necessary.

B. Commissioning Authority (CxA)

1. See Section 01 91 13, General Commissioning Requirements.

C. Owner

1. See Section 01 91 13, General Commissioning Requirements.

D. Design Team

1. See Section 01 91 13, General Commissioning Requirements.

E. General Contractor

1. See Section 01 91 13, General Commissioning Requirements.

F. All Trade Contractors

1. Submit project specific written procedures and blank forms for completing all IV, Startup, and PFT tasks, including manufacturer's installation checks and startup procedures, as a commissioning submittal. See Paragraph 1.9. Electronic files are acceptable.
2. Provide approved submittals, including shop drawings, control drawings, points list and detailed sequences of operation, meter lists and riser diagrams, etc., for each piece of equipment and system to be commissioned. The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the controls specification and/or drawings. Electronic files are acceptable.
3. Provide a list of any test metering and sensors to be used for sensor and device calibration purposes. All test meter and sensors shall have been calibrated within a year and have calibration documentation.
4. Attend commissioning meetings as directed by the CxA and GC to facilitate the commissioning process.
5. Assign personnel with expertise and authority to act on behalf of the Trade Contractor and schedule them to participate in and perform assigned commissioning tasks.
6. Ensure that any required manufacturer factory tests are performed and provide the factory test data and results where required.
7. Demonstrate and document proper system installation, startup and performance.
    a. Perform IV, Startup and PFT tasks for all systems and equipment (no sampling), unless the contract or design documents allow for sampling of these tasks.
    b. Ensure that any required manufacturer's representative field tests, inspections, startup and checkout of selected equipment are performed per the contract documents. Provide completed manufacturer documentation and commissioning forms for these activities.
    c. Complete all IV, Startup and PFT documentation clearly and legibly.
8. Provide a schedule and access for the CxA to witness any equipment Startup and PFT tasks. Notify the GC and CxA at least 10 days in advance of Startup and PFT tasks.
9. Address applicable Cx issues promptly. All IV, Startup and PFT issues must be resolved before the FPTs can proceed.
10. Assist the CxA in preparing the FPT procedures, clarifying the operation and control of commissioned equipment where the specifications, control drawings or equipment documentation are not sufficient for writing detailed testing procedures.
11. Review the FPT procedures to ensure feasibility, safety and equipment protection, and provide necessary written alarm limits, setpoint changes and overrides to be used during the tests.

12. Setup any control system software points, global commands, overrides of any sensor values or relays, and overrides of any setpoints or schedules, to simulate certain conditions and operating modes, in order to conduct the FPTs.

13. Configure all control settings, schedules, alarms, graphics and programming logic for all control systems and any local equipment or stand-alone controls per the project specific sequence of operations.

14. Prior to conducting the CxA witnessed FPTs, place the systems and controls into the operating modes and test and verify all sequences of operation. Check all control system safety cutouts, alarms, and interlocks with other systems during each mode of operation prior to the FPTs. Ensure all systems are operating and performing per the design requirements, and have been pre-tested per the FPTs, and are ready for the CxA witnessed FPTs.

    a. The Trade Contractors shall determine the appropriate level of pre-testing, to prepare for the CxA witnessed FPTs.

15. Perform the FPTs, with the FPTs witnessed by the CxA. Provide at least 10 days advance notice to the GC and CxA for scheduling the FPTs.

16. Setup any Lighting Control System, Power Monitoring or Energy and Water Metering & Sub-metering System, or BAS trends and provide all requested Trend data for the FPTs and post-occupancy warranty phase commissioning review to the CxA.

    a. As an Owner approved option, the Trade Contractors may provide the CxA remote access to the BAS and any other control system, with the Owner's permission, which will allow the CxA to easily and directly download the trend data files.

17. Prepare a training agenda for each training class for the equipment and systems to be commissioned.

18. Coordinate with the GC and Owner to schedule and plan training. Execute training of Owner's personnel per approved training agenda and schedule. Provide copies of training class sign-in sheets and materials / handouts.

19. Prepare O&M Manuals according to the Contract Documents.

20. Assist the CxA in developing the Systems Manual, including providing as-built drawings, controls sequences, setpoints, single-line diagrams, etc., necessary for the Systems Manual.

21. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Contractors shall participate in the FPTs as required for operation of the inter-related systems.

G. Electrical Trade Contractor

1. In addition to the general Trade Contractor responsibilities outlined above, the Electrical Trade Contractor responsibilities during commissioning shall also include, but are not limited to the following.

2. Prior to any lighting controls startup activity, provide the settings and time schedules to be used for the lighting controls and the process for determining any field adjustable settings, for the CxA and Design Professionals to review (if not fully defined in the sequence of operation). The target / design light levels for determining any applicable

daylight harvest, pre-programmed scenes and/or task tuning control settings shall be obtained from the Design Team.

3. Conduct light level measurements, as applicable (if required per the design and specifications) for determining and/or verifying light levels and performance, settings for task tuning, scene settings or other control functions per the sequence of operation.

4. The FPTs for daylight harvest controls may need to be conducted at both night-time periods (in order to test and verify targeted task light levels are maintained without daylighting) and during day time periods.

1.9 SUBMITTAL REQUIREMENTS FOR COMMISSIONING

A. Trade Contractor Pre-Functional Procedures/Plans and Blank Forms.

1. The Trade Contractors shall submit to the CxA all applicable project specific procedures/plans and blank forms for all required IV, Startup and PFT tasks for the project, at least 4 weeks in advance of performing any of these tasks. Provided below are the potential procedures/plans and blank forms required for mechanical systems, including the content requirements for each. The requirements for the project specific procedures and blank forms will be further described in the Cx Plan.

   a. Lighting IV Forms – including the following.

      i. IV forms to be used by the Electrical Trade Contractor to verify the installation of the lighting fixtures per the design and manufacturer requirements.

      ii. These IV forms can be design, shop or submittal drawing plans that are field verified (for example, with checkmarks next to the individual fixtures) or checklists that are completed on a room by room basis.

   b. Lighting Control IV and Pre-Functional Test Forms (Stand-alone Controls & Lighting Control System) – including the following.

      i. Checks to verify that all lighting control sensors, wall switches, dimmers, devices and controllers (on a room or area basis) are properly installed per design and manufacturer requirements. These checks shall include both stand-alone lighting controls and the lighting control system (conducted by the Electrical Contractor and/or the lighting control system Manufacturer's Rep.).

      ii. Checks to verify all lighting control sensor, wall switch, dimmer and device settings and time delays for occupancy, vacancy, dimming, and daylight harvest control functions, etc., per the design sequence of operation. These checks of the settings and time delays shall include both stand-alone lighting controls and the lighting control system (conducted by the Electrical Contractor and/or the lighting control system Manufacturer's Rep.).

      iii. Tests to verify all lighting control sensors, wall switches, dimmers and devices are controlled and operating correctly per the design sequence of operations, including both stand-alone lighting controls and for the lighting control system (conducted by the Electrical Contractor and/or the lighting control system Manufacturer's Rep.).

      iv. Tests to confirm the lighting control system sequences of operation for each room and the entire building have been fully programmed and tested, including

any building wide sequences and settings for time schedules, demand respond, etc.

v. Any applicable lighting control system network communication and software checks, trend log configuration checks, alarm configuration checks, and graphical display checks.

c. Electrical System (Service & Distribution and Emergency Power) IV & Pre-Functional Test Procedures and Forms (prior to startup / energization) – including the following.

i. An outline of the applicable NETA visual and mechanical inspections and electrical tests to be conducted for each system / equipment type, following the NETA Standard, where required per design documents.

ii. Indication of who will complete the NETA visual and mechanical inspections and electrical tests (i.e., the Testing Agency or the Electrical Contractor or the Manufacturer's Representative).

iii. An outline of the other applicable IV and pre-functional tests to be conducted for each system / equipment type, where the NETA Standard is not required per contract documents or where other tasks will be performed in addition to those defined in the NETA Standard, including any specific design or manufacturer requirements.

iv. Third-party Testing Agency Qualifications (if a third-party Testing Agency is required per the design documents).

d. Electric Meter IV & Pre-Functional Test Procedures and Forms – including the following.

i. IV forms to verify the meter installation and the meter programming, configuration, setup per the Manufacturer's IOM and design requirements, including the communication modules for BAS integration.

ii. An outline of any electric meter pre-functional tests (e.g., CT ratio tests, meter primary or secondary injection tests, or tests to compare meter readings to a calibrated hand-held device or calibrated known load), required per the design specifications.

e. Electrical System Startup / Energization Procedures & Forms.

i. The startup / energization procedures and forms for the electrical system (service & distribution, emergency Power) can be supplied by the installing contractor, testing agency and/or the manufacturer, and shall include all required startup procedures from the manufacturer's IOM and any tests (such as voltage and phase rotation verifications) conducted during or immediately after the startups and energization.

ii. Where required per the design specifications, the startups shall be completed by the authorized manufacturer's representative. In the submittal for the startup procedures and blank forms, the contractor shall indicate which startups will be completed by the authorized manufacturer's representative.

f. Solar Photovoltaic IV & Pre-Functional Test Procedures and Forms – including the following.

i. An outline of the applicable visual inspections and electrical tests to be conducted, where required per design documents or manufacturer requirements.

ii. Include an indication of who will complete the visual inspections and electrical tests (i.e., the Testing Agency or the Electrical Contractor or the Manufacturer's Representative).

iii. Third-party Testing Agency Qualifications (if a third-party Testing Agency is required per the design documents).

g. Procedures/Plans for all other applicable electrical systems IV and PFT tasks, per the project design and specifications or as requested by the CxA.

2. The CxA will review these submitted commissioning procedures/plans and forms including whether all project specific requirements are included.

3. The CxA may request additional data, changes and/or additions to these forms prior to their use, including forms any supplemental forms provided by CxA, based on the construction documents and specifications, manufacturer installation manuals and procedures, and/or industry standards or guidelines.

B. Training Agenda. The Trade Contractors shall develop a Training Agenda for each training session, per the requirements of the contract documents and specifications, and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and occupant training. The Training Agenda shall be included in the comprehensive Training Plan to be submitted by the GC for review by the CxA, Design Professionals, and/or the Owner (see Section 01 91 13). The GC and Trade Contractors shall coordinate to fully develop the comprehensive Training Plan with input from the Owner.

1. The Training Agenda for each training session shall include the following:

a. equipment and/or systems covered;

b. recommended attendees;

c. proposed location;

d. estimated duration;

e. level of instruction to be provided and an outline of the training topics and subjects to be covered;

f. list of any materials and handouts to be provided (or provided in advance);

g. company to provide the training and the instructor's name and qualifications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 MEETINGS, SCHEDULING AND COORDINATION

A. See Section 01 91 13.

3.2 DOCUMENTATION

A. The Trade Contractors have specific responsibilities for assisting in the development of equipment check, test and verification procedures and forms, and in performing and documenting commissioning tests, as directed by the GC and as overseen by the CxA.

B. The Trade Contractors shall provide, wherever the Contract Documents require, system checks and testing, test reports, factory test data and reports, checklists, operational verifications and demonstration, etc., whether specified or not in the commissioning sections.

3.3 TEST EQUIPMENT

A. The Trade Contractors shall provide all test equipment in sufficient quantities to execute all Startup, PFT and FPT tasks in an expedient fashion.

B. The test equipment shall be of industrial quality and suitable for testing and calibration with accuracy within the tolerance necessary to demonstrate system performance per the Contract Documents. If not otherwise specified, the following minimum requirements apply:

C. Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5 degree F and a resolution to + or – 0.1 degree F.

D. Pressure sensors shall have an accuracy of + or – 2.0 percent of the value range being measured (not full range of meter) and have been calibrated within the last year.

E. The test equipment shall have calibration certification per equipment manufacturer's interval level or within one year if not otherwise specified. The calibration tags shall be affixed or certificates readily available for all test equipment.

3.4 COMMISSIONING PRE-FUNCTIONAL TASKS

A. The Trade Contractors shall conduct all IV, startup procedures and pre-functional tests (PFTs) without compromise to human or equipment safety. The GC and Trade Contractors shall be responsible for the liability and safety of conducting all startup, checks and tests.

B. The Trade Contractors shall clearly identify and list any issues and deficiencies resulting from the IV, Startup and PFT tasks on the associated forms and immediately notify the CxA. The CxA will additionally document the issues on the Cx Issues Log. Once issues and deficiencies are corrected and verified, the associated forms shall be updated and resubmitted, and any necessary field review, back-checks or re-tests witnessed by the CxA.

C. The GC and Trade Contractors shall provide a minimum 10 days' notice to the CxA for witnessing equipment Startup and PFT tasks.

D. The sample rates for the CxA witnessing the Startup and PFT tasks will be defined in the Cx Plan.

E. The GC and Trade Contractors shall ensure the completion of the IV, Startup and PFT forms. Review and approval of the completed IV, Startup and PFT forms by the CxA is required prior to conducting the FPTs. The CxA may create System Readiness Checklists to track the status of the IV, IV, Startup, and PFT forms, including review by the CxA, prior to the FPTs.

3.5 FUNCTIONAL PERFORMANCE TESTS

A. The Trade Contractors shall perform all FPTs per the final FPT forms, for all systems and equipment in the scope of commissioning. The FPTs shall be witnessed by the CxA unless stated otherwise by the CxA. The Trade Contractors may need to complete off hours or weekend work in order to complete the FPTs. The CxA will document all testing results on the FPT forms.

B. As outlined in the Part 1, a sampling approach shall be used for the FPTs of identical systems and equipment, using the sample rates as defined below and/or in the Cx Plan, with the specific systems and equipment selected by the CxA.

1. FPT Sample Rates for Lighting Controls
    a. Any applicable lighting control system Sequence of Operation Tests for each unique space / room type.
    b. Verification Tests for *** all **** approximately 25% of the spaces, as selected by the CxA.
    c. Performance Tests for approximately 15% to 25% of the spaces, as selected by the CxA. Performance Tests may include day and night-time task light level and lighting fixture power (or driver/ballast control output) measurements.
2. FPT Sample Rates for Solar Photovoltaic Systems
    a. Verification and Performance Tests for all PV systems (no sampling).
3. FPT Sample Rates for automated Switchgear and Unit Substations FPTs (as applicable per the project design)
    a. Verification and Performance Tests for all main switchgear and unit substation automation including main-tie-main breakers (no sampling). These tests may be conducted prior to energization.
4. FPT Sample Rates for Emergency Power Systems (Generators, Paralleling Switchgear, Transfer Switches, etc., as applicable per the project design)
    a. Sequence of Operation, Verification and Performance Tests for all emergency power system equipment (no sampling), including any alarms, annunciators, and load shedding.
    b. The Generator Performance Tests may require a load bank to test the generator performance (per NFPA 110), if required per the specifications. If so, the Generator Performance Tests shall be conducted after completion of manufacturer's field service startup and testing.
    c. The Transfer Switch FPTs are to include any bypass capabilities and interface with remote systems such as elevator controls, as applicable per the project design.
    d. The sequence of operation tests are to include any emergency power load shedding, as applicable per the project design.
5. FPT Sample Rates for Central UPS Systems
    a. Verification and Performance Tests for all central UPS systems (no sampling). The Performance Tests may require a load bank to test the UPS performance including a battery duration test, if required per the specifications. If so, the UPS Performance Tests shall be conducted after completion of manufacturer's field service startup and testing.
6. FPT Sample Rates for Whole Building Emergency Power Integrated Systems Test – all tests (no sampling).
    a. This integrated systems test is to be conducted after successful completion of all individual Emergency Power and UPS Systems FPTs. And will include any applicable

fire-life safety events and load shedding functions and both loss of normal utility power and return to normal utility power.

b. This integrated systems test is initiated by disconnecting the utility power to the building, executed by the Electrical Trade Contractor, and it will involve multiple disciplines. After the operation of the emergency generator and transfer switches, and all building systems on emergency power has completed, the Electrical Trade Contractor shall return the utility power to the building, and the operation of the emergency generator and transfer switches, and all building systems shall be verified upon return to normal utility power.

c. All Trade Contractors shall participate in the FPTs as required for operation of the inter-related systems.

7. FPT Sample Rates for Energy and Water Metering & Sub-Metering System (for Electric, Gas and Water Meters) if scoped

a. Verification Tests and/or Trend Analysis to verify trend log functions and meter recordings for *** all **** approximately 30% to 50% *** of the metering points, depending on the number of metering points, as selected by the CxA.

8. FPT Sample Rates for Electrical System Infrared (IR) Scanning (if applicable).

a. 100% testing by the contractor per any design specification requirements, 0% witnessing by the CxA.

b. The CxA will review the completed IR scanning reports/results, conducted per specifications.

C. The Trade Contractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

D. The GC and Trade Contractors shall coordinate all FPTs with the CxA, and provide a minimum of 10 days' notice prior to conducting each test.

E. The GC and Trade Contractors shall have responsibility for the liability and safety of conducting all functional performance tests.

F. The Trade Contractor executing the test shall provide all necessary materials, system modifications, etc. to produce the conditions and operating modes, etc. to execute the test according to the test procedures.

1. The Trade Contractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures.

G. At completion of the test, the Trade Contractor shall return all affected building equipment and systems to their pre-test normal condition.

3.6 TREND ANALYSIS

A. The CxA may conduct trend analysis as part of the FPT process, after completion of the onsite field conducted FPTs and correction of all issues and deficiencies, to verify integrated system operation and performance.

B. If required, the CxA will prepare a lighting control system trend points list including the trend interval. The BAS Trade Contractor shall set up the trend log definitions prior to the start of the sequence of operation FPTs.

C. The Trade Contractors or Lighting Control System Manufacturer's Representative shall provide the trend to the CxA in an electronic format, either a text file, CSV file or Excel file, with related system parameters grouped together. The estimated duration for the trend data is 1 to 3 weeks (with a minimum of 1 weeks' worth of data).

D. If the CxA discovers any control or performance issues during trend analysis, the Trade Contractors or Lighting Control System Manufacturer's Representative shall correct the issues and provide new trend data for analysis verification by the CxA.

3.7 COMMISSIONING ISSUES, BACK-CHECKS AND RE-TESTS

A. When Cx issues are identified during testing, the CxA will discuss with the executing Trade Contractor and/or GC and determine whether or not testing can proceed. The CxA may allow immediate correction of minor issues and deficiencies identified during testing. The Cx issue and any identified resolution will be documented on the test form in use in addition to the Cx Issues Log.

B. The CxA will maintain and update the Cx Issues Log, and document the issue resolution process. Copies will be distributed to the GC, Owner, and Trade Contractors as appropriate. The Trade Contractors shall provide updates and comments regarding issue status and resolution.

C. The Trade Contractors shall promptly correct all Cx issues. The responsible party shall correct the issue and inform the GC and CxA of the resolution and completion date, and update the Cx Issues Log accordingly (in the fields assigned for contractor updates).

D. The CxA will record completion on the Cx Issues Log after a successful witnessed re-test, field review, back-check, verification obtained through appropriate documentation or photographs, or acceptance by the Design Team or Owner. The GC shall reschedule any applicable re-testing with the CxA and Trade Contractor. The Trade Contractor shall retest until achievement of passing performance or Owner acceptance of the noted issue.

E. Where sampling is used for the PFTs and FPTs, the results shall be deemed acceptable once all noted issues are resolved and any new sample tests or checks have passed.

F. Additional parties may require input during a dispute regarding a Cx issue. Regardless of the validity or responsibility of the issue, the CxA will have the final interpretive authority on Cx issues and the Owner will have the final approval authority.

G. The CxA may recommend solutions to Cx issues. However, the GC and Trade Contractors ultimately have the burden of responsibility to solve, correct and perform required retests.

H. Back-checks, Verifications and Re-testing:

1. The CxA will witness one (1) re-test or will perform one (1) field back-check or verification of any Cx issue.

2. The CxA's total onsite time for re-test witnessing and field verification or back-check of Cx issues will be limited to no more than 2 work days (full 8-hour work days) for all applicable mechanical, electrical, and plumbing systems in the commissioning scope.
3. The Owner may back-charge the GC for any additional fees from the CxA, resulting from any additional re-testing or field back-checks or verification beyond this allocated total time.
4. The GC must provide a minimum 48 hours' notice for scheduling any re-testing, though the CxA will attempt to accommodate a shorter timeframe if feasible.
5. Any required re-testing shall not be considered a justified reason for a claim of delay or for a time extension.
6. For any re-testing required, the CxA will determine if the entire test must be re-tested or if it is acceptable to re-test specific portions of the test that had failed.

3.8 DEFERRED & SEASONAL TESTING

A. Before or during the end of the first year warranty period, the Trade Contractor shall complete any seasonal or deferred testing, required per the design specifications and as defined in the Cx Plan. The Trade Contractors shall complete tests in the same manner as all other commissioning tests, including CxA witnessing.

B. The GC and Trade Contractor shall coordinate with CxA and Owner and schedule all deferred and seasonal testing.

3.9 TRAINING VERIFICATION

A. The GC and Trade Contractors shall coordinate and schedule the training for the Owner's facility and operations personnel, and building occupants. The GC shall ensure that training is completed per the requirements of the contract documents and specifications.

B. Trade Contractors responsible for specific equipment and system training shall submit to the GC, a written training agenda for each training class for the equipment and systems to be commissioned. The GC shall submit a comprehensive Training Plan, including the specific training agendas, to Owner, Design Team and CxA for review and approval. See also Section 01 91 13.

C. The CxA will review the Training Plans for commissioning verification prior to conducting the actual training.

D. For verification of actual training conducted, the GC shall submit to CxA 'attendee signed' attendance sheets for each training session conducted and a copy of any final training presentations or handout materials.

3.10 COMMISSIONING ACCEPTANCE, CLOSE-OUT AND REPORTING

A. Completion of the main commissioning activities (system readiness checks, functional performance testing, and training) shall be accomplished as a prerequisite for substantial completion. Completion of any re-testing shall be completed prior to final acceptance of commissioning.

B. After completion of the main commissioning activities and following review of the completed commissioning documents, test results and the current Cx Issues Log with the Owner, the Owner will indicate whether they accept completion of the project construction phase commissioning or if not, the requirements for acceptance. Upon Owner acceptance, any remaining open Cx issues will be transferred to the warranty phase Cx Issues Log for tracking resolution and completion as part of the warranty phase commissioning.

C. Upon completion of all commissioning activities, the CxA will prepare and submit to the Owner a Cx Report detailing all completed commissioning activities and documentation. The GC shall support this effort by providing all Trade Contractor commissioning documentation.

D. The CxA will complete a Systems Manual for the systems and equipment commissioned, with assistance provided by the GC and Trade Contractors. The Systems Manual will provide the operating staff the information needed to understand and optimally operate the commissioned systems.

3.11 POST-OCCUPANCY WARRANTY PHASE COMMISSIONING

A. The Trade Contractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA, to be witnessed by the CxA, unless stated otherwise by the CxA.

B. The CxA may conduct onsite reviews of the system operation and performance, meet with the O&M Team to discuss system operation and performance, and may also review BAS or lighting control system trend data during the Warranty Phase. The BAS or Electrical Trade Contractor shall be responsible for providing post-occupancy trend data to the CxA.

C. The CxA will report any identified issues and recommendations to the GC via a Warranty Phase Cx Issues Log for review and resolution by the GC and Trade Contractors prior to the end of the warranty period, for any issues or recommendations identified either by the CxA or the Owner. The GC shall work with the Trade Contractors and O&M staff to make corrections and adjustments as required to address the issues and recommendations.

D. Key representatives from the GC and Trade Contractors shall attend a near end of warranty commissioning review meeting, to be scheduled with the Owner's facility staff and the CxA, no later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy.

1. During this meeting, the operation and performance of the systems will be discussed with the Owner's staff, the results of any commissioning reviews and trend analysis will be discussed and the Warranty Phase Cx Issues Log will be reviewed. If needed, a walk-through of the systems with the Owner's staff will be conducted.

2. Next steps and actions items for any open Cx issues and recommendations will be discussed and documented via meeting minutes or a field report issued by the CxA. The intent is to resolve any open Cx issues prior to the end of the warranty phase.

E. After correcting noted Warranty Phase Cx issues, the GC shall notify the CxA, and the CxA will back-check and verify resolution of the issues and recommendations.

F. Issues identified during the warranty period will remain warranty phase Cx issues until satisfactory completion by Trade Contractors, even if the warranty period expires during the correction and back-check period.

END OF SECTION 26 08 10

SECTION 26 09 23 – LIGHTING CONTROL DEVICES AND DLM SYSTEM

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Distributed Digital Lighting Control System: System includes
   1. Digital Lighting and Plug Load Controls
   2. Relay Panels
   3. Emergency Lighting Control.

1.2 RELATED SECTIONS

A. Section 26 51 00 - Lighting.

B. Section 26 56 00 - Exterior Lighting.

1.3 REFERENCES

A. NFPA 70 - National Electrical Code; National Fire Protection Association.

B. NEMA - National Electrical Manufacturers Association

C. FCC emission standards

D. UL - Underwriters Laboratories, Inc. Listings

E. UL 2043 - Standard for Fire Test for Heat and Visible Smoke Release for Discrete Products Installed in Air-Handling Spaces.

F. UL 20 - General Use Switches, Plug Load Controls

G. UL 924 - Standard for Emergency Lighting and Power Equipment

H. ULC - Underwriter Laboratories of Canada Listings

1.4 DESIGN / PERFORMANCE REQUIREMENTS

A. Digital Lighting Management System shall accommodate the square-footage coverage requirements for each area controlled, utilizing room controllers, digital occupancy sensors, switches, daylighting sensors and accessories that suit the required lighting and electrical system parameters.

B. System shall conform to requirements of NFPA 70.

C. System shall comply with FCC emission standards specified in part 15, sub-part J for commercial and residential application.

D. System shall be listed under UL sections 916 and/or 508.

1.5 SUBMITTALS

A. Submit under provisions of Section 01 30 00 - Administrative Requirements.

B. Product Data: Manufacturer's data sheets on each product to be used, including:
   1. Catalog sheets and specifications.
   2. Ratings, configurations, standard wiring diagrams, dimensions, colors, service

condition requirements, and installed features.
3. Storage and handling requirements and recommendations.
4. Installation instructions.
5. Provide physical sample of switches demonstrating faceplate engraving as indicated on plans, as requested.

C. Shop Drawings: Wiring diagrams a for the various components of the System specified including:
1. Composite wiring and/or schematic diagram of each control circuit as proposed to be installed.
2. Show location of all devices, including at minimum sensors, load controllers, and switches/dimmers for each area on reflected ceiling plans.
3. Provide room/area details including products and sequence of operation for each room or area. Illustrate typical acceptable room/area connection topologies.
4. Network riser diagram including floor and building level details. Include network cable specification. Illustrate points of connection to integrated systems. Coordinate integration with mechanical and/or other trades.

D. Manufacturer's Certificates: Certify products meet or exceed specified requirements.

E. Closeout Submittals:
1. Project Record Documents: Record actual installed locations and settings for lighting control devices.
2. Operation and Maintenance Manual:
a. Include approved Shop Drawings and Product Data.
b. Include Sequence of Operation, identifying operation for each room or space.
c. Include manufacturer's maintenance information.
d. Operation and Maintenance Data: Include detailed information on device programming and setup.
e. Include startup and test reports.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing of centralized and distributed lighting control systems with a minimum of 10 years documented experience.

B. Installer Qualifications: Company certified by the manufacturer and specializing in installation of networked lighting control products with minimum three years documented experience.

C. System Components: Demonstrate that individual components have undergone quality control and testing prior to shipping.

1.7 PRE-INSTALLATION MEETINGS

A. Convene minimum two weeks prior to commencing Work of this section. Meeting to be attended by Contractor, Architect, system installer, factory authorized manufacturer's representative, and representative of all trades related to the system installation.

B. Review installation procedures and coordination required with related Work and the following:
1. Confirm the location and mounting of all devices, with special attention to placement of switches, dimmers, and any sensors.
2. Review the specifications for low voltage control wiring and termination.
3. Discuss the functionality and configuration of all products, including sequences of operation, per design requirements.
4. Discuss requirements for integration with other trades

C. Inspect and make notes of job conditions prior to installation:

1. Record minutes of the conference and provide copies to all parties present.
2. Identify all outstanding issues in writing designating the responsible party for follow-up action and the timetable for completion.
3. Installation shall not begin until all outstanding issues are resolved to the satisfaction of the Architect.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Store products in a clean, dry space in original manufacturer's packaging in accordance with manufacturer's written instructions until ready for installation

1.9 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.

B. Do not install equipment until following conditions can be maintained in spaces to receive equipment:
   1. Ambient temperature: 32 to 104 degrees F (0 to 40 degrees C).
   2. Relative humidity: Maximum 90 percent, non-condensing.

1.10 WARRANTY

A. Manufacturer shall provide a 5 year limited warranty on products within this installation, except where otherwise noted, and consisting of a one for one device replacement.

1.11 REMOTE ACCESS AND ENHANCED WARRANTY FOR NETWORKED SYSTEMS

A. Provide Manufacturer's Remote Access and Enhanced Warranty for Networked Lighting Controls as follows:
   1. Configure to allow the manufacturer remote access to the lighting control system. Configuration includes at a minimum: cellular modem, antenna for the modem, cellular service contract and any connections required to enable communication to the specified Network Lighting Control system.
   2. The Remote Access program will automatically trigger a First Year Enhanced Warranty Agreement that will start once lighting control system startup is complete and accepted by the Owner. During this one year period, the Owners authorized site contact can request the manufacturer to check the system for proper operation, and make any programmable changes desired. Manufacturer shall provide a phone number dedicated to customer calls concerning Remote Accessible systems, and a support organization capable of enabling cellular communication to the system for troubleshooting and making requested changes to the system. Any user attempting to request remote support on the system shall be fully verified by the Remote Operations Center (ROC) before providing remote support or making any changes to the system. Systems that allow the modem to be always accessible will not be acceptable. Access must be by a secured VPN connection to the private lighting control network that is completely isolated from the Owner's internal network. Remote access that requires a connection through the Owner's internal network is not acceptable.
   3. The Remote Access Program may be continued by the Owner after the first year. However, If the Owner does not continue the enhanced warranty the cellular contract will lapse, and all hardware components, while still remaining property of the manufacturer, will remain in situ so that they can be re-activated at a later time should the Owner desire.
   4. The Manufacturer's Remote Access capability shall provide at a minimum the following features:
      a. Ability to provide initial system diagnostics through LMCS Software to detect fault conditions in hardware or connected devices.

b. Access to all devices via LMCS Software allowing for programmability of device features. This will include all scheduling of Time of Day Events and programming of individual device parameters to meet Sequence of Operation requirements.
c. Access to the LMSM Segment Manager browser-based interface (if included on project) to verify it is setup per project documentation, and all functional operations are working properly.
d. On demand access to manufacturer technical support via a Remote Operations Center (ROC) that will provide remote troubleshooting, diagnostics, and configuration/programming assistance.
e. Additional client training and tuning on the Lighting Control System after building occupancy can be performed while remotely connected to the site.

5. Contractor shall coordinate networking/IT/VPN requirements with owner prior to start of system installation. The contractor is required to provide information from the lighting controls supplier as to the individual who is responsible for system startup. Coordinate with WCSD IT department for network access requirements.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer: WattStopper, which is located at: 2700 Zanker Rd., Suite 168; San Jose, CA 95134; Tel: 408.988.5331; Fax: 408.988.5373; Web:www.wattstopper.com

B. Substitutions: Acuity, Lutron.

C. With provisions of project general conditions for substitutions.

2.2 DISTRIBUTED DIGITAL LIGHTING CONTROL SYSTEM

A. System General: Provide a WattStopper, Provide Digital Lighting Management System (DLM) complete with all necessary enclosures, wiring, and system components to ensure a complete and properly functioning system as indicated on the Drawings and specified herein. If a conflict is identified, between the Drawing and this Specification, contact the Architect for clarification prior to proceeding.

1. Space Control Requirements: Provide occupancy/vacancy sensors with Manual- or Partial-ON functionality as indicated in sequence of operations.
2. Provide additional sensors as required for a complete detection system in the associated space. Detectors shall be located clear of HVAC systems that may generate noise or vibration that would provide false readings in a space. The contractor is responsible for selecting the proper detection device for each space to provide optimal coverage and minimal nuisance to the user. In all cases the manufacturers direction regarding best possible placement shall be followed for optimal detection in each space located, shown or not.
3. Daylit Areas: Provide daylight-responsive automatic control in all spaces (conditioned or unconditioned) where daylight contribution is available as defined by relevant local building energy code:
   a. All luminaires within code-defined daylight zones shall be controlled separately from luminaires outside of daylit zones.
   b. Daytime setpoints for total ambient illumination (combined daylight and electric light) levels that initiate dimming shall be programmed in compliance with relevant local building energy codes.
   c. Multiple-level switched daylight harvesting controls may be utilized for areas marked on drawings.
   d. Provide smooth and continuous daylight dimming for areas marked on drawings. Daylighting control system may be designed to turn off electric lighting when daylight is at or above required lighting levels, only if system functions to turn lamps back on at dimmed level, rather than turning full-on prior

to dimming.

4. Conference, meeting, and multipurpose rooms shall have controls that allow for independent control of each local control zone. Occupancy / vacancy sensors shall be provided to turn off all lighting in the space.

B. Equipment Required: Lighting Control and Automation system as defined under this section covers the following equipment.
   1. Digital Lighting Management (DLM) local network: Free topology, plug-in wiring system (Cat 5e) for power and data to room devices.
   2. Digital Room Controllers: Self-configuring, digitally addressable one, two or three relay plenum-rated controllers for on/off control. Selected models include 0-10 volt or line voltage forward phase control dimming outputs and integral current monitoring capabilities.
   3. Digital Plug Load Controllers: Self-configuring, digitally addressable, single relay, plenum-rated application-specific controllers. Selected models include integral current monitoring capabilities.
   4. Digital Fixture Controllers: Self-configuring, digitally addressable one relay fixture-integrated controllers for on/off/0-10V dimming control.
   5. Digital Occupancy Sensors: Self-configuring, digitally addressable, calibrated occupancy sensors with LCD display and two-way active infrared (IR) communications.
   6. Digital Switches: Self-configuring, digitally addressable pushbutton on/off, dimming, and scene switches with two-way active infrared (IR) communications.
   7. Digital Daylighting Sensors: Single-zone closed loop, multi-zone open loop and single-zone dual-loop daylighting sensors with two-way active infrared (IR) communications for daylight harvesting using switching, bi-level, tri-level or dimming control.
   8. Configuration Tools: Handheld remote for room configuration and relay panel programming provides two way infrared (IR) communications to digital devices and allows complete configuration and reconfiguration of the device / room from up to 30 feet away.
   9. Digital Lighting Management (DLM) segment network: Linear topology, BACnet MS/TP network (1.5 twisted pair, shielded) to connect multiple DLM local networks for centralized control.
   10. Network Bridge: Provides BACnet MS/TP-compliant digital networked communication between rooms, panels and the Segment Manager or building automation system (BAS) and automatically creates BACnet objects representative of connected devices.
   11. Segment Manager: BACnet MS/TP-based controller with web browser-based user interface for system control, scheduling, power monitoring, room device parameter administration and reporting.
   12. Programming and Configuration Software: Optional PC-native application capable of accessing DLM control parameters within a room, for the local network, via a USB adapter, or globally, for many segment networks simultaneously, via BACnet/IP communication.
   13. Digital Lighting Management Relay Panel and Zone Controller: Provides up to 8, 24, or 48 mechanically latching relays. Relays include a manual override and a single push-on connector for easy installation or removal from the panel. Panel accepts program changes from handheld configuration tool for date and time, location, holidays, event scheduling, button binding and group programming. Provides BACnet MS/TP-compliant digital networked communication between other lighting controls and/or building automation system (BAS). Zero relay Zone Controller primarily supports Digital Fixture Controller applications.
   14. Emergency Lighting Control Unit (ELCU): Allows a standard lighting control device to control emergency lighting in conjunction with normal lighting in any area within a building

C. Local Network LMRJ-Series: DLM local network is a free topology lighting control physical connection and communication protocol designed to control a small area of a building.

1. Features of the DLM local network include:
   a. Plug n' Go automatic configuration and binding of occupancy sensors, switches and lighting loads to the most energy-efficient sequence of operation based upon the device attached.
   b. Simple replacement of any device in the local DLM network with a standard off the shelf unit without requiring significant commissioning, configuration or setup.
   c. Push n' Learn configuration to change the automatic configuration, including binding and load parameters without tools, using only the buttons on the digital devices in the local network.
   d. Two-way infrared communications for control by handheld remotes, and configuration by a handheld tool including adjusting load parameters, sensor configuration and binding, within a line of sight of up to 30 feet from a sensor, wall switch or IR receiver.
2. Digital room devices connect to the local network using pre-terminated Cat 5e cables with RJ-45 connectors, which provide both data and power to room devices. Systems that utilize RJ-45 patch cords but do not provide serial communication data from individual end devices are not acceptable.
3. If manufacturer's pre-terminated Cat5e cables are not used for the installation each cable must be individually tested and observed by authorized service representative following installation.

2.3 DIGITAL LOAD CONTROLLERS (ROOM, FIXTURE CONTROLLERS)

A. Digital Load Controllers: Digital controllers for lighting zones, fixtures and/or plug loads automatically bind room loads to the connected control devices in the space without commissioning or the use of any tools. Provide controllers to match the room lighting and plug load control requirements. Controllers are simple to install, and do not have dip switches/potentiometers, or require special configuration for standard Plug n' Go applications. Control units include the following features
   1. Automatic room configuration to the most energy-efficient sequence of operation based upon the devices in the room.
   2. Simple replacement using the default automatic configuration capabilities, a room controller may be replaced with an off-the-shelf device.
   3. Multiple room controllers connected together in a local network must automatically arbitrate with each other, without requiring any configuration or setup, so that individual load numbers are assigned starting with load 1 to a maximum of 64, assigned based on each controller's device ID's from highest to lowest.
   4. Device Status LEDs to indicate:
      a. Data transmission
      b. Device has power
      c. Status for each load
      d. Configuration status
   5. Quick installation features including:
      a. Standard junction box mounting
      b. Quick low voltage connections using standard RJ-45 patch cable
   6. Based on individual configuration, each load shall be capable of the following behavior on power up following the loss of normal power:
      a. Turn on to 100 percent
      b. Turn off
      c. Turn on to last level
   7. Each load be configurable to operate in the following sequences based on occupancy:
      a. Auto-on/Auto-off (Follow on and off)
      b. Manual-on/Auto-off (Follow off only)
   8. Polarity of each load output shall be reversible, via digital configuration, so that on is off and off is on.
   9. BACnet object information shall be available for the following objects:

a. Load status
b. Schedule state, normal or after-hours
c. Demand Response enable and disable
d. Room occupancy status
e. Total room lighting and plug loads watts
f. Electrical current
g. Total watts per controller
h. Total room watts/sq ft.
i. Force on/off all loads

10. UL 2043 plenum rated
11. Manual override and LED indication for each load
12. Zero cross circuitry for each load
13. All digital parameter data programmed into an individual room controller or plug load controller shall be retained in non-volatile FLASH memory within the controller itself. Memory shall have an expected life of no less than 10 years.
14. Dimming Room Controllers shall share the following features:
    a. Each load shall have an independently configurable preset on level for Normal Hours and After Hours events to allow different dimmed levels to be established at the start of both Normal Hours and After Hours events.
    b. Fade rates for dimming loads shall be specific to bound switch buttons, and the load shall maintain a default value for any bound buttons that do not specify a unique value.
    c. The following dimming attributes may be changed or selected using a wireless configuration tool:
        1) Establish preset level for each load from 0-100 percent
        2) Set high and low trim for each load
        3) Initiate lamp burn in for each load of either 0, 12 or 100 hours
    d. Override button for each load provides the following functions:
        1) Press and release for on/off control
        2) Press and hold for dimming control
    e. Each dimming output channel shall have an independently configurable minimum and maximum calibration trim level to set the dimming range to match the true dynamic range of the connected ballast or driver. LED level indicators on bound dimming switches shall utilize this new maximum and minimum trim.
    f. Each dimming output channel shall have an independently configurable minimum and maximum trim level to set the dynamic range of the output within the new 0-100 percent dimming range defined by the minimum and maximum calibration trim.
    g. Calibration and trim levels must be set per output channel. Devices that set calibration or trim levels per controller (as opposed to per load) are not acceptable.
    h. All configuration shall be digital. Devices that set calibration or trim levels per output channel via trim pots or dip-switches are not acceptable.

B. On/Off Room Controllers shall include:
1. Dual voltage (120/277 VAC, 60 Hz) capable rated for 20A total load
2. One or two relay configuration
3. Simple 150 mA switching power supply (Only 4 100 series devices on a Cat 5e local network)
4. Three RJ-45 DLM local network ports with integral strain relief and dust cover
5. WattStopper product numbers: LMRC-101, LMRC-102

C. On/Off/0-10V Dimming KO Mount Room Controllers shall include:
1. Dual voltage (120/277 VAC, 60 Hz) capable rated for 10A total load
2. Optional real time current and voltage monitoring (with - M Monitoring option).
3. One or two relays configurations
4. Smart 150 mA switching power supply

5. Two RJ-45 DLM local network ports. Provide molded strain relief ring
6. One dimming output per relay
    a. 0-10V Dimming - Where indicated, one 0-10 volt analog output per relay for control of compatible ballasts and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the Room Controller to assure full light output from the controlled lighting
7. Units capable of providing both Class 1 or Class 2 wiring for the 0-10V output
8. WattStopper product numbers: LMRC-111, LMRC-111-M, LMRC-112, or LMRC-112-M.

D. On/Off/0-10V Dimming Enhanced Room Controllers shall include:
1. Dual voltage 120/277 VAC, 60 Hz capable. 120/277 volt models rated for 20A total load.
2. Built in real time current monitoring.
3. One, two or three relays configurations.
4. Smart 250 mA switching power supply.
5. Four RJ-45 DLM local network ports. Provide integral strain relief.
6. One dimming output per relay
    a. 0-10V Dimming - Where indicated, one 0-10 volt analog output per relay for control of compatible ballasts and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the Room Controller to assure full light output from the controlled lighting (LMRC-110 series and 210 series).
7. WattStopper product numbers: LMRC-211, LRMC-212, LRMC-213.

E. On/Off/ Forward Phase Dimming Room Controllers shall include:
1. Dual voltage (120/277 VAC, 60 Hz) rated for 20A total load, with forward phase dimmed loads derating to 16A for some load types
2. Built in real time current monitoring
3. One or two relays configurations
4. Smart 250 mA switching power supply
5. Four RJ-45 DLM local network ports. Provide integral strain relief
6. One dimming output per relay
    a. Line Voltage, Forward Phase Dimming - Where indicated, one forward phase control line voltage dimming output per relay for control of compatible two-wire or three-wire ballasts, LED drivers, MLV, forward phase compatible ELV, neon/cold cathode and incandescent loads. (LMRC-220 series)
7. WattStopper product numbers: LMRC-221, LMRC-222

F. Fixture Controllers shall include
1. A form factor and product ratings to allow various OEM fixture manufacturers to mount the device inside the ballast/driver cavity of standard-sized fluorescent or LED general lighting fixtures.
2. One 3A 120/277V rated mechanically held relay.
3. Programmable behavior on power up following the loss of normal power:
    a. Turn on to 100 percent
    b. Turn off
    c. Turn on to last level
4. Requirement for 7 mA of 24VDC operating power from the DLM local network.
5. Fixture Controller does not require a connection to a neutral conductor to operate, and unlike other types of Load Controllers it does not contribute power to the DLM local network to drive accessory devices.
6. Power to drive the LMFC Fixture Controller electronics can come from any Room or Plug Load Controller, LMPB-100 Power Booster and/or LMZC-301 Zone Controller (described later in the LMCP LIGHTING CONTROL PANELS specification section).
7. 0-10V dimming capability via a single 0-10 volt analog output from the device for control of compatible ballasts and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the Fixture Controller.

8. Connect to a single or dual RJ-45 adaptor with 24 inch leads. Single adaptor mounts in a 1/2 inch KO and dual adaptor in a 2.2 by 1.32 inch rectangular hole for connection to the DLM local network.
9. Adaptor leads are insulated for use in a fixture cavity, and the lead length allows the OEM fixture manufacturer flexibility to position the Fixture Controller and the RJ45 jack in the best locations on each fixture.
10. A complete set of dimming features described above in the paragraph detailing On/Off/Dimming Enhanced Room Controllers.
    a. WattStopper product numbers: Fixture Controller: LMFC-011, DLM Cable Connector: LMFC-RJ-50-24 or LMFC-2RJ, Power Booster: LMPB-100.

2.4 DIGITAL WALL OR CEILING MOUNTED OCCUPANCY SENSOR

A. Digital Occupancy Sensors shall provide graphic LCD display for digital calibration and electronic documentation. Features include the following:
    1. Digital calibration and pushbutton configuration for the following variables:
        a. Sensitivity, 0-100 percent in 10 percent increments
        b. Time delay, 1-30 minutes in 1 minute increments
        c. Test mode, Five second time delay
        d. Detection technology, PIR, Ultrasonic or Dual Technology activation and/or re-activation.
        e. Walk-through mode
    2. Load parameters including Auto/Manual-ON, blink warning, and daylight enable/disable when photosensors are included in the DLM local network.
    3. Programmable control functionality including:
        a. Each sensor may be programmed to control specific loads within a local network.
        b. Sensor shall be capable of activating one of 16 user-definable lighting scenes.
        c. Adjustable retrigger time period for manual-on loads. Load will retrigger (turn on) automatically within a configurable period of time (default 10 seconds) after turning off.
        d. On dual technology sensors, independently configurable trigger modes are available for both Normal (NH) and After Hours (AH) time periods. The retrigger mode can be programmed to use the following technologies:
        e. Ultrasonic and Passive Infrared
        f. Ultrasonic or Passive Infrared
        g. Ultrasonic only
        h. Passive Infrared only
        i. Independently configurable sensitivity settings for passive infrared and ultrasonic technologies (on dual technology sensors) for both Normal (NH) and After Hour (AH) time periods.
    4. One or two RJ-45 port(s) for connection to DLM local network.
    5. Two-way infrared (IR) transceiver to allow remote programming through handheld commissioning tool and control by remote personal controls.
    6. Device Status LEDs, which may be disabled for selected applications, including:
        a. PIR detection
        b. Ultrasonic detection
        c. Configuration mode
        d. Load binding
    7. Assignment of occupancy sensor to a specific load within the room without wiring or special tools.
    8. Manual override of controlled loads.
    9. All digital parameter data programmed into an individual occupancy sensor shall be retained in non-volatile FLASH memory within the sensor itself. Memory shall have an expected life of no less than 10 years.

B. BACnet object information shall be available for the following objects:

1. Detection state
2. Occupancy sensor time delay
3. Occupancy sensor sensitivity, PIR and Ultrasonic

C. Units shall not have any dip switches or potentiometers for field settings

D. Multiple occupancy sensors may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration will be required.

E. WattStopper product numbers: LMPX, LMDX, LMPC, LMUC, LMDC

2.5 DIGITAL WALL SWITCH OCCUPANCY SENSORS

A. Digital Occupancy Sensors shall provide scrolling LCD display for digital calibration and electronic documentation. Features include the following:
   1. Digital calibration and pushbutton configuration for the following variables:
      a. Sensitivity: 0-100 percent in 10 percent increments
      b. Time delay: 1-30 minutes in 1 minute increments
      c. Test mode: Five second time delay
      d. Detection technology: PIR, Dual Technology activation and/or re-activation.
      e. Walk-through mode
      f. Load parameters including Auto/Manual-ON, blink warning, and daylight enable/disable when photosensors are included in the DLM local network.
   2. Programmable control functionality including:
      a. Each sensor may be programmed to control specific loads within a local network.
      b. Sensor shall be capable of activating one of 16 user-definable lighting scenes.
      c. Adjustable retrigger time period for manual-on loads. Load will retrigger (turn on) automatically during the configurable period of time (default 10 seconds) after turning off.
      d. On dual technology sensors, independently configurable trigger modes are available for both Normal (NH) and After Hours (AH) time periods. The retrigger mode can be programmed to use the following technologies:
         1) Ultrasonic and Passive Infrared
         2) Ultrasonic or Passive Infrared
         3) Ultrasonic only
         4) Passive Infrared only
   3. Independently configurable sensitivity settings for passive infrared and ultrasonic technologies (on dual technology sensors) for both Normal (NH) and After Hour (AH) time periods.
   4. Two RJ-45 ports for connection to DLM local network.
   5. Two-way infrared (IR) transceiver to allow remote programming through handheld configuration tool and control by remote personal controls.
   6. Device Status LEDs including
      a. PIR detection
      b. Ultrasonic detection
      c. Configuration mode
      d. Load binding
   7. Assignment of any occupancy sensor to a specific load within the room without wiring or special tools.
   8. Assignment of local buttons to specific loads within the room without wiring or special tools
   9. Manual override of controlled loads
   10. All digital parameter data programmed into an individual wall switch sensor shall be retained in non-volatile FLASH memory within the wall switch sensor itself. Memory shall have an expected life of no less than 10 years.

B. BACnet object information shall be available for the following objects:
   1. Detection state
   2. Occupancy sensor time delay
   3. Occupancy sensor sensitivity, PIR and Ultrasonic
   4. Button state
   5. Switch lock control
   6. Switch lock status

C. Units shall not have any dip switches or potentiometers for field settings.

D. Multiple occupancy sensors may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration will be required.

E. Two-button wall switch occupancy sensors, when connected to a single relay dimming room or fixture controller, shall operate in the following sequence as a factory default:
   1. Left button
      a. Press and release - Turn load on
      b. Press and hold - Raise dimming load
   2. Right button
      a. Press and release - Turn load off
      b. Press and hold - Lower dimming load

F. Low voltage momentary pushbuttons shall include the following features:
   1. Load/Scene Status LED on each switch button with the following characteristics:
      a. Bi-level LED
      b. Dim locator level indicates power to switch
      c. Bright status level indicates that load or scene is active
   2. The following button attributes may be changed or selected using a wireless configuration tool:
      a. Load and Scene button function may be reconfigured for individual buttons (from Load to Scene, and vice versa).
      b. Individual button function may be configured to Toggle, On only or Off only.
      c. Individual scenes may be locked to prevent unauthorized change.
      d. Fade Up and Fade Down times for individual scenes may be adjusted from 0 seconds to 18 hours.
      e. Ramp rate may be adjusted for each dimmer switch.
      f. Switch buttons may be bound to any load on any load controller or relay panel and are not load type dependent; each button may be bound to multiple loads.
      g. WattStopper part numbers: LMPW, LMDW. Available in white, light almond, ivory, grey, red and black; compatible with wall plates with decorator opening.

2.6 DIGITAL WALL SWITCHES

A. Low voltage momentary pushbutton switches in 1, 2, 3, 4 button configurations as shown on plan documents. Wall switches shall include the following features:
   1. Two-way infrared (IR) transceiver for use with personal and configuration remote controls.
   2. Removable buttons for field replacement with engraved buttons and/or alternate color buttons. Button replacement may be completed without removing the switch from the wall. **All faceplates shall be provided with samples for review prior to installation**. All faceplates must be installed and complete prior to punch list.
   3. Configuration LED on each switch that blinks to indicate data transmission.
   4. Load/Scene Status LED on each switch button with the following characteristics:
      a. Bi-level LED
      b. Dim locator level indicates power to switch
      c. Bright status level indicates that load or scene is active
      d. Dimming paddle switches shall include seven bi-level LEDs to indicate load

levels using 14 steps.

5. Programmable control functionality including:
   a. Button priority may be configured to any BACnet priority level, from 1-16, corresponding to networked operation allowing local actions to utilize life safety priority
   b. Scene patterns may be saved to any button other than dimming rockers. Once set, buttons may be digitally locked to prevent overwriting of the preset levels.
6. All digital parameter data programmed into an individual wall switch shall be retained in non-volatile FLASH memory within the wall switch itself. Memory shall have an expected life of no less than 10 years.

B. BACnet object information shall be available for the following objects:
   1. Button state
   2. Switch lock control
   3. Switch lock status

C. Two RJ-45 ports for connection to DLM local network.

D. Multiple digital wall switches may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration shall be required to achieve multi-way switching.

E. Load and Scene button function may be reconfigured for individual buttons from Load to Scene, and vice versa.
   1. Individual button function may be configured to Toggle, On only or Off only.
   2. Individual scenes may be locked to prevent unauthorized change.
   3. Fade Up and Fade Down times for individual scenes may be adjusted from 0 seconds to 18 hours.
   4. Ramp rate may be adjusted for each dimmer switch.
   5. Switch buttons may be bound to any load on any load controller or relay panel and are not load type dependent; each button may be bound to multiple loads.
   6. WattStopper product numbers: LMSW-101, LMSW-102, LMSW-103, LMSW-104, LMSW-105, LMSW-108, LMDM-101. Available in white, light almond, ivory, grey, red and black; compatible with wall plates with decorator opening.

2.7 DIGITAL DAYLIGHTING SENSORS

A. Digital daylighting sensors shall work with load controllers and relay panels to provide automatic switching, bi-level, or tri-level or dimming daylight harvesting capabilities for any load type connected to the controller or panel. Daylighting sensors shall be interchangeable without the need for rewiring.
   1. Closed loop sensors measure the ambient light in the space and control a single lighting zone.
   2. Open loop sensors measure incoming daylight in the space, and are capable of controlling up to three lighting zones.
   3. Dual loop sensors measure both ambient and incoming daylight in the space to ensure that proper light levels are maintained as changes to reflective materials are made in a single zone

B. Digital daylighting sensors shall include the following features:
   1. Sensor's internal photodiode shall only measure lightwaves within the visible spectrum. The photodiode's spectral response curve shall closely match the entire photopic curve. Photodiode shall not measure energy in either the ultraviolet or infrared spectrums. Photocell shall have a sensitivity of less than 5 percent for any wavelengths less than 400 nanometers or greater than 700 nanometers.
   2. Sensor light level range shall be from 1-6,553 foot-candles (fc).
   3. Capability of ON/OFF, bi-level or tri-level switching, or dimming, for each controlled zone, depending on the selection of load controller(s) and load binding to controller(s).

4. For switching daylight harvesting, the photosensor shall provide a field-selectable deadband, or a separation, between the "ON Setpoint" and the "OFF Setpoint" that will prevent the lights from cycling excessively after they turn off.
5. For dimming daylight harvesting, the photosensor shall provide the option, when the daylight contribution is sufficient, of turning lights off or dimming lights to a field-selectable minimum level.
6. Photosensors shall have a digital, independently configurable fade rate for both increasing and decreasing light level in units of percent per second.
7. Photosensors shall provide adjustable cut-off time. Cut-off time is defined by the number of selected minutes the load is at the minimum output before the load turns off. Selectable range between 0-240 minutes including option to never cut-off.
8. Optional wall switch override shall allow occupants to reduce lighting level to increase energy savings or, if permitted by system administrator, raise lighting levels for a selectable period of time or cycle of occupancy.
9. Integral infrared (IR) transceiver for configuration and/or commissioning with a handheld configuration tool, to transmit detected light level to wireless configuration tool, and for communication with personal remote controls.
10. Configuration LED status light on device that blinks to indicate data transmission.
11. Status LED indicates test mode, override mode and load binding.
12. Recessed switch on device to turn controlled load(s) ON and OFF.
13. BACnet object information shall be available for the following daylighting sensor objects, based on the specific photocell's settings:
    a. Light level
    b. Day and night setpoints
    c. Off time delay
    d. On and off setpoints
    e. Up to three zone setpoints
    f. Operating mode - on/off, bi-level, tri-level or dimming
14. One RJ-45 port for connection to DLM local network.
15. A choice of accessories to accommodate multiple mounting methods and building materials. Photosensors may be mounted on a ceiling tile, skylight light well, suspended lighting fixture or backbox. Standard tube photosensors accommodate mounting materials from 0-0.62 inch thick (LMLS-400, LMLS-500). Extended tube photosensors accommodate mounting materials from 0.62 to 1.25 inches thick (LMLS-400-L, LMLS-500-L). Mounting brackets are compatible with J boxes (LMLS-MB1) and wall mounting (LMLS-MB2). LMLS-600 photosensor to be mounted on included bracket below skylight well.
16. Any load or group of loads in the room can be assigned to a daylighting zone
17. Each load within a daylighting zone can be individually enabled or disabled for discrete control (load independence).
18. All digital parameter data programmed into a photosensor shall be retained in non-volatile FLASH memory within the photosensor itself. Memory shall have an expected life of no less than 10 years.

C. Closed loop digital photosensors shall include the following additional features:
1. An internal photodiode that measures light in a 100-degree angle, cutting off the unwanted light from bright sources outside of this cone.
2. Automatic self-calibration, initiated from the photosensor, a wireless configuration tool or a PC with appropriate software.
3. Automatically establishes application-specific setpoints following self-calibration. For switching operation, an adequate deadband between the ON and OFF setpoints shall prevent the lights from cycling; for dimming operation a sliding setpoint control algorithm with separate Day and Night setpoints shall prevent abrupt ramping of loads.
4. WattStopper Product Number: LMLS-400, LMLS-400-L.

D. Open loop digital photosensors shall include the following additional features:

1. An internal photodiode that measures light in a 60-degree angle (cutting off the unwanted light from the interior of the room).
2. Automatically establishes application-specific setpoints following manual calibration using a wireless configuration tool or a PC with appropriate software. For switching operation, an adequate deadband between the ON and OFF setpoints for each zone shall prevent the lights from cycling; for dimming operation, a proportional control algorithm shall maintain the design lighting level in each zone.
3. Each of the three discrete daylight zones can include any non overlapping group of loads in the room.
4. WattStopper Product Number: LMLS-500, LMLS-500-L.

E. Dual loop digital photosensors shall include the following additional features:
1. Close loop portion of dual loop device must have an internal photodiode that measures light in a 100 degree angle, cutting off the unwanted light from sources outside of this con
2. Open loop portion of dual loop device must have an internal photodiode that can measure light in a 60 degree angle, cutting off the unwanted light from the interior of the room.
3. Automatically establishes application-specific set-points following self-calibration. For switching operation, an adequate deadband between the ON and OFF setpoints shall prevent the lights from cycling; for dimming operation a sliding setpoint control algorithm with separate Day and Night setpoints shall prevent abrupt ramping of load.
4. Device must reference closed loop photosensor information as a base line reference. The device must be able to analyze the open loop photosensor information to determine if an adjustment in light levels is required.
5. Device must be able to automatically commission setpoints each night to provide adjustments to electrical lighting based on changes in overall lighting in the space due to changes in reflectance within the space or changes to daylight contribution based on seasonal changes.
6. Device must include extendable mounting arm to properly position sensor within a skylight well.
7. WattStopper product number LMLS-600

2.8 DLM SEGMENT NETWORK

A. Provide a segment network using linear topology, BACnet-based MS/TP subnet to connect DLM local networks (rooms) and LMCP relay panels for centralized control.
1. Each connected DLM local network shall include a single network bridge (LMBC-300), and the network bridge is the only room-based device that is connected to the segment network.
2. Network bridges, relay panels and segment managers shall include terminal blocks, with provisions for separate "in" and "out" terminations, for segment network connections.
3. Segment network utilizes 1.5 twisted pair, shielded, cable supplied by the lighting control manufacturer. Maximum cable run for each segment is 4,000 feet. Conductor-to-conductor capacitance of the twisted pair shall be less than 30 pf/ft and have a characteristic impedance of 120 Ohms.
4. Network wire jacket is available in high visibility green, white, or black.
5. Substitution of manufacturer-supplied cable is not permitted and may void the warranty, if non-approved cable is installed, and if terminations are not completed according to manufacturer's specific requirements.
6. Network signal integrity requires that each conductor and ground wire be correctly terminated at every connected device.
7. Segment networks shall be capable of connecting to any of the following: BACnet-compliant BAS (provided by others) directly via MS/TP, or BACnet/IP via an NB-ROUTER or LMSM Unit. Systems whose room-connected network infrastructure require gateway devices to provide BACnet data to a BAS are unacceptable

B. WattStopper Product Number: LM-MSTP, LM-MSTP-W, LM-MSTP-B, LM-MSTP-DB

2.9 NETWORK BRIDGE

A. Network bridge module connects a DLM local network to a BACnet-compliant segment network for communication between rooms, relay panels and a segment manager or BAS. Each local network shall include a network bridge component to provide a connection to the local network room devices. Network bridge shall use industry standard BACnet MS/TP network communication and an optically isolated EIA/TIA RS-485 transceiver.
   1. Network bridge shall be provided as a separate module connected on the local network through an available RJ-45 port.
   2. Provide Plug n' Go operation to automatically discover room devices connected to the local network and make all device parameters visible to the segment manager via the segment network. No commissioning shall be required for set up of the network bridge on the local network.
   3. Network bridge shall automatically create standard BACnet objects for selected DLM devices to allow any BACnet-compliant BAS to include lighting control and power monitoring features as provided by the DLM devices on each local network. BACnet objects will be created for the addition or replacement of any given DLM device for the installed life of the system. Products requiring that an application-specific point database be loaded to create or map BACnet objects are not acceptable. Systems not capable of providing BACnet data for control devices via a dedicated BACnet Device ID and physical MS/TP termination per room are not acceptable. Standard BACnet objects shall be provided as follows:
      a. Read/write the normal or after hours schedule state for the room
      b. Read the detection state of each occupancy sensor
      c. Read the aggregate occupancy state of the room
      d. Read/write the On/Off state of loads
      e. Read/write the dimmed light level of loads
      f. Read the button states of switches
      g. Read total current in amps, and total power in watts through the load controller
      h. Read/write occupancy sensor time delay, PIR sensitivity and ultrasonic sensitivity settings
      i. Activate a preset scene for the room
      j. Read/write daylight sensor fade time and day and night setpoints
      k. Read the current light level, in foot-candles, from interior and exterior photosensors and photocells
      l. Set daylight sensor operating mode
      m. Read/write wall switch lock status
      n. Read watts per square foot for the entire controlled room
      o. Write maximum light level per load for demand response mode
      p. Read/write activation of demand response mode for the room
      q. Activate/restore demand response mode for the room

B. WattStopper product numbers: LMBC-300

2.10 LMCP LIGHTING CONTROL PANELS AND LMZC ZONE CONTROLLER

A. Hardware: Provide LMCP lighting control panels in the locations and capacities as indicated on the Drawing and schedules. Each panel shall be of modular construction and consist of the following components:
   1. Enclosure/Tub shall be NEMA 1, sized to accept an interior with 1 - 8 relays, 1 - 24 relays and 6 four-pole contactors, or 1 - 48 relays and 6 four-pole contactors.
   2. Cover shall be configured for surface or flush wall mounting of the panel as indicated on the plans. LMCP panel cover shall have a hinged and lockable door with restricted access to line voltage section of the panel.
   3. Interior assembly shall be supplied as a factory assembled component specifically

designed and listed for field installation. Interior construction shall provide total isolation of high voltage (Class 1) wiring from low voltage (Class 2) wiring within the assembled panel. Interior assembly shall include intelligence boards, power supply, DIN rails for mounting optional Class 2 control devices, and individually replaceable latching type relays. Panel interiors shall include the following features:

a. Removable, plug-in terminal blocks with connections for all low voltage terminations.
b. Individual terminal block, override pushbutton, and LED status light for each relay.
c. Direct wired switch inputs associated with each relay shall support 2-wire momentary switches only.
d. Digital inputs (four RJ-45 jacks) shall support 1-, 2-, 3-, 4-, and 8-button digital switches; digital IO modules capable of receiving 0-5V or 0-10V analog photocell inputs; digital IO modules capable of receiving momentary or maintained contact closure inputs or analog sensor inputs; digital daylighting sensors; and digital occupancy sensors. Inputs are divided into two separate digital networks, each capable of supplying 250mA to connected devices.
e. True relay state shall be indicated by the on-board LED and shall be available to external control devices and systems via BACnet.
f. Automatically sequenced operation of relays to reduce impact on the electrical distribution system when large loads are controlled simultaneously.
g. Group and pattern control of relays shall be provided through a simple keypad interface from a handheld IR programmer. Any set of relays can be associated with a group for direct on/off control or pattern (scene) control via a simple programming sequence using the relay override pushbuttons and LED displays for groups 1-8 or a handheld IR programmer for groups 1-99.
h. Relay group status for shall be provided through LED indicators for groups 1-8 and via BACnet for groups 1-99. A solid LED indicates that the last group action called for an ON state and relays in the group are on or in a mixed state.

4. Single-pole latching relays with modular plug-in design. Relays shall provide the following ratings and features:
   a. Electrical:
      1) 30 amp ballast at 277V
      2) 20 amp ballast at 347V
      3) 20amp tungsten at 120V
      4) 30 amp resistive at 347V
      5) 1.5 HP motor at 120V
      6) 14,000 amp short circuit current rating (SCCR) at 347V
      7) Relays shall be specifically UL 20 listed for control of plug-loads
   b. Mechanical:
      1) Replaceable, 1/2 inch KO mounting with removable Class 2 wire harness.
      2) Actuator on relay housing provides manual override and visual status indication, accessible from Class 2 section of panel.
      3) Dual line and load terminals each support two #14 - #12 solid or stranded conductors.
      4) Tested to 300,000 mechanical on/off cycles.
5. Isolated low voltage contacts provide for true relay status feedback and pilot light indication.
6. Power supply shall be a multi-voltage transformer assembly with rated power to supply all electronics, occupancy sensors, switches, pilot lights, and photocells as necessary to meet the project requirements. Power supply to have internal over-current protection with automatic reset and metal oxide varistor protection.
7. Where indicated, lighting control panels designated for control of emergency lighting shall be provided with factory installed provision for automatic by pass of relays controlling emergency circuits upon loss of normal power. Panels shall be properly listed and labeled for use on emergency lighting circuits and shall meet the

requirements of UL924 and NFPA 70 - Article 700.

8. Integral system clock shall provide scheduling capabilities for panel-only projects without DLM segment networks or BAS control.
   a. Each panel shall include digital clock capability able to issue system wide automation commands to up to 11 other panels for a total of 12 tnetworked lighting control panels. Clock shall provide capability for up to 254 independent schedule events per panel for each of the ninety-nine system wide channel groups.
   b. Clock capability of each panel shall support the time-based energy saving requirements of applicable local energy codes.
   c. Clock module shall provide astronomic capabilities, time delays, blink warning, daylight savings, and holiday functions and will include a battery back up for clock function and program retention in non-volatile FLASH memory. Clocks that require multiple events to meet local code lighting shut off requirements shall not be allowed.
   d. Clock capability of each panel shall operate on a basis of ON/OFF or Normal Hours/After Hours messages to automation groups that implement pre-configured control scenarios. Scenarios shall include:
      1) Scheduled ON / OFF
      2) Manual ON / Scheduled OFF
      3) Astro ON / OFF (or Photo ON / OFF)
      4) Astro and Schedule ON / OFF (or Photo and Schedule ON / OFF)
   e. User interface shall be a portable IR handheld remote control capable of programming any panel in the system (LMCT-100)
   f. Clock capability of each panel shall employ non-volatile memory and shall retain user programming and time for a minimum of 10 years.
   g. Schedules programmed into the clock of any one panel shall be capable of executing panel local schedule or Dark/Light (photocell or Astro) events for that panel in the event that global network communication is lost. Lighting control panels that are not capable of executing events independently of the global network shall not be acceptable.
9. Lighting control panel can operate as a stand-alone system, or can support schedule, group, and photocell control functions, as configured in a Segment Manager controller, via a segment network connection.
10. Lighting control panel shall support digital communications to facilitate the extension of control to include interoperation with building automation systems and other intelligent field devices. Digital communications shall be RS485 MS/TP-based using the BACnet protocol.
    a. Panel shall have provision for an individual BACnet device ID and shall support the full 222 range (0 - 4,193,304). The device ID description property shall be writable via the network to allow unique identification of the lighting control panel on the network.
    b. Panel shall support MS/TP MAC addresses in the range of 0 - 127 and baud rates of 9600k, 38400k, 76800k, and 115.2k bits per second.
    c. Lighting control relays shall be controllable as binary output objects in the instance range of 1 - 64. The state of each relay shall be readable and writable by the BAS via the object present value property.
    d. Lighting control relays shall report their true on/off state as binary input objects in the instance range of 1 - 64.
    e. The 99 group Normal Hours/After Hours control objects associated with the panel shall be represented by binary value objects in the instance range of 201 - 299. The occupancy state of each channel group shall be readable and writable by the BAS via the object present value property. Commanding 1 to a channel group will put all relays associated with the channel into the normal hours mode. Commanding 0 or NULL shall put the relays into the after hours mode.
    f. Setup and commissioning of panel shall not require manufacturer-specific

software or a computer. All configuration of the lighting control panel shall be performed using standard BACnet objects or via the handheld IR programming remote. Provide BACnet objects for panel setup and control as follows:

1) Binary output objects in the instance range of 1 - 64 (one per relay) for on/off control of relays.
2) Binary value objects in the instance range of 1 - 99 (one per channel) for normal hours/after hours schedule control.
3) Binary input objects in the instance range of 1 - 64 (one per relay) for reading true on/off state of the relays.
4) Analog value objects in the instance range of 101 - 199 (one per channel group) shall assign a blink warn time value to each channel. A value of 5 shall activate the blink warn feature for the channel and set a 5-minute grace-time period. A value of 250 shall activate the sweep feature for the channel and enable the use of sweep type automatic wall switches.

g. Description property for all objects shall be writable via the network and shall be saved in non-volatile memory within the panel.
h. BO and BV 1 - 99 objects shall support BACnet priority array with a relinquish default of off and after hours respectively. Prioritized writes to the channel BV objects shall propagate prioritized control to each member relay in a way analogous to the BACnet Channel object described in addendum aa. (http://www.bacnet.org/Addenda/Add-135-2010aa.pdf)
i. Panel-aggregate control of relay Force Off at priority 2 shall be available via a single BV5 object. Force On at priority 1 shall be available via a single BV4 object.
j. Lockout of all digital switch buttons connected to a given panel shall be command-able via a single BV2 object. The lock status of any connected switch station shall be represented as BV101-196.

11. In addition to the LMCP Relay Panels, an LMZC Zone Controller panel shall be available for zero-relay applications. The panel is designed for applications where LMFC-011 Fixture Controllers or other distributed load controllers are used to switch and/or dim the controlled loads. Key similarities to and differences from the LMCP panel design shall include:
    a. Use the same intelligence board as the LMCP relay panel.
    b. Shall not include relay driver boards or relays.
    c. Have a removable interior section to facilitate installation, and a Tub/Cover. Cover is for surface mounting applications only.
    d. Tub shall have two interior KOs to allow installation of LMPB-100 Power Boosters. Each installed Power Booster can provide an additional 150 mA for either of the two available DLM local networks provided by the LMZC.
    e. All programming and networking (whether DLM Local Network and/or Segment Network) capabilities in the LMZC Zone Controller shall be similar to capabilities for LMCP relay panels, except for functions designed for panel-mounted HDR relays.
12. To aid in project start up, if LMFC Fixture Controllers are connected to an LMZC Zone Controller, Plug n' Go automatic configuration will establish a unique sequence of operation so that all LMFC-controlled fixtures will turn on to 50 percent output when any digital occupancy sensor detects motion.
13. WattStopper Product Number: Relay Panels: LMCP8, LMCP24 or LMCP48, Zone Controller: LMZC-301.

B. User Interface: Each lighting control panel system shall be supplied with at least one handheld configuration tool (LMCT-100). As a remote programming interface the configuration tool shall allow setup, configuration, and diagnostics of the panel without the need for software or connection of a computer. User interface shall have the following panel-specific functions as a minimum:
    1. Set network parameters including panel device ID, MS/TP MAC address, baud rate and max master range.

2. Relay Group creation of up to 99 groups. Group creation shall result in programming of all seven key relay parameters for member relays. The seven parameters are as follows: After-hours Override Time Delay, Normal Hours Override Time Delay, Action on Transition to Normal Hours, Action on Transition to After Hours, Sensor Action During Normal Hours, Sensor Action During After Hours, Blink-Warn Time for After Hours.
3. Program up to 254 separate scheduled events. Events shall occur on seven day intervals with each day selectable as active or inactive, and shall be configurable as to whether the event is active on holidays. Holidays are also defined through the User Interface.
4. Program up to 32 separate Dark/Light events. Events shall have a selectable source as either calculated Astro with delay, or a digital IO module with an integral 0-5V or 0-10V analog photocell. Dark/Light events shall occur on seven day intervals with each day selectable as active or inactive, and shall be configurable as to whether the event is active on holidays.
5. Button binding of digital switches to groups shall be accessible via the handheld IR remote and accomplished from the digital switch station.
6. Programming of panel location information shall be accomplished by the handheld IR remote and include at a minimum LAT, LON, DST zone, and an approximate city/state location.
7. WattStopper Product Number: LMCT-100

2.11 SEGMENT MANAGER

A. For networked applications, the Digital Lighting Management system shall include at least one segment manager to manage network communication. It shall be capable of serving up a graphical user interface via a standard web browser utilizing either unencrypted TCP/IP traffic via a configurable port (default is 80) or 256 bit AES encrypted SSL TCP/IP traffic via a configurable port (default is 443).

B. Each segment manager shall have integral support for at least three segment networks. Segment networks may alternately be connected to the segment manger via external BACnet-to-IP interface routers and switches, using standard Ethernet structured wiring. Each router shall accommodate one segment network. Provide the quantity of routers and switches as shown on the Drawings.

C. Operational features of the Segment Manager shall include the following:
1. Connection to PC or LAN via standard Ethernet TCP/IP via standard Ethernet TCP/IP with the option to use SSL encrypted connections for all traffic.
2. Easy to learn and use graphical user interface, compatible with Internet Explorer 8, or equal browser. The Segment Manager shall not require installation of any lighting control software on an end-user PC.
3. Log in security capable of restricting some users to view-only or other limited operations.
4. Segment Manager shall provide two main sets of interface screens - those used to initially configure the unit (referred to as the config screens), and a those used to allow users to dynamic monitor the performance of their system, and provide a centralized scheduling interface. Capabilities using the Config Screens shall include:
    a. Automatic discovery of DLM devices and relay panels on the segment network(s). Commissioning beyond activation of the discovery function shall not be required to provide communication, monitoring or control of all local networks and lighting control panels.
    b. Allow information for all discovered DLM devices to be imported into the Segment Manager via a single XML based site file from the WattStopper LMCS Software, significantly reducing the time needed to make a system usable by the end user. Importable information can include text descriptions of every DLM component and individual loads, and automatic creation of room location

information and overall structure of DLM network. Info entered into LMCS should not have to be re-entered manually via keystrokes into the Segment Manager

c. After discovery, all rooms and panels shall be presented in a standard navigation tree format. Selecting a device from the tree will allow the device settings and operational parameters to be viewed and changed by the user.

d. Ability to view and modify DLM device operational parameters. It shall be possible to set device parameters independently for normal hours and after hours operation including sensor time delays and sensitivities, and load response to sensor including Manual-On or Auto-On.

e. Provide capabilities for integration with a BAS via BACnet protocol. At a minimum, the following points shall be available to the BAS via BACnet IP connection to the segment manager: room occupancy state; room schedule mode; room switch lock control; individual occupancy sensor state; room lighting power; room plug-load power; load ON/OFF state; load dimming level; panel channel schedule state; panel relay state; and Segment Manager Group schedule state control. Any of above items shall be capable of being moved into an "Export Table" that will provide any integrator with only the data they need, and by using the Export Table effectively create a firewall between the integrator's request for info and the overall system performance.

5. Capabilities using the Segment Manager's Dashboard Screens shall include:

a. A dynamic "tile" based interface that allows easy viewing of each individual room's lighting and plug load power consumption, and lighting and plug load power density (power consumption information requires Enhanced DLM Room and Plug Load Controllers with integral current transducers such as LMRC-21x).Tiles will be automatically organized according to location so a single tile for the building summarizes all information for tiles beneath it on every floor, in every area, in every room. Tiles use three color coded energy target parameters, allowing an owner to quickly identify rooms that are not performing efficiently. Tiles for rooms with occupancy sensors shall include an icon to indicate whether that room is occupied. Tiles shall be clickable, and when clicked the underlying hierarchical level of tiles shall become visible. Tile interface shall be accessible via mouse, or touch screen devices. Tiles shall be created automatically by the segment manager, based on the information found during the device discovery and/or information included in a file imported in from LMCS (such as tagged descriptions for each room) without any custom programming.

b. Ability to set up schedules for DLM local networks (rooms) and panels. Schedules shall be capable of controlling individual rooms with either on/off or normal hours/after hours set controlled zones or areas to either a normal hours or after hours mode of operation. Support for annual schedules, holiday schedules and unique date-bound schedules, as well as astro On or astro Off events with offsets. Schedules shall be viable graphically as time bars in a screen set up to automatically show scheduled events by day, week or month.

c. For fixtures that are accessible via the Segment Network, and have CCT capability as specified under paragraph Digital Wall Switch and Timer For Correlated Color Temperature, the Segment Manager will provide schedule functionality similar to the CCT Wall Timer, allowing all CCT fixtures across the entire facility to be scheduled together.

d. Ability to provide a simple time vs. power graph based on information stored in each Segment Manager's memory (typically two to three days' data).

6. Segment Manager shall allow access and control of the overall system database via Native Niagara AX FOX connectivity. Systems that must utilize a Tridium Niagara controller in addition to the programming, scheduling and configuration server are not acceptable.

D. Segment Manager v2.2 and later shall support multiple DLM rooms as follows:

1. Support up to 120 network bridges and 750 digital in-room devices (LMSM-3E).
2. Support up to 200 network bridges and 1,100 digital in room devices, connected via network routers and switches (LMSM-6E).

E. WattStopper Product Numbers: LMSM-3E, LMSM-6E, LM-SUPERVISOR, NB-ROUTER, NB-SWITCH, NB-SWITCH-8, NB-SWITCH-16.

2.12 PROGRAMMING, CONFIGURATION AND DOCUMENTATION SOFTWARE

A. PC-native application for optional programming of detailed technician-level parameter information for all DLM products, including all parameters not accessible via BACnet and the handled IR configuration tool. Software must be capable of accessing room-level parameter information locally within the room when connected via the optional LMCI-100 USB programming adapter, or globally for many segment networks simultaneously utilizing standard BACnet/IP communication.

B. Additional parameters exposed through this method include but are not limited to:
1. Occupancy sensor detection LED disable for performance and other aesthetic spaces where blinking LEDs present a distraction.
2. Six occupancy sensor action behaviors for each controlled load, separately configurable for normal hours and after hours modes. Modes include: No Action, Follow Off Only, Follow On Only, Follow On and Off, Follow On Only with Override Time Delay, Follow Off Only with Blink Warn Grace Time, Follow On and Off with Blink Warn Grace Time.
3. Separate fade time adjustments per load for both normal and after hours from 0 - 4 hours.
4. Configurable occupancy sensor re-trigger grace period from 0 - 4 minutes separate for both normal hours and after hours.
5. Separate normal hours and after hours per-load button mode with modes including: Do nothing, on only, off only, on and off.
6. Load control polarity reversal so that on events turn loads off and vice versa.
7. Per-load DR (demand response) shed level in units of percent.
8. Load output pulse mode in increments of 1second.
9. Fade trip point for each load for normal hours and after hours that establishes the dimmer command level at which a switched load closes its relay to allow for staggered On of switched loads in response to a dimmer.

C. Generation of reports at the whole file, partial file, or room level. Reports include but are not limited to:
1. Device list report: All devices in a project listed by type.
2. Load binding report: All load controller bindings showing interaction with sensors, switches, and daylighting.
3. BACnet points report: Per room Device ID report of the valid BACnet points for a given site's BOM.
4. Room summary report: Device manifest for each room, aggregated by common BOM, showing basic sequence of operations.
5. Device parameter report: Per-room lists of all configured parameters accessible via hand held IR programmer for use with O&M documentation.
6. Scene report: All project scene pattern values not left at defaults (i.e. 1 = all loads 100 percent, 2 = all loads 75 percent, 3 = all loads 50 percent, 4 = all loads 25 percent, 5-16 = same as scene 1).
7. Occupancy sensor report: Basic settings including time delay and sensitivities for all occupancy sensors.

D. Network-wide programming of parameter data in a spreadsheet-like programming environment including but not limited to the following operations:
1. Set, copy/paste an entire project site of sensor time delays.

2. Set, copy/paste an entire project site of sensor sensitivity settings.
3. Search based on room name and text labels.
4. Filter by product type (i.e. LMRC-212) to allow parameter set by product.
5. Filter by parameter value to search for product with specific configurations.

E. Network-wide firmware upgrading remotely via the BACnet/IP network.
1. Mass firmware update of entire rooms.
2. Mass firmware update of specifically selected rooms or areas.
3. Mass firmware upgrade of specific products

F. WattStopper Product Number: LMCS-100, LMCI-100

2.13 EMERGENCY LIGHTING CONTROL DEVICES

A. Emergency Lighting Control Unit - A UL 924 listed device that monitors a switched circuit providing normal lighting to an area. The unit provides normal ON/OFF control of emergency lighting along with the normal lighting. Upon normal power failure the emergency lighting circuit will close, forcing the emergency lighting ON until normal power is restored. Features include:
1. 120/277 volts, 50/60 Hz, 20 amp ballast rating
2. Push to test button
3. Auxiliary contact for remote test or fire alarm system interface

B. WattStopper Product Numbers: ELCU-100, ELCU-200.

PART 3 EXECUTION

3.1 PREPARATION

A. Do not begin installation until measurements have been verified and work areas have been properly prepared.

B. If preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

C. Verify that required pre-installation meeting specified in Part 1 of this specification has been completed, recorded meeting minutes have been distributed and all outstanding issues noted have been resolved prior to the start of installation.

3.2 INSTALLATION

A. Install system in accordance with the approved system shop drawings and manufacturer's instructions.

B. Install all room/area devices using manufacturer's factory-tested Cat 5e cable with pre-terminated RJ-45 connectors.
1. If pre-terminated cable is not used for room/area wiring, each field-terminated cable shall be tested following installation and testing results submitted to the Manufacturer's Representative for approval prior to proceeding with the Work.
2. If fixtures have internal DLM Control Modules, ensure that they are also connected with Cat 5e cable.
3. Install all room to room network devices using manufacturer-supplied LM-MSTP network wire or wireless devices. Network wire substitution is not permitted and may result in loss of product warranty.
4. Low voltage wiring topology must comply with manufacturer's specifications.
5. Route network wiring as indicated on the Drawings as closely as possible. Document final wiring location, routing and topology on as built drawings.

C. All line voltage connections shall be tagged to indicate circuit and switched legs.

D. Test all devices to ensure proper communication.

E. Calibrate all sensor time delays and sensitivity to guarantee proper detection of occupants and energy savings. Adjust time delay so that controlled area remains lighted while occupied.

F. Provide written or computer-generated documentation on the configuration of the system including room by room description including:
   1. Sensor parameters, time delays, sensitivities, and daylighting setpoints.
   2. Sequence of operation, (e.g. manual ON, Auto OFF. etc.)
   3. Load Parameters (e.g. blink warning, etc.)

G. Post start-up tuning - Adjust sensor time delays and sensitivities to meet the Owner's requirements 30 days from beneficial occupancy. Provide a detailed report to the Architect / Owner of post start-up activity.

H. Tighten all panel Class I conductors from both circuit breaker and to loads to torque ratings as marked on enclosure UL label.

I. All Class II cabling shall enter enclosures from within low-voltage wiring areas and shall remain within those areas. No Class I conductors shall enter a low-voltage area.

J. Run separate neutrals for any phase dimmed branch load circuit. Different types of dimming loads shall have separate neutral.

K. Verify all non-panel-based lighting loads to be free from short circuits prior to connection to room controllers.

L. Remote Access for Network Systems: If "REMOTE ACCESS AND ENHANCED WARRANTY FOR NETWORKED SYSTEMS" is specified in Part 1 of this specification, ensure Segment Manager enclosure is installed in a location with good to excellent cellular phone coverage based on building orientation and geographic location, and mount magnetic antenna for the modem. For cases where alternate mounting locations are not available and a stronger cellular signal is needed, the manufacturer shall offer additional antenna options to improve signal quality. Verify final mounting location with Engineer and Owner prior to proceeding with the Work.

3.3 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing. Notify Architect and Manufacturer in writing a minimum of 3 weeks prior to system start-up and testing.

B. Tests and Inspections: Manufacturer's service representative shall perform the following inspections and prepare reports.
   1. Verify Class I and II wiring connections are terminated properly by validating system performance.
   2. Set IP addresses and other network settings of system front end hardware per facilities IT instructions.
   3. Verify / complete task programming for all switches, dimmers, time clocks, and sensors.
   4. Verify that the control of each space complies with the Sequence of Operation.
   5. Correct any system issues and retest..

C. Provide a report in table format with drawings, or using a software file that can be opened in

the manufacturer's system software including each room or space that has lighting control installed. Indicate the following:

1. Date of test or inspection.
2. Loads per space, or Fixture Address identification.
3. Quantity and Type of each device installed
4. Reports providing each device's settings.

3.4 DEMONSTRATION AND TRAINING

A. Before Substantial Completion, arrange and provide a one-day Owner instruction period to designated Owner personnel. Set-up, starting of the lighting control system and Owner instruction includes:
   1. Confirmation of entire system operation and communication to each device.
   2. Confirmation of operation of individual relays, switches, and sensors.
   3. Confirmation of system Programming, photocell settings, override settings, etc.
   4. Provide training to cover installation, programming, operation, and troubleshooting of the lighting control system.

3.5 GENERAL PRODUCT SUPPORT AND SERVICE

A. Factory telephone support shall be available at no cost to the Owner following acceptance. Factory assistance shall consist of assistance in solving application issues pertaining to the control equipment.

3.6 SUPPORT SERVICES

Service Description:

A. System Startup
   1. Manufacturer shall have a factory authorized technician confirm proper installation and operation of all system components. The startup requirement is intended to verify:
      a. That all occupancy sensors are located, installed, and adjusted as intended by the factory and the contract documents.
      b. The occupancy sensors are operating within the manufacturers specifications.
      c. The sensors and relay panels interact as a complete and operational system to meet the design intent.
   2. Manufacturer to provide minimum of two day factory start-up at site. Additional days shall be included as required
   3. Manufacturer to provide a written statement verifying that the system meets the above requirements.

B. Training
   1. Manufacturer shall provide factory authorized technician to train owner personnel in the operation, programming and maintenance of the lighting control system including all occupancy sensors and controls.
   2. Manufacturer shall provide minimum of one day on site training.
   3. Training shall be video recorded and provided to Owner on a DVD.

C. Factory Commissioning
   1. Manufacturer shall provide factory authority technician for on site Commissioning Agent Testing. Number of days on-site shall be as necessary based on number of components and systems.
   2. Factory Commissioning shall include:

a. Fine tune occupancy sensors.
b. Program daylight harvesting.
c. Program relay panels,
d. Program dimming panels.
e. Fine tune dimming controls.

D. Follow-up Site Assistance

1. The lighting controls representative shall visit the site 11 months post final commissioning to ensure the system is operating appropriately and make any fine-tuning programming adjustments as requested by the owner at that time.

   The controls representative shall also provide an additional 1-day training session for the owner at the 11 month post final commissioning date.

END OF SECTION 26 09 23

SECTION 26 22 00 - LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Two-winding transformers.

B. Related Requirements:
   1. Section 03 30 00 - Cast-In-Place Concrete: Housekeeping pads.
   2. Section 26 05 26 - Grounding and Bonding for Electrical Systems.
   3. Section 26 05 29 - Hangers and Supports for Electrical Systems.
   4. Section 26 05 33 - Raceway and Boxes for Electrical Systems.
   5. Section 26 05 53 - Identification for Electrical Systems.

1.2 REFERENCE STANDARDS

A. National Electrical Manufacturers Association:
   1. NEMA ST 1 - Specialty Transformers (Except General Purpose Type).
   2. NEMA ST 20 - Dry Type Transformers for General Applications.

B. International Electrical Testing Association:
   1. NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

1.3 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Product Data: Submit outline and support point dimensions of enclosures and accessories, unit weight, voltage, kVA, and impedance ratings and characteristics, tap configurations, insulation system type, and rated temperature rise.

C. Test and Evaluation Reports: Indicate loss data, efficiency at 25, 50, 75 and 100 percent rated load, and sound level.

D. Source Quality Control Submittals: Indicate results of factory tests and inspections.

E. Field Quality Control Submittals: Indicate results of Contractor furnished tests and inspections.

1.4 CLOSEOUT SUBMITTALS

A. General Conditions: Closeout procedures.

B. Record Documentation: Record actual locations of transformers.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years' experience.

1.6 DELIVERY, STORAGE, AND HANDLING

A. General Conditions: Product storage and handling requirements.

B. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, water, construction debris, and traffic.

C. Handle in accordance with manufacturer's written instructions. Lift only with lugs provided. Handle carefully to avoid damage to transformer internal components, enclosure, and finish.

PART 2 - PRODUCTS

2.1 TWO-WINDING TRANSFORMERS

A. Manufacturer List:
1. Eaton Electrical.
2. General Electrical.
3. Square D.
4. Seimens.

B. Substitution Limitations:
1. General Conditions: Requirements for substitutions for other manufacturers and products.

C. Description: NEMA ST 20, factory-assembled, air-cooled, dry type transformers, ratings as indicated on Drawings.

D. Operation:
1. Primary Voltage: 480 volts, 3 phase.
2. Secondary Voltage: 208Y/120 volts, 3 phase.
3. Insulation system and average winding temperature rise for rated kVA as follows:
4. 1-15 kVA: Class 185 with 115 degrees C rise.
5. 16-500 kVA: Class 220 with 150 degrees C rise.
6. Case temperature: Do not exceed 35 degrees C rise above ambient at warmest point at full load.
7. Winding Taps:
   a. Transformers Less than 15 kVA: Two 5 percent below rated voltage, full capacity taps on primary winding.
   b. Transformers 15 kVA and Larger: NEMA ST 20.
8. Sound Levels: NEMA ST 20.
9. Basic Impulse Level: 10 kV for transformers less than 300 kVA, 30 kV for transformers 300 kVA and larger.
10. Mounting:
    a. 1-15 kVA: Suitable for wall mounting.
    b. 16-75 kVA: Suitable for wall, floor, or trapeze mounting.
    c. Larger than 75 kVA: Suitable for floor or trapeze mounting.

E. Materials:
1. Ground core and coil assembly to enclosure by means of visible flexible copper grounding strap.
2. Coil Conductors: Continuous copper windings with terminations brazed or welded.
3. Enclosure: NEMA ST 20, Type 1 or Type 3R ventilated as required to meet service conditions. Furnish lifting eyes or brackets.

F. Fabrication:
   1. Isolate core and coil from enclosure using vibration-absorbing mounts.
   2. Nameplate: Include transformer connection data and overload capacity based on rated allowable temperature rise.

2.2 SOURCE QUALITY CONTROL

A. General Conditions: Testing, inspection and analysis requirements.

B. Production test each unit according to NEMA ST20.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Requirements for installation examination.

B. Verify mounting supports are properly sized and located including concealed bracing in walls.

3.2 PREPARATION

A. General Conditions: Requirements for installation preparation.

B. Provide concrete pads under provisions of Section 03 30 00.

3.3 INSTALLATION

A. Set transformer plumb and level.

B. Use flexible conduit, in accordance with Section 26 05 33, 2 feet (600 mm) minimum length, for connections to transformer case. Make conduit connections to side panel of enclosure.

C. Support transformers in accordance with Section 26 05 29.
   1. Mount wall-mounted transformers using integral flanges or accessory brackets furnished by manufacturer.
   2. Mount floor-mounted transformers on vibration isolating pads suitable for isolating transformer noise from building structure.
   3. Mount trapeze-mounted transformers as indicated on Drawings.

D. Provide seismic restraints.

E. Install grounding and bonding in accordance with Section 26 05 26.

3.4 FIELD QUALITY CONTROL

A. General Conditions: Requirements for inspecting and testing.

B. Inspect and test in accordance with NETA ATS, except Section 4.

C. Perform inspections and tests listed in NETA ATS, Section 7.2.1.

3.5 ADJUSTING

A. General Conditions: Testing, adjusting, and balancing.

B. Measure primary and secondary voltages and make appropriate tap adjustments.

3.6 CLEANING

A. General Conditions: Requirements for cleaning.

B. Clean existing transformers to remain or to be reinstalled.

END OF SECTION 26 22 00

SECTION 26 24 13 – SWITCHBOARDS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes main and distribution switchboards.

B. Related Sections
1. Section 03 30 00 – Cast-In-Place Concrete for concrete pads.
2. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
3. Section 26 05 53 – Identification for Electrical Systems.
4. Section 26 25 00 – Enclosed Bus Assemblies.
5. Section 26 28 13 – Fuses.
6. Section 26 35 56 – Surge Protective Devices.

1.2 REFERENCES

A. American National Standards Institute:
1. ANSI C12.1 - Code for Electricity Metering.
2. ANSI C39.1 - Requirements, Electrical Analog Indicating Instruments.

B. Institute of Electrical and Electronics Engineers:
1. IEEE C57.13 - Standard Requirements for Instrument Transformers.
2. IEEE C62.41 - Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits.

C. National Electrical Manufacturers Association:
1. NEMA FU 1 - Low Voltage Cartridge Fuses.
2. NEMA KS 1 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum).
3. NEMA PB 2 - Deadfront Distribution Switchboards.
4. NEMA PB 2.1 - General Instructions for Proper Handling, Installation, Operation, and Maintenance of Deadfront Distribution Switchboards Rated 600 Volts or Less.

D. International Electrical Testing Association:
1. NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

E. Underwriters Laboratories Inc.:
1. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures.
2. UL 891 - Dead-Front Switchboards.

1.3 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Shop Drawings: Indicate front and side views of enclosures with overall dimensions shown; conduit entrance locations and requirements; nameplate legends; size and number of bus bars for each phase, neutral, and ground; and switchboard instrument details.

C. Product Data: Submit electrical characteristics including voltage, frame size and trip ratings, fault current withstand ratings, and time-current curves of equipment and components.

D. Test Reports: Indicate results of factory production and field tests.

1.4 CLOSEOUT SUBMITTALS

A. General Conditions: Closeout procedures.

B. Project Record Documents: Record actual locations, configurations, and ratings of switchboards and their components on single line diagrams and plan layouts.

C. Operation and Maintenance Data: Submit spare parts data listing; source and current prices of replacement parts and supplies; and recommended maintenance procedures and intervals.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

1.6 DELIVERY, STORAGE, AND HANDLING

A. General Conditions: Requirements for transporting, handling, storing, and protecting products.

B. Deliver in 48 inch maximum width shipping splits, individually wrapped for protection and mounted on shipping skids.

C. Accept switchboards on site. Inspect for damage.

D. Store in clean, dry space. Maintain factory wrapping or provide additional canvas or plastic cover to protect units from dirt, water, construction debris, and traffic.

E. Handle in accordance with NEMA PB 2.1. Lift only with lugs provided. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

1.7 ENVIRONMENTAL REQUIREMENTS

A. General Conditions.

B. Conform to NEMA PB 2 service conditions during and after installation of switchboards.

1.8 FIELD MEASUREMENTS

A. Verify field measurements prior to fabrication.

1.9 SEQUENCING

A. General Conditions: Work sequence.

B. Sequence Work to avoid interferences with building finishes and installation of other products.

1.10 MAINTENANCE MATERIALS

A. General Conditions: Spare parts and maintenance products.

B. Furnish two of each key.

1.11 EXTRA MATERIALS

A. General Conditions: Spare parts and maintenance products.

PART 2 - PRODUCTS

2.1 DISTRIBUTION SWITCHBOARDS

A. Manufacturers:
1. Eaton Electrical.
2. GE Electric Company.
3. Siemens Energy & Automation, Inc.
4. Square D Company.
5. Substitutions: General Conditions.

B. Product Description: NEMA PB 2, enclosed switchboard with electrical ratings and configurations as indicated on Drawings.

C. Service Conditions:
1. Temperature: 100 degrees F.
2. Altitude: 4500 feet.

D. Device Mounting:
1. Main Section: Individually mounted and compartmented.
2. Distribution Section: Individually mounted and compartmented.
3. Auxiliary Section: Individually mounted.

E. Bus:
1. Material: Copper, standard size.
2. Connections: Bolted, accessible from front for maintenance.
3. Insulation: Fully insulate bus bars. Do not reduce spacing of insulated bus.
4. The phase and neutral through-bus shall have an ampacity as shown on the plans. For 4-wire systems, the neutral shall be of equivalent ampacity as the phase bus bar. Tapered bus in not acceptable. Provide full height vertical bus in all sections with minimum number of spaces as shown on Single Line Diagram. Full provisions for the addition of future sections shall be provided. Bussing shall include all necessary hardware to accommodate splicing for future additions.

F. Ground Bus: extend length of switchboard.

G. Minimum Short Circuit Rating: 65,000 symmetrical amperes rms, fully rated, or as indicated.

H. Line and Load Terminations: Accessible from front only of switchboard, suitable for conductor materials and sizes as indicated on Drawings.

I. Utility Metering Compartment: Furnish metering transformer compartment for Utility Company's use, in accordance with Utility Company requirements.

J. Pull Section: Width, depth and height to match switchboard. Arrange as indicated on Drawings.

K. Pull Box: Removable top and sides, same construction as switchboard, Furnish insulating, fire-resistive bottom with separate openings for each circuit to pass into switchboard.

L. Future Provisions: Fully equip spaces for future devices with bussing and bus connections, insulated and braced for short circuit currents. Furnish continuous current rating as indicated on Drawings. Switchboard provisional spaces shall be labeled with max ampacity and frame type of circuit breaker.

M. Enclosure: Type 1 - General Purpose. All Front covers shall be screw removable with a single tool and all doors shall be hinged with removable hinge pins. Floor mounted on concrete pad.

N. Align sections at front and rear.

O. Finish: Manufacturer's standard light gray enamel over external surfaces. Coat internal surfaces with minimum one coat corrosion-resisting paint, or plate with cadmium or zinc.

2.2 FUSIBLE SWITCH ASSEMBLIES

A. Product Description: NEMA KS 1, Type HD, load interrupter knife switch. Handle lockable in OFF position.

B. Fuse clips: Designed to accommodate NEMA FU 1, Class J fuses.

2.3 MOLDED CASE CIRCUIT BREAKER

A. Product Description: UL 489, molded-case circuit breaker.

B. Field-Adjustable Trip Circuit Breaker: Circuit breakers with frame sizes 250 amperes and larger have mechanism for adjusting continuous current setting for automatic operation.

C. Current Limiting Circuit Breaker: Circuit breaker indicated as current-limiting have automatically-resetting current limiting elements in each pole. Let-through Current and Energy: Less than permitted for same size Class RK-5 fuse.

D. Solid-State Circuit Breaker (for all breakers 800 amp and larger): Electronic sensing, timing, and tripping circuits for adjustable current settings; ground fault trip with zero sequence type ground fault sensor (where indicated); instantaneous trip; adjustable short time trip; and energy-reducing active arc flash mitigation system (1200 amp and larger only).

E. Current Limiter: Designed for application with molded case circuit breaker.
   1. Coordinate limiter size with trip rating of circuit breaker to prevent nuisance tripping and to achieve interrupting current rating specified for circuit breaker.
   2. Interlocks trip circuit breaker and prevent closing circuit breaker when limiter compartment cover is removed or when one or more limiter is not in place or has operated.

F. Accessories: Conform to UL 489.
   1. Shunt Trip Device: As shown on plans.
   2. Undervoltage Trip Device: All main breakers.
   3. Auxiliary Switch: As shown on plans.
   4. Alarm Switch: As shown on plans.
   5. Handle Lock: Provisions for padlocking.
   6. Insulated Grounding Lug: In each enclosure.

2.4 GROUND FAULT DEVICES

A. Ground Fault Sensor: Zero sequence type.

B. Ground Fault Relay: Adjustable ground fault sensitivity from 200 to 1200 amperes, time delay adjustable from 0 to 15 seconds. Furnish monitor panel with lamp to indicate relay operation, TEST and RESET control switches.

2.5 SURGE PROTECTIVE DEVICES

A. Product Description: IEEE C62.41, factory-mounted transient voltage surge suppressor, selected to meet requirements for medium exposure and to coordinate with system circuit voltage. See specification section 26 35 56.

2.6 ACCESSORIES

A. Concrete: 3,000 psi (20 MPa) as specified in Section 3.

2.7 SOURCE QUALITY CONTROL

A. Furnish shop inspection and testing in accordance with NEMA PB 2.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Coordination and project conditions.

B. Verify surface is suitable for switchboard installation.

3.2 PREPARATION

A. Concrete Pad: Comply with requirements of Section 03 30 00.

3.3 INSTALLATION

A. Install in accordance with NEMA PB 2.1.

B. Tighten accessible bus connections and mechanical fasteners after placing switchboard.

C. Install fuses in each switch and coordinate sizes with connected load.

D. Install engraved plastic nameplates in accordance with Section 26 05 53.

E. Install breaker circuit directory.

F. Ground and bond switchboards in accordance with Section 26 05 26.

3.4 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Inspect and test in accordance with NETA ATS, except Section 4.

C. Perform inspections and tests listed in NETA ATS, Section 7.1.

D. Measure, using a Megger, the insulation resistance of each bus section phase-to-phase and phase-to-ground for one minute each, at minimum test voltage of 1000 VDC; minimum acceptable value for insulation resistance is 1 megohms. Note: Refer to manufacturer's literature for specific testing procedures.

3.5 ADJUSTING

A. General Conditions: Testing, adjusting, and balancing.

B. Adjust operating mechanisms for free mechanical movement.

C. Tighten bolted bus connections.

D. Adjust circuit breaker trip and time delay settings to values as instructed by Architect/Engineer.

3.6 CLEANING

A. General Conditions: Final cleaning.

B. Touch up scratched or marred surfaces to match original finish.

END OF SECTION 26 24 13

SECTION 26 24 16 – PANELBOARDS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Distribution and branch circuit panelboards.

B. Related Requirements:
   1. Section 26 05 26 - Grounding and Bonding for Electrical Systems.
   2. Section 26 05 53 - Identification for Electrical Systems.
   3. Section 26 28 13 - Fuses.

1.2 REFERENCE STANDARDS

A. Institute of Electrical and Electronics Engineers:
   1. IEEE C62.41 - Recommended Practice on Surge Voltages in Low-Voltage AC Power Circuits.

B. National Electrical Manufacturers Association:
   1. NEMA FU 1 - Low Voltage Cartridge Fuses.
   2. NEMA ICS 2 - Industrial Control and Systems: Controllers, Contactors, and Overload Relays, Rated Not More Than 2000 Volts AC or 750 Volts DC.
   3. NEMA ICS 5 - Industrial Control and Systems: Control Circuit and Pilot Devices.
   4. NEMA KS 1 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum).
   5. NEMA PB 1 - Panelboards.
   6. NEMA PB 1.1 - General Instructions for Proper Installation, Operation, and Maintenance of Panelboards Rated 600 Volts or Less.

C. International Electrical Testing Association:
   1. NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

D. National Fire Protection Association:
   1. NFPA 70 - National Electrical Code.

E. Underwriters Laboratories Inc.:
   1. UL 50 - Cabinets and Boxes
   2. UL 67 - Safety for Panelboards.
   3. UL 489 - Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures.
   4. UL 1283 - Electromagnetic Interference Filters.
   5. UL 1449 - Transient Voltage Surge Suppressors.
   6. UL 1699 - Arc-Fault Circuit Interrupters.

1.3 SUBMITTALS

A. General Conditions: Requirements for submittals.

B. Product Data: Submit catalog data showing specified features of standard products.

C. Shop Drawings: Indicate outline and support point dimensions, voltage, main bus ampacity, integrated short circuit ampere rating, circuit breaker and fusible switch arrangement and sizes.

D. Source Quality control submittals: Indicate results of factory tests and inspections.

E. Field Quality Control Submittals: Indicate results of Contractor furnished tests and inspections.

1.4 CLOSEOUT SUBMITTALS

A. General Conditions: Requirements for submittals.

B. Project Record Documents: Record actual locations of panelboards and record actual circuiting arrangements.

C. Operation and Maintenance Data: Submit spare parts listing; source and current prices of replacement parts and supplies; and recommended maintenance procedures and intervals.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. General Conditions: Requirements for maintenance products.

B. Extra Stock Materials:
1. Furnish two of each panelboard key. Panelboards keyed alike.

1.6 QUALITY ASSURANCE

A. Qualifications
1. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

PART 2 - PRODUCTS

2.1 DISTRIBUTION PANELBOARDS

A. Manufacturer List:

Manufacturer	Lighting Panels rated 240V	Lighting Panels rated 480/277V	Distribution Panels rated 600V
Square D	NQOD	NF	I-Line
ABB/GE	AQ	AE	Spectra
Eaton Cutler-Hammer	Pow-R-Line 1A	Pow-R-Line 2A	Pow-R-Line 4B
Siemens	S1	S2	S5

B. Substitution Limitations:
1. General Conditions: Requirements for substitutions for other manufacturers and products.

C. Description: NEMA PB 1, circuit breaker type panelboard. Distribution boards shall be floor mounted.

D. Operation:
   1. Service Conditions:
      a. Temperature: 100 degrees F.
      b. Altitude: 4500 feet.
   2. Minimum integrated short circuit rating: 10,000 amperes rms symmetrical for 208 volt panelboards; 14,000 amperes rms symmetrical for 480 volt panelboards, or as indicated on Drawings.

E. Materials
   1. Panelboard Bus: Copper, current carrying components, ratings as indicated on Drawings. Furnish copper ground bus in each panelboard.
   2. Molded Case Circuit Breakers: UL 489, circuit breakers with integral thermal and instantaneous magnetic trip in each pole. Furnish circuit breakers UL listed as Type HACR for air conditioning equipment branch circuits.
   3. Molded Case Circuit Breakers with Current Limiters: UL 489, circuit breakers with replaceable current limiting elements, in addition to integral thermal and instantaneous magnetic trip in each pole.
   4. Current Limiting Molded Case Circuit Breakers: UL 489, circuit breakers with integral thermal and instantaneous magnetic trip in each pole, coordinated with automatically resetting current limiting elements in each pole. Interrupting rating 100,000 symmetrical amperes, let-through current and energy level less than permitted for same size NEMA FU 1, Class RK-5 fuse.
   5. Surge Suppressers: Integrated in panelboard, refer to Section 26 35 53.
   6. Enclosure: NEMA PB 1, Type 1or as required to meet service conditions.
   7. Cabinet Front: Surface door-in-door type, fastened with concealed trim clamps, hinged door with flush lock and plastic directory card holder. Fronts shall have cylindrical tumbler type lock with catch and spring-loaded door pull. All lock assemblies shall be keyed alike.
   8. Circuit breaker accessories: Trip units and auxiliary switches as indicated on drawings.

F. Finishes
   1. Manufacturer's standard gray enamel.

2.2 BRANCH CIRCUIT PANELBOARDS

A. Manufacturer List:

Manufacturer	Lighting Panels rated 240V	Lighting Panels rated 480/277V	Distribution Panels rated 600V
Square D	NQOD	NF	I-Line
ABB/GE	AQ	AE	Spectra
Eaton Cutler-Hammer	Pow-R-Line 1A	Pow-R-Line 2A	Pow-R-Line 4B
Siemens	S1	S2	S5

B. Substitution Limitations:
   1. General Conditions: Requirements for substitutions for other manufacturers and products.

C. Description: NEMA PB1, circuit breaker type, lighting and appliance branch circuit panelboard.

D. Materials:
   1. Panelboard Bus: Copper, current carrying components, ratings as indicated on Drawings. Furnish copper ground bus in each panelboard.
   2. For non-linear load applications subject to harmonics furnish 200 percent rated, plated copper, solid neutral.

3. Minimum Integrated Short Circuit Rating: 10,000 amperes rms symmetrical for 208 volt panelboards; 14,000 amperes rms symmetrical for 480 volt panelboards, or as indicated on Drawings.
4. Molded Case Circuit Breakers: UL 489, bolt-on type thermal magnetic trip circuit breakers, with common trip handle for all poles, listed as Type SWD for lighting circuits, Type HACR for air conditioning equipment circuits, Class A ground fault interrupter circuit breakers as indicated on Drawings. Provide UL class 760 arc-fault interrupter circuit breakers as indicated on Drawings. Do not use tandem circuit breakers.
5. Current Limiting Molded Case Circuit Breakers: UL 489, circuit breakers with integral thermal and instantaneous magnetic trip in each pole, coordinated with automatically resetting current limiting elements in each pole. Interrupting rating 100,000 symmetrical amperes, let-through current and energy level less than permitted for same size NEMA FU 1, Class RK-5 fuse.
6. Enclosure: NEMA PB 1, Type 1 or Type 3R as required to meet service conditions.
7. Split solid neutral shall be plated and located in the main compartment up to 225 amperes so incoming neutral cable may be of the same length. UL listed paneboards with 200% rated solid neutral shall be plated copper for non-linear load applications. Panelboards shall be marked for non-linear load applications.
8. Interior trim shall be of dead-front construction to shield user from energized parts. Dead-front trim shall have pre-formed twist-outs covering unused mounting space.
9. Breaker handle and faceplate shall indicate rated ampacity. Standard construction circuit breakers shall be UL listed for reverse connection without restrictive line or load markings. Circuit breaker handle accessories shall provide provisions for locking handle in the OFF position.

E. Cabinet Front: Door-in-door Flush or Surface cabinet front as indicated on drawings with concealed trim clamps, concealed hinge, plastic directory card holder, and flush lock keyed alike. Front shall have cylindrical tumbler type lock with catch and spring-loaded door pull. All lock assemblies shall be keyed alike. Finishes:
   1. Finish in manufacturer's standard gray enamel.

2.3 SOURCE QUALITY CONTROL

A. General Conditions: Testing, inspection and analysis requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install panelboards in accordance with NEMA PB 1.1.

B. Install panelboards plumb.

C. Install recessed panelboards flush with wall finishes.

D. Height: 6 feet (1800 mm) to top of panelboard install panelboards taller than 6 feet (1800 mm) with bottom no more than 4 inches (100 mm) above floor.

E. Install filler plates for unused spaces in panelboards.

F. Provide typed circuit directory for each branch circuit panelboard and load center. Revise directory to reflect circuiting changes to balance phase loads. Identify each circuit as to its clear, evident and specific purpose of use.

G. Install engraved plastic nameplates in accordance with Section 26 05 53.

H. Install spare conduits out of each recessed panelboard to accessible location above ceiling and below slab not on grade. Minimum spare conduits: 5 empty 1 inch (DN27) (above and below). Identify each as SPARE.

I. Ground and bond panelboard enclosure according to Section 26 05 26. Connect equipment ground bars of panels in accordance with NFPA 70.

J. Provide each panelboard with nameplate showing panel designation, voltage rating and phase. Indicate source of power (feeder origin) and feeder size (awg/mils and conduit).

K. Label shall be engraved laminated-plastic nameplate. Nameplates shall be black with white letters (normal power) or red with white letters (emergency power).

L. Mount panelboards securely to building structure with 3/8" minimum diameter galvanized bolts and inserts number as required for size of panel, but not less than 4. Mount panelboards with centerline 4'-6" approximately above finished floor with the top a maximum of 74” AFF. Where panels of different heights are mounted adjacent, install top of panel trim at same height above floor. Close all unused openings.

M. Mount feeder panelboards taller than 66" on 4" high 2500# concrete pad and bolt to wall and pad with 1/2" diameter bolts and inserts .Breaker handles in the “ON” position shall not be higher than 6-7” to centerline from the Finished Floor when panelboards are installed on concrete pads

N. Where two sets of feeder cables are required in panel gutter space, run one set in each side of panel.

O. When connecting a panelboard to a transformer, connected conductors shall include a slack 90-degrees bend in flexible conduit between the transformer and any subsequent rigid connection to building structure. Use stranded, flexible conductors to maintain as much flexibility as practical. Do not permit flexible conductors to contact or drape against floor or wall surfaces. The first panelboard, cabinet or switch connected to a transformer shall be resiliently supported from structure by affixing with bolts through holes with grommets (wall supported; equal to Kinetics Model TG Isolation Grommet) or by being set on ¾” thick Neoprene isolation pads (equal to Kinetics Type RSP) sized so that the supported load deflects pads approximately 0.12”, or in the upper half of the manufacturer’s recommended loading range in pounds per square inch. Pad type isolators should use load spreading steel plates to avoid damaging the pad by narrow base rails or sections, as required.

P. Provide seismic bracing in accordance with the manufacturer's recommendations and in compliance with the seismic zone requirements for the zone in which the equipment is located.

Q. Connect only one wire/cable to each breaker terminal.

3.2 FIELD QUALITY CONTROL

A. General Conditions: Requirements for testing, adjusting, and balancing.

B. Inspect and test in accordance with NETA ATS, except Section 4.

C. Perform circuit breaker inspections and tests listed in NETA ATS, Section 7.6.

D. Perform switch inspections and tests listed in NETA ATS, Section 7.5.

E. Perform controller inspections and tests listed in NETA ATS, Section 7.16.1.

3.3 ADJUSTING

A. General Conditions: Requirements for starting and adjusting.

B. Measure steady state load currents at each panelboard feeder; rearrange circuits in panelboard to balance phase loads to within 20 percent of each other. Maintain proper phasing for multi-wire branch circuits.

3.4 CLEANING

A. General Conditions: Requirements for cleaning.

B. Clean interior of panelboards of all debris at substantial completion.

END OF SECTION 26 24 16

SECTION 26 2716 - CABINETS AND ENCLOSURES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Hinged cover enclosures.
   2. Cabinets.
   3. Terminal blocks.
   4. Accessories.

B. Related Requirements:
   1. Section 26 05 26 - Grounding and Bonding for Electrical Systems.
   2. Section 26 05 29 - Hangers and Supports for Electrical Systems.
   3. Section 26 05 33 - Raceway and Boxes for Electrical Systems.

1.2 REFERENCE STANDARDS

A. National Electrical Manufacturers Association:
   1. NEMA 250 - Enclosures for Electrical Equipment (1000 Volts Maximum).
   2. NEMA ICS 4 - Industrial Control and Systems: Terminal Blocks.

1.3 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Product Data: Submit manufacturer's standard data for enclosures, cabinets, and terminal blocks.

C. Manufacturer's Instructions: Submit application conditions and limitations of use stipulated by product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, and installation of product.

1.4 MAINTENANCE MATERIAL SUBMITTALS

A. General Conditions: Requirements for maintenance materials.

B. Extra Stock Materials:
   1. Furnish two of each key.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three years documented experience.

PART 2 - PRODUCTS

2.1 HINGED COVER ENCLOSURES

A. Description: NEMA 250, Type 1 or 3R steel enclosure.
   1. Covers: Continuous hinge, held closed by hasp and staple for padlock.

2. Furnish interior metal panel for mounting terminal blocks and electrical components; finish with white enamel.
3. Enclosure Finish: Manufacturer's standard enamel.

2.2 CABINETS

A. Description:
1. Boxes: Galvanized steel with removable end walls.
2. Backboard: Furnish 3/4 inch (19 mm) thick plywood backboard for mounting terminal blocks. Paint matte white.
3. Fronts: Steel.

B. Fabrication
1. Furnish metal barriers to form separate compartments wiring of different systems and voltages.
2. Furnish accessory feet for free-standing equipment.

C. Finishes:
1. Finish with gray baked enamel.

2.3 TERMINAL BLOCKS

A. Description:
1. Terminal Blocks: NEMA ICS 4.
2. Power Terminals: Unit construction type with closed back and tubular pressure screw connectors, rated 600 volts.
3. Signal and Control Terminals: Modular construction type, suitable for channel mounting, with tubular pressure screw connectors, rated 300 volts.
4. Furnish ground bus terminal block, with each connector bonded to enclosure.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install enclosures and boxes plumb. Anchor securely to wall and structural supports at each corner in accordance with Section 26 05 29.

B. Install cabinet fronts plumb.

3.2 CLEANING

A. General Conditions: Final cleaning.

B. Clean existing cabinets and enclosures to remain or to be reinstalled.

C. Clean electrical parts to remove conductive and harmful materials.

D. Remove dirt and debris from enclosure.

E. Clean finishes and touch up damage.

END OF SECTION 26 27 16

SECTION 26 27 26 – WIRING DEVICES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes wall switches; wall dimmers; wall and ceiling occupancy sensors; receptacles; multioutlet assembly; and device plates and decorative box covers.

B. Related Sections:
1. Section 26 05 33 - Raceway and Boxes for Electrical Systems: Outlet boxes for wiring devices.
2. Section 26 09 23 – Lighting Control Devices; Wall and ceiling occupancy sensors.

1.2 REFERENCES

A. National Electrical Manufacturers Association:
1. NEMA WD 1 - General Requirements for Wiring Devices.
2. NEMA WD 6 - Wiring Devices-Dimensional Requirements.

1.3 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Product Data: Submit manufacturer's catalog information showing dimensions, colors, and configurations.

1.4 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

1.5 EXTRA MATERIALS

A. General Conditions: Spare parts and maintenance products.

B. Furnish two of each style, size, or switch, receptacle type and finish wall plate.

PART 2 - PRODUCTS

2.1 WALL SWITCHES

A. Manufacturers:
1. Cooper Wiring Devices.
2. Hubbell, Inc.
3. Leviton Manufacturing Company.
4. P&S.
5. Substitutions: Upon review.

B. Product Description: NEMA WD 1, Heavy-Duty, AC only general-use snap switch.

C. Body and Handle: White plastic with toggle handle.

D. Indicator Light: Lighted handle type switch; green color handle.

E. Locator Light: Lighted handle type switch; red color handle.

F. Ratings:
1. 120-277 volts, AC.
2. Current: 20 amperes.

2.2 WALL DIMMERS

A. Manufacturers:
1. Eagle.
2. Hubbell Wiring Devices.
3. Leviton.
4. Lutron.
5. P&S.
6. Synergy Lighting Controls.
7. Substitutions: Not Permitted.

B. Product Description: NEMA WD 1; Semiconductor dimmer for the following load types.
1. Dimmers shall provide full range, continuously variable control of light intensity.
2. Controls shall provide preset single pole, 3-way, or multi-location control from the dimmer location regardless of the position of the other 3-way switch location.
3. Ten-year operational life while operating continually at any temperature in an ambient temperature range of 0 degrees C (32 degrees F) to 40 degrees C (104 degrees F) and 90 percent non-condensing relative humidity.
4. Operate at the rated capacity across the full ambient temperature range including modified capacities for ganging configurations with require the removal of fins.
5. Control should be designed to not interfere with audio, video, or radio equipment.
6. Utilize air gap off, activated when user selects “off” at any control to disconnect the load from line supply eliminating any leakage current.
7. Possess power failure memory such that if power is interrupted and subsequently returned, lights will automatically return to same levels (dimmed setting, full on, or off) prior to power interruption.
8. Designed and tested with withstand electrostatic discharges up to 15,000 V without impairment per IEC 801-2.
9. Design and test dimmers to withstand line-side surges without impairment to performance when subjected to surges of 6,000 volts, 200 amps per ANSI/ IEEE C62.41C.
10. Capable of operating at the rated capacity; this includes modified capacities for ganging configurations which require the removal of fins. Operation at rated capacity shall be possible across the full ambient temperature range, without shortening design lifetime.

C. Load Specific Requirements: Within rated capacity, dimmers shall be available for direct control of the following loads.
1. Dimming LED Lamps:
a. Contain circuitry specifically designed to control dimmable self ballasted CFL loads.
b. Provide with lower dimming range adjustment.
c. Listed to UL 172.
2. Electronic Low Voltage (ELV):
a. Dimmers shall contain circuitry specifically designed to control the input of electronic solid state low voltage transformers.

b. Shall have a maximum output of no less than 92% of line voltage.
c. Dimmers using standard phase control shall not be acceptable.

3. Fan Speed Control:
   a. Fully Variable fan speed controls for paddle fans, ventilation fans and exhaust fans.
   b. Quiet fan speed controls shall provide low-medium-high speeds settings and off.
   c. Shall be listed to UL 1917.
4. Remote Dimming Modules:
   a. Provide high power module and wall dimmer from a single manufacturer.
   b. High power module listed to UL 508 for control of incandescent/ halogen, magnetic low voltage, electronic low voltage, fluorescent, and neon/cold cathode loads. Provide high power modules as defined on project drawings.

D. Body and Handle: White Nylon or match existing with linear slide.

E. Voltage: 120 or 277 volts.

F. Power Rating: Match load shown on drawings; 600 watts minimum.

G. Accessory Wall Switch: Match dimmer appearance.

2.3 OCCUPANCY SENSORS AND POWER PACKS

A. Occupancy Sensors

1. Ceiling sensors.
2. Wall sensors.
3. Dual technology sensors shall:
   a. Either corner mounted or ceiling mounted in such a way as to minimize coverage in unwanted areas
   b. Passive infrared and ultrasonic technologies for occupancy detection. Products that react to noise or ambient sound shall not be considered.
4. Ultrasonic sensors shall:
   a. Utilize Advanced Signal Processing to adjust the detection threshold dynamically to compensate for constantly changing levels of activity and airflow throughout controlled space.
   b. Have an ultrasonic operating frequency that is crystal controlled at 25 kHz within ± 0.005% tolerance, 32 kHz within ± 0.002% tolerance, or 40 kHz ± 0.002% tolerance to assure reliable performance and eliminate sensor cross-talk. Sensors using multiple frequencies are not acceptable.
5. All sensors shall be capable of operating normally with electronic ballasts, PL lamp systems and rated motor loads.
6. Coverage of sensors shall remain constant after sensitivity control has been set. No automatic reduction shall occur in coverage due to the cycling of air conditioner or heating fans.
7. All sensors shall have readily accessible, user adjustable settings for time delay and sensitivity. Settings shall be located on the sensor (not the control unit) and shall be recessed to limit tampering.
8. In the event of failure, a bypass manual override shall be provided on each sensor. When bypass is utilized, lighting shall remain on constantly or control shall divert to a wall switch until sensor is replaced. This control shall be recessed to prevent tampering.
9. All sensors shall provide an LED as a visual means of indication at all times to verify that motion is being detected during both testing and normal operation.

B. Products
   1. Wall Mounted Single Level Motion Sensor Switch.
   2. Wall Mounted Bi-Level Motion Sensor Switch.
   3. Ceiling Mounted Dual Technology Occupancy Sensor with Power Pack.

C. Circuit Control Hardware – (Power Packs)
   1. Control Units - For ease of mounting, installation and future service, control unit(s) shall be able to externally mount through a 1/2" knock-out on a standard electrical enclosure and be an integrated, self-contained unit consisting internally of an isolated load switching control relay and a transformer to provide low-voltage power. Control unit shall provide power to a minimum of two (2) sensors.
   2. Provide power packs as required. Power Pack shall be installed in jbox.
   3. Relay Contacts shall have ratings of:
      a. 13A - 120 VAC Tungsten
      b. 20A - 120 VAC Ballast
      c. 20A - 277 VAC Ballast
      d. 20A – 347 VAC Ballast

D. Control wiring between sensors and control units shall be Class II, 18-20 AWG, stranded U.L. Classified, PVC insulated or TEFLON jacketed cable suitable for use in plenums, where applicable.
   1. Minimum acceptable wire gauge from the circuit control hardware relays shall be #14 AWG.

E. Mount switches and occupancy sensors as indicated on Drawings and by manufacturer's requirements.

CONTROL TYPE	**COMMISSIONING AND CALIBRATION**
Occupancy sensors	Ensure that the sensor is correctly placed and oriented per the specifications and/ or construction drawings. If unanticipated obstructions are present, it may be necessary to adjust the sensor location and orientation.
Occupancy sensors	Adjust the sensitivity and time delay of the occupancy sensor, and test to ensure it provides appropriate response. For optimal user acceptance, energy savings and lamp life, set the time delay initially for a minimum of 15 minutes (NEMA recommendation).
Manual dimming	Ensure correct placement of the dimmer per the construction drawings. Adjust the upper limit of the dimming range according to the task being performed, and set the lower limit of the range so that the minimum light level meets the use/application of the space.

2.3 RECEPTACLES

A. Manufacturers:
   1. Cooper Wiring Devices.
   2. Harvey Hubbell, Inc.
   3. Leviton Manufacturing Company.

4. P&S.
5. Substitutions: Not permitted.

B. Product Description: NEMA WD 1, Heavy-duty general use receptacle.
1. Receptacles shall be Tamper-Resistant where required by section 406.12 of the National Electrical Code, 2017.

C. Device Body: White nylon.

D. Configuration: NEMA WD 6, type as indicated on Drawings.

E. Convenience Receptacle: Type 5-20.

F. GFCI Receptacle: Convenience receptacle with integral ground fault circuit interrupter to meet regulatory requirements.

2.4 WALL PLATES

A. Manufacturers:
1. Cooper Wiring Devices.
2. Harvey Hubbell, Inc.
3. Leviton Manufacturing Company.
4. P&S.
5. Substitutions: Not permitted.

B. Decorative Cover Plate: White nylon.

C. Jumbo Cover Plate: White nylon.

D. Weatherproof Cover Plate: Gasketed cast metal plate with hinged and gasketed cast metal cover device cover. The system shall be weatherproof while in use.

E. Wall plates for devices in laboratories, kitchen areas, mechanical rooms, where located on CMU/block Surface and other similar areas shall be beveled edge stainless steel plates, single or multi-gang as required by the outlet. Wall plates for devices in surface boxes, unless specified otherwise, shall be beveled edge satin finish stainless steel plates, single or multi-gang as required by the outlet. Blank plates shall be furnished and installed on all empty, blanked or unused outlets. Device plates manufactured by device manufacturer where available. Wall Plates shall be single and combination types that mate and match with corresponding devices.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Coordination and project conditions.

B. Verify outlet boxes are installed at proper height.

C. Verify wall openings are neatly cut and completely covered by wall plates.

D. Verify branch circuit wiring installation is completed, tested, and ready for connection to wiring devices.

3.2 PREPARATION

A. Clean debris from outlet boxes.

3.3 INSTALLATION

A. Install devices plumb and level.

B. Install switches with OFF position down.

C. Install wall dimmers to achieve full rating specified and indicated after derating for ganging as instructed by manufacturer.

D. Do not share neutral conductor on load side of dimmers.

E. Install receptacles with grounding pole on bottom.

F. Connect wiring device grounding terminal to outlet box with bonding jumper and branch circuit equipment grounding conductor.

G. Install wall plates on flush mounted switches, receptacles, and blank outlets.

H. Install decorative plates on switch, receptacle, and blank outlets in finished areas.

I. Connect wiring devices by wrapping solid conductor around screw terminal. When stranded conductors are used in lieu of solid, use crimp on fork terminals for device terminations. Do not place bare stranded conductors directly under device screws.

J. Use jumbo size plates for outlets installed in masonry walls.

K. Install galvanized steel plates on outlet boxes and junction boxes in unfinished areas, above accessible ceilings, and on surface mounted outlets.

L. Match devices to plug connectors for Owner-furnished equipment. Verify type, configuration, etc., prior to providing devices. Including all such costs in bid submission.

3.4 INTERFACE WITH OTHER PRODUCTS

A. Coordinate locations of outlet boxes provided under Section 26 05 33 to obtain mounting heights as indicated on drawings.

B. Install wall switch 48 inches above finished floor.

C. Install convenience receptacle 18 inches above finished floor.

D. Install convenience receptacle 6 inches above back splash of counter.

E. Install dimmer 48 inches above finished floor.

3.5 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Inspect each wiring device for defects.

C. Operate each wall switch with circuit energized and verify proper operation.

D. Verify each receptacle device is energized.

E. Test each receptacle device for proper polarity.

F. Test each GFCI receptacle device for proper operation.

3.6 ADJUSTING

A. General Conditions: Testing, adjusting, and balancing.

B. Adjust devices and wall plates to be flush and level.

3.7 CLEANING

A. General Conditions: Final cleaning.

B. Clean exposed surfaces to remove splatters and restore finish.

END OF SECTION 26 27 26

SECTION 26 28 13 - FUSES

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes fuses and spare fuse cabinet.

1.2 REFERENCES

A. National Electrical Manufacturers Association:
1. NEMA FU 1 - Low Voltage Cartridge Fuses.

1.3 DESIGN REQUIREMENTS

A. Select fuses to provide appropriate levels of short circuit and overcurrent protection for the following components: wire, cable, bus structures, and other equipment. Design system to maintain component damage within acceptable levels during faults.

B. Select fuses to coordinate with time current characteristics of other overcurrent protective elements, including other fuses, circuit breakers, and protective relays. Design system to maintain operation of device closest to fault operates.

1.4 FUSE PERFORMANCE REQUIREMENTS

A. Main Service Switches Larger than 600 amperes: Class L (time delay).

B. Main Service Switches: Class RK1 (time delay).

C. Power Load Feeder Switches Larger than 600 amperes: Class L (time delay).

D. Power Load Feeder Switches: Class RK1 (time delay).

E. Motor Load Feeder Switches: Class RK1 (time delay).

F. Lighting Load Feeder Switches Larger than 600 amperes: Class L time delay.

G. Lighting Load Feeder Switches: Class RK1 (time delay).

H. Other Feeder Switches Larger than 600 amperes: Class L time delay.

I. Other Feeder Switches: Class RK1 (time delay).

J. General Purpose Branch Circuits: Class RK1 (time delay).

K. Motor Branch Circuits: Class RK1 (time delay).

L. Lighting Branch Circuits: Class G.

1.5 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Product Data: Submit data sheets showing electrical characteristics, including time-current curves.

1.6 CLOSEOUT SUBMITTALS

A. General Conditions: Closeout procedures.

B. Project Record Documents: Record actual sizes, ratings, and locations of fuses.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

1.8 MAINTENANCE MATERIALS

A. General Conditions: Spare parts and maintenance products.

1.9 EXTRA MATERIALS

A. General Conditions: Requirements for extra materials.

B. Furnish 20% spare fuses of each Class, size, and rating installed.

PART 2 - PRODUCTS

2.1 FUSES

A. Manufacturers:
1. Bussman
2. Gould Shawmut
3. Substitutions: General Conditions

B. Dimensions and Performance: NEMA FU 1, Class as specified or as indicated on Drawings.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.2 CLASS RK1 (TIME DELAY) FUSES

A. Manufacturers:
1. Bussman.
2. Gould Shawmut.
3. Substitutions: General Conditions.

B. Dimensions and Performance: NEMA FU 1.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.3 CLASS RK1 (NON-TIME-DELAY) FUSES

A. Manufacturers:
1. Bussman.
2. Gould Shawmut.
3. Substitutions: General Conditions.

B. Dimensions and Performance: NEMA FU 1.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.4 CLASS RK5 FUSES

A. Manufacturers:
1. Bussman.
2. Gould Shawmut.
3. Substitutions: General Conditions.

B. Dimensions and Performance: NEMA FU 1.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.5 CLASS J (TIME DELAY) FUSES

A. Manufacturers:
1. Bussman
2. Gould Shawmut.
3. Substitutions: General Conditions.

B. Dimensions and Performance: NEMA FU 1.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.6 CLASS J (NON-TIME-DELAY) FUSES

A. Manufacturers:
1. Bussman
2. Gould Shawmut.
3. Substitutions: General Conditions

B. Dimensions and Performance: NEMA FU 1.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.7 CLASS L (FAST-ACTING) FUSES

A. Manufacturers:
1. Bussman
2. Gould Shawmut.
3. Substitutions: General Conditions.

B. Dimensions and Performance: NEMA FU 1.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.8 CLASS L (TIME DELAY) FUSES

A. Manufacturers:
1. Bussman
2. Gould Shawmut.
3. Substitutions: General Conditions

B. Dimensions and Performance: NEMA FU 1.

C. Voltage: Rating suitable for circuit phase-to-phase voltage.

2.9 SPARE FUSE CABINET

A. Product Description: Wall-mounted sheet metal cabinet with shelves, suitably sized to store spare fuses and fuse pullers specified.

B. Doors:Hinged, with hasp for Owner's padlock.

C. Finish: Gray enamel.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install fuse with label oriented so manufacturer, type, and size are easily read.

B. Install spare fuse cabinet at location as directed by Owner.

END OF SECTION 26 28 13

SECTION 26 28 19 - ENCLOSED SWITCHES

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Fusible.
   2. Nonfusible switches.

B. Related Requirements
   1. Section 26 05 29 - Hangers and Supports for Electrical Systems.
   2. Section 26 05 53 - Identification for Electrical Systems.
   3. Section 26 28 13 - Fuses.

1.2 REFERENCE STANDARDS

A. National Electrical Manufacturers Association:
   1. NEMA FU 1 - Low Voltage Cartridge Fuses.
   2. NEMA KS 1 - Enclosed and Miscellaneous Distribution Equipment Switches (600 Volts Maximum).

B. International Electrical Testing Association:
   1. NETA ATS - Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

1.3 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Product Data: Submit switch ratings and enclosure dimensions.

1.4 CLOSEOUT SUBMITTALS

A. General Conditions: Closeout procedures.

B. Project Record Documents: Record actual locations of enclosed switches and ratings of installed fuses.

1.5 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

PART 2 - PRODUCTS

2.1 FUSIBLE SWITCH ASSEMBLIES

A. Description: NEMA KS 1, Type HD (Heavy Duty), enclosed load interrupter knife switch. Handle lockable in OFF position.

B. Operation:

1. Switch Ratings
    a. Switch Rating: Horsepower rated for AC or DC as indicated on Drawings.
    b. Short Circuit Current Rating: UL listed for 10,000 rms symmetrical amperes when used with or protected by Class H or K fuses (30-600 ampere). 200,000 rms symmetrical amperes when used with or protected by Class L fuses (800-1200 ampere).

C. Materials:
1. Fuse clips: Designed to accommodate NEMA FU 1, Class R fuses.
2. Enclosure: NEMA KS 1, to meet conditions. Fabricate enclosure from steel finished with manufacturer's standard gray enamel.
    a. Interior Dry Locations: Type 1.
    b. Exterior Locations: Type 3R.
3. Service Entrance: Switches identified for use as service equipment are to be labeled for this application. Furnish solid neutral assembly and equipment ground bar.
4. Furnish switches with entirely copper current carrying parts.

2.2 NONFUSIBLE SWITCH ASSEMBLIES

A. Description: NEMA KS 1, Type HD (Heavy Duty) enclosed load interrupter knife switch. Handle lockable in OFF position.

B. Operation:
1. Switch Ratings
    a. Switch Rating: Horsepower rated for AC or DC as indicated on Drawings.
    b. Short Circuit Current Rating: UL listed for 10,000 rms symmetrical amperes when used with or protected by Class H or K fuses (30-600 ampere).

C. Materials:
1. Enclosure: NEMA KS 1, to meet conditions. Fabricate enclosure from steel finished with manufacturer's standard gray enamel.
    a. Interior Dry Locations: Type 1.
    b. Exterior Locations: Type3R.
2. Service Entrance: Switches identified for use as service equipment are to be labeled for this application. Furnish solid neutral assembly and equipment ground bar.
3. Furnish switches with entirely copper current carrying parts.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install enclosed switches where indicated. Secure switches to building or equipment surface as shown. Where the surface is not adaptable for mounting, provide unistrut P-1000 rack mounted as required to secure switch.

B. Install enclosed switches plumb. Provide supports in accordance with Section 26 05 29.

C. Height: 5 feet (1500 mm) to operating handle.

D. Install fuses for fusible disconnect switches. Refer to Section 26 28 13 for product requirements.

E. Install engraved plastic nameplates in accordance with Section 26 05 53. Engrave nameplates with the equipment served and the panel and circuit number supplying the switch.

F. Apply adhesive tag on inside door of each fused switch indicating NEMA fuse class and size installed.

G. Secure switches and circuit breakers to building structure in accordance with seismic zone specified in other sections of this specification.

H. All exterior mounted switches shall comply with NEC 312.2.

I. All switches shall be mounted to comply with NEC 404.8.

3.2 FIELD QUALITY CONTROL

A. General Conditions: Requirements for testing, adjusting, and balancing.

B. Inspect and test in accordance with NETA ATS, except Section 4.

C. Perform inspections and tests listed in NETA ATS, Section 7.5.

3.3 CLEANING

A. General Conditions: Requirements for cleaning.

B. Clean existing enclosed switches to remain or to be reinstalled.

END OF SECTION 26 28 19

SECTION 263100 - SOLAR ENERGY ELECTRICAL POWER GENERATION SYSTEM

PART 1 – GENERAL

1.1 DESCRIPTION

A. This section specifies the furnishing, installation, connection, testing, and commissioning of solar energy electrical power generation systems.

B. The requirements of this Section apply to all sections of Division 48 related to solar energy electrical power generation systems.

C. Photovoltaic system is a bid alternate. Infrastructure conduit(s) between rooftop areas and from electrical room to Service Entrance shall be part of the BASE BID. Panels, racking, wiring, inverters, mounting, and associated accessories are to be included in ALTERNATE #1 BID item.

D. System Size: Roof Mounted 300kWdc. The basis of design solar PV systems includes qty 750 400-watt panels with optimizers and solar inverter(s) as required. Panels to be mounted at a 10-degree angle facing directly south to maximize solar energy capture throughout the day. Utilization of a ballasted flat roof mounting system ensures secure attachment without penetrating the roof membrane, preserving its integrity.

E. The PV system shall be delivered as a delegated design package. Contractor shall provide a complete and operational grid-tied PV system in accordance with parameters provided within this specification, the drawings, and NV Energy requirements. **In addition, the photovoltaic system shall be monitored & able to provide accessible data collection and provide WCSD personnel with PV data analysis and visualization to be able to maintain and monitor the solar system performance. The installed monitoring system should also be able to access detailed module-level and inverter-level performance data.**

F. The bid shall clearly itemize manufacturers, model numbers, capacities, locations, and quantities of the products (panel, racking and inverter) that are proposed.

G. The Contractor may propose other products and system configurations provided they meet the design intent, generate an equal amount of electricity per year as the basis of design, are within the physical limitations of the array locations as indicated on the drawings, and meet all other criteria in the Contract Documents. If alternate products or system configurations are proposed, the bid is to document the proposed solution’s impacts to system energy yield, efficiency, longevity, and overall cost effectiveness (on a life-cycle cost basis) to WCSD.

1.2 RELATED WORK

A. Section 26 05 19, LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES: Requirements for low-voltage conductors.

B. Section 26 05 26, GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS: Requirements for personnel safety and requirements for providing a low impedance path for possible ground fault currents.

C. Section 26 05 33, RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS: Requirements for boxes, conduits, and raceways.

1.3 DEFINITIONS

A. Unless otherwise specified or indicated, electrical and electronics terminology used in these specifications, and on the drawings, shall be as defined in IEEE 100 CD.

B. Unless otherwise specified or indicated, solar energy conversion and solar photovoltaic energy system terminology used in these specifications, and on the drawings, shall be as defined in ASTM E772.

1.4 QUALITY ASSURANCE

A. Supports and racking for solar photovoltaic system designs shall be prepared under the seal of a licensed Professional Structural Engineer in the State of Nevada (PE). Where applicable, such as roof top installations, the engineer shall also provide adequate review and structural analysis of the existing structure that will be supporting the proposed solar photovoltaic system. Among the documents that shall be submitted by the engineer are environmental loading analyses (including wind, snow, hail, and where applicable, seismic) and the rack and substrate's ability to withstand these environmental forces and shall be in compliance with local City (Reno, NV) and County (Washoe) standards. Racking shall not result in a panel having a high side greater than 24" above the roof. This is to ensure proper screening of the system.

B. Investigate any other local ordinances that may apply to installation of a solar energy electrical generating system in the proposed location. Bring any conflicts with the drawings and specifications to the attention of the engineer.

C. System AC output shall be the maximum calculated for the areas shown allotted on the plans and shall be demonstrated as such via shop drawings.

D. Warranties: The warranty period shall be as noted for the items below*:*

1. Solar photovoltaic modules and inverter: 10 year manufacturer's warranty against defects in materials and workmanship.

2. Power output: 25 year manufacturer's power output warranty, with the first 10 years at 90% minimum rated power output and the balance of the 25 years at 80% minimum rated power output.

1.5 SUBMITTALS

A. Submittals shall comply with paragraph, SUBMITTALS, in Section 26 00 01, and the following requirements:

1. Shop Drawings:
   a. Submit sufficient information to demonstrate compliance with drawings and specifications.
   b. Include electrical ratings, dimensions, mounting details, materials, required clearances, terminations, weight, wiring and connection diagrams, accessories, and nameplate data.
   c. Include shop drawings for foundations and other support structures.

2. Product Data:
   a. Include detailed information for components of the solar energy electrical generation system.

1. Wiring.
2. Inverter.
3. Photovoltaic modules.
4. Rack and support assemblies.
5. Instrumentation.
6. Switchgear.
7. DC and AC disconnects.
8. Combiner boxes.
9. Battery systems and racks.

3. Manuals:
   a. Submit, simultaneously with the shop drawings, complete maintenance and operating manuals including technical data sheets, wiring diagrams, and information for ordering replacement parts.
      1. Safety precautions.
      2. Operator restart.
      3. Startup, shutdown, and post-shutdown procedures.
      4. Normal operations.
      5. Emergency operations.
      6. Environmental conditions.
      7. Preventive maintenance plan and schedule.
      8. Troubleshooting guides and diagnostic techniques.
      9. Wiring and control diagrams.
      10. Maintenance and repair procedures.
      11. Removal and replacement instructions.
      12. Tracking systems (where applicable).
      13. Spare parts and supply list.
      14. Parts identification.
      15. Testing equipment and special tool information.
      16. Warranty information.
      17. Testing and performance data.
      18. Contractor information.
   b. If changes have been made to the maintenance and operating manuals originally submitted, then submit updated maintenance and operating manuals two weeks prior to the final inspection.

4. Certifications: Two weeks prior to final inspection, submit the following.
   a. Certification by the manufacturers of all major items of the solar energy electric generation system that the system conforms to the requirements of the drawings and specifications, and that they have jointly coordinated and properly integrated their equipment and controls to provide a complete and functional installation.
   b. Certification by the Contractor that the solar energy electric generation system has been properly installed, adjusted, tested, commissioned, and warrantied. Contractor shall make all necessary field measurements and investigations to ensure that the equipment and assemblies meet contract requirements.

B. If equipment submitted differs in arrangement from that shown on the drawings, provide drawings that show the rearrangement of all associated systems. Approval will be given only if all features of the equipment and associated systems, including accessibility, are equivalent to that required by the contract and acceptable to the engineer.

C. Submittals and shop drawings for independent but related items shall be furnished together and complete in a group. Coordinate and properly integrate materials and equipment in each group. Final review and approval will be made only by groups.

1.6 APPLICABLE PUBLICATIONS

A. Publications listed below (including amendments, addenda, revisions, supplements and errata) form a part of this specification to the extent referenced. Publications are referenced in the text by the basic designation only.

B. American Society for Testing and Materials (ASTM):

1741-10..... Standard for Inverters, Converters, Controllers and Interconnection System Equipment for Use with Distributed Energy Resources

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide materials to fabricate functioning photovoltaic system in accordance with ASTM, IEEE, NEMA, NFPA, and UL, as specified in this section, and as shown on the drawings.

B. Factory-prefabricated solar equipment packages which include photovoltaic modules, batteries or other energy storage, inverters, and controls and which meet the requirements of this section are acceptable.

2.2 GROUNDING

A. All applicable components of the solar energy electrical power generating system must be grounded per latest NEC requirements.

B. DC Ground-Fault Protector:

1. Shall be listed per UL 1703.

2. Shall comply with requirements of the NEC.

2.3 PHOTOVOLTAIC ARRAY CIRCUIT COMBINER BOX

A. Shall be listed to UL 1741.

B. Shall include internal overcurrent protection devices with dead front.

C. Shall be contained in non-conductive NEMA Type 4X enclosure.

D. Up to 48 volts DC: Shall use UL-listed DC breakers that meet NEC requirements for overcurrent protection.

E. Up to 600 volts DC, paralleling system: Shall use fuses instead of breakers.

F. Where applicable, combiner box shall be a disconnecting combiner box.

2.4 SWITCH/DISCONNECTING MEANS

A. Shall be UL-listed, in accordance with the NEC, as shown on the drawings, and as specified.

2.5 WIRING SPECIALTIES

A. Direct Current Conductors:

1. If Exposed: Shall be USE-2, UF (inadequate at 60°C [140°F]), or SE, 90°C [194°F] wet-location rated and sunlight-resistant (usually for tracking modules).

2. If in Conduit: Shall be RHW-2, THWN-2, or XHHW-2 90°C [194°F], wet-location rated.

B. Conduits and Raceways:

1. Shall use steel conduit listed per UL 6, UL 1242, UL 797 (as appropriate), except for tracking modules. Weathertight EMT installations shall be allowed for DC wiring in weather-protected areas.
2. Shall use expansion joints on long conduit runs.
3. Shall not be installed on photovoltaic modules.

C. Enclosures subject to weather shall be rated NEMA 3R or better.

D. Cable Assemblies and Junction Boxes:
1. Shall be UL-listed.
2. Shall be rated to 5VA flammability per UL 94.

E. Prohibited Wiring Materials: Those which are not UL-listed, or listed materials used in environments outside those covered in their listing.

2.6 DC-AC INVERTER

A. Shall be listed to UL 1741.

B. Shall comply with IEEE 519 and IEEE 1547.

C. Shall be listed per FCC Part 15 Class A.1.

D. Shall have stand-alone, utility-interactive, or combined capabilities.

2.7 SOLAR PHOTOVOLTAIC (PV) MODULES

A. Minimum Performance Parameters as per IBC 1509.7.4, IRC M2302.3, UL 1703.

B. Photovoltaic Panel Types:
1. Monocrystalline: Listed to UL 1703.
2. Polycrystalline: Listed to UL 1703.
3. Thin-Film/Flexible: Listed to UL 1703.
4. Building-Integrated & Solar Shingles: Listed to UL 1703.

C. Module and System Identification
1. Module or Panel:
   a. Listed to UL 969 for weather resistance.
   b. Listed to UL 1703 for marking contents and format.
2. Main Service Disconnect: per CEC.
3. Identification Content and Format: per CEC.
4. Identification for DC Conduit, Raceways, Enclosures, Cable Assemblies, and Junction Boxes: IFC 605.
5. Identification for Inverter: per CEC.

D. Bypass diodes shall be built into each PV module either between each cell or each string of cells.

E. Other Components: per UL 1703.

2.8 BATTERY CHARGE CONTROLLER

A. Listed per UL 1741.

B. Charge controller or self-regulating system shall be required for a stand-alone system with battery storage. Charge controller’s adjusting mechanism shall be accessible only to qualified persons.

C. Shall be capable of withstanding 25% over-amperage while charging for limited time per the NEC.

2.9 BATTERY

A. General: Comply with NEC. Flooded lead-acid, captive electrolyte lead acid and nickel-cadmium are acceptable. Consider climate when selecting battery type.

B. Off-Grid: Always use high-quality, industrial-grade, deep-cycle batteries.

C. Sizing: For stand-alone systems, size per IEEE 1013 and/or 1562.

D. Installation and Maintenance: Follow practices per IEEE 937.

E. Test and Evaluation:
   1. Stand-Alone System: Follow procedures per IEEE 1361.

F. Optimize Performance and Life: Follow practices per IEEE 1561.

G. Safety and Ventilation:
   1. Use protective enclosure and proper ventilation per the NEC.
   2. Exposed battery terminals and cable connections shall be protected, and live parts of batteries shall be guarded. Batteries should be accessible only to a qualified person via locked room, battery box, or other container.
   3. Spacing around battery enclosures and boxes and other equipment shall be at least 36 inches; batteries shall not be installed in living areas, or below enclosures, panelboards, or load centers.
   4. Prohibited are conductive cases for flooded, lead-acid batteries operating above 48-volt nominal. Battery racks shall have no conductive parts within 6 inches of the tops of cases.
   5. To reduce risk of electric shock, storage batteries in dwellings shall operate at less than 50 volts (48-volt nominal battery bank). Live parts of any battery bank shall be guarded.

I. Interconnection:
   1. Per NEC, battery cables shall be a standard building wire type conductor. Welding and automobile “battery” cables (listed and non-listed) are prohibited.
   2. Flexible cables, listed for hard service use and moisture resistance, are permitted (not required) from battery terminals to nearby junction box and between battery cells. Flexible, highly-stranded building-wire type cables (USE/RHW and THW) are available. Battery terminals shall be compatible with flexible cables.

2.10 COLLECTOR SUPPORTS

A. Wind Resistance Requirement:
   1. For rack-mounted: per IBC 1509.7.1.
   2. For building-integrated photovoltaic and solar shingles: IBC 1507.17.3.

B. Mechanical Load Requirement: per UL 1703.

C. Maximum angle shall result in a panel elevation above the roof not greater than 24” on the high side.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Install the solar photovoltaic system in accordance with the NEC, this section, and the printed instructions of the manufacturer.

B. Prior to system start-up, ensure no copper wire remains exposed with the exception of grounding wire as allowed in certain circumstances per manufacturer's instructions.

C. In seismic areas, systems shall be adequately anchored and braced per details on structural contract documents to withstand seismic forces at the locations where installed.

D. Wiring Installation: Workers shall be made aware that photovoltaic modules will be live and generating electricity when there is any ambient light source and shall take appropriate precautions. Utilize on-site measurements in conjunction with engineering designs to accurately cut wires and layout before making permanent connections. Locate wires out of the way of windows, doors, openings, and other hazards. Ensure wires are free of snags and sharp edges that have the potential to compromise the wire insulation. All cabling shall be mechanically fastened. If the system is roof-mounted it shall have direct current ground fault protection according to CEC. Ensure breakers in combiner box are in the off position (or fuses removed) during combiner box wiring.

E. Instrumentation: Install instruments as recommended by the manufacturer. Locate control panels inside a room accessible only to qualified persons.

F. Rack-Mounted Photovoltaic Installations: Rack-mounted photovoltaic modules shall be installed in accordance with the manufacturer's installation instructions.

G. Provide safety signage per NEC.

3.2 FIELD QUALITY CONTROL

A. Field Inspection: Perform in accordance with manufacturer's recommendations. Prior to initial operation, inspect the solar energy electrical power generation system for conformance to drawings, specifications, and NEC. In addition, include the following:
   1. Visual Inspection and Tests:
      a. Compare equipment nameplate data with specifications and approved shop drawings.
      b. Inspect physical, electrical, and mechanical condition.
      c. Verify required area clearances.
      d. Verifying tightness of accessible bolted electrical connections by calibrated torque-wrench method, or performing thermographic survey after energization.
      e. Verify the correct operation of all sensing devices, alarms, and indicating devices.
      f. Verify that all cable entries from top of junction boxes are sealed per junction box rating.
      g. Verify all connections and integrity of printed circuit boards in all applicable junction boxes.

B. Tests: Provide equipment and apparatus required for performing tests. Correct defects disclosed by the tests and repeat tests.
   1. Module String Voltage Test: Prior to connecting wiring to the combiner box, use a digital multi-meter to ensure each series string's polarity is correct.
   2. Operational Tests: Perform tests in accordance with the manufacturer's written recommendations. Tests for stand-alone systems shall be performed per IEEE 1526.

3.3 FOLLOW-UP VERIFICATION

A. Upon completion of acceptance checks, settings, and tests, the Contractor shall show by demonstration in service that the solar photovoltaic electrical power generation system is in good operating condition and properly performing the intended function.

3.4 INSTRUCTION

A. A complete set of operating instructions for the solar photovoltaic electrical power generation system shall be laminated or mounted under acrylic glass and installed in a frame near the equipment.

B. Furnish the services of a factory-trained technician for one, 4-hour training period for instructing personnel in the maintenance and operation of the solar photovoltaic electrical power generation system, on the date requested by the owner.

END OF SECTION

SECTION 26 35 56 – SURGE PROTECTIVE DEVICES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes SPD for low-voltage power, control, and communication equipment.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating weights, operating characteristics, furnished specialties, and accessories.

B. Provide UL 1449, 3rd Edition test reports showing Suppressed Voltage Ratings (SVR) and all “Engineering Considerations”. The SPD shall also be complementary listed to UL 1283

C. Qualification Data: Provide the following:
   1. Provide test reports from a recognized independent testing laboratory verifying the COMPLETE SPD will survive the published and specified maximum surge current rating. Test reports will clearly show that all components that make up a COMPLETE system were included in these tests (including but not limited to all necessary fuses, thermal disconnects, integral disconnects and monitoring systems).
   2. Provide data confirming that the SPD will survive the published and specified repetitive surge current rating (longevity characteristic).
   3. Per the requirements of NEC Article 285.6, provide test data demonstrating that the SPD is capable of surviving the published and specified short circuit current capability (AIC rating) without the use of external fusing.
   4. Provide a COMPLETE set of test and ratings data per the recommendations of NEMA LS1 – 1992.

D. Operation and Maintenance Data: For transient voltage suppression devices to include in emergency, operation, and maintenance manuals.

E. Warranties: Special warranties specified in the Section.

1.4 QUALITY ASSURANCE

A. Testing Agency Qualifications: Testing agency as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.
   1. Testing Agency’s Field Supervisor: Person currently certified by the International Electrical Testing Association or the National Institute for Certification in Engineering Technologies to supervise on-site testing specified in Part 3.

B. Source Limitations: Obtain suppression devices and accessories through one source from a single manufacturer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

D. Comply with IEEE C62.41, “IEEE Guide for Surge Voltages in Low Voltage AC Power Circuits,” and test devices according to IEEE C62.45, “IEEE Guide on Surge Testing for Equipment Connected to Lo-Voltage AC Power Circuits.”

E. Comply with NEMA LS1, “Low Voltage Surge Protection Devices.”

F. Comply with UL 1283, “Electromagnetic Interference Filters,” and UL 1449, “Transient Voltage Surge Suppressors.”

G. MIL-STD-220A Compliance: Comply with military standard for measuring filter attenuation using the 50-ohm insertion loss method.

1.5 PROJECT CONDITIONS

A. Placing into Service: Do not energize or connect service entrance equipment or panelboard to their sources until the surge protective devices are installed and connected.

B. Service Conditions: Rate surge protection devices for continuous operation under the following conditions, unless otherwise indicated:
1. Maximum Continuous Operating Voltage: Not less than 115% of nominal system operating voltage.
2. Operating Temperature: 30 to 120 deg F (0 to 50 deg C)
3. Humidity: 0 to 85 percent, noncondensing.
4. Altitude: Less than 20,000 feet (6090 m) above sea level.

1.6 COORDINATION

A. Coordinate location of field-mounted surge suppressor to allow adequate clearances for maintenance.

1.7 WARRANTY

A. Most manufacturers offer five-year extended warranties on their equipment. Some manufacturers of cord-connected, plug-in surge suppressors offer extended warranties that either repair or replace damaged equipment that is protected by the suppressor. When warranties are required, verify with Owner’s counsel that special warranties stated in this Article are not less than remedies available to Owner under prevailing local laws. Coordinate with Division 1 Section “Warranties”.

B. General Warranty: Manufacturer’s standard form in which manufacturer agrees to repair or replace components of surge suppressors that fail in materials or workmanship within five years from date of Substantial Completion.

C. Special Warranty for Cord-Connected, Plug-in Surge Suppressors: Manufacturer’s standard form in which manufacturer aggress to repair or replace electronic equipment connected to circuits protected by surge suppressors.

PART 2 – PRODUCTS

2.1 SERVICE ENTRANCE/DISTRIBUTION BOARD SUPPRESSORS

A. Surge Protection Device Description: Non-modular type from the following list of approved manufacturers and products provided the product meets all requirements of these Specifications:
1. Liebert Corporation – LM Series
2. Current Technology, Inc. – CG Plus Series
3. Eaton Cutler-Hammer - CPS Series

The SPD will be provided with the following features and accessories:
1. Repetitive Rating: SPD shall be capable of surviving at least 10,000 ANSI/IEEE C62.41 Category C3 impulses (10kA) without failure or less than 10% degradation of original performance characteristics.
1. Fusing system to provide 200kAIC short circuit rating.
2. Individually fused MOVs to provide system redundancy
3. Integral disconnect (only when a breaker is NOT provided in distribution equipment)
4. LED indicator lights for power and protection status.
5. Audible alarm, with silencing switch, to indicate when protection has failed.
6. One set of dry contacts rated at 5A and 250V ac, for remote monitoring of protection status.
7. NEMA 12 Enclosure

B. Surge Protection Device Description: Modular type from the following list of approved manufacturers and products provided the product meets all requirements of these Specifications:
1. Liebert Corporation – Interceptor II Series
2. Current Technology, Inc. – SEL Series
3. Eaton Cutler-Hammer – CPS Series

The modular SPD will be provided with the following features and accessories:
1. Repetitive Rating: SPD shall be capable of surviving at least 15,000 ANSI/IEEE C62.41 Category C3 impulses (10kA) without failure or less than 10% degradation of original performance characteristics.
2. Fusing system to provide 200kAIC short circuit rating.
3. Fabrication using bolted compression lugs for internal wiring.
4. Integral disconnect switch (only when a breaker is NOT provided in distribution equipment).
5. Individually fused MOVs to provide system redundancy.
6. Built-in push-to-test feature that tests the integrity of each fuse/MOV pair. Manufacturers who accomplish by use of an external surge generator will provide the device with their quotation.
7. Redundant replaceable modules
8. Arrangement with copper bus bars and for bolted connection to phase buses, neutral bus, and ground bus.
9. Arrangement with wire connection to phase buses, neutral bus, and ground bus.
10. LED indicator lights for power and protection status.
11. Audible alarm, with silencing switch, to indicate when protection has failed.
12. One set of dry contacts rated at 5A and 250V ac, for remote monitoring of protection status.
13. Surge event operations counter.
14. NEMA 4 Enclosure

C. Peak Single-Impulse Surge Current Rating: 250 kA per phase, 125kA per mode. Manufacturer will provide a higher maximum surge current rating if necessary to meet the repetitive requirements listed above.

D. Connection Means: Permanently wired.

E. Protection modes and UL 1449 SVR for grounded wye circuits with voltages of 480Y/277, 208Y/120, 3-phase, 4-wire circuits shall be as follows:
   1. Line to Neutral: 700V for 480Y/277, 400V for 208Y/120.
   2. Line to Ground: 700V for 480Y/277, 400V for 208Y/120.
   3. Neutral to Ground: 700V for 480Y/277, 400V for 208Y/120.

2.3 ENCLOSURES

A. NEMA 250, with type matching the enclosure of panel or device being protected.

PART 3 – EXECUTION

3.1 INSTALLATION OF SURGE PROTECTION DEVICES

A. Install devices at service entrance on load side, with ground lead bonded to service entrance ground.

B. Install devices for panelboard and auxiliary panels with conductors or buses between suppressor and points of attachment as short and straight as possible. Locate the externally mounted SPD as close as possible to the panelboard neutral lug. Locate the recommended breaker as close as possible to the SPD location. The panelboard manufacturer will supply the breaker. Do not exceed manufacturer's recommended lead length. Do not bond neutral and ground.
   1. Provide a multi-pole circuit breaker in the service entrance equipment and a multi-pole circuit breaker in branch panel equipment to serve as a dedicated disconnect for suppressor, unless otherwise indicated. Sized per manufacturer specifications.

3.2 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B.

3.3 FIELD QUALITY CONTROL

A. Testing: Owner will engage a qualified testing and inspecting agency to perform field tests and inspections and prepare test reports.

B. Testing: Engage a qualified testing and inspecting agency to perform field tests and inspections and prepare test reports.

C. Testing: Perform the following field quality control testing:
   1. After installing surge protection devices, but before electrical circuitry has been energized, test for compliance with requirements.
   2. Complete startup checks according to manufacturer's written instructions.
   3. Perform each visual and mechanical inspection and electrical test stated in NETA ATS, Section 7.19. Certify compliance with test parameters.

D. Repair or replace malfunctioning units. Retest after repairs or replacements are made.

E. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.
   1. Verify that electrical wiring installation complies with manufacturer's installation requirements.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain surge protective devices.
   1. Train Owner's maintenance personnel on procedures and schedules for maintaining suppressors.
   2. Review data in maintenance manuals. Refer to Division 1 Section "Contract Closeout."
   3. Review data in maintenance manuals. Refer to Division 1 Section "Operation and Maintenance Data."
   4. Schedule training with Owner, through Architect, with at least seven days' advanced notice.

END OF SECTION 26 35 56

SECTION 26 51 00 – INTERIOR LIGHTING

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes interior luminaires, lamps, ballasts, and accessories.

B. **LIGHTING AGENCIES, DISTRIBUTORS, ETC. ARE REQUIRED TO HAVE A COMPLETE FIXTURE SCHEDULE, ALL LIGHTING PLANS, ARCHITECTURAL REFLECTED CEILING PLANS AND SPECIFICATIONS IN ORDER TO BID THE PROJECT. PRICING SHALL NOT BE BASED ON CATALOG NUMBERS ALONE. COORDINATE AND PROVIDE ALL MOUNTING HARDWARE AND ACCESSORIES AS REQUIRED BY ARCHITECTURAL CEILING TYPES AND CEILING TILE CONFIGURATIONS. CHANGE ORDERS WILL NOT BE ALLOWED FOR FAILURE TO USE THE COMPLETE SET OF PLANS FOR BID PURPOSES.**

C. Related Sections:
   1. Section 26 05 19 – Low Voltage Electrical Power Conductors and Cables
   2. Section 26 05 23 – Lighting Control Devices
   3. Section 26 05 26 - Grounding and Bonding for Electrical Systems.

1.2 REFERENCES

A. American National Standards Institute:

B. Illuminating Engineering Society (IES)
   1. IES LM-79-08
   2. IES LM-80-08

C. US Department of Energy
   1. Lighting Facts

1.3 SYSTEM DESCRIPTION

A. Catalog numbers indicated in the Luminaire Schedule are a design series reference and do not necessarily represent the exact catalog number, size, voltage, wattage, type of light bar, driver, finish trim, ceiling type, mounting hardware or special requirements as specified or as required by the particular installations. Provide complete luminaire to correspond with the features, accessories, number of LED's, wattage and/or size specified in the text description of each luminaire type. Additional features, accessories and options specified shall be included.

Provide all frames, supplementary support structures, hangers, spacers, stems, aligner canopies, auxiliary junction boxes and other hardware as required for a complete and proper installation. Recessed luminaires shall have frames that are compatible with the ceiling systems.

B. Luminaire voltage shall match the voltage of the circuit serving same.

1.4 SUBMITTALS

A. SUBSTITUTIONS

1. See General Conditions of the specifications for information regarding substitutions. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples if requested by Engineer are provided. Alternate products shall meet or exceed design criteria.

2. If submitted fixtures are not as specified, provide footcandle calculations showing the actual rooms, correct ceiling heights, mounting heights, and surface reflections. Provide IES files in digital format of all substituted fixtures to the Engineer for review. The engineers model will not be provided for this purpose. The lighting representative shall produce all required files and documentation to the satisfaction of the Engineer.

B. PRODUCT DATA

For each type of luminaire, arranged in order of luminaire designation. Include data on features, accessories, finishes, and the following:

1. Material and physical description of luminaire including dimensions.
2. Emergency lighting units including battery and charger.
3. Energy-efficiency data.
4. Life, output (lumens, CCT, and CRI), Kelvin temperature, and energy-efficiency data for LED light bars.
5. Photometric data and adjustment factors based on laboratory tests, complying with IESNA Lighting Measurements Testing & Calculation Guides, of each luminaire type. The adjustment factors shall be for light bars, drivers, and accessories identical to those indicated for the luminaire as applied in this Project.

    a. Testing Agency Certified Data: For indicated luminaires, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining luminaires shall be certified by manufacturer. LM-79 and LM-80 data for solid state lighting.
    b. Manufacturer Certified Data: Photometric data shall be certified by a manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.

6. Photometric data, certified by a qualified independent testing agency, in IESNA format, based on certified results of laboratory tests of each luminaire type, outfitted with light bars, drivers and accessories identical to those indicated for the luminaire as applied in the Project.
7. Low voltage transformers.
8. LED power supplies.
9. Types of LED's, including manufacturer, wattage, and Color Rendering Index (CRI) and color temperature in degrees Kelvin (K).

C. SHOP DRAWINGS

1. Show detail of nonstandard or custom luminaires.
2. Indicate dimensions, weights, method of field assembly, components, features and accessories.
3. For custom luminaires, modified luminaires or linear luminaires mounted in continuous rows, submit scaled drawings prepared by the manufacturer showing all details of construction, lengths in runs, pendant or power feed locations, accessories, finishes and lists of materials.
4. This Contractor shall provide the manufacturer with accurate field dimensions where required.
5. Include wiring diagrams, power and control wiring.

D. Wiring diagrams shall detail wiring for luminaires and differentiate between manufacturer installed and field installed wiring.

E. Dimming Driver Compatibility Certificates shall be signed by the manufacturer of driver certifying that drivers are compatible with dimming systems and equipment with which they are used.

F. Maintenance Data shall be provided for luminaires and equipment to include in emergency, operation and maintenance manuals specified in specifications section describing Operations and Maintenance Data.

G. Field quality control test reports.

H. Special Warranties specified in the Section.

I. Review of luminaire submittals which indicate voltage, mounting condition, or quantities shall not be considered to be approval of said voltage, mounting condition or quantities. This Contractor shall field verify voltage and actual mounting condition and method.

J. Product samples complete with housing, trim, specified lumen package, and 8’ cord with plug for 120 V shall be submitted if requested.

1.5 CUSTOM LUMINAIRES

A. All custom luminaires require a prototype to be submitted prior to commencement of fabrication. The purpose of the prototype will be to review construction, LED placement within luminaire, LED type, optical assembly, finishes, etc. Modifications may be required as a result of prototype review. These modifications and others that do not materially affect the cost of the luminaire shall be incorporated at no additional cost to the Owner, Architect, or Engineer.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For lighting equipment and luminaires to include in emergency, operation, and maintenance manuals.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

1.8 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to the Authorities Having Jurisdiction, and marked for intended use.

C. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

D. Comply with NFPA 70.

E. Designated manufacturers are listed to define the requirements for quality and function of the specified product.

F. Mockups: Provide interior luminaires for room or module mockups complete with power and control connections.

1. Obtain Lighting Designer's and Architect's approval of luminaires for mockups prior to starting installations.
2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
3. Remove mockups when directed. Luminaires may be reinstalled in the Work with approval from the University.
4. Install luminaires for mockups with power and control connections.
5. Mockups evaluated on the Project site may become part of the complete Work with the approval of the University, Lighting Designer and Architect if the mockup is undisturbed at the time of substantial completion.

1.8 COORDINATION

A. Coordinate layout and installation of luminaires with ceiling system and other construction that penetrates ceilings or is supported by them including mechanical system, fire suppression, and technology and partition assemblies.

B. Provide all frames, supplementary support structures, hangers, spacers, stems, aligner canopies, auxiliary junction boxes and other hardware as required for a complete and proper installation.

C. Recessed luminaires shall have frames that are compatible with the ceiling system indicated on the Architectural Drawings.

D. Coordination Meetings: This Contractor shall meet at least twice with the ceiling installer. Hold first meeting before submittal of shop drawings to coordinate each luminaire mounting condition with ceiling type. During second meeting, coordinate luminaire layout in each area. This Contractor shall meet at least twice with the mechanical systems installer prior to fabrication and installation of ductwork. Coordinate depth and location of all luminaires with ductwork, fire suppression, and technology in all areas.

1.9 MAINTENANCE MATERIALS

A. General Conditions: Spare parts and maintenance products.

B. Furnish two of each plastic lens type.

C. Furnish 10% of each type of driver type.

D. Furnish five (5) of each type of exit sign.

1.10 SUPPORT AND BRACING

A. All luminaires shall be installed with supports and bracing required for the seismic zone in which the project is located. See Spec Section 26 05 30.

B. Contractor to provide and install any hangars and supports to suspend or attach fixtures to locations as shown on reflected ceiling plans. Including any trapeze assemblies or special installation techniques to achieve installation in the desired locations. See all other project documentation for other systems that may conflict with traditional support methods.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Recessed Luminaires: Comply with NEMA LE 4 for ceiling compatibility for recessed luminaires.

B. Luminaires: Comply with UL 1598.

C. Metal Parts: Free of burrs, sharp corners and edges. Metal work shall be free of tool marks and dents and shall have accurate angles bent as sharply as compatible with the gauges of the required metal. Intersections and joints shall be formed true and of adequate strength and structural rigidity to prevent any distortion after assembly. All miters shall be in accurate alignment with abutting intersection members.

D. Sheet Metal Components: Steel unless otherwise indicated. Form and support to prevent warping and sagging. Luminaires to be painted after fabrication. Finish ferrous mounting hardware and accessories to prevent corrosion and discoloration to adjacent materials.

E. Luminaire hardware to comply with the following material standards: For steel and aluminum luminaires, all screws, bolts, nuts and other fastening and latching hardware shall be cadmium or equivalent plated. For stainless steel luminaires, all hardware shall be stainless steel.

F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Safety devices shall be detachable if necessary and shall not interfere with luminaire performance, maintenance or the seating of any luminaire element. Safety device shall not be visible during normal luminaire operation and from normal viewing angles.

G. Luminaires provided shall have means for disconnection from power source during service, as required in NEC Article 410.

H. Reflecting Surfaces: Minimum reflectance as follows, unless indicated otherwise:

1. White Surfaces: 85%
2. Specular Surfaces: 90%
3. Diffusing Specular Surfaces: 75%

I. Reflector cones shall adhere to the following:

1. Cones shall provide a minimum of 50-degree cutoff to source and source image.
2. Plastic material shall not be used for reflector cones.
3. Cones shall not be permanently fastened to the housing and shall be removable without tools. Retention devices shall not deform the cone or be visible from normal viewing angles.
4. Trim shall be flush to ceiling without gaps or light leaks. Where the flange trim is separate from the cone, it shall have the same finish as the reflector cone.
5. Reflector cones shall be uniform gauge, not less than 0.032” thick, high purity aluminum Alcoa 3002 alloy. Cones shall be free from spin marks or other defects.
6. Manufacture cones using the Alzak® process. Refer to Luminaire Schedule for cone color and finish, i.e., specular or diffuse requirements.

J. Lenses, Covers, Diffusers and Globes:

1. Acrylic Lighting Diffusers: 100% virgin acrylic plastic. UV stabilized high resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

   a. Lens Thickness: At least 0.125 inch minimum unless otherwise indicated.
   b. Lenses shall have uniform brightness throughout the entire visible area without LED pixelation.

2. Glass Globes: Annealed crystal glass unless otherwise indicated.

K. Adjustable luminaires shall have positive locking devices to fix aiming angle. Luminaires shall be capable of being relamped without adjusting aiming angle.

L. Each luminaire that has an array with a beam pattern or a spread lens that defines beam orientation shall contain locking devices to insure the orientation is not disturbed during array replacement or cleaning.

M. All luminaires and drivers shall operate within the temperature limits of their design and as specified by UL in the applications and mounting conditions specified.

N. Luminaires recessed in suspended ceilings where the space above the ceiling is either an air supply or return plenum shall conform to NEC Article 300-22.

O. Provide plaster frame for recessed luminaires mounted in other than T-bar ceilings. Verify mounting with architectural reflected ceiling plan before ordering luminaires.

P. Fixtures installed in “hard” ceilings shall have all connections accessible through the luminaire.

Q. For weatherproof or vapor-tight installations, finishes of luminaires and accessories shall be a premium 5 stage TGIC polyester powder coat paint minimum 2.5 mils thick, applied to factory-assembled and -tested luminaires before shipping, so that the entire assembly is completely corrosion resistant for the service intended. Exterior finishes shall have an outdoor life expectancy of not less than 20 years without any visible rust or corrosion. Where aluminum parts come in contact with bronze or steel parts, apply a coating material to both surfaces to prevent corrosion.

R. Luminaires for use in areas designated as damp locations shall be suitable gasketed to prevent the entrance of moisture. Provide approved wire mesh screens for ventilation openings. Dissimilar metals shall be separated by non-conductive material to prevent galvanic action.

S. Factory-Applied Labels: Comply with UL 1598. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when light bars are in place.

T. Luminaires shall be free of light leaks while providing sufficient ventilation of LED’s and drivers to provide the required photometric performance.

U. Luminaires shall hold LED arrays securely against normal vibration and maintenance handling.

2.2 LED LUMINAIRES

A. Shall be tested according to the Illuminating Engineering Society of North America (IESNA) LM-79 and LM-80.

1. Shall supply third party testing and data in compliance with Commercially Available LED Product Evaluation and Reporting (CALiPER) or National Voluntary Laboratory Accreditation Program (NVLAP).
2. The testing laboratory must be listed on the U.S. Department of Energy's Solid-State Lighting website as an accredited testing laboratory.
3. Manufacturers shall provide supporting evidence of lamp life calculation based on junction temperature and drive current upon request.

B. Shall be listed and labeled in accordance with the U.S. Department of Energy Lighting Facts Program.

C. Shall provide independent test laboratories IES photometrics which verify light levels.

D. Correlated Color Temperature (CCT) measured in Kelvin's shall meet Nominal CCTs and tolerances as defined in ANSI_NEMA_ANSLG C78.377-2008.
1. Nominal CCT: 3000 K: 3045 ± 175 K or
2. Nominal CCT 3500 K: 3465 ± 245 K
3. Nominal CCT: 4000 K: 3985 ± 275 K or
4. Nominal CCT 4500 K: 4503 ± 243 K
5. Nominal CCT 5000 K: 5028 ± 283 K or
6. Nominal CCT 5700 K: 5665 ± 355 K
7. Nominal CCT: 6500 K: 6530 ± 510 K

E. Minimum CRI > 80 or as noted in the fixture schedule.

F. The LED light source shall be fully dimmable with use of compatible dimmers switch designated for low voltage loads.

G. Luminaires shall have internal thermal protection.

H. Luminaires shall not draw power in the off state. Luminaires with integral occupancy, motion, photo-controls, or individually addressable luminaires with external control and intelligence are exempt from this requirement. The power draw for such luminaires shall not exceed 0.5 watts when in the off state.

I. Luminaire manufacturers shall adhere to device manufacturer guidelines, certification programs, and test procedures for thermal management

J. LED package(s)/module(s)/array(s) used in qualified luminaires shall deliver a minimum 70% of initial lumens, when installed in-situ, for a minimum of 50,000 hours.

K. Luminaires shall be fully accessible from below ceiling plane for changing drivers, power supplies and arrays.

L. Power Supplies and Drivers

1. Power Factor: 0.90 or higher
2. Maximum driver case temperature not to exceed driver manufacturer recommended in-situ operation.
3. Output operating frequency: 60Hz.
4. Interference: EMI and RFI compliant with FCC 47 CFR Part 15.
5. Total Harmonic Distortion Rating: 20% Maximum.
6. Meet electrical and thermal conditions as described in LM-80 Section 5.0.
7. Fully dimmable, 0 – 10 VDC standard.

8. Secondary Current: Confirm secondary current specified by individual luminaire manufacturers.
9. Compatibility of dimming switches: Certified by manufacturer for use with individually specified luminaire and individually specified control components.

M. LED ARRAYS

1. All LED's of the same type are to be provided by the same manufacturer.
2. Equip each luminaire with the proper LED array of the type shown or specified in the Luminaire Schedule.

N. WIRING

1. No internal wiring shall be visible at normal viewing angles.

2.6 RECESSED LUMINAIRES

A. Furnish all recessed luminaires in compliance with U.L. Standards for:
   1. Suspended Ceilings Non-Type I.C.
      a. Where luminaire is used in a suspended ceiling.
   2. Thermally Protected Fixture - Non-Type I.C.
      a. Where luminaire is installed in a ceiling with the possibility of overheating.
   3. DC - IC Luminaire - Type I.C.
      a. Where luminaire is intended to be installed where direct contact with insulation is expected.

B. Check Architectural drawings, sections and specifications for insulation methods and ceiling types for additional information to determine the correct method to furnish luminaires for U.L. compliance.

2.7 STEMS

A. Ball aligned, swivel 30 or 45 degrees from vertical with swivel below canopy. Painted same color as luminaire trim unless otherwise noted.

2.8 EXIT LIGHTS

A. Exit lights furnished with 6" high stencil letters. Use green LED's. Verify color used with local codes, if a different color is required, indicate on the shop drawing submittal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Support of luminaires responsibility of this Section.

B. See Spec Section 26 05 30, Seismic Protection for Electrical Equipment for additional requirements.

C. Fixtures mounted in grid ceilings and in hard ceilings shall be supported independently of the ceiling or ceiling grid. See details on plans. For recessed fixtures in hard ceilings provide one support at each corner of 2' x 4' and larger luminaries and one at each end at opposite corners of 1' x 4' and 2' x 2' luminaries. In hard ceilings, galvanized hanger wires may be used.

D. Provide devices for securing luminaire to ceiling grid to comply with Article 410-16(c) of National Electrical Code. ("Earthquake Clips").

E. Wire luminaires with flexible conduit individually to junction boxes. Do not wire luminaire to luminaire.

F. Support recessed luminaires with 3/4" black iron ceiling channel, one piece on each side of luminaire, anchored to ceiling system. Support large recessed luminaires over 20 pounds independent of furred ceiling system with rods, size as required, anchored to structure.

G. Support surface and pendant luminaires from 3/8" fixture stud in outlet box. Large surface or pendant luminaires (in excess of 20 pounds) with 3/8" rod run through the outlet box to structure and anchored independent of ceiling and conduit systems.

H. Provide plaster frames for recessed luminaries in plaster and concealed spline ceilings supported independent of ceiling construction with 1/4" rod anchored to structure.

I. Individual flexible connections to luminaires shall be made with 2#14 and 1#14 (ground) THHN-2 in 3/8" flexible conduit not to exceed 6'. Bond ground wire at each end. Provide additional wire(s) as required for a/b and similar switching schemes.

J. Stems on linear luminaires shall be installed as follows (except luminaires with slide grip hangers): First and last stem in row shall be installed in first knockout from end of luminaires; one stem shall be installed between each two luminaires connect intermediate stems to center joint where luminaires join and attach by use of "joining plates". Provide adequate number of stems to completely support luminaires and keep luminaires aligned straight and plumb.

K. Connect luminaires in continuous rows other than recessed grid type connected by nipples with locknuts and bushings.

L. Furnish complete manufacturers shop drawing for continuous luminaires showing mounting, ceiling interface and complete luminaire layout.

M. Refer to architectural reflected ceiling plans for coordination of luminaire locations with mechanical, fire protection, technology and fire safety equipment. Where conflicts occur, coordinate with Architect, Engineer and Lighting Designer prior to installing any of the Systems.

N. Install surface mounted luminaires plumb and adjust to align with building lines and with each other. Secure to prevent movement.

O. Luminaires located in recessed ceilings with a fire resistive rating of 1 hour or more shall be enclosed in an approved fire resistive rated box equal to that of the ceiling. Acoustical ceiling tiles are not acceptable.

P. Install recessed luminaires to permit removal from below.

Q. Install recessed luminaires where installed in rated assemblies using accessories and firestopping materials to meet regulatory requirements for fire rating.

R. Install wall-mounted luminaires at height as indicated on Drawings.

S. Remote mounting of drivers: Distance between the driver and fixture shall not exceed that recommend by manufacturer. Verify the maximum distance between the driver and luminaire with the manufacturer.

T. Pendant Mounted Fixtures

1. Where suspended below accessible ceiling, provide structural support at suspended ceiling level from structural members above ceiling. Do not run hanger rods through ceiling.
2. Continuous Runs of Luminaires: Laser sight to insure luminaires are straight and true when sighting from end to end, regardless of irregularities in the ceiling. Where luminaires are so installed, omit ornamental ends between sections. All seams/joints shall be tightly fitted.
3. All power feeds shall originate from the same location/end of each run.

U. Install accessories furnished with each luminaire.

V. Make wiring connections to branch circuit using building wire with insulation suitable for temperature conditions within luminaire.

W. Ground and bond interior luminaires in accordance with Section 26 05 26.

3.2 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Operate each luminaire after installation and connection. Inspect for proper connection and operation.

3.3 ADJUSTING

A. General Conditions: Testing, adjusting, and balancing.

B. Aim and adjust luminaires as indicated on Drawings.

3.4 CLEANING AND ADJUSTING

A. Remove protective plastic covers from luminaires and luminaire diffusers only after construction work, painting and clean-up are completed. Remove, clean, and reinstall all dirty reflectors and diffusers.

B. Clean luminaires internally and externally after installation. Use methods and materials recommended by manufacturer for cleaning Alzak reflectors and other surfaces.

C. Make final adjustment of aimable luminaires and adjustable light settings under the direction of the Architect and/or Lighting Designer during a scheduled period of time prior to the completion of the Project, after normal business hours if required. Include all equipment and personnel expenses including overtime required for focusing.

3.5 PROTECTION OF FINISHED WORK

A. General Conditions: Protecting finished work.

B. Replace all inoperable LED arrays at the end of construction prior to substantial completion.

3.6 GUARANTEE

A. All luminaires, components, accessories etc., shall be guaranteed against defects in materials and workmanship for five (5) years from date of in-service acceptance by owner. Replacement shall include parts and labor at the site of the work for the term of the warranty.

3.6 PROJECT CLOSEOUT

A. The contractor and lighting representative shall demonstrate maintenance procedures for replacement and renewal of each individual fixture type with facilities maintenance staff upon project completion. The contractor shall remove and re-install each replaceable component within each fixture type in the presence of the owner.

END OF SECTION 26 51 00

SECTION 26 56 00 - EXTERIOR LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section provides general requirements for a complete and fully operational Exterior Lighting System including:

1. Exterior Luminaires
2. Accessories
3. Luminaire supports
4. Poles
5. LED Arrays
6. Controls
7. Standard Fixture Schedule

B. Related Sections:

1. Section 26 05 19 Low Voltage Electrical Power Conductors and Cables.
2. Section 26 05 26 Grounding and Bonding for Electrical Systems

1.3 SYSTEM DESCRIPTION

A. Catalog numbers indicated in the Luminaire Schedule are a design series reference and do not necessarily represent the exact catalog number, size, voltage, wattage, type of LED, driver, finish trim, mounting hardware or special requirements as specified or as required by the particular installations. Provide complete luminaire to correspond with the features, accessories, number of LED's, wattage and/or size specified in the text description of each luminaire type, as well as performance requirements outlined in Lighting Control Sequence of Operation. Additional features, accessories and options specified shall be included.

B. Luminaire voltage shall match the voltage of the circuit serving same.

1.4 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

1.5 STRUCTURAL ANALYSIS CRITERIA FOR POLE SELECTION

A. Dead Load: Weight of luminaire and its horizontal and vertical supports, lowering devices, and supporting structure, applied as stated in AASHTO LTS-4-M.

B. Live Load: Single load of 500 lbf, distributed as stated in AASHTO LTS-4-M.

C. Ice Load: Load of 3 lbf/sq. ft., applied as stated in AASHTO LTS-4-M Ice Load Map.

D. Wind Load: Pressure of wind on pole and luminaire and banners and banner arms, calculated and applied as stated in AASHTO LTS-4-M.

1. Basic wind speed of calculating wind load for poles 50 feet (15 M) high or less is 105 MPH. See details on plans.

    a. Wind Importance Factor: 1.3.
    b. Minimum Design Life: 25 years.
    c. Wind induced vibration.

1.6 SUBMITTALS

A. SUBSTITUTIONS

1. See General Conditions of the specifications for information regarding substitutions. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples if requested by Engineer are provided. Alternate products shall meet or exceed design criteria.
2. If submitted fixtures are not as specified, provide footcandle calculations showing the actual site plan. Provide IES files in digital format of all substituted fixtures to the Engineer for review.

B. The authorized manufacturer's representative for the Project area shall prepare Submittals for each luminaire type. In addition to the luminaire Submittals, a list shall be provided identifying the manufacturer representative for each luminaire type. Provide manufacturers' names, addresses, and telephone numbers. Requests for prior approval shall also include this information. Submittals or requests for prior approval without this information will be rejected.

C. Product Data shall indicate that luminaire, LED arrays, and drivers fully comply with Contract Documents. Data shall be submitted for each type of luminaire indicated, arranged in order of luminaire designation. For standard catalog luminaires provide original product catalog sheets indicating data on features, accessories, finishes, and the following:

1. Materials and dimensions of luminaires.
2. Photometric data, in IESNA format, based on certified results of laboratory tests of each luminaire type, outfitted with LED arrays, drivers and accessories identical to those indicated for the luminaire as applied in the Project.

    a. Photometric data shall be certified by a qualified independent testing agency.
    b. Foot-candle map including existing fixtures' contributions

3. Low voltage transformers.
4. LED power supplies.
5. Types of LED's, including manufacturer, wattage, and Color Rendering Index (CRI) and color temperature in degrees Kelvin (K).
6. Wireless controls: nodes, gateways, modems, and server.

D. Shop Drawings shall:

1. Show details of nonstandard or custom luminaires.
2. Indicate dimensions, weights, method of field assembly, components, features, and accessories.
3. This Contractor shall provide the manufacturer with accurate field dimensions where required.
4. Include wiring diagrams, power and control wiring.

E. Wiring Diagrams shall detail wiring for luminaires and differentiate between manufacturer-

installed and field-installed wiring.

F. Product Certificates shall be signed by manufacturers of luminaires certifying that products comply with requirements.

G. Maintenance Data shall be provided for luminaires and equipment to include in emergency, operation, and maintenance manuals Specified in Specifications Section describing Operations and Maintenance Data.

H. Field quality control test reports.

I. Special Warranties Specified in this Section.

J. Review of luminaire submittals which indicate voltage, mounting condition, or quantities shall not be considered to be approval of said voltage, mounting condition, or quantities. This Contractor shall field verify voltage and actual mounting condition and method.

K. Product samples complete with housing, trim, specified lumen package, and 8’ cord with plug for 120 V shall be submitted if requested.

L. Pole and Support Component Certificates: Signed by Manufacturers of poles, certifying that products are designed for indicated load requirements in AASHTO LTS-4-M and that load imposed by luminaire and attachments has been included in design. The certification shall be based on design calculations by a Professional Engineer.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For lighting equipment and luminaires to include in emergency, operation, and maintenance manuals.

1. Provide a list of all driver types used on Project; use ANSI and manufacturers' codes.
2. Submit site map showing dimensioned locations of all exterior lighting fixtures and poles with labels. Also show stubbed-out spare conduits, in-ground junction boxes, and underground sleeves. Indicate dimensioned locations of sleeve ends, conduits, and junction boxes from a permanent building or landscape feature. Circuit numbers for all loads shall be shown. Electronic files of site lighting maps be provided at Substantial Completion.

1.8 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Glass, Plastic Diffusers and Lenses: 10% or one dozen (whichever is less) of each type and rating installed. Furnish at least one of each type.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Package poles for shipping according to ASTM B 660.

B. Store poles on decay-resistant-treated skids at least 12 inches above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.

C. Retain factory-applied pole wrappings on metal poles until right before pole installation. Handle with web fabric straps.

1.10 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to Authorities Having Jurisdiction, and marked for intended use.

C. Comply with IESNA TM-15-11 and Addendum A for Backlight, Uplight, and Glare (BUG) ratings.

D. Comply with ANSI C7.3777.208 Standards for chromaticity of SSL products.

E. Comply with NFPA 70.

F. All luminaires shall bear a UL or ETL label.

G. Comply with IEEE C2, “National Electrical Safety Code.”

H. Designated manufacturers are listed in the Luminaire Schedule to define the requirements for quality and function of the specified product.

1.11 COORDINATION

A. Coordinate layout and installation of luminaires with plantings, paving, site walls, other site work elements, and existing luminaires.

B. Coordination Meetings: This Contractor shall meet at least twice with the sitework installer(s). Hold first meeting before submittal of shop drawings to coordinate each luminaire mounting condition and location. During second meeting, coordinate layout with other site components. Coordinate depth and location of all luminaire pole bases in all areas.

1.12 WARRANTY

A. Comply with Division 1 requirements.

B. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace products that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs or alterations from special warranty coverage.

1. Warranty Period for Fixture, including the LEDs, drivers and electrical components: Five years from date of Certificate of Occupancy.
2. Warranty Period for housing paint and finish: Five years from date of Certificate of Occupancy.
3. Warranty Period for Color Retention: Five years from date of Certificate of Occupancy.
4. Warranty Period for Poles: Repair or replace lighting poles and standards that fail in finish, materials, and workmanship within manufacturer's standard warranty period, but not less five years from date of Certificate of Occupancy.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Products: Subject to compliance with requirements, provide one of the products indicated on

Drawings.

2.2 GENERAL REQUIREMENTS FOR LUMINAIRES

A. Luminaires shall be listed and labeled for installation in wet locations.

B. Comply with IESNA RP-8 for parameters of lateral light distribution patterns indicated for luminaires.

C. Comply with IESNA TM-15-07 Luminaire Classification System for Outdoor Luminaires.

D. Metal Parts: Free of burrs and sharp corners and edges.

E. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use.

F. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit easy replacement of drivers. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during maintenance and when secured in operating position. Doors shall be removable for cleaning or replacing lenses.

G. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.

H. Optical assemblies: where specified, full cutoff with zero uplight, “dark sky” compliant. LED assemblies shall comply with IESNA BUG rating system.

I. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses in luminaire doors.

2.3 LED DRIVERS AND ARRAYS

A. UL 1598 listing.

1. Lumen Depreciation Data: maintain greater than 95% lumen maintenance at 60,000 hours per IES TM-21.
2. LED color: neutral white, 4000 deg K, minimum CRI of 70, or as scheduled on the drawings.

B. LED arrays shall have an IP66 enclosure rating.

C. Power supply / driver shall be field replaceable by means quick-disconnect connectors and easy access mounting hardware.

D. Drives shall accept 120 – 277 volts or 480 volts, 60 Hz.

E. Power Factor > 0.9@ full load.

F. THD < 20% @ full load.

G. Surge protection: 10kA/10kV per ANSI/IEEE C136.2-2014

H. The housing shall have an integral thermal management system with extruded aluminum radiation fins and lateral airways for passive cooling, no devices using moving parts are

permitted.

I. Minimum starting temperature: minus 30 deg C, 40 deg C ambient.

J. Comply with IES LM-79-08 and LM-90-08 Approved Methods.

2.4 GENERAL REQUIREMENTS FOR POLES AND SUPPORT COMPONENTS

A. Structural Characteristics: Comply with AASHTO LTS-4-M.

1. Wind-Load Strength of Poles: Adequate at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of speed indicated in "Structural Analysis Criteria for Pole Selection" Article, with a gust factor of 1.3.
2. Strength Analysis: For each pole, multiply the actual equivalent projected area of luminaires and brackets by a factor of 1.1 to obtain the equivalent projected area to be used in pole selection strength analysis.

B. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.

C. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.

1. Materials: Shall not cause galvanic action at contact points.
2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.
3. Anchor-Bolt Template: Plywood or steel.

D. Handhole: Minimum clear opening of 2-1/2 by 5 inches with cover secured by stainless-steel captive screws.

E. Concrete Pole Foundations: Cast in place, with anchor bolts to match pole-base flange. Concrete, reinforcement, and formwork are specified in Division 3 Concrete Sections.

2.5 STEEL POLES

A. Poles: Seamless, extruded structural tube complying with ASTM 1A123/A123M hot-dipped galvanized steel, unless noted otherwise, and with access handhole in pole wall.

1. Shape: Refer to Luminaire Schedule or shall match existing site poles.
2. Mounting Provisions: Butt flange for bolted mounting on foundation.

B. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.

C. Grounding and Bonding Lugs: Welded 1/2-inch threaded lug, complying with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.

D. Brackets for Luminaires: Detachable, with pole and adapter fittings of cast steel. Adapter fitting welded to pole and bracket, and then bolted together with stainless-steel bolts or high strength galvanized carbon steel.

1. Finish: Match pole and luminaire material and finish.

E. Steel Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

1. Finish: Premium five (5) stage TGIC polyester powder coat paint.

a. Color: As selected by Architect from manufacturer's full range or to match existing adjacent poles.
b. Pole finish shall match that of fixture head finish.

2.6 POLE ACCESSORIES

A. Base Covers: Manufacturers' standard metal units, arranged to cover pole's mounting bolts and nuts. Finish same as pole.

B. Fusing: One in each ungrounded power supply conductor. Voltage and current ratings as recommended by driver manufacturer. Fuseholders shall be completely waterproof and shall grip the fuse in the load side section when opened. The circuit shall be fused in the base of the pole and accessible through the handhole.

C. Wind Mitigation Devices/Vibration Dampener: Provide for all site poles.

PART 3 - EXECUTION

3.1 LUMINAIRE INSTALLATION

A. Fasten luminaire to indicated structural supports.

1. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.

B. Adjust luminaires that require field adjustment or aiming. Include adjustment of photoelectric device to prevent false operation of relay by artificial light sources, favoring a north orientation.

1. Provide house side shields where necessary to control spill light.

3.2 POLE INSTALLATION

A. Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.

B. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in Division 3 Concrete Sections.

C. Foundation-Mounted Poles: Mount pole with leveling nuts, and tighten top nuts to torque level recommended by pole manufacturer.

1. Grout void between pole base and foundation. Use non-shrink or expanding concrete grout firmly packed to fill space.
2. Install base covers unless otherwise indicated.
3. Use a short piece of 1/2-inch diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.

D. Raise and set poles using web fabric slings (not chain or cable).

3.3 BOLLARD AND INDIVIDUAL GROUND MOUNTED LUMINAIRES

A. Align units for optimum directional alignment of light distribution.

B. Install on concrete base with top 4 inches above finished grade or surface at bollard location. Cast conduit into base, and shape base to match shape of bollard base. Finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Division 3 Concrete Section.

3.4 CORROSION PREVENTION

A. Steel Conduits: Comply with Section 26 05 33 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch thick, pipe-wrapping plastic tape applied with a 50 percent overlap.

3.5 GROUNDING

A. Ground metal poles and support structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

1. Install grounding electrode for each pole unless otherwise indicated.
2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.
3. Provide a continuous grounding conductor in all exterior lighting circuits.

3.6 FIELD QUALITY CONTROL

A. Inspect each installed luminaire for damage. Replace damaged luminaires and components.

B. Replace all burned out or inoperative LED arrays at the end of Construction prior to Certificate of Occupancy.

C. Advance Notice: Give dates and times for field tests.

D. Provide instruments to make and record test results.

E. Test as follows:

1. Verify proper operation, switching and phasing of each luminaire after installation.
2. Emergency Lighting: Interrupt electrical supply to demonstrate proper operation. Verify normal transfer to generator and retransfer to normal.
3. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to the lighting system, retest to demonstrate compliance with standards.

F. Malfunctioning Luminaires and Components: Replace or repair, then retest. Repeat procedure until units operate properly.

G. Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.

1. Verify operation of photoelectric controls.

END OF SECTION 26 56 00

SECTION 26 60 00 – ELECTRICAL SYSTEMS TESTING

PART 1 – GENERAL

A. The Contractor shall retain the services of an independent testing firm to perform International Electrical Testing Association (NETA) testing. Testing services shall be as described in this specification and shall be paid for and coordinated by the Contractor.

B. NETA testing procedures and requirements for tested values shall be in accordance with the most current edition of the NETA Acceptance Testing Specifications.

C. Any deficiencies or failures discovered during the NETA testing procedures shall be promptly corrected by the Contractor to ensure timely completion of the project and to minimize the time required for the independent testing firm to complete their work.

D. Independent testing firms shall be as listed below or approved equal.

A.Nat'l Field Services
B.Electrical Professional Consultants
C.Electrical Reliability Services | Vertiv

1.1 TEST REPORTS

A. Intermediate Test Reports

1. Intermediate test reports shall be issued by the independent testing firm immediately following each site visit. Intermediate test reports shall identify the general results of all field testing and field observations, and shall specifically identify any deficiencies, problems, or failures noted during the site visit.

2. Intermediate test reports shall be issued/distributed to the electrical subcontractor, the general contractor, the electrical engineer, and to the Owner. The intent of this direct communication and/or notification to multiple parties is to ensure the 'independent' function of the independent testing firm and to prevent such information from being delayed or filtered by processing it through the electrical subcontractor and/or the general contractor.

B. Final Test Report

1. The final test report shall be issued by the independent testing firm following successful completion all required electrical systems testing. The final test report shall be typed, bound, and indexed, and shall include a cover page that identifies the project name, project location, and project number. The final test report shall include a separate section for each area of required testing (tests as summarized below).

a. Grounding Systems
b. Ground Fault Protection Systems
c. Circuit Breakers (Over 100 Amps)
d. Transformers (Dry Type)
e. Low Voltage Feeders (up to 600 Volts) Serving Loads of 100 Amps or Greater
f. Main Switchboard
g. Distribution Boards
h. Branch Circuit Panelboards

1.2 TESTING REQUIREMENTS

A. Grounding Systems

1. The following grounding system testing shall be conducted on two separate occasions, once prior to initializing electrical power for construction activities, and once when all electrical systems have been finalized.
2. Perform fall-of-potential testing of the main grounding electrode or grounding system in accordance with IEEE Standard No. 81. If suitable locations for test rods are not available, a low resistance dead earth or reference ground shall be utilized.
3. Perform point-to-point testing to determine the resistance (bonding) between the main grounding system and all major electrical equipment frames, system neutral, and/or derived neutral points.
4. Measure system neutral-to-ground insulation resistance with the neutral disconnect link temporarily removed (replace neutral disconnect link after testing).
5. This testing shall be performed at the origination point of all separately derived systems.
6. Verification shall be made that the grounding electrode system is installed per NEC at all connection points.

B. Ground Fault Protection Systems

1. Perform pickup tests utilizing primary injection. Verify that the relay does not operate at 90% of the pickup setting. Verify pickup is less than 125% of setting or 1200 amps (whichever is less).
2. On summation type systems utilizing phase and neutral current sensors verify correct polarities by applying current to each phase-neutral current transformer pair).
3. Measure time delay of the relay at 150% of pickup or greater by injecting current into the sensor. Total trip time shall be electronically monitored.
4. Verify that the reduced control voltage tripping capability is 55% of rated voltage for systems with external control power (reference UL-1053).
5. Test zone interlock systems by simultaneous sensor current injection and monitoring of zone blocking function.

C. Circuit Breakers (Over 100 Amps)

1. Test requirements apply to adjustable molded case, insulated case, and metal frame circuit breakers.
2. Measure contact resistance by millivolt drop method at rated current or by digital low resistance ohmmeter method.
3. Test insulation resistance from pole-to-pole and from pole-to-ground with breaker closed and across open contacts of each phase.
4. Adjust trip settings in accordance with coordination study.
5. Measure instantaneous pickup current by primary current injection.
6. Measure long-time pickup and delay by primary current injection.
7. Measure short-time pickup and delay by primary current injection.
8. Verify trip unit reset operation.

D. Transformers (Dry Type)

1. Test insulation resistance winding-to-winding and winding-to-ground and calculate the polarization index.
2. Test turns ratio between windings for all tap positions. Verify that winding polarities match the transformer nameplate.
3. Measure resistance of each high voltage winding in each no-load tap-changer position. Also measure resistance of each low voltage winding in each load tap-changer position (when applicable).

E. Low Voltage Feeders (up to 600 Volts) Serving Loads of 100 Amps or Greater

1. Conduct megohm (Megger) testing of shield continuity resistance utilizing a megohmmeter.
2. Test insulation resistance phase-to-ground and phase-to-phase for one minute.
3. Test voltages shall be as recommended by the feeder manufacturer (or by NETA Acceptance Testing Specification).

F. Main Switchboard

1. Review cable testing report for each conductor.
2. Record all circuit breaker settings and very that each setting is in accordance with the coordination study.
3. Test and verify the accuracy of the load meter in each function and verify values can be seen on the campus control system.
4. Test and verify the operation of the shunt trip mechanism.
5. Inspect installation and functions of the surge suppression device and verify SPD lengths are as short as possible.

G. Distribution Boards

1. Review cable testing report for each conductor.
2. Record all circuit breaker settings and very that each setting is in accordance with the coordination study.
3. Inspect installation and functions of the surge suppression device and verify SPD lengths are as short as possible.

H. Branch Circuit Panels

1. Review cable testing report for each conductor.
2. Record all circuit breaker settings and very that each setting is in accordance with the coordination study.

END OF SECTION 26 60 00

SECTION 270500 – COMMON WORK RESULTS FOR COMMUNICATIONS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Drawings and general provisions of the Contract, Including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. Include all labor, materials, tools, transportation, storage costs, excavation, training, equipment, insurance, temporary protection, permits, inspections, taxes and all necessary and related items required to provide a complete and operational communications system as shown on the Drawings and described in the Specifications.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 05 43: Exterior Communications Pathways
4. 27 08 00: Commissioning of Communications
5. 27 11 00: Communications Equipment Room Fittings
6. 27 13 00: Communications Backbone Cabling
7. 27 15 00: Communications Horizontal Cabling
8. 27 41 00: Audio Visual Systems
9. 27 41 16: AV and Safety Alert Systems
10. 27 51 13: Paging Systems
11. 27 51 29: Emergency Communications Systems
12. 27 53 13: Wireless Clock Systems
13. 27 53 19: Emergency Responder Radio System

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 QUALITY ASSURANCE

A. The Contractor installing communications cabling and termination equipment shall have a minimum of (5) years experience installing communications systems of similar size and scope.

B. The Contractor must be licensed by the Nevada State Contractors Board.

C. Formal, written evidence of the following shall be presented to the WCSD Project Manager during the BID process and before contract is awarded:

1. The Contractor, including any subcontractor, must have BICSI® Registered Installers and Technicians on staff and assign them to the Project. The project shall be staffed at all times by Installers and Technicians who, in the role of lead craftsperson, shall be able to provide leadership and technical resources for the

remaining craftspersons on the project. At all times, a minimum of 30 percent of on-site Contractor personnel shall be BICSI® registered communications installers. The Field Supervisor must be a BICSI® Technician or RCDD.

2. If requested, the Contractor, including any subcontractor, shall show proven expertise in the implementation of communications projects including details of at least three projects involving the design and installation of Category 6 unshielded twisted-pair cabling systems and optical fiber cabling systems within the past two year period. Names, addresses, and telephone numbers of references for the three projects shall be included.
3. The Contractor shall accept complete responsibility for the design, installation, acceptance testing and certification of the Belden 10GX, 2400 and/or IBDN FiberExpress System. Objections to the design shown on the Drawings and Specifications shall be made prior to bidding the project.
4. In the event subcontractors are used for any portion of the installation or acceptance testing, The Contractor shall be responsible for any subsequent corrective action required on that portion.

D. Manufacturer Product Data Sheets

1. Submit product data sheets in electronic PDF (portable document format).
2. Provide table of contents for each submittal indicating the items being submitted. Products listed in the table of contents should be in the same order as they appear in the Specifications.
3. Provide product data sheets for all items listed in each specification section. Partial submittals will not be accepted.
4. Where product data sheets include more than one distinct item, clearly mark data sheet with arrow or other identifying means to indicate the items being submitted for approval. Delete or cross-out all non-applicable data.

E. Shop Drawings and Coordination Drawings

1. Submit shop drawings and coordination drawings in electronic PDF (portable document format).
2. Shop drawings and coordination drawings shall bear the stamp of approval of the Communications Contractor as evidence that they have checked the drawings. Drawings submitted without this stamp of approval will not be considered and will be returned for proper resubmission. All shop drawings shall be submitted as a single complete package. Partial packages will not be reviewed.
3. Shop drawings and coordination drawings must be submitted and approved prior to the installation of the work. Installation of work prior to the submittal and approval of the shop drawings will proceed at the contractor’s risk.
4. See individual Division 27 specification sections for specific shop drawing and coordination drawing requirements. At a minimum, drawings shall be submitted for the following items:

    a. Routing of conduits 2” and larger.
    b. Routing of basket tray and or cable tray.
    c. Routing of telecom cable pathway in telecom equipment rooms.
    d. Layout of floor and wall mounted equipment in telecom equipment rooms.

F. Cable Test Reports

1. Submit test reports signed and dated by the technician performing the cable testing.

G. Other Submittals

1. See individual Specification Sections for requirements.

1.4 REGULATIONS AND CODE COMPLIANCE

A. The Contractor will comply with all applicable governmental regulations including Federal, State, City, and Local applicable codes and ordinances.

B. References to codes and standards called for in the Specifications refer to the latest edition, amendments, and revisions to the codes and standards in effect on the date of these Specifications.

C. All work and materials shall conform to and be installed, inspected and tested in accordance with the governing rules and regulations of the telecommunications industry, as well as federal, state and local governmental agencies, including, but not limited to the following:

1. ANSI/TIA-568.0-E: Generic Telecommunications Cabling for Customer Premises (Revision E, March 2020).
2. ANSI/TIA-568.1-E: Commercial Building Telecommunications Infrastructure Standard (Revision E, March 2020).
3. ANSI/TIA-568.2-D: Balanced Twisted-Pair Telecommunications Cabling And Components Standards (Revision D, September 2018).
4. ANSI/TIA-568.3-E: Optical Fiber Cabling and Component Standard (Revision E, September 2022).
5. ANSI/TIA-569-E: Telecommunications Pathways and Spaces (Revision E, May 2019)
6. ANSI/TIA-598-D: Optical Fiber Cable Color Coding (Revision D, July 2014).
7. ANSI/TIA-606-D: Administration Standard for Telecommunications Infrastructure (Revision D, October 2021).
8. ANSI/TIA-607-D: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises (Revision D, July 2019).
9. ANSI/TIA-758-B: Customer-Owned Outside Plant Telecommunications Infrastructure Standard (Revision B, March 2012).
10. ANSI TIA-526-7-A: Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant (Revision A, July 2015).
11. ANSI/TIA-526-14-C: Optical Power Loss Measurement of Installed Multimode Fiber Cable Plant (Revision C, 2015).
12. ANSI/TIA-1152-A: Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling (Revision A, November 2016).
13. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
14. Underwriter’s Laboratories, Inc. (UL).
15. Federal Communications Commission (FCC).
16. Americans with Disabilities Act (ADA).

1.5 DEFINITIONS

A.	Accessible Ceiling	Space above a ceiling constructed of removable tiles (clipped or unclipped). Acoustical ceiling grid with removal tiles would be considered an accessible ceiling. A gypboard ceiling would not be considered an accessible ceiling.
B.	Approved/Approval	Written permission to use a material or system.

D.	As Called For	Materials, equipment including the execution specified/shown in the Specifications.
D.	Code Requirements	Minimum requirements.
E.	Concealed	Work installed in pipe and duct shafts, chases or recesses, inside walls, above ceilings, in slabs or below grade.
F.	Exposed	Work not identified as concealed.
G.	Final Acceptance	Owner acceptance of the project from the Contractor upon certification by the Owner's Representative.
H	Furnish	Supply and deliver to installation location.
I.	Furnished by Others	Receive delivery at job site or where called for and install.
J.	Inspection	Visual observations by Owner or Owner's Representative.
K.	Install	Mount and connect equipment and associated materials ready for use.
L.	Listed	Refers to classification by a standards agency.
M.	Or Approved Equal	Approved equal or equivalent as determined by Owner or Owner's Representative.
N.	Owner's Representative	Design professional or Consultant representing the Owner.
O.	Provide	Furnish, install and connect ready for use.
P.	Relocate	Disassemble, disconnect, and transport equipment to new locations: then clean, test, and install ready for use.
Q.	Replace	Remove and provide new item.
R.	Review	A general contractual conformance check of specified products.
S.	Satisfactory	As specified in Specifications.

1.6 INTENT OF DRAWINGS

A. All drawings are diagrammatic unless otherwise noted as detailed dimensioned drawings. Drawings show approximate locations of equipment and devices. Exact locations are subject to the approval of the Owner or Owner’s Representative. The Contractor shall verify dimensions and shall be responsible for their accuracy

B. Items mentioned in the Specifications and not shown in the Drawings, or shown in the Drawings and not mentioned in the Specifications, shall be of like effect as if shown and mentioned in both. In the case of differences between the Drawings and the

Specifications, the stricter provision as determined by the Owner or Owner's Representative shall govern.

C. Omissions from the Drawings or Specifications, or the incorrect description of details of Work which are necessary to carry out the intent of the Drawings and Specifications, or work which is customarily performed, shall not relieve the Contractor from performing such omitted or incorrectly described work.

D. No exclusion from, or limitations in, the language used in the Project Documents shall be interpreted as meaning that ancillary or accessory items necessary to complete any required system or item of equipment are to be omitted.

1.7 REVIEW OF SPECIFICATIONS

A. The Contractor shall carefully study and compare the Drawings and Specifications. Any error, inconsistency or omission discovered shall be immediately reported to the Owner or Owner's Representative. If the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission without such notice to the Owner or Owner's Representative, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the cost for any correction.

1.8 EXAMINATION OF THE PREMISES

A. The Contractor shall visit the Site to become familiar with the local conditions under which the work is to be performed and correlate the observations with the requirements of the Drawings and Specifications. No allowance will be made for claims of concealed conditions which the Contractor learned or should have learned in exercising due diligence in its observations of the site and review of the local conditions.

B. Before ordering any materials or performing any work, the Contractor shall coordinate the installation with the work of other trades and shall verify all measurements. No extra charge or compensation will be allowed for duplicate work or material required because of an unverified difference between an actual dimension and the measurement indicated in the Drawings. Any discrepancies found shall be submitted in writing to the Owner or Owner's Representative for consideration before proceeding with the work.

1.9 COORDINATION OF TELECOM CABLING PATHWAYS AND TELECOM EQUIPMENT ROOMS

A. The telecom drawings are diagrammatic in depicting the routing of communications pathways and the layout of communications equipment.

B. The contractor shall coordinate the installation of all telecom work with the work of other trades including Mechanical, Electrical, Plumbing, Sprinkler, Structural and Architectural.

C. The contractor shall participate in coordination meetings with other trades prior to the installation of the work. For a specific space/area, the telecom contractor shall coordinate the routing and installation of all telecom work with all other trades that have work in that specific space/area.

D. Prior to the installation of telecom cabling pathway including conduit, basket tray, cable tray, ladder rack, sleeves, etc., the contractor shall coordinate the routing of this pathway to avoid conflicts with and provide necessary clearances from the work of other trades. The contractor shall provide all horizontal offsets, vertical offsets and radius bends as necessary to coordinate the routing of the telecom pathway with the work of other trades and building structure.

E. Prior to the installation of equipment and/or cabling in the communication rooms, the contractor shall coordinate the layout of all equipment and cable pathways. The contractor shall submit shop drawings for approval of each room. At a minimum, the following information shall be included on the shop drawings:

1. Layout of all floor mounted equipment including racks, cabinets and uninterruptible power supplies. Drawings shall show the required clearances with dimensions in the front, rear and side of all floor and wall mounted equipment.
2. Layout of all floor mounted sleeves and cable openings.
3. Layout of horizontal and vertical ladder rack.
4. Layout of light fixtures, HVAC equipment and ductwork serving the room. Coordinate the layout of this equipment with the overhead cable pathways.
5. Provide elevations of each wall showing the location of all wall mounted equipment including racks, ground bars, electrical panels, electrical outlets, wall mounted termination equipment, cable slack storage rings, security panels, etc.

1.10 WARRANTY AND SERVICES

A. The installed Belden 10GX, 2400, and/or FiberExpress System shall be covered by a certification program provided by BELDEN/CDT and the Certified System Vendor (Contractor).

B. All Contractor-installed cabling shall be certified as per BELDEN/CDT requirements for the Belden 10GX, System 2400, and/or FiberExpress System. Any requirements for Belden Certification not specified within the Plans and Specifications but necessary for certification are assumed.

C. Lifetime Application Assurance

1. Belden certification shall provide the assurance that all present and future applications engineered for the performance level of the cabling system used shall work for the lifetime of the certified Belden 10GX, System 2400, and/or FiberExpress System.
2. Should the certified Belden 10GX, System 2400, or FiberExpress System fail to support the application(s) designed to operate over it—whether at the time of cutover to the new cabling system, during subsequent use, or after upgrading to a newer supported application (for example, to a Gigabit Ethernet or an ATM network from a lower-speed network environment)—BELDEN/CDT and The Certified System Vendor (Contractor) shall take prompt corrective action.

D. 25-Year Product Warranty

1. Belden certification shall provide a twenty-five (25) year product warranty for all Belden passive components used in the installed Belden 10GX, System 2400, and/or FiberExpress System. Defective and/or improperly installed products shall be replaced and/or correctly installed at no cost to the Owner.

PART 2 – PRODUCTS

2.1 EQUIPMENT AND MATERIALS MINIMUM REQUIREMENTS

A. Electrical equipment and systems shall meet UL Standards and requirements of the National Electric Code. This listing requirement applies to the entire assembly. Any modifications to equipment to suit the intent of the Specifications shall be performed in accordance with these requirements.

B. Equipment shall meet all applicable FCC Regulations.

C. All materials, unless otherwise specified, shall be new and be the standard products of the manufacturer. Used equipment or damaged material will be rejected.

D. The listing of a manufacturer as “acceptable” does not indicate acceptance of a standard or cataloged item of equipment. All equipment and systems must conform to the Specifications.

2.2 WORKMANSHIP, SUBSTITUTIONS, WARRANTY

A. Materials and workmanship shall meet or exceed industry standards and be fully guaranteed for a minimum of one (1) year from the date of final acceptance. Cable integrity and associated terminations shall be thoroughly inspected, fully tested and guaranteed free from defects, transpositions, open shorts, tight kinks, damaged jacket insulation, etc.

B. Refer to the individual Division 27 Specifications for additional and/or extended warranty requirements.

C. All labor must be thoroughly competent, skilled and trained, and all work shall be executed in strict accordance with the best practice of the trades.

D. The Contractor shall be responsible for and make good, without expense to the Owner, any and all defects arising during this warranty period that are due to imperfect materials, improper installation or poor workmanship.

E. After the Contract is awarded, requests to substitute for specified materials shall be submitted by the Contractor to the Owner or Owner’s Representative within thirty (30) days, complete with reasons for the substitution and savings which accrue to the Owner if the substitutions are approved. Substitutions after Contract award will be considered only if the substitutions are equal or superior to the products specified.

F. No material substitutions will be allowed except by written acceptance from the Consultant. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples are provided.

G. Approval of alternate or substitute equipment or material in no way voids the Specification requirements.

H. Under no circumstances shall the Owner be required to prove that an item proposed for substitution is not equal to the specified item. It shall be mandatory that the Contractor submit to the Owner or Owner’s Representative all evidence to support the contention that the item proposed for substitution is equal to the specified item. The Owner’s decision as to the equality of substitution shall be final and without further recourse.

2.3 FACTORY ASSEMBLED PRODUCTS

A. Manufacturers of equipment assemblies that include components made by others shall assume complete responsibility for the final assembled unit.

1. All components of an assembled unit need not be products of the same manufacturer.
2. Component parts, which are alike, shall be from a single manufacturer.

3. Components shall be compatible with each other and with the total assembly for the intended service.
4. Components of equipment shall bear the manufacturer's name or trademark model number and serial number on a name plate securely affixed in a conspicuous place, or cast integral with, stamped or otherwise permanently marked upon the components of the equipment.

B. Major items of equipment that serve the same function must be the same make and model.

C. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that a complete and fully operational system will result.

D. Maximum standardization of components shall be provided to reduce spare part requirements.

PART 3 – EXECUTION

3.1 ROUGH-IN

A. Before construction work commences, the Contractor shall visit the site and identify the exact routing of horizontal and backbone cable pathways.

B. All equipment locations and cabling pathway shall be coordinated with other trades and existing conditions to eliminate interference with required clearances for equipment maintenance and inspections.

C. Coordinate work with other trades and existing conditions to determine exact location of equipment and routing of cable pathways.

1. Where more than one trade is involved in an area, space or chase, all shall cooperate and install their own work to utilize the space equally between them in proportion to their individual requirements. If, after installation of any equipment, piping, ducts, conduit, etc., it is determined that adequate space has not been provided for passage or maintenance, rearrange the work. Any changes in the size or location of the material or equipment supplied or proposed, which may be necessary in order to meet field conditions or in order to avoid conflicts between trades, shall be brought to the immediate attention of the Owner's Representative and approval received before such alterations are made.

D. Provide easy, safe and code mandated clearances at equipment racks and enclosures.

3.2 CUTTING, CORING AND PATCHING

A. The Contractor shall be responsible for all cutting, patching, coring and associated work to complete the communications cabling pathway system.

B. Protect existing finishes from water damage during core/cutting work and cleanup all related water and debris. Patch adjacent work disturbed by installation of new work including insulation, walls and wall covering, ceiling and floor covering or other finished surfaces.

C. Contractor to submit all proposed concrete wall or floor penetrations to the Structural Engineer for approval prior to performing the work. Contractor shall locate and avoid cutting concrete reinforcing steel using current x-ray or pachometer equipment.

3.3 FIRESTOPPING

A. All penetrations through fire-rated building structures (walls and floors) shall be sealed with an appropriate fire stop system. This requirement applies to through penetrations (complete penetration) and membrane penetrations (through one side of a hollow fire rated structure). Any penetrating item i.e., riser slots and sleeves, cables, conduit, cable tray, and raceways, etc. shall be properly fire stopped.

B. Firestopping assemblies shall meet or exceed the rating of the wall or floor being penetrated.

C. Fire stopping References:

1. ASTM E814, Standard Method of Fire Tests of Through-Penetration Fire Stops.
2. ASTM E 119, Fire Tests of Building Construction and Materials (for fire-rated architectural barriers).
3. 2002 NFPA National Electrical Code, Section 800-52, Paragraph 2(b), Spread of Fire and Products of Combustion.

3.4 CONCEALMENT

A. Telecom cabling pathways including conduit, sleeves and tray shall be concealed above ceilings, in walls, below slabs, and elsewhere throughout building. If concealment is impossible or impractical, or in areas without ceilings, the Owner’s Representative shall be notified of the proposed routing prior to starting that portion of the work.

B. All telecom cabling must be routed concealed above accessible ceilings or in conduit. No exposed telecom cabling is permitted with the exception of telecom cabling routed within the telecom rooms.

3.5 CONDUIT SEALING

A. All penetrations through slab-on-grade and concrete-filled metal decks to be sealed watertight. See Section 07 92 00 – Joint Sealants.

B. The Contractor shall seal all foundation penetrating conduits and all service entrance conduits and sleeves to eliminate the intrusion of moisture, gases and rodents into the building. This requirement also applies to spare conduits.

C. Spare conduits shall be plugged with expandable plugs.

D. All service entrance conduits shall be sealed or resealed after cable installation.

3.6 GENERAL INSTALLATION REQUIREMENTS

A. Coordinate ordering and installation of all equipment with long lead times or having a major impact on work by other trades so as not to delay the job or impact the schedule.

B. Where mounting heights are not dimensioned, install systems, materials and equipment to provide the maximum headroom possible.

C. Set all equipment to accurate line and grade, level all equipment and align all equipment components.

D. Provide all scaffolding, rigging, hoisting and services necessary for erection and delivery of equipment and apparatus furnished into the premises.

E. No equipment shall be hidden or covered up prior to inspection by the Owner's Representative. All work that is determined to be unsatisfactory shall be corrected immediately.

F. All work shall be installed level and plumb, parallel and perpendicular to other building systems and components.

G. The Contractor shall replace all ceiling tiles damaged by work performed as part of the communications contract.

H. Storage and security of material and equipment shall be the responsibility of the Contractor.

END OF SECTION 270500

SECTION 270528 – INTERIOR COMMUNICATION PATHWAYS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Drawings and general provisions of the Contract, Including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. The Contractor shall provide all equipment, materials, labor, and services necessary to complete interior communication pathways and to ensure that the pathways are in compliance with requirements stated or reasonably inferred by this Specifications, and the Constructions Drawings.

C. This section includes minimum requirements for communication pathways for horizontal and backbone cabling.

D. This section includes minimum requirements for the following

1. Conduit
2. Sleeves
3. Smoke and Acoustical Cable Pathways
4. Fire Stop Pathways
5. Penetrations
6. Wire Cable Tray
7. Pull Boxes
8. Velcro Tie Wraps
9. Cable Hangers (J-Hooks)
10. Measuring Tape and Pull String
11. Innerduct
12. Fire Stop

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 11 00: Communications Equipment Room Fittings
3. 27 13 00: Communications Backbone Cabling
4. 27 15 00: Communications Horizontal Cabling
5. 27 41 00: Audio Visual Systems
6. 27 41 16: AV and Safety Alert Systems
7. 27 51 13: Paging Systems
8. 27 51 29: Emergency Communications Systems
9. 27 53 13: Wireless Clock Systems
10. 27 53 19: Emergency Responder Radio System

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of 27 05 00 1.4 and in particular the following code requirements

1. ANSI/TIA-568.0-E: Generic Telecommunications Cabling for Customer Premises (Revision E, March 2020).
2. ANSI/TIA-568.1-E: Commercial Building Telecommunications Infrastructure Standard (Revision E, March 2020).
3. ANSI/TIA-569-E: Telecommunications Pathways and Spaces (Revision E, May 2019)
4. ANSI/TIA-607-D: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises (Revision D, July 2019).
5. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
6. Underwriter’s Laboratories, Inc. (UL).

1.4 QUALITY ASSURANCE

A. All pathways and associated equipment shall be installed in a neat and workmanlike manner. Conduit, J-hooks, cable tray and pull boxes shall be installed and properly coordinated with other trades so that they are fully accessible for installation and pulling of cable. All methods of construction that are not specifically described or indicated in the Specifications shall be subject to the control and approval of the Owner's Representative.

1.5 SUBMITTALS

A. The Contractor shall provide product manufacturers data sheets for the following Items

1. Cable Tray.
2. Smoke and Acoustical Cable Pathways
3. Velcro tie wraps.
4. Measuring tape / pull string.
5. Innerduct.
6. Firestop.

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

C. Shop drawings indicating the proposed layout and elevation of the following items shall be submitted for review and approval. Shop drawings shall be coordinated with the work of other trades.

1. Cable tray.
2. Conduit 2” and larger.
3. Pull boxes.
4. Main J-Hook runs.
5. Sleeves.

D. As-built drawings shall be submitted at the completion of the project showing the actual routing and location of the following items:

1. Cable Tray.
2. Conduit 2” and larger.
3. Pull boxes.
4. Sleeves
5. Main J-Hook runs.

PART 2 – PRODUCTS

2.1 CONDUITS

A. See Electrical Specifications for additional raceway and j-box products and additional requirements.

B. Install conduit where shown on the drawings.

C. All backbone fiber and copper telecom cabling shall be installed in conduit.

D. Conduit shall be routed concealed unless otherwise noted on the drawings.

E. Install conduit for routing of horizontal telecom cabling where cable is routed through inaccessible areas including but not limited to walls, floors, chases, above gypboard or plaster ceilings, etc. Provide access doors as required to provide reasonable access for the installation of telecom cabling in inaccessible ceiling and wall spaces.

F. Install conduit for routing of horizontal telecom cabling where cabling is routed in areas subsequent to damage including mechanical and electrical rooms.

G. Install ground bushing on the ends of conduit at telecommunication rooms. Install a #6 green insulated ground conductor from the ground bushing to the grounding bar in the telecommunication room.

H. At each wall or ceiling mounted telecom outlet, the contractor shall install a 4 11/16” wide by 4 11/16” high by 2 ½” deep box with 1” conduit (UON) to an accessible ceiling space. Where the conduit stubs into an accessible ceiling space, install a plastic bushing on the end of the conduit to prevent damage to the cable jacket.

I. Where conduit penetrations are exposed in finished areas, install steel, chrome plated split ring escutcheon plates.

J. At all exterior locations or in areas subject to damage, install rigid or IMC conduit. Exposed conduit shall be painted to match existing surfaces.

2.2 WIRE CABLE TRAY

A. Provide wire cable tray where shown on the drawings meeting the following specifications:

1. UL Classified.
2. 12” width x 4” depth, 18” width x 4” depth and 24” width x 4” depth. See plans for sizes.
3. Constructed of high strength steel wires formed into 2 inch by 4 inch wire mesh pattern.
4. Continuous welded construction.
5. Electroplated Zinc finish.

B. The wire cable tray routing shown on the drawings is diagrammatic. Prior to the installation of wire cable tray, the contractor shall coordinate the routing to avoid conflicts with and provide necessary clearances from the work of other trades. The contractor shall provide all horizontal offsets, vertical offsets and radius bends as necessary to

coordinate the routing of the wire cable tray with the work of other trades and building structure.

C. The basket tray shall be designed of adequate strength to support the entire volume of the tray filled with horizontal 4-pair UTP communications cables.

D. Provide Manufacturer's splice connections between all sections of tray. Provide quantity of splice connectors as required by the Manufacturer. Splice connectors shall provide a continuous ground path for the tray in accordance with the NEC. All splicing assemblies shall be bolted with serrated flange lock nuts.

E. Provides "T" sections and radius bends in the basket tray at all perpendicular tray intersections.

F. Where wire cable trays penetrate non-rated walls, stop cable tray short of wall and provide smoke and acoustical pathways.

G. Where wire cable trays penetrate fire rated walls, stop cable tray short of wall and provide 4" conduit sleeves with a UL listed firestop assembly.

H. Provide grounding jumpers to bond discontinuous sections of the wire cable tray. At transitions between the cable tray and conduit/sleeves, install ground bushings on the conduit/sleeves and install a #6 ground wire to bond the cable tray to the conduit/sleeves.

I. Wire cable tray shall be supported using a trapeze system consisting of horizontal 1 5/8" Unistrut and two 3/8" threaded rods. Install "drop-in" anchors, wedge anchors and beam clamps to support the threaded rod from the building structure. Space supports per manufacturer's requirements but not to exceed 8'-0" on center.

J. Provide Unistrut lateral and longitudinal bracing every 40'-0", at 90 degree turns, and where required by local building codes. Provide rod stiffeners as necessary.

K. Installed wire cable tray shall have rounded edges and smooth surfaces to prevent damage to cable jackets.

L. Provide radius corners at all 90 degree bends, tees and crosses.

M. Acceptable products:

1. Cooper B-Line WB400 Series (WB412, WB418 and WB424 tray and associated connectors, splices, supports, etc).
2. Cablofil CF 105 series (CF 105/300, CF 105/450 and CF 105/600 tray and associated connectors, splices, supports, etc).
3. Chatsworth OnTrac Wire Mesh Cable Tray System (CPI P/N's 34821-512, 34821-518 and 34821-524 and associated connectors, splices, supports, etc).
4. Or approved equal.

2.3 SLEEVES

A. Contractor shall provide sleeves as shown on the drawings and as required to route telecom cabling through floor, ceiling and wall penetrations.

B. Contractor shall provide size and quantity of sleeves so as not to exceed 20% fill ratio and to accommodate future telecom cabling.

C. Where wire cable trays penetrate fire rated walls, stop cable tray short of wall and provide 4” conduit sleeves with a UL listed firestop assembly.

D. See the Electrical Specifications for acceptable products and additional requirements.

E. Provide 4” vertical steel sleeves where shown on the drawings and to accommodate conduit or cable routing through floor slabs. Sleeves shall extend 6 inches above and below the floor slab and shall be cast into the concrete. Where sleeves are core drilled into the concrete, install firestopping material between the sleeve and the floor slab to maintain the floor rating. Provide plastic or nylon bushings on both sides of sleeves to prevent damage to cabling.

F. Provide 4” horizontal sleeves where shown at telecom rooms or rated walls to accommodate routing of horizontal cabling from the corridors. Sleeves should extend 2” beyond the wall on both sides. Provide plastic or nylon bushings on both sides of sleeves to prevent damage to cabling.

G. Install split sleeves (not shown on the drawings) to accommodate routing of horizontal cabling through non-rated full height gypboard walls. Sleeves shall be sized so as not to exceed a 20% fill rate.

H. Provide separate sleeves for routing of CAT 6 and CAT 6A cabling.

I. Install firestopping between the sleeve and structure, and between the telecom cables and the sleeve to maintain the wall rating.

J. Where sleeve penetrations are exposed in an architectural finished area, install chrome plated steel split ring escutcheon plates.

2.4 CABLE TRAY WALL PENETRATIONS AT NON-RATED WALLS

A. Where wire cable trays penetrate non-rated walls, stop cable tray short of wall and provide smoke/acoustical pathways.

B. Pathways shall contain a built-in sealing mechanism and shall automatically adjust to the installed cables.

C. Pathways shall allow cables to be installed, removed or retrofitted without the need to remove or reinstall acoustical materials.

D. Pathways shall provide a minimum Sound Transmission Classification (STC) of 61.

E. Do not exceed 40% cable fill ratio through pathways.

F. Acceptable Products:

1. STI Technologies EZ Path 33NEZ.
2. Or Approved Equal.

2.5 FIRE RATED PATHWAYS AT FIRE RATED WALLS

A. Provide rectangular “EZ-Path” fire rated pathways at cable penetrations through telecom room walls.

B. At each penetration location, the contractor shall provide quantity of “EZ-path” fire rated pathways to accommodate all cabling shown on the drawings. The contractor shall

provide one (1) additional empty “EZ-Path” at each penetration location to accommodate future communications cabling.

C. Fire rated pathways shall have the following physical characteristics:

1. Pathways shall be UL Classified and FM approved in accordance with ASTM E814 (UL1479).
2. Pathways shall be filled with intumescent material. Intumescent material shall expand when exposed to heat and shall completely seal the pathway preventing the passage of flames and smoke.
3. Pathways shall be fastened to wall plates on each side of the wall. Multiple pathways shall be ganged with mfg gang kit.
4. The contractor shall install quantity of pathways to accommodate all telecom cables plus one additional empty pathway. Do not exceed manufacturer’s recommended fill capacity.

a. Acceptable Products:

(1) Specified Technologies, Inc. EZ-Path Series 44+.
(2) No Substitutions accepted.

2.6 PULL BOXES

A. See the Electrical Specifications for additional pull box requirements and acceptable manufacturers.

B. Provide pull boxes where shown on the drawings to accommodate copper backbone cable splices.

C. Provide pull boxes in backbone cabling conduit every 100 feet and every 180 degrees of bend (whichever is the more strict provision) to facilitate pulling of backbone cabling.

D. Pull boxes shall be sized so as not to exceed the minimum bend radius of the backbone fiber and copper cabling.

E. Coordinate location of pull boxes with other trades. Provide access doors where required to access pull boxes in inaccessible wall or ceiling spaces.

2.7 CABLE HANGERS (J-HOOKS) AND SUPPORTS

A. Provide cable hangers (J-hooks) spaced at 5’’-0” centers to support horizontal cable from the workstation outlet to the cable tray.

B. Hangers shall be prefabricated, zinc coated, carbon steel hangers designed specifically for 4-pair UTP communications cabling installations.

C. Hangers shall have an open top and rolled edges. Hangers shall have a minimum 2” and maximum 4” diameter loop.

D. Hangers shall be supported directly from the building structure. The Contractor shall provide anchors, beam clamps, threaded rod, rod fasteners, flange clips and brackets as needed to support the cable hangers from the building structure. Do not attach hangers to ceiling support wires or other support systems installed by other building trades.

E. J-hooks shall not support more cables than recommended by the manufacturer. J-hooks shall be sized to provide a minimum 20 percent spare capacity.

F. Cable bundles shall not exceed (24) cables and shall be loosely bound with Velcro cable straps.

G. Acceptable Products

1. Erico Caddy CableCat Clips.
2. B-Line Cable Hook System.
3. Panduit J-Pro Cable Support System.
4. Or approved equal.

2.8 VELCRO CABLE STRAPS

A. Install Velcro cable ties cut to length from a continuous roll to loosely bundle horizontal cabling routed down J-hook lines, on the cable tray and ladder rack.

B. Install Velcro cable ties at 2'-0" intervals outside of the telecom room and 1'-0" intervals inside the telecom room.

C. Do not exceed qty (24) cables per bundle.

D. Provide plenum rated Velcro tie wraps where cable is routed in plenum spaces.

E. The use of plastic tie-wraps to bundle cabling is not permitted.

A. Acceptable Products
1. Panduit HLS-15R6 or HLSP (plenum rated).
2. Leviton 43115-075.
3. Or approved equal.

2.9 MEASURING TAPE AND PULL STRING

A. Install pull string in all telecom conduit and innerduct. Pull string shall be ½" pre-lubricated high strength woven polyester with sequential foot markings. The tensile strength of the pull string shall be greater than or equal to 1,250 lbs.

B. Pull string shall meet or exceed the requirements of Bellcore GR-356-CORE "Generic Requirements for Optical Cable Innerduct and Accessories".

C. Acceptable Products

1. Carlon TL145xx.
2. A-D Technologies Bull-Line WP12xx.
3. Or approved equal.

2.10 INNERDUCT

A. Provide multi-cell fabric innerduct where shown on the drawings and for installation of backbone fiber and copper cabling.

B. Innerduct should be terminated at the conduit entrance in the telecom rooms and secured to the plywood backboard.

C. Provide fabric innerduct size and cell count as shown on the drawings.

D. Acceptable Products

1. Maxcell Fabric Innerduct
2. No Known Equal.

2.11 FIRE STOPPING

A. Provide fire stopping and backing material between sleeves/conduit penetrations through rated partitions or floors. Provide fire stopping in sleeves/conduits after all cables have been installed.

B. The minimum required fire resistance ratings of the wall of floor assembly shall be maintained by the fire stop system. The installation shall provide an air and watertight seal.

C. Fire stopping shall be listed or classified by an approved independent testing laboratory. The system shall meet the requirements of “Fire Tests of Through-Penetration Fire Stops” designated ASTM E814.

D. Manufacturer’s recommended installation standards shall be closely followed (i.e. minimum depth of material, use of ceramic fiber and installation procedures).

E. For each firestopping system on the project, submit the page from the UL fire resistance directory showing the firestopping system.

F. Acceptable Manufacturers:

1. 3M.
2. Hilti.
3. Nelson.
4. Specified Technology.
5. Or approved equal.

PART 3 – EXECUTION

3.1 COMMUNICATION PATHWAY SUPPORTS

A. All hangars for communication items (conduit, boxes, wire basket tray, j-hooks and all other related equipment) where an “Epic Deck” system occurs shall be compatible for use with this system, “Epic Deck” is by Epic Metals Corporation. See Architectural and Structural drawings for locations.

3.2 CONCEALMENT

A. Telecom cabling pathways including conduit, sleeves and cable tray shall be concealed above ceilings, in walls, below slabs, and elsewhere throughout building. If concealment is impossible or impractical, or in areas without ceilings, Contractor shall submit proposed routing of the raceway for review and approval prior to starting that portion of the work.

B. All telecom cabling must be routed concealed above accessible ceilings or in conduit. No exposed telecom cabling is permitted with the exception of telecom cabling routed within the telecom rooms.

3.3 COORDINATION DRAWINGS

A. The telecom drawings are diagrammatic in depicting the routing of telecom cabling pathways.

B. The contractor shall coordinate the installation of all telecom pathways with the work of other trades including Mechanical, Electrical, Plumbing, Sprinkler, Structural and Architectural.

C. The contractor shall participate in coordination meetings with other trades prior to the installation of telecom cabling pathways. For a specific space/area, the telecom contractor shall coordinate the routing of telecom pathways with all other trades that have work in that specific space/area.

D. Prior to the installation of telecom cabling pathway including conduit, basket tray, cable tray, ladder rack, sleeves, etc., the contractor shall coordinate the routing of this pathway to avoid conflicts with and provide necessary clearances from the work of other trades. The contractor shall provide all horizontal offsets, vertical offsets and radius bends as necessary to coordinate the routing of the telecom pathway with the work of other trades and building structure.

3.4 COMMUNICATION PATHWAYS

A. Prior to cable installation, the Contractor shall verify that the telecommunications pathways are installed as specified in the Drawings and Specifications. Any variations or violations from these documents shall be immediately reported to the Owner’s Representative. No portion of the Structured Cabling System shall be installed in any component of the Telecommunications Pathways and Spaces which deviates from these documents. All cabling designated on the Blueprints as terminating within a specific Telecom Room shall be installed as such unless otherwise specified in writing by the Owner’s Representative.

B. Cabling for other trades shall not occupy any pathway utilized for telecommunications cabling.

C. The cable tray shall be installed so that a minimum of 6” clear space is maintained above the top of the tray to facilitate cable installation. The contractor shall coordinate the routing of the cable tray with other trades so that plumbing piping, fire sprinkler piping, ductwork, conduits, etc are not routed within the 6” clear space above the tray.

D. Where the routing of telecom pathways conflicts with the work of other trades, the telecom contractor shall reroute the telecom pathway (cable tray, conduit, sleeves, etc.) as required to eliminate the conflict.

E. The drawings are diagrammatic and provide a general routing for conduit, J-hooks and cable tray. The Contractor shall coordinate the exact routing of the communication raceway systems with other trades and the building structure. Access doors shall be installed as necessary to provide access for cable installation, inspection and maintenance.

F. Install conduit where shown on the drawings or as required to route telecom cabling in inaccessible ceiling or wall spaces. Install conduit to protect cable where routed through areas subject to damage including mechanical and electrical rooms.

G. Cable pathways including conduit, cable tray, sleeves, and J-hooks shall be sized for 20% fill capacity.

H. When installing conduit, J-hooks and cable tray, the Contractor shall maintain the following minimum clearance from sources of electro-magnetic interference (EMI).

1. 6” clear from power conductors.
2. 12” clear from fluorescent lighting fixtures and ballasts.
3. 36” clear from transformers and motors.

I. Provide all items necessary for the support and seismic bracing of conduit and cable tray including concrete anchors, clamps, brackets, hanger rods, rod stiffeners, unistrut, splice plates, couplers, expansion joint assemblies, etc.

J. The conduit and cable tray system shall provide a continuous ground path per the National Electrical Code. Conduit and tray shall be bonded to ground at the telecom rooms. All sections of the backbone conduit and tray shall be mechanically fastened and bonding jumpers shall be installed as necessary to provide continuous ground path.

K. In order to maximize floor and wall space in the telecom rooms, all conduit must be stubbed into the room above the ladder rack UON. Conduits shall not be stubbed up through the floor slab unless specifically shown on the drawings.

3.5 SLEEVES

A. Install sleeves through walls and floors as required to route horizontal and backbone telecom cabling.

B. Provide sleeves for penetration of all gypboard walls. Layout wall penetrations as directed by the General Contractor and provide split sleeves to the framing contractor for installation.

C. Where wire cable trays penetrate non-rated walls, stop cable tray short of wall and provide smoke and acoustical pathways.

D. Where wire cable trays penetrate fire rated walls, stop cable tray short of wall and provide 4” conduit sleeves with a UL listed firestop assembly.

E. Firestop all penetrations through rated walls. Firestop assemblies shall meet or exceed the rating of the walls or floors being penetrated.

F. Coordinate layout and installation of concrete wall and floor sleeves prior to concrete pours. Contactor is responsible for providing, installing, securing and covering sleeves. The contractor shall have field personnel on site during concrete pours to ensure that sleeves are not dislodged or moved during concrete pours. Contractor will be responsible for core drilling costs related to missed or improperly located sleeves.

G. Where sleeves are installed more than 24” above the overhead ladder rack in the telecom rooms, install wall mounted vertical ladder rack below the sleeves to support cabling.

H. Provide separate sleeves for routing of CAT 6 and CAT 6A cabling.

3.6 CUTTING, CORING AND PATCHING

A. The Contractor shall be responsible for all cutting, patching, coring and associated work to complete the telecommunications cabling pathway system.

B. Protect existing finishes from water damage during core/cutting work and cleanup all related water and debris. Patch adjacent work disturbed by installation of new work including insulation, walls and wall covering, ceiling and floor covering or other finished surfaces.

C. Contractor to submit all proposed concrete wall or floor penetrations to the Structural Engineer for approval prior to performing the work. Contractor shall locate and avoid cutting concrete reinforcing steel using current x-ray or pachometer equipment.

3.7 CABLE HANGERS

A. Secure cable tray and J-hook hanger supports directly to the building structure. Hangers shall not be supported from the work of other trades including ceiling supports, electrical conduits, plumbing pipes, sprinkler piping, ductwork, ceiling mounted equipment or their supports unless it is part of an engineered system.

B. Install J-hooks on a maximum of 5’-0” centers. Install J-hooks a minimum of 6” above ceiling tiles to facilitate ceiling tile removal.

END OF SECTION 270528

SECTION 270543 – EXTERIOR COMMUNICATION PATHWAYS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. The Contractor shall provide all equipment, materials, labor, and services necessary to complete the exterior communication pathways and to ensure that they are in compliance with requirements stated or reasonably inferred by the Specifications and the Construction Drawings.

B. This section includes requirements for underground conduit and communication vaults as shown on the Telecom Site Plans.

C. Minimum requirements and installation methods are included for the following:

1. PVC and Rigid Conduit.
2. Precast Hand Holes and Covers 10” Wide X 17” Long.
3. Precast Hand Holes and Covers 13” Wide X 24” Long.
4. Precast Hand Holes and Covers 17” Wide X 30” Long.
5. Precast Pull boxes and Covers 30” Wide X 48” Long.
6. Multi-cell fabric innerduct.
7. Muletape (Pull rope).
8. Waterproofing.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 11 00: Communications Equipment Room Fittings
3. 27 13 00: Communications Backbone Cabling

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of Specification Section 27 05 00 1.4 and in particular the following code requirements:

1. ANSI/TIA-569-E: Telecommunications Pathways and Spaces (Revision E, May 2019)
2. ANSI/TIA-606-D: Administration Standard for Telecommunications Infrastructure (Revision D, October 2021).
3. ANSI/TIA-607-D: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises (Revision D, July 2019).
4. ANSI/TIA-758-B: Customer-Owned Outside Plant Telecommunications Infrastructure Standard (Revision B, March 2012).
5. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
6. Underwriter’s Laboratories, Inc. (UL).

1.4 SUBMITTALS

A. Manufacturer's Data Sheets: Provide data sheets for the following products:

1. PVC and Rigid Conduit.
2. Precast Hand Holes and Covers 10" Wide X 17" Long.
3. Precast Hand Holes and Covers 13" Wide X 24" Long.
4. Precast Hand Holes and Covers 17" Wide X 30" Long.
5. Precast Pullboxes and Covers 30" Wide X 48" Long.
6. Multi-cell fabric innerduct.
7. Muletape (Pull rope).

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

C. As-Built Drawings: Provide as-built drawings for the outside plant conduit and vaults. Drawings must be dimensioned off of building lines or curbs indicating the exact routing of the conduit and location of vaults.

PART 2 – PRODUCTS

2.1 PVC CONDUIT

A. Provide PVC conduit as shown on the Site Plan. Conduit shall be rated for direct burial, ultraviolet resistant, and conforming to UL Standard 651, NEC 347, Federal Specification W-C-1094A, Schedule 40 or Schedule 80 as specified on drawings.

B. PVC fittings shall be the same material as conduit and installed with watertight joint compound recommended by manufacturer.

C. Install pre-manufactured conduit supports and spaces spacers as required to maintain proper conduit separation between multiple conduits routed in a trench.

1. Acceptable PVC Conduit manufactured by:

a. Carlon
b. Queen City Plastics
c. Certainteed Corporation
d. Pacific Western Extruded Plastics
e. Georgia Pipe Company
f. Hubbell Incorporation
g. Cantex Incorporation
h. Triangle

2.2 RIGID METAL CONDUIT

A. Underground PVC conduit shall transition to rigid metal conduit at stub up locations through the slab on grade.

B. Conduit stub-ups in the telecom rooms shall be vinyl coated rigid steel or rigid steel wrapped with 10 mil tape.

C. Rigid metal galvanized steel conduit (RMC) shall conform to Federal Specification WW-C-581E, NEC Article 346, ANSI Standard C80.1 and U.L. Standard No. 6 for rigid metallic conduit, except hot dipped galvanized after threading.

D. Fittings, sweeps, couplings, etc., shall be galvanized threaded type meeting above standards. Threadless fittings shall not be used.

1. Acceptable RMC Manufacturers:

a. Allied Tube and Conduit Corporation
b. LTV Steel Tubular Productions Co.
c. Midwest Electric-Cooper Industries
d. Wheatland Tube Company
e. Western Tube and Conduit Corp.
f. Triangle Wire and Cable Inc.

2. Acceptable Bushing Manufacturers:

a. Appleton
b. Thomas & Betts
c. OZ/Gedney
d. Midwest
e. Steel City

2.3 MULTI-CELL FABRIC INNERDUCT

A. Provide UL Listed fabric innerduct for routing of all backbone copper and fiber optic communications cabling between the MDF and all IDFs.

B. Provide qty (1) 2” 3-Cell MaxCell fabric innerduct “packs” in each 2” conduit between the MDF and the IDF’s.

C. Provide qty (2) 3” 3-Cell MaxCell fabric innerduct “packs” in each 4” conduit between the MDF and the IDF’s.

D. The MaxCell innerduct shall be terminated at the entry point of the telecom rooms and secured to the plywood backboard. 1 ¼” non-split orange corrugated innerduct shall be installed to route fiber optic backbone cabling from this point to the fiber termination cabinet(s).

E. Acceptable Products:
1. MaxCell Edge 2” 3-Cell Part Number MXE52223xx1000 (for installation in 2” conduits) and 3” 3-Cell Part Number MXE64283xx1000 (for installation in 4” conduits).
2. No Substitutions accepted.

2.4 MULETAPE (PULL ROPE)

A. Polyester Muletape shall be installed within each outside plant conduit and within each innerduct.

B. Mule tape shall be secured to the plywood backboard at the telecom rooms and to the unistrut racking in the pull boxes.

C. Provide 3/8” nylon mule tape with sequential foot markings and 600 lb pull strength.

D. Acceptable products:

1. NEPTCO WP600P.

2. Or approved equal.

2.2 TELECOM PULL BOXES (10” WIDE X 17” LONG) NON-TRAFFIC RATED

A. Provide reinforced precast concrete telecom pull boxes where shown on the drawings.

B. Provide 10” wide x 17” long x 12” deep reinforced concrete pull box.

C. Provide 10” wide x 17” long x 12” deep reinforced concrete extension.

D. Provide reinforced concrete lockable bolt down lid.

E. Provide additional reinforced concrete risers as required to maintain conduit depth as shown on the drawings.

F. Acceptable Products:

1. Jensen Precast HN1017-B pullbox, HN1017-E Extension and HN1017-L01 Lid.
2. Or Approved Equal.

2.3 TELECOM PULL BOXES (13” WIDE X 24” LONG) NON-TRAFFIC RATED

A. Provide reinforced precast concrete telecom pull boxes where shown on the drawings.

B. Provide 13” wide x 24” long x 12” deep reinforced concrete pull box.

C. Provide 13” wide x 24” long x 12” deep reinforced concrete extension.

D. Provide reinforced concrete lid. Covers shall be labeled “COMMUNICATIONS”.

E. Provide additional reinforced concrete risers as required to maintain conduit depth as shown on the drawings.

F. Acceptable Products:

1. Jensen Precast HN1324 pull box, HN1324-E extension and HN1324-L02 Lid.
2. Or Approved Equal.

2.4 TELECOM PULL BOXES (17” WIDE X 30” LONG) NON-TRAFFIC RATED

A. Provide reinforced precast concrete telecom pull boxes where shown on the drawings.

B. Provide 17” wide x 30” long x 12” deep reinforced concrete pull box.

C. Provide 17” wide x 30” long x 12” deep reinforced concrete extension.

D. Provide reinforced concrete lockable bolt down lid. Covers shall be labeled “COMMUNICATIONS”.

E. Provide additional reinforced concrete risers as required to maintain conduit depth as shown on the drawings.

F. Acceptable Products:

1. Jensen Precast HN1730-B pull box, HN1730-E extension and HN1730-L01 Lid.
2. Or Approved Equal.

2.5 TELECOM INTERCEPT PULL BOXES (30” WIDE X 48” LONG)

A. Provide reinforced precast concrete telecom pull boxes where shown on the drawings.

B. Provide 30” wide x 48” long x 30” deep reinforced concrete intercept pull box with 4” deep base.

C. Provide 30” wide x 48” long x 12” deep reinforced concrete riser.

D. Provide split incidental H-20 steel bolt down diamond plate surface. Covers shall be labeled “COMMUNICATIONS”.

E. Provide corrosion resistant galvanized steel channel racking and cable support hooks in all pull boxes. Racking and cable support hooks shall be installed on both sides of each pullbox.

F. Acceptable Products:

1. Jensen Precast PB3048-I intercept pullbox (PB3048-I), 12” Riser RS304812 and incidental H-20 Cover CA3048C61.
2. Or Approved Equal.

PART 3 – EXECUTION

3.1 UTILITY COORDINATION

A. Contact local utility companies and utility locating services prior to excavation to locate and mark existing underground utilities.

B. Coordinate conduit routing with existing underground utilities. Reroute conduit and provide horizontal and vertical offsets as required to avoid and to provide necessary clearances from existing utilities.

3.2 CONDUIT

A. OSP conduits shall be installed with a slight drain slope (0.125 inches-per-foot) away from buildings to prevent the accumulation of water in the conduit or ingress to the buildings.

B. Factory-manufactured sweeps which meet ANSI/TIA-569-B bend radius requirements shall be used for all telecommunications conduit. The bend radius of the sweeps must be a minimum of 10-times the internal conduit diameter. Bending conduit in the field using manual or mechanical methods is not acceptable.

C. Any 4" conduit with a sweep of more than 11 degrees is to have a minimum concrete encasement of 4".

D. OSP conduits shall be installed a minimum of 48” below finished grade. Conduits shall be encased in hard-tamped sand a minimum of 6” above and below the conduits. 6” clear space shall be maintained between conduits. Backfill above the conduits shall be installed and compacted to 95% density.

E. OSP conduit and duct bank runs must have a continuous orange colored, metal detectable warning tape installed half the distance between the top of the conduit and the finished grade.

F. All cable shall be installed in the lowest available conduit in a duct bank, working up as additional cables are installed.

G. Prior to installing cables, all new or unused OSP conduits must be cleaned with a brush pulled through the conduit at least two times in the same direction and swabbed with clean rags until the rag comes out of the conduit clean and dry. Conduits shall then be tested with a mandrel to prove compliance with the sweep radius requirements throughout the conduit run.

H. Spare OSP conduits and innerducts shall be plugged with watertight plugs at both ends to prevent the intrusion of moisture, gasses, and rodents throughout the construction project.

I. All OSP conduits and innerduct shall have a 3/8” nylon pull rope installed. Pull rope shall be re-pulled each time an additional cable is installed.

3.3 PULL BOXES

A. Install pull boxes and set covers to match finished grade.

B. Conduits shall enter pull boxes from the side. Do not sweep conduits into the bottom of the pull box.

3.4 CUTTING AND PATCHING

A. Sawcut and remove existing pavement, sidewalks, gutters, etc., to accommodate installation of outside plant conduit and pull boxes.

B. Replace sub-base, pavement, sidewalks gutters, etc., to match existing.

C. Repair and replace all landscaping and sitework disturbed by excavation including but not limited to irrigation lines, lawns, planting, etc. Resod lawn areas disturbed by excavation.

END OF SECTION 270543

SECTION 270800 – COMMISSIONING OF COMMUNICATIONS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Drawings and general provisions of the Contract, Including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. The Contractor shall provide all equipment, materials, labor, and services necessary to complete the testing, labeling and documentation of the telecom cabling system in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

C. This section includes the minimum requirements for the testing, identification and administration for the telecommunications cabling system, including the following:

1. Testing

    a. Category 6 Cable Test Equipment and Test Procedures.
    b. Category 6A Cable Test Equipment and Test Procedures.
    c. Copper backbone cable test equipment and test procedures.
    d. Fiber optic cable test equipment and test procedures.
    e. Cable test reports.

2. Identification

    a. Labeling of work area outlet faceplates and jacks.
    b. Labeling of horizontal data, voice and video cabling.
    c. Labeling of Copper Patch Panels.
    d. Labeling of fiber optic patch panels.
    e. Labeling of 110 wiring blocks.
    f. Labeling of racks and cabinets.
    g. Labeling of copper and fiber backbone cable.
    h. Labeling of innerduct.

3. Administration

    a. As-built drawings.
    b. Materials listing.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 11 00: Communications Equipment Room Fittings
3. 27 13 00: Communications Backbone Cabling
4. 27 15 00: Communications Horizontal Cabling
5. 27 41 00: Audio Visual Systems

6. 27 41 16: AV and Safety Alert Systems
7. 27 51 13: Paging Systems
8. 27 53 13: Wireless Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of Specification Section 27 05 00 1.4 and in particular the following requirements

1. ANSI/TIA-568.2-D: Balanced Twisted-Pair Telecommunications Cabling And Components Standards (Revision D, September 2018).
2. ANSI/TIA-568.3-D: Optical Fiber Cabling and Component Standard (Revision D, October 2016).
3. ANSI/TIA-598-D: Optical Fiber Cable Color Coding (Revision D, July 2014).
4. ANSI/TIA-606-D: Administration Standard for Telecommunications Infrastructure (Revision D, October 2021).
5. ANSI TIA-526-7-A: Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant (Revision A, July 2015).
6. ANSI/TIA-526-14-C: Optical Power Loss Measurement of Installed Multimode Fiber Cable Plant (Revision C, 2015).
7. ANSI/TIA-1152-A: Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling (Revision A, November 2016).
8. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
9. Underwriter’s Laboratories, Inc. (UL).

1.4 SUBMITTALS

A. Test Equipment: Submit manufacturers’ catalog sheets and specifications for the following cable testers

1. Category 6 cable tester.
2. Category 6A cable tester.
3. Category 3 backbone copper cable tester.
4. Multimode and singlemode fiber optic cable tester.

B. Calibration Reports: Provide calibration reports for all test equipment to be used on the Project. The calibration must have been performed by a manufacturer certified calibration facility and be dated no more than 60 days prior to the start of testing.

C. Cable Test Reports: Provide bound test reports for all cables signed by the technician performing the cable testing. Include Manufacturers data sheets for the cabling being tested.

D. Labels: Submit manufacturer’s data sheets on the type of labels to be used for each labeling application.

PART 2 – PRODUCTS

2.1 HORIZONTAL CATEGORY 6 UNSHIELDED TWISTED-PAIR CABLE TESTER

A. Shall perform all tests necessary to certify the horizontal Category 6 UTP cabling in accordance with ANSI/TIA/EIA 568 B.2-1.

B. Shall be a UL certified Level III test set calibrated by a manufacturer certified calibration facility. The calibration shall be dated no more than 60 days prior to the start of testing.

C. Acceptable Manufacturers

1. Fluke Networks
2. Ideal Industries
3. Agilent Technologies
4. Or equal.

2.2 CATEGORY 6A (AUGMENTED) UNSHIELDED TWISTED-PAIR CABLE TESTER

A. Shall perform all tests necessary to certify the horizontal Category 6A UTP cabling in accordance with ANSI/TIA/EIA 568 B.2-1 and Category 6A standard ANSI/TIA/EIA–568-B.2-10 -- Augmented Category 6 Cable.

B. Shall be a UL certified Level IV test set calibrated by a manufacturer certified calibration facility. The calibration shall be dated no more than 60 days prior to the start of testing.

C. Acceptable Manufacturers

1. Fluke Networks
2. Ideal Industries
3. Agilent Technologies
4. Or equal.

2.3 OPTICAL FIBER CABLE TESTERS

A. The Contractor shall test all strands of optical fiber cable with an approved power meter and light source. OTDR Trace results to be provided on all fiber strands.

B. The tester shall be capable of performing the tests required by ANSI/TIA/EIA – 568-B.1, ANSI/TIA/EIA–526-14A, and ANSI/TIA/EIA–526-7.

C. The tester shall have been calibrated by a manufacturer certified calibration facility. The calibration shall be dated no more than 60 days prior to the start of testing.

D. Acceptable Manufacturers

1. Fluke Networks
2. Ideal Industries
3. Agilent Technologies
4. Or equal.

2.4 LABELS

A. Labels shall be laser printed and shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

B. Acceptable manufacturers

1. Belden
2. Brady
3. Brother
4. HellermannTyton.

5. Or approved equal

2.5 WORK AREA OUTLET FACEPLATE LABELS

A. Label each port in each faceplate in accordance with Labeling Scheme identified on the Drawings. Label must be machine printed and inserted in the faceplate label window. Labels shall be provided by the faceplate manufacturer of the faceplate.

B. Acceptable manufacturers

1. Belden
2. Brother
3. HellermannTyton.
4. No Substitution

2.6 HORIZONTAL CABLE SHEATH LABELS

A. Label horizontal cable sheaths at work area outlets and at patch panels with laser printed self-laminating wrap around vinyl labels. Labels shall be in accordance with the Labeling Scheme identified in WCSD SCS-014.

B. Labels shall be white with black type. Label size shall be 1.0” wide by 1.5” high.

C. At the Telecom Room, cable labels will be affixed to cable a minimum of 1 inch from the termination on the patch panel, and placed in such a way as to be clearly visible.

D. At the work area outlet, cable labels shall be affixed to the cable 2 inches from the termination on the jack.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

2.7 COPPER PATCH PANEL LABELS.

A. Label each patch panel with a single panel ID label in accordance with the labeling scheme identified WCSD SCS-014.

B. Labels shall be compatible with the patch panels provided for the Project.

C. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.5” wide by 0.5” high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

D. Label each patch panel port with a laser printed label. Label each port with the room number of the room housing the work area outlet.

E. Labels shall be compatible with the patch panels provided for the Project.

F. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.375” high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

2.8 TELECOM ROOM FIBER OPTIC TERMINATION CABINET LABELS

A. Label each fiber optic patch panel with a single panel ID label in accordance with the labeling scheme identified WCSD SCS-014.

B. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.5” wide by 0.5” high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

C. A label will be affixed to the fiber termination cabinet as shown using the Backbone Cable Labeling Scheme.

D. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.5” high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

2.9 EQUIPMENT ROOM FIBER OPTIC TERMINATION CABINET LABELS

A. Label each fiber termination cabinets in accordance with the labeling scheme identified in WCSD-SCS-014.

B. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.5” wide by 0.5” high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

C. Label fiber modules in accordance with the labeling scheme identified in WCSD-SCS-014. Labels shall be affixed to the fiber termination cabinet directly on the Plexiglas front cover so labels will be visible when the cover is closed. Each label will indicate the exact location and position of the cable's far end according to the Backbone Cable Labeling Scheme.

D. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.5" high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

E. Label each Connector Module with its Slot in accordance with the labeling scheme identified on the drawings.

F. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.5" wide by 0.5" high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

2.10 EQUIPMENT RACK LABELS

A. Provide labels on the top angle of all equipment racks. Labels shall in accordance with the labeling scheme identified in WCSD-SCS-014.

B. Racks shall be labeled with Space ID and Rack ID.

C. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 1.0" high.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

2.11 COPPER BACKBONE CABLE SHEATH LABELS

A. The backbone cable sheaths in the Telecom rooms and at pull boxes shall be labeled. Labels shall be in accordance with the labeling scheme identified in WCSD-SCS-014.

B. Labels must be clearly visible at the rear of the rack.

C. Labels shall be self-laminating vinyl labels and must be compatible with the diameter of the backbone cable. Labels shall be 2.5” high by 1.5” wide.

1. Acceptable Manufacturers:

a. Belden
b. Brady
c. Brother
d. HellermannTyton.
e. Or approved equal

PART 3 – EXECUTION

3.1 CABLE TESTING – GENERAL

A. Visually inspect all cables, cable reels, and shipping cartons to detect cable damage incurred during shipping and transport. Return visibly damaged items to the manufacturer.

B. Where post-manufacture test data has been provided by the manufacturer on the reel or shipping carton, submit copies to the Owner's Representative as part of the cable test results.

C. The Owner's Representative reserves the right to observe any or all portions of the cable testing process.

D. The Owner's Representative further reserves the right to conduct, using contractors equipment and labor, a random re-test of up to ten percent (10%) of the cable plant to confirm documented test results.

E. Test results and corrective procedures are to be documented and submitted to the Owner's Representative within five (5) working days of test completion.

3.2 CATEGORY 6 UTP CABLE TESTING

A. A representative of the end-user shall be invited to witness field testing. The representative shall be notified of the start date of the testing phase 5 business days before testing commences.

B. Field test measurements shall be made in accordance with Annex I of ANSI/TIA/EIA-568-B.2 unless otherwise noted.

C. Field test measurements shall be conducted from 1 MHz to 250 MHz.

D. Field testing shall be conducted using a level III tester. The accuracy of the level III tester shall meet or exceed the requirements of Annex B of ANSI/TIA/EIA-568-B.2-1. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.

E. Every cabling link shall be tested in accordance with the ANSI/TIA/EIA-568-B.1 Section 11.2: “100-Ohm twisted-pair transmission performance and field test requirements”.

F. The installed twisted-pair horizontal links shall be tested from the patch panel in the telecommunications room to the work area outlet. The cable must pass the “Permanent Link” performance limits specification as defined in ANSI/TIA/EIA-568-B.1.

G. 100% of the installed cabling links must be tested and must pass the requirements of the standards mentioned above. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation.

H. Trained technicians who have successfully attended an appropriate training program shall execute the tests. Appropriate training programs include but are not limited to installation certification programs provided by BICSI or the ACP (Association of Cabling Professionals).

I. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field tester manufacturer must provide documentation as an aid to interpret results marked with asterisks. (Reference TIA-568-B; Annex I: Section I.2.2).

J. The Contractor shall provide Category 6, 250 MHz channel test results on all pairs of cable. The following minimum field test parameters are required:

1. Wire map (including cable shield if present).
2. Length.
3. Insertion loss.
4. Near-end crosstalk (NEXT) loss.
5. Power sum near-end crosstalk (PSNEXT) loss.
6. Equal-level far-end crosstalk (ELFEXT).
7. Power-sum equal-level far-end crosstalk (PSELFEXT).
8. Return loss.
9. Propagation delay.
10. Delay skew.

K. Test results shall be provided in electronic format and printed 8.5” x 11” format signed by the technician performing the testing. The electronic format should be a Microsoft Word .doc file. Along with the above test parameters, the following information must be included for each cable tested:

1. Name of Owner and name of project (building name).
2. Date and time of test.
3. Name of technician performing the field testing.
4. Manufacturer, model number, serial number and software revision of field tester.
5. Cable ID (Telecom Room # - Patch Panel # - Port # / Work Area Room # - Telecom Outlet – Jack #).
6. Overall Pass/Fail result.
7. Manufacturer, category and model number of cable.
8. NVP used to determine cable length.

3.3 CATEGORY 6A (AUGMENTED) UTP CABLE TESTING

A. A representative of the end-user shall be invited to witness field testing. The representative shall be notified of the start date of the testing phase 5 business days before testing commences.

B. Field test measurements shall be made in accordance with Annex I of ANSI/TIA/EIA-568-B.2 1 and the Category 6A standard ANSI/TIA/EIA–568-B.2-10.

C. Field test measurements shall be conducted from 1 MHz to 500 MHz.

D. Field testing shall be conducted using a level IV tester. The accuracy of the level IV tester shall meet or exceed the requirements of Annex B of ANSI/TIA/EIA-568-B.2-1 and the Category 6A standard ANSI/TIA/EIA–568-B.2-10. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.

E. Every cabling link shall be tested in accordance with the ANSI/TIA/EIA-568-B.1 Section 11.2: “100-Ohm twisted-pair transmission performance and field test requirements”.

F. The installed twisted-pair horizontal links shall be tested from the patch panel in the telecommunications room to the work area outlet. The cable must pass the “Channel” performance limits specification as defined in ANSI/TIA/EIA-568-B.1.

G. 100% of the installed cabling links must be tested and must pass the requirements of the standards mentioned above. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation.

H. Trained technicians who have successfully attended an appropriate training program shall execute the tests. Appropriate training programs include but are not limited to installation certification programs provided by BICSI or the ACP (Association of Cabling Professionals).

I. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field tester manufacturer must provide documentation as an aid to interpret results marked with asterisks. (Reference TIA-568-B; Annex I: Section I.2.2).

J. The Contractor shall provide Category 6A, 500 MHz channel test results on all pairs of cable. The following minimum field test parameters are required:

1. Wire map (including cable shield if present).
2. Length.
3. Insertion loss.
4. Near-end crosstalk (NEXT) loss.
5. Power sum near-end crosstalk (PSNEXT) loss.
6. Equal-level far-end crosstalk (ELFEXT).
7. Power-sum equal-level far-end crosstalk (PSELFEXT).
8. Return loss.
9. Propagation delay.
10. Delay skew.

K. Testing and certification of the Category 6A cabling system for Alien Crosstalk IS REQUIRED as follows:

The Contractor shall perform Alien Crosstalk testing on 1% of the installed CAT 6A links. Testing shall be performed in accordance with Fluke Electronic's or Agilent Technologies' current White Paper specifying field Alien Crosstalk testing procedures. "Worst case" CAT 6A links shall be selected for the testing based on overall cable length and where the cable is routed adjacent to the largest number of cables.

L. Test results shall be provided in a CD-ROM format within 5 days after the completion of the project. Test documentation shall be saved in Fluke LinkWare file format version 2.2 or later and must include (along with the above test parameters), the following information:

1. Test results as downloaded from the tester. The following information shall be included in the test results:

    a. Record of test frequencies.
    b. Cable type.
    c. Conductor pair and cable I.D.
    d. Measurement direction.
    e. Reference setup.
    f. Crew member name(s).

2. Additional documentation required to provide the following (if not included in test results):

    a. Test equipment name, manufacturer, model number, serial number, software version and last calibration date.
    b. The test method used and the specific settings of the equipment during the test as well as the software version being used in the field test equipment.
    c. Any required information not listed in test results (crew member, etc.).

3. The CD shall be clearly marked on the outside front cover with the words "Project Test Documentation", the project name, and the date of completion (month and year).

4. Unless the manufacturer specifies a more frequent calibration cycle, an annual calibration cycle is anticipated on all test equipment used for this installation. The Contractor must provide a copy of the last calibration certification with submitted test results.

5. When repairs and re-tests are performed, the problem found and corrective action taken shall be noted, and both the failed and passed test data shall be documented.

3.4 BACKBONE UTP COPPER CABLE TESTING

A. 100% of the backbone copper cable pairs shall be tested for opens, short, polarity reversals, transpositions, and the presence of AC voltage.

B. The Contractor shall examine open and shorted pairs to determine if the termination has been done properly. If so, the Contractor shall tag bad pairs at both ends and make note on the as-built documentation.

C. If copper backbone cable contains more than two percent (2%) bad pairs, the Contractor shall remove and replace the cable at the Contractor's expense.

D. The Contractor shall test all backbone copper cables and submit test result information in an electronic format and a printed 8.5” x 11” format signed by the technician performing the testing. The electronic format should be a Microsoft Word .doc file.

3.5 OPTICAL FIBER CABLE TESTING

A. A representative of the end-user shall be invited to witness field testing. The representative shall be notified of the start date of the testing phase 5 business days before testing commences.

B. 100% of the installed cabling links must be tested and must pass the field test specifications defined by the Telecommunications Industry Association (TIA) standard ANSI/TIA/EIA-568-B.1, ANSI/TIA/EIA-568-B.3 and ANSI/TIE/EIA-568-C.0. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation.

C. Trained technicians who have successfully attended an appropriate training program and have obtained a certificate as proof thereof shall execute the tests. These certificates may have been issued by any of the following organizations or an equivalent organization:

1. The manufacturer of the fiber optic cable and/or the fiber optic connectors.
2. The manufacturer of the test equipment used for the field certification tests.
3. Training organizations authorized by BICSI or by the ACP (Association of Cabling Professionals™) Cabling Business Institute.

D. Field test instruments for multimode fiber cabling shall meet the requirements of ANSI/TIA/EIA-526-14A. The light source shall meet the launch requirements of ANSI/EIA/TIA-455-50B, Method A. This launch condition can be achieved either within the field test equipment or by use of an external mandrel wrap (as described in clause 11 of ANSI/TIA/EIA-568-B.1) with a Category 1 light source. Field test instruments for singlemode fiber cabling shall meet the requirements of ANSI/EIA/TIA-526-7.

E. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.

F. The fiber optic launch cables and adapters must be of high quality and the cables shall not show excessive wear resulting from repetitive coiling and storing of the tester interface adapters.

G. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter.

H. Performance Test Parameters:

1. The multimode backbone links shall be tested in one direction at 850 nm and 1300 nm in accordance with ANSI/EIA/TIA-526-14A.
2. Singlemode backbone links shall be tested at 1310 nm and 1550 nm in accordance with ANSI/TIA/EIA-526-7, Method A.1, One Reference Jumper or equivalent method.
3. The link attenuation shall be calculated by the following formulas specified in ANSI/TIA/EIA standard 568-C.

Link Attenuation = Cable Attenuation + Connector Insertion Loss + Splice Insertion Loss

Where:

Cable Attenuation(dB) = Attenuation Coefficient(dB/Km) x Length(km)

Connector Insertion Loss(dB) = # of connector pairs x connector loss(dB)

Splice Insertion loss(dB) = # of splices(S) x splice loss(dB)

The values for the Attenuation Coefficient are listed in the following table below:

Type of Optical Fiber	Wavelength (nm)	Attenuation Coefficient (dB/km)
Multimode 50/125 um	850	3.5
Multimode 50/125 um	1300	1.5
Single Mode	1310	0.5
Single Mode	1550	0.5

4. The maximum allowable connector insertion loss = 0.75 dB. The maximum allowable splice loss = 0.3 dB.

I. The Contractor shall test all fiber optic cables and provide test results in electronic format and printed 8.5” x 11” format signed by the technician performing the testing. The electronic format should be a Microsoft Word .doc file. The following field test documentation shall be provided for each fiber optic strand:

1. Wavelength of test (850 nm or 1300 nm for Multimode and 1310 nm or 1550 nm for Singlemode)
2. Length of segment.
3. Number of splices.
4. Link attenuation (for each wavelength).
5. Overall Pass/Fail result.
6. Margin by which the strand passed the test (difference between the allowable link attenuation and the measured link attenuation).
7. Name of Owner and name of project (building name).
8. Date and time of test.
9. Name of technician performing the field testing.
10. Manufacturer, model number, serial number and software revision of field tester.
11. Cable ID (Telecom Room # - Patch Panel # - Port # / Telecom Room # - Patch Panel # - Port #.Telecom Outlet – Jack #).
12. Manufacturer, model number of cable, type of cable and strand count.

3.6 CABLE TESTING VALIDATION

A. If requested by the Owner’s Representative, the Contractor shall participate in cable testing validation.

B. After the Contractor has completed all cable testing and submitted test results, the Contractor shall, in the presence of the Owner's Representative, test up to 5% of the installed and tested cables (random sample to be selected by the Owner's Representative).

3.7 IDENTIFICATION AND LABELING

A. The Contractor shall confirm the telecom room and work area room numbers with the Owner or Owner's Representative prior to labeling.

B. Labeling scheme shall follow the requirements of Washoe County School District Structured Cabling Specification WCSD-SCS-014 dated October 21, 2016.

C. Work Area Outlet Face Plates: See WCSD-SCS-014 for requirements.

D. Work Area Data and Voice Jacks: See WCSD-SCS-014 for requirements.

E. Work Area Horizontal Data, Voice and Video Cable: See WCSD-SCS-014 for requirements.

F. Telecom Room Horizontal Data, Voice and Video Cable: See WCSD-SCS-014 for requirements.

G. Patch Panels: See WCSD-SCS-014 for requirements.

H. Patch Panel Ports: See WCSD-SCS-014 for requirements.

I. Fiber Termination Cabinets: See WCSD-SCS-014 for requirements.

J. 110 Blocks: See WCSD-SCS-014 for requirements.

K. Backbone Cables: See WCSD-SCS-014 for requirements.

L. Equipment Racks and Cabinets: See WCSD-SCS-014 for requirements.

3.8 ADMINISTRATION

A. As-Built Drawings.

1. The Contractor shall provide As-Built drawings at the end of the project. One (1) reproducible and (1) blue line shall be provided. Electronic versions of the drawings in AutoCAD version 2000/2002 and PDF shall also be provided. The following information shall be provided on the As-Built Drawings:

   a. Plan location of all telecom outlets.
   b. Quantity and type of drops at each telecom outlet.
   c. Telecom room where the drops are terminated.
   d. Cable tray layout. Provide dimensions from building grid lines to locate cable tray.
   e. J-hook layout. Provide dimensions from building grid lines to locate J-hook runs.
   f. Conduits and pull box layout. Provide dimensions from building grid lines to locate conduits and pull boxes.
   g. Backbone cable runs and pair/strand counts.
   h. Horizontal and vertical sleeve layout.
   i. Outside plant vaults and pull boxes. Provide dimensions from curbs to locate vaults and pull boxes.
   j. Outside plant conduits. Provide dimensions from curbs to locate conduit.

B. Materials Listing

1. The contractor shall provide a spreadsheet indicating the materials and quantities used on the project. At a minimum, the spreadsheet will contain the following

information: Item description, manufacturer, part number, quantity and color (where applicable).

END OF SECTION 270800

SECTION 271100 – COMMUNICATION EQUIPMENT ROOM FITTINGS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Drawings and general provisions of the Contract, Including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. The Contractor shall provide all equipment, materials, labor, and services necessary to complete communication equipment rooms and spaces, and to ensure that they are in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

C. Minimum requirements and installation methods are included for the following:

1. 4-Post Equipment Racks (45 RU)
2. Concrete Expansion Anchors
3. Plywood Backboards
4. Horizontal Cable Managers
5. Vertical Cable Managers for Floor Standing Racks
6. Category 5E Copper Patch Panels
7. Category 6 Copper Patch Panels
8. Category 6 Copper Patch Cords
9. Category 6A Copper Patch Panels
10. Category 6A (Augmented) Copper Patch Cords
11. Rack Mounted Optical Fiber Termination Cabinets
12. Optical Fiber Patch Cords
13. Wall Mounted “Re-closeable” Fiber Optic Cable Storage Rings
14. Cable Runway (Ladder Rack)
15. Velcro Cable Ties
16. Grounding Bars and Ground Conductors

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 05 43: Exterior Communications Pathways
4. 27 08 00: Commissioning of Communications
5. 27 13 00: Communications Backbone Cabling
6. 27 15 00: Communications Horizontal Cabling
7. 27 41 00: Audio Visual Systems
8. 27 41 16: AV and Safety Alert Systems
9. 27 51 13: Paging Systems
10. 27 53 13: Wireless Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of Specification Section 27 05 00 1.4 and in particular the following standards and code requirements.

1. ANSI/TIA-568.0-E: Generic Telecommunications Cabling for Customer Premises (Revision E, March 2020).
2. ANSI/TIA-568.1-E: Commercial Building Telecommunications Infrastructure Standard (Revision E, March 2020).
3. ANSI/TIA-568.2-D: Balanced Twisted-Pair Telecommunications Cabling And Components Standards (Revision D, September 2018).
4. ANSI/TIA-568.3-D: Optical Fiber Cabling and Component Standard (Revision D, October 2016).
5. ANSI/TIA-569-E: Telecommunications Pathways and Spaces (Revision E, May 2019)
6. ANSI/TIA-598-D: Optical Fiber Cable Color Coding (Revision D, July 2014).
7. ANSI/TIA-606-D: Administration Standard for Telecommunications Infrastructure (Revision D, October 2021).
8. ANSI/TIA-607-D: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises (Revision D, July 2019).
9. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
10. Underwriter’s Laboratories, Inc. (UL).

1.4 QUALITY ASSURANCE

A. All cable, raceways and equipment in the telecom rooms shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the Specifications shall be subject to the control and approval of the Owner's Representative.

1.5 SUBMITTALS

A. Manufacturer’s Data Sheets: Submit manufacturer’s data sheets in electronic PDF format for the following items:

1. 4-Post Equipment Racks (45 RU)
2. Concrete Expansion Anchors
3. Plywood Backboards
4. Horizontal Cable Managers
5. Vertical Cable Managers for Floor Standing Racks
6. Category 5E Copper Patch Panels
7. Category 6 Copper Patch Panels
8. Category 6 Copper Patch Cords
9. Category 6A Copper Patch Panels
10. Category 6A (Augmented) Copper Patch Cords
11. Category 6 Entrance Terminals with Primary Protector Modules
12. Rack Mounted Optical Fiber Termination Cabinets
13. Optical Fiber Patch Cords
14. Wall Mounted “Re-closeable” Fiber Optic Cable Storage Rings
15. Cable Runway (Ladder Rack)
16. Velcro Cable Ties
17. Grounding Bars and Ground Conductors

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

C. Shop Drawings: Submit shop drawings indicating the proposed layout of all telecom cabling pathways and equipment located in the telecommunication rooms. Shop drawings shall be coordinated with all trades having work in the telecom rooms. Shop drawings shall include the following items:

1. Plan view showing the layout of all floor mounted telecom and electrical equipment including cabinets, racks, UPS's and vertical cable management devices. Dimensions shall be provided showing required maintenance clearances in the front, rear and side of all equipment.
2. Plan view of all vertical floor sleeves and floor openings.
3. Plan view showing the layout of all cable pathway including horizontal ladder rack, horizontal basket tray, cable radius drop outs, vertical ladder rack and sleeves.
4. Plan view showing the location of all lighting fixtures, HVAC ductwork, fan coil units and/or split units serving the room. The contractor shall coordinate this work so that it does not conflict with the overhead cabling pathways or other telecom equipment.
5. Plan view showing the layout of all wall mounted equipment including ground bars, wall mounted racks, building entrance terminals, wall mounted termination fields, security panels, electrical panels, etc.
6. Wall elevations showing the layout and elevation of all wall mounted equipment.

1.6 DELIVERY, STORAGE & HANDLING

A. Protect all wiring blocks, patch panels, jacks and patch cords from moisture, dust and debris prior to installation.

B. Install equipment in the telecom rooms only after the room construction is complete and the room clean. This includes all gypboard walls, gypboard ceilings, floor finishes, t-bar grid, plywood backboards, door frames, doors and paint. Notify the Owner's Representative of any incomplete items prior to installing equipment.

1.7 GUARANTEE

A. See Specification Section 270500 1.10 for warranty requirements which apply to the patch panels and cabling specified in this section.

PART 2 – PRODUCTS

2.1 4-POST OPEN EQUIPMENT RACKS (45 RU)

A. Floor mounted racks shall meet the following physical specifications

1. UL Listed.
2. Lightweight aluminum construction with black finish.
3. 19" rack mounting space, 84" high.
4. 15" deep x 20.25" wide base with four (4) ¾" bolt down holes.
5. 3" deep channel side rails with double-sided tapped holes. Tapped holes shall conform to the standard EIA/TIA hole pattern.
6. Provide square-punched hardware kits (cage nuts – color black) to mount all hardware and owner furnished equipment.
7. Provide 50 Phillips head equipment mounting screws with each rack.
8. Provide a ground termination bracket with each rack to enable connection of a 2 hole grounding lug.

B. Acceptable Products

1. Chatsworth Quadrarack 4-Post Rack 15053-703.
2. No Substitutions.

C. Provide base dust cover for each rack:

1. Acceptable Products:

a. Chatsworth p/n 16341-719.
b. No Substitutions.

D. Provide rack grounding kit with each rack:

1. Acceptable Products:

a. Rack Grounding Kit (Chatsworth p/n 40167-001).
b. No Substitutions.

E. Provide Square-Punched Hardware Kits with each rack.

1. Acceptable Products:

a. Chatsworth p/n 12639-001.
b. No Substitutions.

F. Provide 1RU blank filler panels where shown on the rack elevations.

1. Acceptable Products:

a. Chatsworth p/n 30024-701.
b. No Substitutions.

G. Provide 4RU lock boxes where shown on the rack elevations.

1. Acceptable Products:

a. Middle Atlantic P/N LBX-4
b. No Substitutions.

2.2 CONCRETE EXPANSION ANCHORS

A. Secure equipment racks and cabinets to the concrete floor with a minimum of four (4) 1/2” diameter concrete expansion anchors. Expansion anchors shall be manufactured of carbon steel with zinc plating.

B. Anchors shall have a minimum concrete embedment depth of 2 ¾” inches.

C. Expansion anchors shall have a minimum allowable pull out strength of 1,800 lbs and a minimum ultimate pull out strength of 7,000 lbs in 3,000 psi concrete.

1. Acceptable manufacturers

a. Hilti.
b. Red Head.
c. Or approved equal.

2.3 PLYWOOD BACKBOARDS

A. Install fire treated 4’-0” x 8’-0” x ¾” AC void free plywood in all telecom rooms.

B. Install plywood to completely cover all 4 walls in each telecom room unless noted otherwise on the drawings.

C. Install plywood sheets from 6” to 8’-6” AFF.

D. Paint plywood with 2 coats of white paint. Mask fire treatment labels prior to painting.

E. Secure plywood to walls with sufficient anchors to support 1,500 lbs of equipment weight.

2.4 HORIZONTAL CABLE MANAGEMENT

A. Horizontal and vertical cable managers shall be provided from the same manufacturer and shall be compatible with the specified racks.

B. Horizontal cable managers shall be 2 rack units in height and have. See rack elevations for quantity.

C. All components shall be color black.

1. Acceptable Products:

a. Chatsworth P/N 11564-719 with slip on cover P/N 11764-719.
b. No Substitutions.

2.5 VERTICAL CABLE MANAGEMENT FOR FLOOR STANDING RACKS

A. Horizontal and vertical cable managers shall be provided from the same manufacturer and shall be compatible with the specified racks.

B. Provide 6” wide by 84” high or 10” wide x 84” high vertical cable managers for all racks. See rack elevations for size and quantity:

1. Vertical cable managers shall be bolted to the racks. Where vertical cable managers are located between racks, the vertical managers shall be bolted to both racks.

2. Each vertical cable manager shall provide separate front and rear raceways.

3. Holes shall be provided between the front and rear raceway sections to facilitate cable routing.

4. Vertical cable managers shall have 6” wide x 5.35” deep slotted ducts on the front of the rack and open ring cabling sections on the rear of the rack.

5. Hinged black plastic covers shall be provided on the front of the vertical cable manager to conceal cable after installation.

6. All components shall be color black.

7. Acceptable Products

a. Chatsworth CCS Combination Cabling Section p/n 30162-703 (6” wide), Chatsworth CCS Combination Cabling Section p/n 30163-703 (10” wide)
b. No Substitutions.

C. Provide (12) fiber management spools within the vertical cable management sections installed on each side of the main fiber rack in the MDF room (6 spools in each vertical section). Attach spools to the 2.5” pass-through holes in the CCS combination cabling section. The top 6 pass-through holes shall be used, leaving the bottom pass-through hole empty.

2.6 CATEGORY 5E COPPER PATCH PANELS

A. Provide 19” rack mounted 48-port or 24-port Category 5E data patch panels as shown on the drawings.

B. Patch panels shall be constructed of black anodized aluminum or black powder coated steel.

C. Patch panels shall have fixed outlet jacks with 110 IDC connectors on the rear of the panel.

D. Patch panels shall be wired in accordance with the T568B standard.

E. The same manufacturer will be used for both the patch panels and workstation outlets throughout the Project.

F. Provide rear cable termination bracket with each patch panel.

G. Patch panels shall conform to ANSI/TIA/EIA–568-A Addendum 5 as shown below.

Parameter	Worst Case Channel Performance at 100MHz
Specified Frequency Range	1-100 MHz
Attenuation	0.4 dB
NEXT	43.0 dB
Return Loss	20.0 dB

H. Acceptable Products:

1. Belden/CDT P/N AX103258 (24-port), AX103259 (48-port). Provide cable tie-bar for each patch panel AX101173.
2. No Substitutions.

2.7 CATEGORY 5E COPPER PATCH CORDS FOR BACKBONE VOICE CABLING.

A. For every installed 25-pair CAT 5E backbone cable, provide qty (4) 7'-0" cat 5E patch cords jacket color blue.

B. Acceptable Products:

1. Belden/CDT P/N C501106007.
2. No Substitutions.

2.8 CATEGORY 6A (AUGMENTED) COPPER DATA PATCH PANELS

A. Patch Panels shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Provide 19” rack mounted 48-port Category 6A data patch panels as shown on the drawings.

C. Patch Panels shall be 100% pre-loaded with CAT 6A modules.

D. Each patch panel CAT 6A module shall be provided with a color coded icon insert to designate its relationship to the following systems:

1. Data Port: Icon Insert – No icon insert required.
2. Wireless Access Point Port: Icon Insert color “White”.
3. CCTV System: Icon insert color “Black”.
4. Audio Enhancement System: Icon insert color “Gray”.
5. Paging System: Icon insert color “Green”.
6. Access Control System: Icon insert color “Blue”.

E. Patch panels shall conform to the performance requirements of ANSI/TIA/EIA–568-B.2-10 for Augmented Category 6 Cable as outlined below.

Frequency (MHz)	NEXT (dB) (min.)	PSANEXT (dB) (min.)	RETURN LOSS (dB) (min.)
0.772	96.2	112.2	70.2
1	94.0	110.0	68
4	82.0	98.0	56
8	75.9	91.9	49.9
10	74.0	90.0	48.0
16	69.9	85.9	43.9
20	68.0	84.0	42.0
25	66.0	82.0	40.0
31.25	64.1	80.1	38.1
62.5	58.1	74.1	32.1
100	54.0	70.0	28.0
200	48.0	64.0	22.0
250	46.0	62.0	20.0
300	44.5	60.5	18.5
350	43.1	59.1	17.1
400	42.0	58.0	16.0
450	40.9	56.9	114.9
500	40.0	56.0	14.0
550	39.2	55.2	13.2
600	38.4	54.4	12.4
625	38.1	54.1	12.1

F. Acceptable Products:

1. 48-Port Cat 6A Patch Panels:

a. Belden/CDT RevConnect P/N RVAPPF2U48BK.

b. No Substitutions.

2. Colored Icon Inserts:

a. Belden/CDT RevConnect P/N RVUICxx-B24 (provide icon insert colors for different systems as indicated above).
b. No Substitutions.

2.9 CATEGORY 6 COPPER PATCH CORDS

A. Patch cords shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Provide Category 6 UTP patch cords for interconnection of owner furnished switches and patch panels in all IDF's and the MDF.

C. Provide one (1) 4'-0" CAT 6 patch cord for each data drop related to the following systems:

1. CCTV System: Patch Cord Color "Black".
2. Audio Enhancement System: Patch Cord Color "Gray".
3. Paging System: Patch Cord Color "Green".
4. Access Control System: Patch Cord Color "Blue".

D. Cabling used for patch cords shall be manufactured by the same manufacturer as the horizontal cabling and shall be of the same product line. Cable shall conform to the requirements of ANSI/TIA/EIA–568-B.2 Addendum 1. Electrical characteristics and performance of the patch cables shall be nearly identical to the horizontal cable with exceptions given due to differences between solid and stranded conductors as indicated in the following table.

Frequency (MHz)	Stranded Conductor Cable Insertion Loss (dB)
1	2.4
4	4.5
8	6.4
10	7.1
16	9.1
20	10.2
25	11.4
31.25	12.8
62.5	18.5
100	23.8
200	34.8
250	39.4

E. Patch cords shall be rated for use as communications cable and shall have the designation "CM" or "CMR" printed on the jacket.

F. Acceptable Products:

1. Belden/CDT GigaFlex PS6+ Modular Cord P/N C60110xxxx (provide patch cord jacket colors for different systems as indicated above).

2. No Substitutions..

2.10 CATEGORY 6A (AUGMENTED) PATCH CORDS

A. Patch cords shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Provide Category 6A patch cords for interconnection of owner furnished switches and patch panels in all IDF's and the MDF. Provide one (1) 4'-0" CAT 6A patch cord for each data drop related to the following systems:

1. Telecom Outlet: Patch Cord Color "Yellow".
2. Wireless Access Point: Patch Cord Color "White".

C. Provide Category 6A "work-area" patch cords for interconnection of owner furnished workstations and phones at the work-area outlets. Provide one (1) 15'-0" CAT 6A patch cord for each data drop related to the following systems:

3. Telecom Outlet: Work-Area" Patch Cord Color "Yellow".

D. Patch cords shall be 4-pair, Category 6A unshielded twisted pair with solid conductors. Patch cords shall be manufactured by the same manufacturer of the horizontal cabling.

E. Physical Characteristics:

1. Category 6A cable shall meet or exceed the requirements of ANSI/TIA/EIA–568-B.2-10 -- for Augmented Category 6 Cable.

2. Cable shall have a listed riser rated jacket (CMR).

3. Cables shall be constructed of 4-pair, 23 AWG solid copper conductors.

4. The cable jacket must have the following legible markings

a. Manufacturer's name.
b. Copper conductor gauge.
c. Pair count.
d. UL and CSA listing.
e. Manufacturer's trademark.
f. Category rating.
g. Jacket rating (CMR).

F. Acceptable Products:

1. Belden/CDT CA21104004 (4'-0" data drop patch cord - color yellow), CA21109004 (4'-0" WAP drop patch cord - color white), CA21104015 (15'-0" data drop "work-area" patch cord – color yellow).
2. No substitutions.

2.11 WALL MOUNTED CATEGORY 5E 110 BLOCKS

A. Provide 100-pair Category 5E wall mounted 110 IDC blocks with plastic stand-off mounting legs for termination of voice cabling from the AT&T demarc location to the 24-port demarc patch panel in the voice rack (see drawings for location).

B. Provide label kit w/plastic holders.

C. Provide plastic jumper troughs with stand-off legs at the top, bottom and side of each 100-pair wiring block for routing of cross connect wire.

D. Completely load 110 blocks with C5 connecting blocks.

E. Acceptable Products

1. Belden/CDT AX100694-S.
2. Or approved equal.

2.12 RACK MOUNTED OPTICAL FIBER TERMINATION CABINETS & PIGTAIL SPLICE CASSETTES

A. Provide 19” rack mounted optical fiber termination cabinets. See rack elevations for quantity, size and port density of panels.

B. Provide fiber termination cabinets with the following physical characteristics:
1. 2RU (accepts 8 pigtail splice cassettes) and 4RU (accepts 16 pigtail splice cassettes).
2. Black powder coat finish.
3. Integral cable strain relief clamps.
4. Panels shall accept factory manufactured fusion splice cassettes.
5. Provide blank covers over unused cassette openings.

C. Acceptable Products:

1. Fiber Termination Cabinets & Fusion Splice Cassettes Located in the MDF.
   a. 4RU Cabinet - Belden/CDT P/N AX105565.
   b. 24-Fiber Multimode duplex LC fusion splice cassette – Belden/CDT P/N FCH12LDFS. Provide 12-fiber OM4 multimode fusion splice pigtails to terminate all multimode fiber (Belden P/N FT4LD900PR123ME).
   c. 24-Fiber Singlemode duplex LC fusion splice cassette – Belden/CDT P/N FCS4H12LDFS. Provide 12-fiber OS2 singlemode fusion splice pigtails to terminate all singlemode fiber (Belden P/N FTSLD900PR123MY).
   d. Provide blank covers for all unused fiber termination panel cassette openings (Belden P/N FFZH00BB).
   e. No Substitutions.

2. Fiber Termination Cabinets & Fusion Splice Cassettes Located in the IDF’s:
   a. 2RU Cabinet - Belden/CDT P/N AX105564.
   b. 24-Fiber Multimode duplex LC fusion splice cassette – Belden/CDT P/N FCH12LDFS. Provide 12-fiber OM4 multimode fusion splice pigtails to terminate all multimode fiber (Belden P/N FT4LD900PR123ME).
   c. 24-Fiber Singlemode duplex LC fusion splice cassette – Belden/CDT P/N FCS4H12LDFS. Provide 12-fiber OS2 singlemode fusion splice pigtails to terminate all singlemode fiber (Belden P/N FTSLD900PR123MY).
   d. Provide blank covers for all unused fiber termination panel cassette openings (Belden P/N FFZH00BB).
   e. No Substitutions.

2.13 OPTICAL FIBER PATCH CORDS

A. Provide duplex LC singlemode and multimode fiber optic patch cords for interconnection of owner furnished switches and fiber backbone cabling. Polarization of fiber optic patch cords shall comply with ANSI/TIA/EIA – 568-B.1 Section 10.3.3.

B. Fiber optic cabling shall comply with the requirements of ANSI/TIA/EIA-568-B.3 and ANSI/TIA/EIA-568-B.3 Addendum 1.

C. Fiber patch cords shall be manufactured of fiber optic cabling meeting the transmission characteristics of the fiber optic backbone cabling. The manufacturer of the fiber patch cord cabling and the fiber backbone cabling shall be identical.

D. For every 48-port copper patch panel (including spare patch panels), contractor shall provide qty (2) 5-meter duplex LC OM4 multimode fiber patch cords (Belden/CDT P/N FP4LDLD005MR2XA) and qty (2) 3-meter duplex LC OM4 multimode fiber patch cords (Belden/CDT P/N FP4LDLD003MR2XA).

E. For every installed 12-strand and 6-strand Singlemode fiber optic cable, provide qty (2) 3-meter duplex LC OS2 singlemode fiber patch cord (Belden/CDT P/N FPSLDLD003MR1XY).

F. Acceptable Products:
1. 3-Meter duplex LC OM4 Multimode Patch Cords – Belden/CDT P/N FP4LDLD003MR2XA.
2. 5-Meter duplex LC OM4 Multimode Patch Cords - Belden/CDT P/N FP4LDLD005MR2XA.
3. 3-Meter duplex LC OS2 singlemode patch cords – Belden/CDT P/N FPSLDLD003MR1XY.
4. No Substitutions.

2.14 TELECOM ROOM HORIZONTAL CABLE RUNWAY AND SUPPORTS

A. Horizontal cable runway, angle support brackets, butt splices, junction splices, mounting plates, elevation kits, grounding straps, etc. shall be provided by a single manufacturer. Installed system shall be grounded per ANSI/TIA/EIA-607-A.

B. Provide 18” wide horizontal universal style ladder rack in the telecom rooms where shown on the drawings. Ladder rack will be constructed of welded steel tubing. Stringers will be 1.5” in depth with 1.5” wide cross members spaced at 12” OC. Cable runway shall have a black finish.

1. Acceptable Products:

a. Chatsworth Universal Cable Runway - CPI Part Number 1125-718, alternate space cable runway – CPI Part Number 31472-718.
b. No Substitutions.

C. Provide 15” radius corner brackets at perpendicular intersections of the cable runway.

1. Acceptable Products:

a. Chatsworth Cable Runway Corner Bracket, 15 Wide (Black). CPI Part Number 11959-715.
b. No Substitutions.

D. Provide corner radius E-bends where shown on the drawings.

1. Acceptable Products:

a. Chatsworth Cable Runway E-Bend (Black). CPI Part Number 10822-718.

b. No Substitutions.

E. Provide qty (2) cable runway radius drops above each vertical cable manager to maintain cable bend radius. Coordinate layout of overhead ladder rack cross members so that radius drops are located directly above vertical cable managers. Where cross members conflict with the vertical cable managers, cut and remove cross members and replace with removable cross members. Where radius drops are connected to removable cross members, install custom radius drops. All components to have a black finish.

1. Acceptable Products:

a. Chatsworth Cable Runway Radius Drop, Cross Member (Black). CPI Part Number 12100-718 (for 18” wide runway).
b. No Substitutions.

F. Provide steel triangular support brackets to support the horizontal cable runway. Triangular support brackets shall be fastened to the stud wall framing. Spacing of the support brackets shall not exceed 4’-0” on center. Support brackets shall have a load capacity of 100 pounds (for 12” wide runway) and 400 pounds (for 18” runway) and shall have a black finish.

1. Acceptable Products:

a. Chatsworth Triangular Support Bracket, Steel, 12” and 18” Wide (Black). CPI Part Number 11312-712 (12”) and 11746-718 (18”).
b. No Substitutions.

G. Provide manufacturer’s butt-splice connections between continuous sections of horizontal ladder rack.

1. Acceptable Products:

a. Chatsworth Butt Splice Kit 1 ½” x 3/8” Stringer (Black). CPI Part Number 11301-701.
b. No Substitutions.

H. Provide manufacturer’s junction-splice connections at 90 degree intersections of horizontal ladder rack.

1. Acceptable Products:

a. Chatsworth Junction Splice Kit 1 ½” x 3/8” Stringer (Black). CPI Part Number 11302-701.
b. No Substitutions.

I. Provide cable runway wall angle supports.

1. Acceptable Products:

a. Chatsworth Wall Angle Support Kit, Cable Runway (Black). CPI Part Number 11746-718.
b. No Substitutions.

J. Provide cable runway elevation kit to secure the top of the equipment racks to the overhead ladder rack. Provide Qty (1) elevation kit per rack.

1. Acceptable Products:

    a. Chatsworth Cable Runway Elevation Kit (Black). CPI Part Number 10506-706. 3” Channel Rack-to-Runway Mounting Plate, 18” Wide (Black). CPI Part Number 10595-718.
    b. No Substitutions.

K. Provide cable runway end closing kit to close unspliced ends of the cable runway.

1. Acceptable Products:

    a. Chatsworth End Closing Kit, Cable Runway, 12” (Black). CPI Part Number 11700-712.
    b. No Substitutions.

L. Provide cable runway ground straps to bond each section of the cable runway system together.

1. Acceptable Products:

    a. Chatsworth Cable Runway Ground Strap. CPI Part Number 40164-001.
    b. No Substitutions.

M. Install plastic dust protectors on exposed threaded rod supports (color black).

1. Acceptable Products:

    a. Panduit Pan-Wrap split harness wrap.
    b. Or approved equal.

2.15 VELCRO CABLE TIES

A. Provide Velcro cable ties cut to length from a continuous roll to loosely bundle horizontal cabling in the telecom rooms routed on the ladder rack to the patch panels. Install Velcro cable ties at 1’-0” intervals.

B. Do not exceed qty (50) cables per bundle.

C. Do not attach cable bundles to the runway with the Velcro cable ties. Do not use plastic tie-wraps.

D. Acceptable Products

1. Panduit HLS-15R6.
2. Leviton 43115-075.
3. Or approved equal.

2.16 GROUNDING BARS

A. The entire telecom grounding system including grounding bars, grounding conductors, lugs, etc shall be installed in accordance with ANSI-J-STD-607-B “Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications”.

B. Provide UL listed copper grounding bars with insulated standoffs and stainless steel mounting brackets. Provide the size and quantity of grounding bars as shown on the drawings.

C. Telecommunications grounding bus bars (TGB) located in the telecom rooms (IDF's) shall be copper 12" x 2" x ¼" UON on the Drawings.

D. The telecommunications main grounding bus bar (TMGB) located in the Equipment Room (MDF) shall be copper 20" x 4" x ¼" UON on the Drawings.

E. Grounding bars shall have BICSI patterned pre-drilled lug mounting holes to accommodate two hole lug attachment. 5/16" hole sets shall be spaced on 5/8" centers. 7/16" hole sets shall be spaced on 1" centers.

1. Acceptable Products
   a. Chatsworth 13622-012 (2" high), 40153-020 (4" high).
   b. Erico TGB-A20L12PT (2" high), TMGB-A20L27PT (4" high).
   c. Harger GBI14220TGB (2" high), GBI14420TMGB (4" high).
   d. Or approved equal.

F. Provide separate green insulated #6 AWG grounding conductors from equipment racks, cabinets, metallic backboards, cable sheaths, metallic strength members, ladder rack, conduits, splice cases and building entrance terminals to the grounding bar in each telecom room. Do not "daisy chain" ground conductors.

G. Grounding bars (TGB's) located in the telecom rooms shall be bonded to the grounding bar (TMGB) located in the Equipment Room with a telecom bonding backbone (TBB) conductor. The TBB shall be continuous without splices. The minimum TBB conductor size shall be 3/0.

H. Provide an insulated grounding conductor (#2 AWG minimum) from the ground bar in each telecom room to building steel. The grounding conductor shall be cad welded to the building steel. See grounding riser detail for conductor sizes and additional grounding requirements.

I. Provide an insulated grounding conductor (#2 AWG minimum) from the ground bar in each telecom room to an approved electrical ground (electrical panel ground serving the telecom room). See grounding riser detail for conductor sizes and additional grounding requirements.

J. Ground wires shall have solderless, copper, two bolt, two hole long barrel compression lugs placed on both ends. The two bolt lug holes shall be ¼" and on ¾" centers.

K. All grounding conductors shall be green in color. All cables and bus bars shall be identified and labeled in accordance with the recommendations made in ANSI/TIA/EIA-606-A.

PART 3 – EXECUTION

3.1 TELECOM EQUIPMENT ROOM COORDINATION

A. The electrical and telecom contractors are responsible for coordinating the installation of all equipment and cabling pathways located within the telecom rooms.

B. The electrical and telecom contractors shall coordinate the work of all other trades that have work located within the telecom equipment rooms.

C. The electrical and telecom contractors shall create and submit for approval coordinated scaled shop drawings of the telecom room showing the proposed location of all work. Shop drawings shall be submitted and approved prior to installing any work in the telecom rooms.

3.2 UTILITIES INSTALLED AND ROUTED THROUGH COMMUNICATION ROOMS

A. Telecom rooms are dedicated for the installation and support of telecom and security related equipment. Other equipment and utilities not specifically dedicated to the support of the telecom room are not permitted. This includes the telecom room and the space above the finished ceiling (where occurs) to the structure above. The following items are permitted:

1. Telecom and security related equipment and cabling.
2. Electrical panels, electrical outlets and uninterruptable power supplies directly serving equipment within the telecom room.
3. Electrical lighting and switches directly serving the telecom room.
4. HVAC ductwork, AC units, fan coil units and piping directly serving the telecom room.
5. Sprinkler piping directly serving sprinkler heads located in the telecom room.
6. Fire protection devices including smoke detectors and heat detectors directly serving the telecom room.

B. The following items are not permitted to be installed or routed through the telecom equipment rooms:

1. Electrical panels, transformers, feeders and/or conduit not specifically dedicated to the telecom room.
2. Fire alarm panels (unless specifically shown on the drawings or approved by the Owner’s representative).
3. HVAC ductwork, fan coil units, chilled water piping, heating hot water piping, and/or control panels not specifically dedicated to the telecom room.
4. Plumbing piping including cold water piping, hot water piping, condensate piping, waste piping and/or drain piping not specifically dedicated to the support of the telecom room.

C. Any utilities routed through a telecom equipment room that do not directly serve the room must be rerouted and/or relocated at the contractor’s expense.

D. Any equipment located in the telecom equipment rooms not directly serving the room shall be relocated at the Contractor’s expense.

E. Any utilities within a telecom room that pose a leak hazard to the equipment located within the room (with the exception of dedicated sprinkler piping) shall have a drip pan and appropriate drain piping installed to mitigate the leak risk.

3.3 FLOOR MOUNTED RACKS

A. Floor mounted racks and cabinets shall be secured to structure with a minimum of (4) 1/2” diameter concrete expansion anchors or as required by local codes.

B. Racks and cabinets shall be placed with a minimum of 36” clearance from the walls on at least three sides (two of which must be front and rear) of the rack. When mounted in a row, maintain a minimum of 36” from the wall behind and in front of the row of racks and from the wall to at least one end of the row.

C. All racks, free-standing cabinets, and wall-mount cabinets shall be bonded to the ground bar in each room with a separate #6 green insulated grounding conductor.

D. Rack mount cage nuts/screws not used for installing patch panels and other hardware shall be bagged and left with the rack or cabinet upon completion of the installation.

3.4 PLYWOOD BACKBOARDS

A. Mechanically fasten fire treated plywood sheets to the walls.

B. Install plywood on all 4 walls of the telecom room unless specifically noted otherwise on the drawings.

C. Run plywood sheets vertically from 6” AFF to 8’-6” AFF.

D. Where plywood will support backbone cabling, secure plywood to wall with sufficient fasteners to support 1,500 pounds of weight.

E. Paint plywood with 2 coats of white paint. Mask fire treatment labels on plywood prior to painting.

3.5 HORIZONTAL CABLE PATHWAY

A. Should vertical or horizontal clearances not be possible due to physical constraints of the designated space, the Contractor shall immediately contact the Owner’s Representative for alternative routing.

B. Coordinate routing of cable pathway with lighting and HVAC serving the room. Secure cable pathway to walls, overhead structure and or equipment racks/cabinets as required.

C. Bond cable pathway sections together with #6 green insulated bonding jumpers. Bond pathway to telecom room ground bar with #6 green insulated conductor.

3.6 CABLE MANAGEMENT

A. Neatly bundle cabling with Velcro tie wraps on the horizontal ladder rack. Space Velcro tie wraps at 1’-0” on center.

B. Do not exceed qty (24) cables per bundle.

C. Neatly dress horizontal cable from the horizontal ladder rack, through the rear vertical cable managers to the rear of the patch panels. Use Velcro cable ties as necessary to maintain cable bundles. Do not exceed the manufacturer’s cable bend radius.

D. Do not install cable ties to bundle patch cables.

3.7 PATCH PANELS

A. Terminate and dress cables on the rear of the patch panels in accordance with manufacturer instructions using the provided rear cable management bar or bracket.

B. Maintain cable twists within ½” of the patch panel IDC blocks.

3.8 OPTICAL FIBER PATCH PANELS

A. Fusion splice all backbone fibers to duplex LC connectors and insert into the fiber termination cabinet bulkhead frames.

B. Secure backbone fiber cable sheath to the fiber patch panel with manufacturer supplied clamps. Route exposed fibers through fiber guides.

3.9 HORIZONTAL AND VERTICAL LADDER RACK

A. Install horizontal ladder rack at elevations shown on the drawings. Bolt horizontal ladder rack to tops of equipment racks with custom cable runway elevation kit.

B. Install vertical ladder to route cabling from floor sleeves to the overhead ladder rack.

C. Install vertical ladder to route cabling from overhead wall and deck conduit penetrations to the overhead ladder rack.

D. Install triangular ladder rack support brackets (knee braces) at a maximum of 4’-0” O.C. Secure support brackets to the stud wall framing with manufacturer’s recommended lag bolts.

E. Secure continuous sections of runway together with butt splices. Install “L” brackets to bolt together perpendicular intersections of runway. Install wall support angles at perpendicular intersections of the ladder rack to the wall.

F. Support and brace ladder rack from the building structure with threaded rod and Unistrut where runway is not routed adjacent to the wall and the span exceeds 4’-0”.

G. Seismically brace ladder rack and tops of equipment racks as required by local building codes.

H. De-burr all field cut sections of ladder rack prior to installation.

I. Install bonding jumpers between sections of ladder rack to maintain ground continuity.

J. Install touch-up paint to repair scratched or damaged ladder rack finish.

3.10 GROUNDING AND BONDING

A. All components of the Telecommunications system shall be bonded and grounded in accordance with ANSI/TIA-607-B “Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications”.

B. Bond equipment racks, cabinets, wiring blocks, conduits, cable tray, ladder rack, building entrance terminals and cable shields to the ground bar in each telecom room with #6 AWG ground conductors. Provide a separate ground conductor for each item. Do not daisy chain ground conductors.

C. Bond the ground bar in each Telecom room to building steel (#2 AWG minimum). Cad weld the grounding conductor to the building steel. See grounding riser diagram for ground conductor sizes.

D. Bond the ground bar in each Telecom room to the electrical panel serving that Telecom room (#2 AWG minimum). See grounding riser diagram for ground conductor sizes.

E. Bond the Telecommunications Ground Bar (TGB) in each Telecom room to the Telecommunications Main Ground Bus (TMGB) with a Telecommunications Bonding

Backbone (TBB) conductor. The minimum TBB conductor size shall be minimum 3/0. See grounding riser diagram for ground conductor sizes.

F. Bond the Telecommunications Main Ground Bus (TMGB) to the main electrical building ground (#2 AWG minimum). See grounding riser diagram for ground conductor sizes.

G. Grounding conductors shall be installed continuous. There shall be no splices or mechanical couplers.

H. Locate the Telecommunications Main Grounding Bar within 5’-0” of the building entrance terminal(s) (BET).

I. The Electrical Contractor shall test the continuity of all grounding conductors.

END OF SECTION 271100

SECTION 271300 – COMMUNICATIONS BACKBONE CABLING

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Drawings and general provisions of the Contract, Including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. The Contractor shall provide all equipment, materials, labor, and services necessary to complete the backbone cabling system, and to ensure that it is in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

C. Backbone cabling includes inter-building (Outside Plant) and intra-building (Premise) copper and fiber optic cabling.

D. This section includes minimum requirements for the following

1. Singlemode Tight Buffered Fiber Optic Cabling – Indoor/Outdoor
2. Multimode OM4 Tight Buffered Fiber Optic Cabling – Indoor/Outdoor
3. Multi-Pair Copper Cabling – Indoor/Outdoor

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 05 43: Exterior Communications Pathways
4. 27 08 00: Commissioning of Communications
5. 27 11 00: Communications Equipment Room Fittings

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of Specification Section 27 05 00 and in particular the following code requirements

1. ANSI/TIA-568.0-E: Generic Telecommunications Cabling for Customer Premises (Revision E, March 2020).
2. ANSI/TIA-568.1-E: Commercial Building Telecommunications Infrastructure Standard (Revision E, March 2020).
3. ANSI/TIA-568.3-D: Optical Fiber Cabling and Component Standard (Revision D, October 2016).
4. ANSI/TIA-598-D: Optical Fiber Cable Color Coding (Revision D, July 2014).
5. ANSI/TIA-607-D: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises (Revision D, July 2019).

6. ANSI/TIA-758-B: Customer-Owned Outside Plant Telecommunications Infrastructure Standard (Revision B, March 2012).
7. ANSI TIA-526-7-A: Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant (Revision A, July 2015).
8. ANSI/TIA-526-14-C: Optical Power Loss Measurement of Installed Multimode Fiber Cable Plant (Revision C, 2015).
9. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
10. Underwriter's Laboratories, Inc. (UL).

1.4 QUALITY ASSURANCE

A. All materials shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the Specifications shall be subject to the control and approval of the Owner's Representative. Equipment and materials shall be of the quality and manufacturer indicated. The equipment specified is based upon the acceptable manufacturers listed.

B. All fiber optic cabling and related fiber termination equipment shall be installed by a trained technician with a minimum of (2) years experience in the termination of fiber optic cabling. The technician will have received training through a nationally recognized program offered by BICSI, Corning, AT&T, 3M or equivalent. The contractor shall provide all specialized tools required for proper installation.

1.5 SUBMITTALS

A. Submit manufacturers' data sheets for the following

1. Singlemode Tight Buffered Fiber Optic Cabling – Indoor/Outdoor
2. Multimode OM4 Tight Buffered Fiber Optic Cabling – Indoor/Outdoor
3. Multi-Pair Copper Cabling – Indoor/Outdoor

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

C. Submit all factory test information of cables prior to installation of the product.

1.6 DELIVERY, STORAGE & HANDLING

A. Visually examine cable spools and boxes for damage after delivery to the jobsite prior to installation. Visibly damaged goods are to be returned to the supplier and replaced at no additional cost to the Owner.

1.7 GUARANTEE

A. The outside plant (OSP) and premise fiber optic cabling system including fiber termination cabinets, fiber connectors, fiber optic patch cords, etc. shall be covered by a 25-year system warranty from Corning LANScape.

PART 2 – PRODUCTS

2.1 SINGLEMODE TIGHT BUFFERED FIBER OPTIC CABLING – INDOOR/OUTDOOR

A. Provide cables with fiber strand counts as shown on the drawings.

B. Fiber optic cable shall be indoor/outdoor rated suitable for underground duct installation.

C. Fiber Optic cabling shall have a riser rated jacket (OFNR).

D. Fiber optic cables shall be tight buffered with a black colored jacket.

E. Maximum attenuation characteristics
1. Maximum attenuation 0.80/0.50 dB/Km @ 1310/1550 nm.

F. Physical Characteristics
1. Cable will have 900 µm buffer with mechanically strippable PVC jacket.
2. The designation “UL” and “OFNR” shall be printed on the jacket with length markings every 2’-0”.
3. The cable shall have individual fiber tube colors per TIA/EIA-606 and overall yellow jacket.
4. The cable shall contain an aramid yarn strength member with cables stranded around center.
5. The cable shall be suitable for operating temperatures of -40º to +70º C.

G. Acceptable Products:
1. Belden/CDT P/N FDSD012R9 (12-Strand SM) and P/N FDSD006R9 (6-Strand SM).
2. No Substitutions.

2.2 MULTIMODE OM4 TIGHT BUFFERED FIBER OPTIC CABLING – INDOOR/OUTDOOR

A. Provide cables with fiber strand counts as shown on the drawings.

B. Fiber optic cable shall be indoor/outdoor rated suitable for underground duct installation.

C. Fiber optic cables shall be tight buffered with a 50/125µm-core/cladding diameter.

D. Fiber optic cable shall be OM4 laser optimized and rated for 10 Gigabit Ethernet at a distance of 300 meters.

E. Fiber Optic cabling shall have a riser rated jacket (OFNR).

F. Fiber optic cables shall be tight buffered with a black colored jacket.

A. Fiber optic cable shall comply with the requirements of ANSI/TIA/EIA-568-B.3 Addendum 1 “Additional Transmission Performance Specifications for 50/125 µm Optical Fiber Cables”.

B. Maximum attenuation and bandwidth characteristics
1. Maximum attenuation 3.5/1.25 dB/Km @ 850/1300 nm.
2. Bandwidth 3000 MHz-km @850 nm.
3. Bandwidth 500 MHz-km @1300 nm.

C. Physical Characteristics
1. Cable will have 900 µm buffer with mechanically strippable PVC jacket.
2. The designation “UL” and either “OFNP” or “OFNR” shall be printed on the jacket with length markings every 2’-0”.
3. The cable shall have individual fiber tube colors per TIA/EIA-606 and overall orange jacket.
4. The cable shall contain an aramid yarn strength member with cables stranded around center.

5. The cable shall be suitable for temperatures of -40º to +70º C.

H. Acceptable Products:

1. Belden/CDT P/N FD4D024R9 (24-Strand MM).
2. No Substitutions.

2.3 MULTI-PAIR COPPER BACKBONE CABLING – INDOOR/OUTDOOR

A. Shall be Category 5E and consist of a core of 24 AWG solid annealed copper conductors, color-coded in accordance with telephone industry standards.

B. Backbone cabling shall meet or exceed the Category 5E requirements listed in ANSI/TIA/EIA-568-B.

C. Provide quantity of backbone cables to meet pair counts as shown on the drawings.

D. Each 25 pairs shall be assembled in units and individually identified by color-coded unit binders.

E. Cable shall be indoor/outdoor rated suitable for underground duct installation.

F. Acceptable Products:
1. Superior Essex P/N 51-499-EL.
2. Or approved equal.

PART 3 – EXECUTION

3.1 BACKBONE CABLING

A. Ten (10) feet of fiber cable slack shall be stored at the telecom room in a figure eight configuration in the overhead ladder rack. Additional cable slack will be installed within the vertical cable managers in a "drip loop" configuration.

B. No more than 50’-0” of exposed “non-listed” outside plant cabling shall be permitted inside the building.

C. Vertical runs of cable shall be supported to a messenger strand, cable ladder, or other method to provide proper support for the weight of the cable.

D. Backbone cables spanning more than three floors shall be securely attached at the top of the cable run with a wire mesh grip and on alternating floors or as required by local codes.

E. Three feet of fiber slack shall be neatly coiled within the fiber enclosure.

F. Each optical fiber cable shall be individually attached to its enclosure by mechanical means. The cables strength member shall be securely attached the cable strain relief bracket in the enclosure. Refer to manufacturer installation instructions.

G. Each optical fiber cable shall be clearly labeled at the entrance to the fiber termination enclosure. Cables labeled within the bundle where the label is obscured from view shall not be acceptable.

H. Prior to installation of fiber optic backbone cable, test one fiber strand using an OTDR or light meter to verify continuity of the cable.

I. All fiber optic cable shall be installed within fabric innerduct. Where the innerduct terminates at the telecom room wall or floor, install riser rated corrugated innerduct from that point to the fiber termination cabinet.

3.2 OPTICAL FIBER CONNECTORS

A. Adhere to all manufacturer installation guidelines.

B. Polarization for entire system shall be maintained as described in ANSI/TIA/EIA – 568-B.1 Section 10.3.2.

3.3 COPPER CABLE TERMINATIONS

A. Terminate premise backbone copper cabling on rack mounted Category 5E voice patch panels. Maintain cable pair twists up to 0.5 inch of the point of termination for "Category 5E" Backbone distribution cables. Under no circumstances shall cable pairs be untwisted or otherwise altered prior to termination.

END OF SECTION 271300

SECTION 271500 – COMMUNICATIONS HORIZONTAL CABLING

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. The Contractor shall provide all equipment, materials, labor, and services necessary to complete the horizontal cabling system, and to ensure that it is in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

B. The horizontal cabling is that portion of the communication cabling system that extends from the work area communications outlets to the patch panels in the communications rooms.

C. This section includes minimum requirements for the following

1. Horizontal Category 6 Cabling.
2. Horizontal Category 6A (Augmented) Cabling.
3. CAT 6A Patch Cords.
4. Category 6A 8-Position Jacks.
5. Category 6A Field Mount Plugs
6. Work Area 4-Port Plastic Faceplates
7. Work Area 4-Port Stainless Steel Faceplates
8. Velcro Cable Straps

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 05 43: Exterior Communications Pathways
4. 27 08 00: Commissioning of Communications
5. 27 11 00: Communications Equipment Room Fittings
6. 27 41 00: Audio Visual Systems
7. 27 41 16: AV and Safety Alert Systems
8. 27 51 13: Paging Systems
9. 27 53 13: Wireless Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of Specification Section 27 05 00 and in particular the following code requirements

1. ANSI/TIA-568.0-E: Generic Telecommunications Cabling for Customer Premises (Revision E, March 2020).
2. ANSI/TIA-568.1-E: Commercial Building Telecommunications Infrastructure Standard (Revision E, March 2020).

3. ANSI/TIA-568.2-D: Balanced Twisted-Pair Telecommunications Cabling And Components Standards (Revision D, September 2018).
4. ANSI/TIA-569-E: Telecommunications Pathways and Spaces (Revision E, May 2019)
5. ANSI/TIA-1152-A: Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling (Revision A, November 2016).
6. Underwriter's Laboratories, Inc. (UL).

1.4 QUALITY ASSURANCE

A. All materials shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the Specification shall be subject to the control and approval of the Owner's Representative. Equipment and materials shall be of the quality and the manufacturer indicated. The equipment specified is based upon the acceptable manufacturers listed.

B. The Contractor shall strictly adhere to all Category 6 and Category 6A installation practices when installing unshielded twisted-pair cabling.

1.5 SUBMITTALS

A. Manufacturer's Data Sheets: Submit manufacturers data sheets for the following items

1. Horizontal Category 6 Cabling.
2. Horizontal Category 6A (Augmented) Cabling.
3. Category 6A 8-Position Jacks.
4. Category 6A Field Mount Plugs
5. Work Area 4-Port Plastic Faceplates
6. Work Area 4-Port Stainless Steel Faceplates
7. Velcro Cable Straps

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

1.6 DELIVERY, STORAGE & HANDLING

A. Visually inspect all cables, cable reels, and shipping cartons to detect possible cable damage incurred during shipping and transport. Visibly damaged goods are to be returned to the supplier and replaced at no additional cost to the Owner.

1.7 GUARANTEE

A. The Category 6 and 6A horizontal cabling system including work area jacks, horizontal cabling, patch panels and patch cords shall be covered by a minimum 25-year system warranty from Belden/CDT (see section 270500 1.10 for warranty requirements).

PART 2 – PRODUCTS

2.1 HORIZONTAL CATEGORY 6 CABLE

A. Horizontal cabling shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Horizontal cabling shall be 4-pair, Category 6 unshielded twisted pair.

C. Physical Characteristics

1. Category 6 cable shall meet or exceed the requirements of ANSI/TIA/EIA–568-B.2 and ANSI/TIA/EIA–568-B.2 Addendum 1.

2. Cable shall have a listed plenum rated jacket (CMP).

3. The cable jacket must have the following legible markings

   a. Manufacturer's name.
   b. Copper conductor gauge.
   c. Pair count.
   d. UL and CSA listing.
   e. Manufacturer's trademark.
   f. Category rating.
   g. Sequential foot markings, in one foot increments.
   h. Jacket rating (CMP).

4. Horizontal data cable shall have a GRAY jacket with black lettering.

D. Transmission Characteristics

1. Cable shall conform to ANSI/TIA/EIA–568-B.2 Addendum 1 as shown below.

Frequency (MHz)	Solid Conductor Cable Insertion Loss (dB)	NEXT Loss (dB)	PSNEXT Loss (dB)	ELFEXT Loss (dB)	Power Sum ELFEXT (dB)	Return Loss (dB)
1	2.0	74.3	72.3	67.8	64.8	20.0
4	3.8	65.3	63.3	55.8	52.8	23.0
8	5.3	60.8	58.8	49.7	46.7	24.5
10	6.0	59.3	57.3	47.8	44.8	25.0
16	7.6	56.2	54.2	43.7	40.7	25.0
20	8.5	54.8	52.8	41.8	38.8	25.0
25	9.5	53.3	51.3	39.8	36.8	24.3
31.25	10.7	51.9	49.9	37.9	34.9	23.6
62.5	15.4	47.4	45.4	31.9	28.9	21.5
100	19.8	44.3	42.3	27.8	24.8	20.1
200	29.0	39.8	37.8	21.8	18.8	18.0
250	32.8	38.3	36.3	19.8	16.8	17.3

2. Propagation delay skew shall not exceed 45 ns per 100 meters for all frequencies from 1 MHz to 250 MHz.

E. Acceptable Products:

1. Belden/CDT Gigaflex 2400 P/N 2413 08U1000 (jacket color gray).
2. No Substitutions.

2.2 CATEGORY 6A (AUGMENTED) HORIZONTAL CABLE

A. CAT 6A Horizontal cabling shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Horizontal data cabling for standard telecom outlets and wireless access points shall be 4-pair, Category 6A unshielded twisted pair.

C. Physical Characteristics

1. Category 6A cable shall meet or exceed the requirements of ANSI/TIA/EIA–568-B.2-10 -- for Augmented Category 6 Cable.

2. Cable shall have a listed plenum rated jacket (CMP).

3. Cables shall be constructed of 4-pair, 23 AWG solid copper conductors.

4. The cable jacket must have the following legible markings

   a. Manufacturer's name.
   b. Copper conductor gauge.
   c. Pair count.
   d. UL and CSA listing.
   e. Manufacturer's trademark.
   f. Category rating.
   g. Sequential foot markings, in one foot increments.
   h. Jacket rating (CMP).

5. Horizontal data cable shall have a YELLOW jacket with black lettering.

D. Transmission Characteristics

1. Cable shall conform to ANSI/TIA/EIA–568-B.2-10 as shown below.

Frequency (MHz)	NEXT (dB) (min.)	PSANEXT (dB) (min.)	RETURN LOSS (dB) (min.)
0.772	96.2	112.2	70.2
1	94.0	110.0	68.0
4	82.0	98.0	56.0
8	75.9	91.9	49.9
10	74.0	90.0	48.0
16	69.9	85.9	43.9
20	68.0	84.0	42.0
25	66.0	82.0	40.0
31.25	64.1	80.1	38.1
62.5	58.1	74.1	32.1
100	54.0	70.0	28.0
200	48.0	64.0	22.0
250	46.0	62.0	20.0
300	44.5	60.5	18.5
350	43.1	59.1	17.1
400	42.0	58.0	16.0
450	40.9	56.9	14.9

500	40.0	56.0	14.0
550	39.2	55.2	13.2
600	38.4	54.4	12.4
625	38.1	54.1	12.1

2. Propagation delay skew shall not exceed 35 ns per 100 meters for all frequencies from 1 MHz to 625 MHz.

E. Acceptable Products.

1. Belden 10GXS CAT 6A Cabling. Belden/CDT Part Number 10GXS13 0041000 (jacket color yellow).
2. No Substitutions.

2.3 CATEGORY 6A FIELD MOUNT PLUGS

A. Field mount plugs shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Terminate CAT 6 cabling at all device locations for the following systems on CAT 6A field mount plugs and connect directly to the device.

1. CCTV System.
2. Audio Enhancement System.
3. Paging System.
4. Access Control System.

C. Terminate CAT 6A cabling at all device locations for the following systems on CAT 6A field mount plugs and connect directly to the device.

1. Wireless Access Points.

D. Field mount plugs shall be 8-pin Category 6A and will conform to the requirements of ANSI/TIA/EIA–568-B.2-10.

E. Pin/Pair assignment shall be in accordance with T568B.

F. Acceptable Products:

1. Belden/CDT RevConnect P/N RVAFPUBK-S1.
2. No Substitutions.

2.4 CATEGORY 6A MODULAR JACKS

A. CAT 6A modular jacks shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Modular jacks shall be 8-pin Category 6A and will conform to the requirements of ANSI/TIA/EIA–568-B.2-10.

C. Pin/Pair assignment shall be in accordance with T568B.

D. Modular jacks shall be manufactured by the same manufacturer as the patch panels in the telecommunication rooms.

E. Modular data jacks shall be color YELLOW.

F. Modular jacks shall be compatible with plastic faceplates and stainless steel faceplates.

G. Modular jacks shall be “Keystone” style.

H. Transmission characteristics for a mated-connection (jack and cord) shall conform to ANSI/TIA/EIA–568-B.2-10 as shown below.

Frequency (MHz)	NEXT (dB) (min.)	PSANEXT (dB) (min.)	RETURN LOSS (dB) (min.)
0.772	96.2	112.2	70.2
1	94.0	110.0	68.0
4	82.0	98.0	56.0
8	75.9	91.9	49.9
10	74.0	90.0	48.0
16	69.9	85.9	43.9
20	68.0	84.0	42.0
25	66.0	82.0	40.0
31.25	64.1	80.1	38.1
62.5	58.1	74.1	32.1
100	54.0	70.0	28.0
200	48.0	64.0	22.0
250	46.0	62.0	20.0
300	44.5	60.5	18.5
350	43.1	59.1	17.1
400	42.0	58.0	16.0
450	40.9	56.9	14.9
500	40.0	56.0	14.0
550	39.2	55.2	13.2
600	38.4	54.4	12.4
625	38.1	54.1	12.1

I. Acceptable Products:

1. Belden/CDT 10GX RevConnect Jacks P/N RVAMJKUYL-S1.
2. No Substitutions.

2.5 WORK AREA 4-PORT PLASTIC FACEPLATES

A. Faceplates shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Provide UL listed faceplates. Faceplates should be white (verify with Architect), flush mounted and manufactured of high impact thermoplastic.

C. Faceplates shall have top and bottom label holders with plastic inserts.

D. Provide faceplates with a minimum of 4 and a maximum of 6 modules. Provide blank inserts in unused openings.

E. Faceplates shall accept “Keystone” style modular jacks.

F. Faceplates shall be manufactured by the same manufacturer as the outlet jacks and shall be compatible with the submitted outlet jacks.

G. Acceptable Products:

1. Belden/CDT 4-Port Faceplate P/N AX102249 (color white) – verify color w/Architect.
2. No Substitutions.

2.6 WORK AREA 4-PORT STAINLESS STEEL FACEPLATES

A. Provide UL listed stainless steel faceplates at workstation outlets in the multipurpose room and where shown on the drawings.

B. Provide 4-port faceplates. Provide blank inserts in unused openings.

C. Faceplates shall accept “Keystone” style modular jacks.

D. Faceplates shall be manufactured by the same manufacturer as the outlet jacks and shall be compatible with the submitted outlet jacks. Provide “keystone” jacks as necessary.

E. Acceptable Products:

1. Stainless SG Faceplate. Belden/CDT AX102009.
2. No Substitutions.

2.7 VELCRO CABLE STRAPS

A. Loosely bundle horizontal cabling with Velcro tie wraps.

B. Velcro tie wraps shall ¾” in width and cut from a continuous roll.

C. Install Velcro cable ties at 2’-0” intervals outside of the telecom rooms and 1’-0” intervals inside the telecom rooms.

D. Do not exceed qty (24) cables per bundle.

E. Acceptable Products

1. Panduit TAK-TY HLSP (plenum).
2. Leviton 43115-075.
3. Or equal.

PART 3 – EXECUTION

3.1 HORIZONTAL CABLE ROUTING AND TERMINATION

A. Horizontal CAT 6/6A cable routed in underground and/or under slab conduit shall be indoor/outdoor rated suitable for wet locations.

B. Ten feet of cable slack shall be stored at the telecom room and three feet of cable slack shall be provided in the ceiling space above the telecom outlet for every installed horizontal cable.

C. All horizontal cables shall be installed in cable bundles. Cable bundles shall not exceed qty (24) cables per bundle and will be loosely bound with velcro straps. Cables in a bundle should be uncombed until entry into each rack's vertical cable management, where the cables are to be combed and dressed together until terminated on each patch panel.

D. Category 6 and Category 6A cables shall be bundled separately.

E. Cables shall be installed in continuous lengths from origin to destination (no splices) except for transition points or consolidation points specifically shown on the drawings.

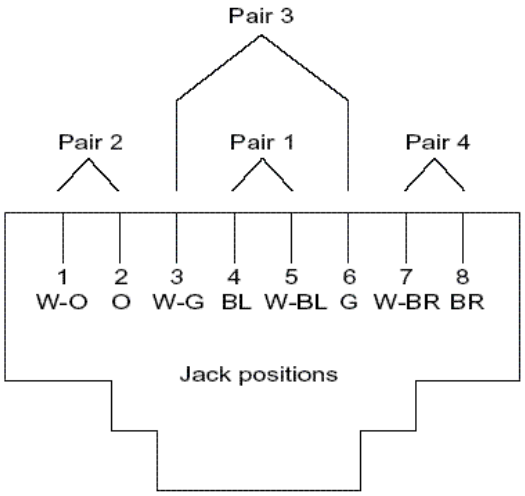
F. The cable's minimum bend radius and maximum pulling tension shall not be exceeded. Refer to manufacturers requirements and reference documents.

G. All telecom cables shall be supported by approved telecom pathways having dedicated support systems directly attached to structure (i.e. conduit, j-hooks, cable tray, etc.). Cables shall not be attached to or supported by ceiling grid, ceiling grid support wires, lighting fixture support wires or the work of other mechanical, electrical, plumbing or sprinkler trades.

H. All telecom cables shall be stored in accordance with the manufacturer’s requirements.

I. Any cable damaged or exceeding the manufacturer’s recommended installation parameters during installation shall be replaced by the Contractor prior to final acceptance at no cost to the Owner.

J. All telecom cables shall be labeled with self-adhesive labels. At the work area outlet, the cable label shall be applied to the cable behind the faceplate on a section of cable that can be accessed by removing the cover plate. At the Telecom Room, each cable shall be clearly labeled on the cable jacket behind the patch panel at a location that can be viewed without removing the bundle support ties. Cable labels located within the bundle or where obscured from view shall not be acceptable.



K. Cables shall be installed in accordance with the recommendations made in the ANSI/TIA/EIA-568-B standard document, manufacturer’s recommendations and installation guides, and best industry practices.

L. Plastic “zip-ties” shall not be permitted within the Structured Cabling System. “Velcro” type (hook and loop) tie wraps shall be used for the purpose of bundling / managing horizontal and backbone cabling (must be plenum rated if installed within a plenum space).

M. Horizontal UTP pair untwist at the termination shall not exceed 0.5”.

N. Jack pin/pair assignments shall be T568B for all installed horizontal cabling unless otherwise specified within the Project Documents.

1. T568B Jack pin/pair assignments are as follows:

O. For horizontal cabling, if a J-hook System is used to support cable bundles, all horizontal cables shall be supported at a maximum of 60” intervals. J-hooks must be secured to the permanent building structure. J-Hooks shall not be attached to ceiling tiles, ceiling grid, ceiling support wires or to the work of other mechanical, electrical, plumbing and sprinkler trades.

P. The horizontal telecom pathway and pathway support system shall not permit significant lateral or vertical motion. Cable quantities shall not exceed J-Hook System manufacturer recommendations or qty (24) cables, whichever is fewer.

Q. Telecom cables may not rest on acoustic ceiling grids or panels, or be attached to any portion of the building except for dedicated telecom pathway including conduit, innerduct, ladder rack, cable tray and/or J-hooks.

R. The cable length between the work area outlet and the termination in the telecommunications closet shall not exceed 295 feet. Any horizontal cable runs longer than 295 feet should be brought to the immediate attention of the Owner's Representative prior to installation.

S. When placing cable, the Contractor shall maintain the following minimum clearance from sources of electro-magnetic interference (EMI).

1. 6” clear from power conductors.
2. 12” clear from fluorescent lighting fixtures and ballasts.
3. 36” clear from transformers and motors.

3.2 WORK AREA OUTLETS

A. Work Area outlets and connectors shall be installed in accordance with manufacturer’s recommendations and installation guides, and best industry practices.

B. Cables shall be dressed and terminated in accordance with the recommendations made in the ANSI/TIA/EIA-568-B standard document, manufacturer’s recommendations and best industry practices.

C. Pair untwist at the termination shall not exceed 0.5”.

D. Bend radius of the cable in the termination area shall not be less than 4 times the outside diameter of the cable.

END OF SECTION 271500

SECTION 274100 – AUDIO VISUAL SYSTEMS

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs, programming, testing, adjusting, tuning, training and all necessary and related items as required to provide complete and operational Audio Visual (A/V) Systems as shown on the Drawings and described in the Specifications.

B. Provide Audio / Visual system for the Elementary School Multipurpose Room stage consisting of the following components:

1. Qty (1) Wall mounted 10RU AV equipment cabinet with lockable vented door. Provide power and network connections at AV cabinet as shown on the drawings.
2. Qty (2) wall mounted self-powered loudspeakers. 120V electrical outlet to be provided at each speaker location.
3. Qty (2) loudspeaker wall support systems including yokes, fasteners, safety support wires, etc.
4. Shielded 2-conductor 22 gauge cabling from loudspeakers to AV cabinet.
5. Qty (1) wall mounted combination XLR microphone and audio input plate.
6. Shielded 2-conductor 22 gauge XLR microphone and audio input plate cabling from XLR microphone and audio plates to the AV cabinet.
7. Qty (1) 7,000 lumen wall mounted projector with HDBaseT input. 120V electrical outlet to be provided at projector location.
8. Qty (1) Projector mounting cage for mounting and protection of projector including projector cage, strut, fasteners, etc.
9. CAT 6A plenum HDBaseT cable from projector to AV cabinet.
10. Qty (1) Wall mounted HDBaseT AV input plate with HDMI, USB-C and USB inputs.
11. CAT 6A plenum HDBaseT cable from AV input plate to AV cabinet.
12. Qty (1) HDBaseT audio/video matrix switcher rack mounted in AV equipment cabinet.
13. Qty (1) Digital Signal Processor (DSP).
14. Qty (1) 5” POE touch screen controller.
15. Qty (1) wireless microphone receiver with rack mount kit.
16. Qty (1) handheld wireless microphone.
17. Qty (1) wired microphone with stand.
18. Qty (1) FM assisted listening system kit consisting of qty (1) wireless transmitter, qty (10) receivers, qty (3) neck loops, qty (7) ear buds, qty (1) 12-bay receiver charging station, rechargeable receiver batteries.

C. The Specifications list equipment, devices, software and programming that comprise the overall Audio Visual System. The Contractor shall integrate all individual items so that they function together as one overall system. The Contractor shall provide all necessary equipment, cabling, software, programming and ancillary items as required to integrate all components.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications
4. 27 15 00: Communications Horizontal Cabling

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

1. ANSI/InfoComm.
2. NFPA-70, 2017 -- National Electrical Code (NEC).
3. FCC Regulations:
   a. Part 15 – Radio Frequency Devices & Radiation Limits
4. Underwriter’s Laboratories, Inc. (UL).
5. Electronic Industry Association (EIA) testing standards
6. Americans with Disabilities Act (ADA)
7. American Standard Code for Information Interchange (ACSI)
8. American Society for Testing and Materials (ASTM)
9. National Electrical Manufacturers' Association (NEMA)

1.4 QUALITY ASSURANCE

A. Contractor Qualifications:

1. The contractor shall be licensed by the Nevada State Contractors Board.
2. The Contractor shall have a minimum of five (5) years experience in the installation, integration and testing of Audio Visual Systems of similar size and scope.
3. The Contractor shall be a firm normally engaged in the design, installation and maintenance of Audio Visual Systems. The Contractor shall provide details of at least three (3) projects of similar size and scope involving the design, installation and testing of Audio Visual Systems in the last 5 years. Names, addresses and telephone numbers of references for the three projects shall be included.
4. The Contractor shall have service facilities near the project site and shall respond to service phone calls within one (1) business day of receipt. The Contractor shall provide an on-site response time of two (2) business days for critical system items during regular business hours.

B. UL Listing and Labeling: Unless specific equipment specified within the Audio Visual Specifications is not listed or labeled by UL, provide components listed and labeled by UL.

C. All work shall conform to the National Electrical Code (NEC) and to applicable National Fire Protection Association (NFPA) codes.

D. Compliance with Local Requirements: Comply with the applicable building code, state and local ordinances, and regulations and the requirements of the authority having jurisdiction.

E. All equipment supplied shall be listed by a nationally recognized test laboratory where applicable.

F. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture.

G. All items of a given type shall be the products of the same manufacturer.

H. All items shall be of the latest technology; no discontinued models or products are acceptable.

I. The manufacturer, or their Authorized Representative, shall confirm that within 300 miles of the project site there is an established agency which:

1. Stocks a full complement of parts.
2. Offers service during normal working hours as well as emergency service on all equipment to be furnished.
3. Will supply parts and service without delay and at reasonable cost.
4. Contractor shall be capable of performing service or maintenance work on these specified or accepted systems. Contractor shall be factory-certified where such certification is available or required.

1.5 INTENT OF DRAWINGS

A. Layout: Follow the general layout shown on the Drawings except where other work may conflict with the Drawings.

B. Accuracy: The Drawings show a diagrammatic representation of the system. Field verify all dimensions and locations.

C. Provide detailed point-to-point wiring and block diagrams of the entire Audio Visual System. Submit cut sheets of all equipment, equipment enclosures, devices, cabling, software, etc. for review approval prior to installing the work.

1.6 REVIEW OF SPECIFICATIONS

A. The Contractor shall carefully study and compare the Drawings and Specifications and shall at once report to the Owner or Owner’s Representative any error, inconsistency or omission discovered. If the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission in the Specifications without such notice to the Owner or Owner’s Representative, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the cost for any correction.

1.7 EXAMINATION OF THE PREMISES

A. The Contractor shall visit the Site to become familiar with the local conditions under which the work is to be performed and correlate observations with the requirements of the Drawings and Specifications. No allowance will be made for claims of concealed

conditions which the Contractor learned or should have learned in exercising due diligence in its observations of the site and review of the local conditions.

B. Before ordering any materials or performing any work, the Contractor shall verify all measurements and be responsible for correctness of same. No extra charge or compensation will be allowed for duplicate work or material required because of an unverified difference between an actual dimension and the measurement indicated in the Drawings. Any discrepancies found shall be submitted in writing to the Owner or Owner's Representative for consideration before proceeding with the work.

1.8 AUDIO VISUAL SYSTEM INTEGRATION

A. The Contractor will be responsible for integrating each individual system component so that the systems function as one overall Audio Visual System.

B. The Contractor shall provide all necessary programming, software, software licensing, software development kits (SDK's), cabling, AV equipment and ancillary items required to achieve this integration.

C. Where more than one acceptable manufacturer is listed for a specific A/V component, the Contractor will be responsible for verifying that the manufacturer's equipment can be integrated into the overall Audio Visual System.

1.9 SUBMITTALS

A. Submit manufacturer product data sheets for all system components and cabling.

B. Product Data Sheet Submittals shall comply with the following:

1. Product data submittals must be submitted to and approved by the Owner prior to release of order for equipment and prior to installation.
2. Submit product data sheets in PDF format.
3. Provide the following information in the submittal:
    a. Client Name.
    b. Project Number and Contract Number.
    c. Project Name and Address.
    d. Contractor's Submittal Number.
    e. Submittal Title.
    f. Specification Section Number.
    g. Date of Submittal.
    h. Contractor Name and contact information.
4. Provide a table of contents indicating the products submitted.
5. Products listed in the table of contents should be in the same order as they appear in the Specifications.
6. Submittals must include all items identified in each specification section. Partial submittals will not be accepted.
7. Where product data sheets cover more than one distinct item, clearly indicate by arrows or brackets precisely what is being submitted including optional accessories. Delete or cross-out non-applicable data.

C. Shop drawings:

1. All Audio / Visual System drawings generated for this project shall be created utilizing AutoCAD 2007 or newer file format.
2. Drawings shall be drafted on 30" x 42" sheets to match the contract drawings.
3. Submit shop drawings for all equipment showing:

a. Location and layout of all field devices, equipment, termination blocks and panels on the floor plans.
b. Single line diagrams for devices, equipment and components. Single line diagrams shall identify all devices and equipment and shall include all interconnecting wiring, cable types and sizing. Provide manufacturers wire type where required.
c. Block diagram(s) depicting system integration details.
d. Elevations of Audio Visual cabinet showing equipment mounting locations, electrical outlet locations, termination equipment.
e. Drawings for each field device type detailing wiring and mounting instructions.
f. Point-to-point wiring data, utilizing a combination of AutoCAD generated drawings and device/equipment Excel schedules.
g. Provide all Graphical User Interface screen layouts, menu and navigation structures (where applicable). Layouts shall be created by the GUI configuration software and shall not consist of line drawings created by CAD programs.

D. Operation and Maintenance Manuals

1. Quantity: Furnish three (3) O&M Manuals.
2. Format:
   a. Furnish each O & M Manual in a white, 3-ring binder with front cover and spine clear pockets for insertion of the project information.
   b. Clearly label the cover of each O & M Manual with the following information:
      (1) Client Name.
      (2) Project and Contract Numbers.
      (3) Project Name and Address.
      (4) Manual Name .
      (5) Date of Submittal
      (6) Contractor Name.
   c. Include a Table Of Contents at the beginning that lists the contents.
   d. Include tabbed separators for improved navigation through the manual.
3. Content:
   a. Functional Design Manual: Includes a detailed explanation of the operation of the system.
4. Hardware Manual which includes:
   a. Pictorial parts list and part numbers.
   b. Pictorial and schematic electrical drawings of wiring systems, including devices and equipment.
   c. Telephone numbers for the authorized parts and service distributors.
   d. Include all service bulletins.
5. Operator’s Manual which full explains all procedures and instructions for the operation of the system and includes:
   a. System start up and shut down procedures.
   b. Use of system.
   c. Equipment recovery and restart procedures.
   d. Software and firmware backup procedures (where applicable).
6. Maintenance Manual which includes:
   a. A summary of the TCP/IP address used and which system component they are associated with. Include the gateway address, subnet mask, DNS server, and host name information.
   b. Manufacturer’s warranty certificates.

E. Software

1. Provide copies of system software upon final system turnover. Software discs and documentation shall be bound in a three ring, hard cover binder that shall include at a minimum, the following items:
   a. Software drivers.
   b. Device / Equipment firmware.
   c. GUI runtime software licenses (where applicable).
   d. Original and final passwords (at time of final completion) to access all devices and equipment.
   e. IP addresses of all network equipment.

F. Record Drawings

1. See Division 1 Specifications for additional record drawing requirements.
2. Content:
   a. Fully represent actual installed conditions and incorporate all revisions made during the course of construction.
   b. Include drawings submitted as part of the Shop Drawing package, plus any additional information required to accurately document installed conditions.
   c. Device addresses & IP address information.
   d. Floor plans shall show:
      (1) Locations and identifiers of all devices.
      (2) Size, quantity, location, and routes of all pathways (such as cable trays, conduits, J-hangers, and other cable support devices).
      (3) Equipment rack elevations scaled at 1”=1’-0” showing exact placement of all system equipment.

1.10 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery.

1. Do not deliver products to the site until protected storage space is available. Coordinate delivery of materials with scheduled installation date to allow minimum storage time at jobsite.
1. Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels (name of the manufacturer, product name, type, grade, UL classification, etc.) intact.
2. Replace materials damaged during shipping at no cost to the Owner.

B. Storage.

1. Store materials in clean, dry, ventilated space free from temperature and humidity conditions (as recommended by manufacturer) and protected from exposure to harmful weather conditions.
2. Comply with manufacturer's requirements for each product. Comply with recommended procedures, precautions or remedies as described in the Material Safety Data Sheets (MSDS) as applicable.
3. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
4. Storage outdoors covered by rainproof material is not acceptable.
5. Provide heat where required to prevent condensation or temperature related damage.

C. Handling.

1. Handle in accordance with manufacturer's written instructions.
2. Damaged equipment shall not be installed.
3. Replace damaged equipment at no cost to the Owner.
4. Handle with care to prevent internal component damage, breakage, denting, and scoring.

1.11 SUBSTITUTIONS

A. No material substitutions will be allowed except by written acceptance from the Owner's Representative. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples are provided.

B. Approval of alternate or substitute equipment or material in no way voids the Specification requirements.

C. Under no circumstances shall the Owner's Representative be required to prove that an item proposed for substitution is not equal to the specified item. It shall be mandatory that the Contractor submit to the Owner or Owner's Representative all evidence to support the contention that the item proposed for substitution is equal to the specified item. The Owner's decision as to the equality of substitution shall be final and without further recourse.

1.12 WARRANTY

A. The warranty period will begin after substantial completion of the project.

B. The complete Audio / Visual System including all devices, equipment, software and programming shall be guaranteed to be free from defects in workmanship and materials for a minimum period of one (1) year from date of substantial completion. Promptly remedy such defects and any subsequent damage caused by the defects or repair thereof at no expense to the Owner.

C. Provide maintenance of systems and equipment for a period of one (1) year from date of substantial completion.

D. All Audio / Visual equipment shall have a three (3) year warranty. Defective or damaged equipment shall be replaced by the manufacturer during this three (3) year warranty period at no cost to the Owner. Replacement equipment shall be delivered to the project site. During year one (1) of this warranty period, the contractor shall provide all labor to replace the equipment at no cost to the owner. During years two (2) and three (3) of this warranty period, the Owner will be responsible for the Contractor's labor costs to replace the equipment.

E. The Contractor shall demonstrate that they maintain a service organization capable of providing all necessary service and maintenance of the systems. This includes providing replacement parts and making additions or changes to the software systems used in the project.

F. During the warranty period, all service (including equipment, labor, travel, expenses, etc.) is to be provided during normal working hours at no cost to the Owner. The Contractor shall provide the Owner with a phone number for service. The Contractor shall provide the Owner a phone response within one (1) business day of receipt of service call. The Contractor shall provide an on-site response time of two (2) business days for system critical items during regular business hours.

G. The guarantee shall exclude acts of God, vandalism, physical abuse or operator misuse.

H. Provide one routine maintenance visit 6 months prior to and a second visit at the end of the one (1) year warranty period at a time coordinated with the Owner. Adjust and replace defective parts and components with original manufacturer's replacement parts, components, and supplies.

I. Renewal of Maintenance Service Contract: No later than 60 days prior to the expiration of the one (1) year maintenance services contract, deliver to the Owner a proposal to provide contract maintenance and repair services for an additional one-year term. The Owner will be under no obligation to accept maintenance service proposal.

PART 2 -PRODUCTS

2.1 GENERAL REQUIREMENTS

A. All products must be new and unused and without blemish or defect.

B. All products used in parts replacement shall meet the specifications for the original equipment.

C. Materials and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items, for which replacement parts are available.

D. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that a complete and fully operational system will result.

E. The contractor shall download and install the most current “stable” firmware version from the manufacturer’s website for each device and piece of equipment (where applicable).

2.2 PRODUCTS

A. See drawings for equipment list(s) which provide the description, manufacturer and part number for each audio/visual (AV) system component.

B. The Contractor may propose alternate components that are equivalent to the specified components. Substitutions will be reviewed in accordance with Specification Section 274100 1.11 listed above. The contractor will be responsible for integrating all specified and alternate system components in accordance with Specification Section 274100 1.8 listed above.

PART 3 -EXECUTION

3.1. INSTALLATION

A. General: Install systems and equipment in accordance with applicable codes. Install equipment in accordance with manufacturer's written instructions. Systems shall be complete and operational in all respects.

B. Coordinate IP addresses and VLANS for equipment requiring network connectivity. Provide the owner with a spreadsheet indicating the name of each piece of network

equipment, the MAC address of the device and the necessary VLAN (control network or LAN). The Owner's IT department will provide the IP addresses and addressing scheme for each device.

C. Provide labels on all AV devices and equipment. Labels shall indicate the name and function of the equipment. Labels shall indicate the IP address(s) of the equipment as applicable.

3.2. A/V SYSTEM TESTING AND COMMISSIONING

A. Test and demonstrate all equipment and system functionality at the completion of the project.

B. Testing and commissioning includes but is not limited to the following:

1. Confirm the installation, mounting and support of all devices and equipment.
2. Verify installation, termination and connection of all A/V cabling.
3. Verify switching and control of all audio and video signals.
4. Verify all audio levels, microphone echo cancellation and feedback elimination.
5. Verify labeling of all equipment and cabling.
6. Verify system control from wireless mobile tablet (where applicable).
7. Verify the documentation of all equipment, devices and cabling in the as-built drawings and O&M manuals.

3.3. CLEANING AND PROTECTION

A. Prior to final acceptance, the contractor shall vacuum, wipe down and clean all system components and protect them from damage and deterioration. All blank spaces in equipment cabinets will be covered with blank panels. Top and side panels, and all cabinet doors will be installed. All general areas within and around all equipment rack/cabinets in the facility will be swept, vacuumed, and cleaned up. No cabinets will be left unlocked and all cabinet keys will be turned over to the owner or designated owner's representative.

3.4. TRAINING

A. Train Owner's maintenance and operator personnel in the procedures and schedules involved in operating, programming, troubleshooting, servicing, and preventative maintenance of the system. Provide a minimum of 2 hours training during normal business hours for each independent AV system.

B. Training shall be by engineers or technicians highly skilled in the systems and certified by manufacturer as qualified to provide training in the particular systems.

C. Schedule training with the Owner with at least seven days in advance.

D. Contractor to provide sign-in sheet for training attendees.

END OF SECTION 274100

SECTION 274116 – CLASSROOM AUDIO ENHANCEMENT AND SAFETY ALERT SYSTEM

PART 1 – GENERAL

1.1 SUMMARY

A. Provide all labor, materials, equipment, tools, transportation, storage costs, programming, testing, adjusting, tuning, training and all necessary and related items as required to provide complete and operational Classroom Audio Enhancement System and Safety Alert System as shown on the Drawings and described in the Specifications.

B. Section Includes:

1. School-wide safety alert system and classroom audio enhancement system including: DECT RF based receivers, network attached amplifiers, wireless microphones, speakers, ceiling enclosures, system controller and alarm notification device.
2. This is an equipment specification for the Owner to purchase and furnish this equipment to the Contractor. See drawings for a complete listing of Owner furnished and Contractor installed equipment. The Contractor is responsible for installing, cabling, configuring, programming, adjusting, tuning, testing and demonstrating all equipment.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications.
4. 27 11 00: Communications Equipment Room Fittings.
5. 27 15 00: Communications Horizontal Cabling.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.5 SYSTEM DESCRIPTION

A. For each classroom and instructional space, Contractor shall furnish a complete Audio Enhancement and Safety Alert System as shown on the drawings.

B. See Audio Enhancement equipment schedule on drawings for owner furnished, contractor installed (OFCI) and contractor furnished, contractor installed (CFCI) equipment and cabling.

C. Contractor installing the Audio Enhancement equipment shall be a certified installer for this equipment. Contractor to complete all required manufacturer training to obtain the necessary certifications. Alternatively, contractor shall hire Audio Enhancement to configure, test and commission the system.

D. Contractor shall provide a complete takeoff of all OFCI equipment and verify completeness with Audio Enhancement. Contractor shall submit a completed and approved takeoff to WCSD for purchasing of the Audio Enhancement equipment.

E. WCSD will purchase the OFCI equipment and will deliver to WCSD Edison warehouse. Contractor shall arrange pickup of the equipment from the warehouse.

F. Install flush 4 11/16" x 4 11/16" x 2 1/8" deep wall box with 1" conduit to accessible ceiling for mounting of the Audio Enhancement amplifier/receiver. Install (1) plenum cat 6 network drop from amplifier to telecom room. Terminate cat 6 cable at wall box on cat 6 field mount plug and connect directly to amplifier.

G. Provide (1) cat6 4' patch cord (jacket color grey) for each amplifier to cross connect to network switches in the telecom room.

H. Install ceiling mounted speakers in each classroom (see floor plans for speaker types and quantity). Provide and install 18/2 plenum cabling from speakers to wall mounted amplifier. Terminate, label and test cabling.

I. Install ceiling mounted 360 degree camera and associated CAT 6 network drop and connection to classroom amplifier as shown in the drawings.

J. Furnish and install all A/V cabling and A/V patch cords as required for a complete and operational system. All A/V cabling to be plenum rated. A/V cabling shall be "pro-audio" grade suitable for commercial use. Submit cut sheets for approval of proposed hdmi, mini-stereo and speaker cable. Contractor to terminate, label and test all cabling.

K. Provide spreadsheet of amplifiers to WCSD IT department indicating mac address of device, classroom location, terminating telecom room, patch panel and patch panel port #. Assign IP addresses to amplifiers as directed by WCSD.

L. Pair teacher pendant microphone and student handheld microphone with wall mounted amplifier/receiver in all classrooms.

M. Install, configure, program and adjust all Audio Enhancement equipment to provide a complete and operational system.

N. Install and configure rack mounted “SAFE” Server in the MDF room.

O. Install and configure “SAFE” monitoring workstation in the admin office.

P. The System is to include all equipment, materials, labor, and training as required to install and test a complete and operating System as described herein.

Q. Awarded Contractor shall follow installation instructions provided by the manufacturer. Installation drawings shall show the location and general arrangement of equipment, electrical systems and related items. They shall be followed as closely as elements of the construction will permit.

R. Awarded contractor will be required to engage with the manufacturer to provide programming and commissioning of the complete operational system. Manufacturer agrees to work with the awarded contractor on each site, and provide those services to the contractor. Contractor is responsible for paying manufacturer for these services.

S. Contractor shall examine the installation drawings and verify the conditions governing the work on the job site. Contractor shall arrange accordingly, providing such fittings, horizontal cable raceways, conduits, junction boxes and accessories as may be required to meet such conditions.

T. Deviations from the installation drawings, with the exception of minor changes in routing and other such incidental changes that do not affect the functionality or serviceability of the systems, shall not be made without the written approval of the Engineer.

U. Test and demonstrate the entire system at the completion of the project. Provide two (2) hours of training to the owner at the completion of the project.

1.6 ACTION SUBMITTALS

A. Provide Product Data Sheets: For each type of product required, demonstrating compliance with requirements.

B. Shop Drawings: Indicate the following:

1. Schematic diagram of circuits, conduits and equipment

1.7 INFORMATIONAL SUBMITTALS

A. Sample of manufacturer's warranty.

1.8 1.7 CLOSEOUT SUBMITTALS

A. Operating and maintenance instructions.

1.9 QUALITY ASSURANCE

A. Manufacturer Qualification: Manufacturer of system with minimum five years record of satisfactory manufacturing and support of components comparable to basis of design system.

B. All miscellaneous equipment required for a complete, professional installation shall be included in the base bid by the contractor. The district will supply the equipment provided as part of this base bid, no allowances for any additional equipment, hardware, cabling, or miscellaneous will be considered unless specifically excluded from the base bid. Contractor is responsible during the bidding process to include any additional materials needed to install these systems.

C. All work materials shall be removed at the end of the work day and the work area left in the same condition as found.

D. The work herein specified shall be performed by fully competent workmen, in a thorough manner. All materials furnished by the Contractor shall be new, and all work shall be completed to the satisfaction of the Architect/Engineer.

E. All equipment shall be held firmly in place. This shall include speakers, receiver/amplifiers, cables, etc. Fastenings and supports shall be adequate to support their loads with a safety factor of at least three. All switches, connectors, outlets, etc., shall be clearly, logically, and permanently marked during installation.

F. The Contractor must take such precautions as are necessary to guard against electromagnetic and electrostatic hum and ground loops, to supply adequate ventilation, and to install the equipment so as to provide maximum safety to the person who operates it.

G. Care shall be exercised in wiring so as to avoid damage to the cables (e.g., stapling, pinching, excessive bending) and to the equipment. All joints and connections shall be made with lead-free rosin-core solder or with mechanical connectors approved by the Engineer. All wiring shall be executed in strict adherence to standard broadcast practices.

H. The Contractor shall be an established communications and electronics Contractor that has had and currently maintains a locally run and operated business for at least five years. The Contractor shall utilize a duly authorized reseller of the equipment supplied for this project location with full Manufacturer's warranty privileges.

I. The Contractor shall test the installed System according to the Manufacturer’s instructions and verify that the equipment has been installed properly and is functioning as designed.

J. Manufacturer Qualifications: Approved manufacturer of components listed in this Section with minimum five years record of satisfactory manufacturing and support of components comparable to basis of design system.

1. Approval of Comparable Products: The district will be providing the equipment for this specification – no substitutions will be allowed.

K. Regulatory Requirements: Provide components and systems that comply with requirements of the following:

1. Refer to Section 1.2 A.

1.10 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of controls system that fail in materials or workmanship within the specified warranty period following substantial completion.

1. Warranty Period: Wireless transmitters, wireless receivers, amplifiers, loudspeakers, controllers, alert notification station and microphone chargers: 5 years.
2. Warranty Period: Rechargeable batteries, power cords, power supplies: 1 year.

B. Manufacturer's Extended Support Service: Extended telephone support: Unlimited period.

PART 2 – PRODUCTS

2.1 MANUFACTURERS

A. Owner will provide products from:

1. Audio Enhancement, Inc., Bluffdale, UT 84065, Phone +1 801 254 9263, www.AudioEnhancement.com.

2.2 CLASSROOM AND INSTRUCTIONAL SPACE AUDIO ENHANCEMENT & SAFETY ALERT SYSTEM

A. For each classroom and instructional space, Contractor shall furnish a complete Audio Enhancement and Safety Alert System as shown on the drawings. Each system shall include but not be limited to:

1. One Dual Channel DECT microphone receiver. Receiver shall be mounted on the ceiling enclosure door.
2. One DECT Teacher microphone
3. One DECT Student microphone
4. One dual microphone charger
5. One Classroom Amplifier which provides connections for AV control panel, speakers, receivers etc. Any external connection blocks or other accessories shall be supplied to provide for a complete, functional system.
6. System must provide DECT wireless transmission of AV sources from a mobile display to receiver.
7. Four (4) ceiling speakers for each classroom. Additional speakers will be supplied by the vendor as necessary to provide complete even coverage throughout each educational space.
8. 12MP 360 degree ceiling mounted camera.

B. DECT Receiver specifications:

1. Transmission type: DECT RF
2. Frequency response: 50Hz to 10kHz
3. Signal to Noise: > 65dB (system)
4. THD: < 1% @ 1kHz
5. Power Supply: Supplied by MFG – appropriate to system used
6. USER CONTROLS –Controls from the teacher microphone only

    a. Teacher Microphone Volume Control
    b. Student Microphone Volume Control
    c. Line (Multi-Media) level Control

7. INPUTS/OUTPUTS:

    a. Input power jack
    b. Audio out jack
    c. Line Input jack

C. Teacher microphone specifications:

1. Transmission type: DECT RF
2. Frequency response: 70Hz – 8kHz
3. Microphone: Unidirectional cardioid
4. Battery life: 7 hours (typical)
5. Battery type: NiMH or Li-Ion
6. USER CONTROLS:

    a. Own/Other/Line Volume Controls
    b. Power
    c. Mute
    d. Special Function Control (Duress Button)

7. INPUTS/OUTPUTS:

    a. 3.5mm aux input
    b. 3.5mm External Mic Input Jack
    c. Micro USB Charging Jack

D. Student microphone specifications

1. Transmission type: DECT RF
2. Frequency response: 70Hz – 8kHz
3. Microphone: Unidirectional cardioid
4. Battery life: 7 hours (typical)
5. Battery type: Li-Ion or NiMH
6. USER CONTROLS:

    a. on/off
    b. push-to-talk

7. INPUTS/OUTPUTS:

    a. 3.5mm aux input
    b. Micro USB Charging Jack

E. Dual microphone charger specifications:

1. Provide a Dual USB Charger
2. Provide a Micro USB to USB-A cable for each microphone

F. Amplifier specifications:

1. Inputs/Outputs:

a. input power jack
b. Minimum of 3 Audio Inputs – 3.5mm Jacks
c. RS232 serial control
d. loudspeaker terminals
e. Audio output (3.5mm)
f. Serial Baud rate: 2400 to 115200 baud

2. Power supply: Supplied by MFG – appropriate to system used
3. Minimum output power: 2 x 8w (8 Ω), 2 x 16w (4 Ω)

G. Ceiling Speaker specifications – In most cases, the rooms being supplied will have drop tile ceilings and should always have ceiling speakers installed overhead of the listeners.

1. Average sensitivity: 86dB-SPL 1W/1M
2. Impedance: 8Ω nominal
3. Continuous power: Minimum 30W
4. Peak power: Minimum 45W
5. Frequency response: 60Hz to 20kHz
6. Mounting: Metal tile bridge, steel back enclosure, built for Plenum spaces
7. Speaker wire: 18 AWG 2 conductor UL listed CL3P Plenum-rated

H. Wall Enclosure specifications

1. Provide a wall enclosure that is sized appropriately to accommodate the amplifier and microphone receiver in each classroom

2.3 SAFETY ALERT SYSTEM SERVER

A. SAFE System SERVER

1. Provide a system administration and management server as part of the teacher personal alert system. This server shall be rack mounted in the main telecom room and connected to the network.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Prior to installation, examine work area to verify measurements, and that commencing installation complies with manufacturer's requirements.

3.2 INSTALLATION

A. Comply with requirements of Division 27 Sections "Common Work Results for Communications."

B. Do not install AV or control devices until space is enclosed, HVAC systems are running, and overhead and wet work in work space are complete.

C. Install all AV and Network devices in accordance with manufacturer's instructions. Installer must be approved or certified by manufacturer to install equipment.

D. Install speakers in accordance with manufacturer's instructions.

E. Grounding: Provide electrical grounding in accordance with NFPA 70.

F. Perform setup for each audio-visual equipment component.

G. Contractor is responsible to contract with the manufacturer to provide all programming services for the district supplied equipment

3.3 SYSTEM STARTUP AND TESTING

A. The contractor installing the Audio Enhancement system is responsible for installing, startup, adjusting and testing the equipment in accordance with manufacturer's recommendations.

B. Perform operational testing to verify compliance with Specifications. Adjust as required.

3.4 CLOSEOUT ACTIVITIES

A. Commissioning

1. Commissioning services will be provided by the manufacturer and will be mandatory for the contractor to complete the demonstration requirement in this section of the specification. Contractor shall be responsible for the equipment manufacturer’s commissioning costs.
2. Contractor will be responsible to work with the equipment manufacturer to provide complete commissioning services.

B. Demonstration: The Contractor shall demonstrate the System to operate in accordance with the requirements of these specifications as well as the Manufacturer’s performance specifications. The test shall be performed in the presence of an authorized representative of the Owner.

C. Should such a demonstration of performance show that the Contractor has not properly installed the System, the Contractor shall make all changes or adjustments at no additional cost to the Owner.

D. Training: Train Owner's personnel to operate, maintain, and program AV and Safety systems

END OF SECTION 274116

SECTION 275113 – PAGING SYSTEM

PART 1 – GENERAL

1.1 SUMMARY OF WORK

A. This section includes a fully operational IP platform for a district-wide internal and school Critical Communications Solution, incorporating school safety notifications and general communications including but not limited to the following:

1. The platform shall provide complete internal communications and employ state of the art IP Technology including the minimum functions listed.

    a. Two-way internal intercommunications between staff locations and classrooms.
    b. Scheduled bell events.
    c. Emergency announcements that will override any pre-programmed audio, assuring that all Emergency/Lockdown etc., are heard at each and every speaker location.
    d. Capability of prerecording emergency announcements that can be activated by a Soft Key on an administrative console, panic button, dial string, or web browser.
    e. Atomic Time Synchronization with Class Change Tones utilizing multiple, programmable schedules for each zone.
    f. District-wide, Emergency, Group, All School and Zone live voice paging.
    g. District-wide, Emergency, Group, All School and Zone paging for pre-recorded audio – tones, music and voice.
    h. Web-based user interface.
    i. “Code Red” push button to initiate pre-recorded lock down announcement.
    j. Status indicator lights adjacent to all clocks.

2. The system shall support a minimum of 1000 level priorities which shall be user-definable, allowing each end point to place a minimum of 5 different priority calls at the same time.
3. Any authorized administrator shall be able to call from outside the school into any classroom, zone, or entire school directly via the School District supplied SIP enabled Telephone Network. This shall allow remote monitoring, call-in annunciation, and two-way conversation from outside the facility as well as paging into the system. (Compliance with NEMA Standard SB-40 for emergency communications in K-12 Schools).
4. Authorized system users shall be able to create a minimum of 100 automated sequences with voice instructions, tones, emails, program distribution, and relay activations and replay them.
5. Automated message strings shall be manually initiated from a single-button access on the console, on a SIP connected telephone, a panic button, from the web-based user interface or via interface with third party systems.
6. Paging and two-way intercom features shall be accessible from any system console or SIP connected telephone for each campus.
7. The platform shall synchronize its system time to the network timeserver or a web-based time server.
8. Each single campus installation shall be locally survivable for intercom, paging, bells, and emergencies such as lockdown, even when the district connection is unavailable.

9. This specification establishes a minimum level of quality, features, and performance for individual components as well as the integrated system.
10. Systems that do not comply with the feature-sets highlighted in this Specification will not be considered.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications
4. 27 11 00: Communications Equipment Room Fittings
5. 27 15 00: Communications Horizontal Cabling
6. 27 41 16: AV and Safety Alert Systems
7. 27 53 13: Wireless Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 DEFINITION OF TERMS

A. Installer(s): Shall refer to the person, persons, or company who or which actually contracts to perform the work specified herein.

1.4 SUBMITTALS

A. Product data for each component.

B. Shop Drawings: Prior to proceeding with the work: Provide detailed equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, location of each field connection, and a complete schedule of all equipment and materials with associated manufacturer’s product data sheets which are to be used.

1. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring. Identify terminals to facilitate installation, operation, and maintenance. Include a single-line diagram showing cabling interconnection of components and levels throughout system and impedances.
2. Drawings and lists indicating proposed nameplate nomenclature and arrangements for control panels and plug panels prior to fabrication reflecting equipment used.
3. Each drawing shall have a descriptive title and all sub-parts of each drawing shall be labeled. All drawings shall have the name and locations of the project, Systems Contractor’s name in the title block.
4. Details and descriptions of any other aspect of the system, which must differ from the contract documents due to field conditions or equipment, furnished.

C. FCC Approval: The system shall be approved for direct interconnection to the telephone utility under Part 68 of FCC rules and regulations. Systems, which are not FCC approved

or utilize an intermediary device for connection, will not be considered. Provide the FCC registration number of the system being proposed as part of the submittal process.

D. Product Certificates: Signed by manufacturers certifying that products furnished comply with specified requirements.

E. Installer Certificates: Signed by manufacturers certifying that Installers comply with specified requirements.

F. Manufacturer Certificates: Signed by manufacturers certifying that they comply with specified requirements.

G. Field Test Reports: Indicate and interpret test results for compliance with performance requirements. Include record of final matching transformer-tap settings, and signal ground-resistance measurement certified by Installer.

H. Maintenance Data: For equipment to be included in maintenance manuals specified in Division 1.

1. Record of Owners equipment-programming option decisions.
2. All instructions necessary for proper operation and manufacturer's instructions.
3. "Proof of Performance" information.
4. Manufacturer's maintenance information.
5. Copies of non-proprietary computer programs and system set up disks documenting all programmable features of the installed system.

I. Record Drawings: Prior to final acceptance, provide three (3) complete sets of drawings indicating all cable numbers and construction details in accordance with the actual system installation. Revise all shop drawings to represent actual installation conditions. These Record Drawings will be used during "Final Acceptance Testing".

J. System Training: Submit the following information describing the training programs and system trainers as outlined in paragraph 1.6 of this specification and in accordance with Division 1 specifications.

1. Include with the submittal a preliminary staff development training program in outline form for review and approval by the owner's representative.
2. Include with the submittal a current copy of the trainer's certification from the manufacturer that certifies and identifies the trainer(s) who are eligible to provide training and support for the project.
3. Include with the submittal a current copy of trainer's needs assessment form which will be reviewed with the owner's designated representative for the system's preliminary system programming and configuration.
4. Include with the submittal copies of all documentation used to identify for the owner those participants attending and completing the training programs.

K. A copy of the manufacturer's standard statement of warranty proving all equipment provided for the school communications network is covered with the required five-year warranty shall be included with the project submittal. This statement of warranty shall be provided on the manufacturer's stationary.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced Installer who is an authorized representative of equipment manufacturer for both installation and maintenance of equipment required for this Section. Provide the following within thirty (30) days after notification to proceed:

1. Provide a list of installations that the Installer has specifically installed for verification by the Owner. Random installations from other vendors and/or Installers shall not be accepted. The Installer, not its employees, must meet these qualifications.
2. The Installer shall be bondable.
3. The Installer shall demonstrate to the satisfaction of the Owner or his representative that he has:

    a. Adequate plant and equipment to pursue the work properly and expeditiously.
    b. Adequate staff and technical experience to implement the work.
    c. Suitable financial status to meet the obligations of the work.
    d. Technically capable and factory trained service personnel at a local service facility to provide routine and emergency service for all products used in this project.

B. Any Contractor, who intends to bid on this work and does not meet the requirements of the “Quality Assurance” paragraph(s), shall employ the services of an “Installer” who does meet the requirements and who shall provide the equipment, make all connections and continuously supervise the installation. A subcontractor so employed as the “Installer” must be acceptable to the Architect/Engineer. The “Installer” shall be identified within thirty (30) days of notification to proceed for acceptance by the Architect/Engineer.

C. Because the life expectancy of this type of communications structure normally exceeds 10 years, the owner expects continuity from the service provider. If the installing/servicing company has not been an authorized provider of the manufacturers product for at least three (3) years, the following is required:

1. A list of (2) systems manufacturers of which they currently are authorized service providers where the relationship exceeds three (3) years.
2. A letter from the manufacturer outlining the details of changes in service providers over the last three (3) years and what actions they will take to ensure continuity of service to the customer.

D. Each major component of equipment shall have the manufacturers name, address and model number on a plate securely affixed in a conspicuous place. NEMA code ratings, UL Label, or other data that is die-stamped into the surface of the equipment shall be easily visible.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

F. Comply with NFPA 70

G. Comply with NEMA Standard SB-40 for Emergency Communications in K-12 schools.

H. Comply with UL 60950.

1.6 IN-SERVICE TRAINING

A. The contractor shall provide and implement a complete and comprehensive staff training program for all administrators, facility staff members, and teachers. This mandatory training program will provide school staff a complete understanding of how to utilize and properly operate all functions.

B. The training program shall be implemented by a staff member/trainer employed by the contractor. The trainer must be factory certified to provide training on their product.

C. All staff development training is to be coordinated through the owner's designated representative. As training sessions are completed, the trainer will provide the school's administrative staff and school district's staff a document listing all of the staff and faculty members who attended, received, and completed the training program.

1.7 WARRANTY

A. Provide a manufacturer's five-year warranty of the school communications network equipment against defects in material and workmanship. This warranty will cover all electronic system components. Additional warranties cover clocks, speakers, and call in switches. If any defects are found within the warranty period, the defective equipment shall be replaced at no cost (equipment only); a one year warranty shall be provided for labor.

B. A copy of the manufacturer's standard statement of warranty proving all equipment provided for the school communications network is covered with the required five-year warranty shall be included with the project submittal. This statement of warranty shall be provided on the manufacturer's stationary. The standard five-year warranty is an important element in establishing a standard in quality. Manufacturers who circumvent the five-year warranty by offering special "extended warranties" that are not part of their normal published warranty will not be accepted.

C. Contractor shall respond, excluding weekends and holidays, within 24 hours to any warranty service calls. If equipment cannot be repaired within 24 hours of service visit, the contractor shall provide "loaner" equipment to the facility at no charge.

D. Make available a service contract offering continuing factory authorized service of the system after the initial warranty period.

1.8 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide the following system:

1. Telecenter manufactured by Rauland

a. Authorized Rauland Distributor contact:

(1) Jeff Bowers
Innovative Communications Systems, Inc.
775-825-2011
jbowers@innovativecomsys.com

PART 2 – PRODUCTS

2.1 SYSTEM REQUIREMENTS

A. The platform shall utilize state of the art IP Technology for Call-in Notification, School Safety Paging and Evacuation tones, Atomic Time Synchronization, Class Change Tones utilizing multiple, programmable schedules for each zone, Two-way hands-free Internal Communications and Paging, and Program Distribution. The system shall be easy to learn and operate. All standard programming shall be web-based and user friendly to allow the system administrator the ability to easily program system features.

B. Provide complete and satisfactorily operating district/school communications and district/school safety as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated. Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information. Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.

C. The platform shall be a single electronic system consisting of a minimum of 10 audio channels for each campus, (classroom) IP Speaker Modules and call switches, IP Zone Modules connecting corridor speakers, inside and outside horns, IP Administrative Consoles, SIP enabled PBX integration and district-wide integration for paging, emergency notifications, calendar scheduling and configuration.

D. Each Classroom shall be provided with a Speaker Module interface and a minimum of 5 different call switches, each with their own annunciation path and priority.

E. Call-ins may automatically annunciate (display of priority and location) to administrative consoles, SIP enabled phones, and outside phones.

F. Call-ins shall be programmed to automatically change priority and annunciation route based on age of call-in and original priority.

G. Call-ins may have priority (and annunciation route) changed by user action from a console or SIP enabled phone.

H. Call-in annunciation route shall include playing pre-recorded audio over speakers, sending a pre-configured email, and activating relays.

I. The platform shall lend itself to expansion by simple addition of hardware modules.

J. The platform shall connect directly to an existing, standard protocol WAN/LAN network, without the need for a separate server at each school location. Configuration, including bell schedules, calendars, and emergency sequences can be remotely created, changed, stored and downloaded to the system by an authorized user from a web-based user interface.

K. The platform shall provide the ability to initiate school safety paging announcements, evacuation tones and take cover tones from any telephone or connected web browser within the facility or outside the facility to any other location within the facility or district.

L. The platform shall provide the ability to selectively communicate or monitor individual classrooms in emergency situations from any telephone within the facility or outside the facility to any other location within the facility; all communication within the classroom shall be hands-free and will not require any interaction by the classroom user.

M. The platform shall provide classroom users the ability to confirm that they have safely secured their classrooms during an emergency with a single button press. The front office administrator will receive confirmation that the classroom is safely secured via an administrative console and web-based user interface. The front office administrator can view classrooms that are not safely secured via the administrative console. The front office administrator can view classrooms that are not safely secured via the web-based user interface. The front office administrator shall be able to initiate two-way communication, without a pre-announcement tone, to the classroom during an emergency via the administrative console. Web-based user interface will still identify that a school is in an emergency, even if all classrooms are safely secured. Individual

classroom check-in and school emergency status shall be viewed from the web-based user interface, both on-site and remotely.

N. IP Addressable and POE powered Speaker Modules for individual rooms shall be system programmable and may be assigned any two, three, four, five or six digit number as well as name and description. Any extension may be reassigned at any time.

O. IP-enabled two-way voice communication shall be available from any provided telephone or administrative console through any speaker in a campus. This shall allow hands-free communication to any classroom or any individual loudspeaker unit. A programmable pre-announce tone shall sound immediately before the intercom path is opened and a supervisory tone shall continue to sound at regular intervals when speaker monitoring is active, complying fully with all privacy legislation. Pre announce tone and supervisory tones shall be disabled during designated emergencies automatically.

P. The platform shall allow users to configure multiple schedules per school, with a minimum of 500 unique events per schedule, and automatic Daylight Savings time correction. Schedules can be programmed to occur once, daily, weekly, monthly, or in any combination of the preceding recurrences. Each school may have a minimum of 20 unique bell schedules, with a minimum of 5 active schedules on any given day for each campus. User shall be able to select from 25 standard included tones as well additional user created and uploaded audio files for class change signaling and messaging. In addition, scheduled events shall include relay actions, email notifications, and paging exclusions as system configuration changes. The platform shall allow control of the bell schedules via the district WAN/LAN without the need for a separate server at each school location. Bell schedules can be remotely created, changed, stored and assigned to calendar days for the local school by an authorized user from a web-based user interface.

Q. The platform shall be able to integrate with an existing PA system or operate as a fully independent IP solution. The platform shall be able to function in combination of said configurations, and allow for seamless communication within a school or district-wide, regardless of the type of configuration used. The platform shall be scalable, with the ability to easily add, install, and configure additional equipment to a system.

R. The platform allows for customization of preprogrammed sequences, used for emergencies, events, and everyday communications. Preprogrammed sequences can be activated from the push of a relay button, soft key of an administrative console, a dial string of a SIP phone, or a web browser configured to the district network. Sequences can be initiated automatically as part of a schedule or on the fly. Preprogrammed sequences can be customized to utilize any combination of audio tones, emails, relays, tone exclusions, swings, delays, duples, SIP phone notifications, and program distribution. Audio tones can include customized audio files and voice messages, recorded in any language. Uploaded audio tones and messages can be preprogrammed to annunciate repeatedly or individually, as part of a scheduled sequence or on the fly. Each school in a district can have its own customized sequences, and can be activated individually, in groups, or district-wide.

2.2 EQUIPMENT AND MATERIAL

A. Server Software

1. Provides district-wide paging, bell event scheduling, emergency notification and configuration for entire district.
2. Ability to configure system and initiate system features, per school and district-wide via web-based user interface.

3. The software has the ability to sync system time to the Atomic Clock Signal or to the school's or district's network time server.
4. The software will provide a web browser to deliver district-wide emergency paging, pre-recorded messages and tones from any authorized computer in the facility or the district. The software must be capable of automatically notifying district personnel via the WAN/LAN of an alarm condition.
5. The software can automatically broadcast emergency instructions via associated system hardware throughout an entire district when an alarm (e.g. lockdown, lockout, security, fire) is initiated via the web-based user interface. The emergency instructions are preprogrammed and require no user intervention. Bell tones are able to be halted during an emergency. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.
6. The software allows for user-uploaded pre-recorded messages and tones. Software supports the upload of MP3 and WAV file types. User-uploaded pre-recorded messages and tones can be part of emergencies, sequences, and bell schedules.
7. The software can be installed in cloud, virtual or physical server environments.
8. The web-based user interface supports secure HTTP browsing.
9. The software supports encryption to ensure secure access.
10. The system shall monitor itself if devices go offline and system actions are not received. Specified users shall receive email notifications when devices go offline. The software shall be able to keep a log and report on system activity within a school or all schools district-wide for a minimum of one year. These reports can be exported to excel spreadsheets.
11. The software will support a minimum of 20 bell schedules per school, with 5 schedules assignable to a specific school day. Bell schedules can be programmed to annunciate tones, activate relays, send emails, activate program distribution, and notify SIP phones.
12. The system allows programmable end points to be automatically included or excluded for live paging, bell tones, or prerecorded audio, depending on the time or day or day of the week. These inclusions/exclusions can be applied manually or automatically depending on their schedule.
13. The software can automatically send an email, as part of a programmed sequence of events, to district administrators alerting them of an emergency within the district.
14. The software provides the ability to view schools that are in an emergency status, using any web browser on the district's network. The software shall identify the name of the school in an emergency as well the type of emergency that school is in.
15. The software provides the ability to view individual classrooms that are not checked-in during an emergency, using any web browser on the district's network. The software shall identify the name, extension, and description of the classroom that is not checked-in during the emergency.
16. The system has a minimum of 5 customizable emergencies, one of them being an All-Clear – with the ability to return the system from an emergency to normal status. Each emergency shall have a minimum of 500 unique events.
17. As a district-wide communications solution, the system shall be able to provide simultaneous communications to all schools or groups of schools within a district. The system shall allow a user to initiate district-wide communications to individual schools, all schools or groups of schools, from a web-based user interface. The system shall allow a user to initiate prerecorded audio, live paging, or programmed sequences to individual schools, all schools or groups of schools, from the web-based user interface. Programmed sequences shall be customizable per school, and the system shall be able to activate them

simultaneously to individual schools, all schools or groups of schools, from the web-based user interface.

18. The communications software must allow upgrade from an individual school system to multiple schools, or an entire school district, using the same web-based user interface. The communications software from an individual school system must be identical in typical user operation to the multiple schools or entire school district communications system software.

B. Campus Controller

1. Provides call routing for paging and intercom for a single facility.
2. System shall connect to the district provided Telephone Network via a SIP connection.
3. Support a flexible numbering plan allowing two, three, four, five, or six digit extensions.
4. SIP interface to a district provided Telephone Network shall be capable of allowing connected phones to display classroom call-ins, answer internal intercom call-ins, make pages and change priorities of call-ins in progress.
5. Direct dialing, two-way amplified voice intercom between any provided telephone or admin console and speaker without the use of a press-to-talk or talk-listen switch.
6. Ability to upgrade priority level from individual call switch.
7. The ability to answer intercom call-ins registered at administrative consoles and pre-selected telephones.
8. The ability to automatically escalate incoming call-ins to an alternate telephone or group of telephones if they remain unanswered for a predetermined amount of time.
9. The ability to manually upgrade an intercom call-in to an alternate telephone or group of telephones.
10. The ability for classrooms to “check-in” via push button when they have successfully secured their location during emergency.
11. Administrative console shall display locations that have not checked in to confirm their secured location and provide hands-free audio monitoring and communication to unsecured locations.
12. The controller shall not need direct connection to any classroom via home run or distributed wiring. It shall communicate solely through the IP network.
13. Single button access from any console on the system to distribute emergency announcements within the facility to all or select locations equipped with speakers. Emergency announcements originating from any assigned administrative console shall have priority over all regular system functions.
14. Ability for administrative consoles and connected phones to selectively monitor audio at any two way speaker during an emergency.
15. Stores a minimum of 48 hours’ worth of Bell Event Schedules, all emergency notification sequences as well as facility wide configuration.
16. System has the ability to sync system time to the Atomic Clock Signal or to the school’s or districts network time server.
17. System’s SIP Interface shall provide:

    a. Audio paging access from any telephone to any single intercom speaker, zone (group) of intercom/paging speakers, or all speakers/paging horns throughout the entire facility.
    b. Ability to answer a call-in directed to that SIP extension.
    c. Ability to upgrade a call-in directed to that SIP extension.
    d. Single button access from any telephone on the system to initiate alarm signals within the facility to all or select locations equipped with speakers. A minimum of 25 separate distinct alarm signals shall be

provided. Alarm signals originating from any assigned administrative telephone shall have priority over all regular system functions.

e. Ability to initiate a school-wide emergency including lockdown and evacuate sequences.

f. SIP device shall display call-in information from call in switch. Information will include a minimum of Classroom Name, Number, and Priority Level.

18. The system will have the ability to utilize a web browser and a USB microphone connected to the PC to deliver district-wide live emergency paging, pre-recorded messages and tones from any authorized computer in the facility or the district. The system must be capable of automatically notifying district personnel via the WAN of an alarm condition.

19. The system can automatically broadcast emergency instructions throughout an entire campus when an alarm (e.g. lockdown, lockout, security, fire) is tripped or manually activated. The emergency instructions are preprogrammed and require no user intervention. Bell tones are able to be halted during an emergency. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.

C. IP Addressable Modules:

1. System shall provide multiple IP Addressable Modules for intercom, paging and relay activation.

   a. All Modules are POE 802.3af compliant
   b. All Modules support DHCP.
   c. All Modules connect to network with a single RJ45 connector

2. IP Addressable Speaker Module

   a. Shall interface to school's data network, a classroom speaker, and multiple call switches.
   b. A minimum of 5 levels of call-in can be placed from an IP Speaker Module. The call-ins are routed to administrative consoles and select SIP connected telephones and can only be cleared from the system once answered. If a call-in is not answered within a preprogrammed time the call-in may reroute to other telephones, consoles, and speakers.
   c. An option for Privacy call in switches is supported. When the Privacy switch is activated it prevents administrative or classroom telephones from monitoring the specific classroom/location intercom speaker.
   d. The ability to belong to one or more of a minimum of 100 independent zones for zone paging, program/music distribution zones and class change tone zones; this assignment is a programmable function, changeable by time of day. Each IP Speaker Module's location shall be programmed in software to belong to any combination of software zones. IP Speaker Modules shall be designed to mount near ceiling and wall speakers and in the plenum space.
   e. Intercom and paging volume adjustable from Software interface.

3. IP Addressable Zone Paging Module

   a. Zone Paging Module shall connect multiple speakers for district all page, all page, zone paging, bells, audio events and, emergency notification.
   b. Zone Paging Modules shall be rack and wall mountable.

c. Zone Paging Modules shall be able to belong to one or more of 100 independent zones for live paging, bells, pre-recorded audio and emergency notification.

4. IP Addressable Aux I/O Module

a. Aux I/O Module shall have two input contacts and two output contacts.
b. Input and output contacts are individually addressable.
c. Aux I/O Module shall be wall and rack mountable.
d. User can program relays to be activated manually, through an event/bell schedule, or during emergency notification.
e. Aux I/O Module can perform school lockdown from a single press of a panic button.

5. IP Addressable Program Line Input Module

a. Program Line Input Module shall provide line level audio program distribution into system.
b. Program Line Input Module shall have a 3.5mm cable jack.
c. Program Line Input Module shall be configured via web-based user interface.
d. User can configure program distribution to be activated manually or automatically through an event/bell schedule.
e. Program Line Input Module will have a system priority level such that emergency communications override program distribution.

D. IP Addressable Analog Gateway

1. IP Addressable Gateway provides integration with existing analog wiring infrastructure – consisting of shielded two-pair classroom field wiring. The Gateway provides the ability to reuse speaker wiring, speakers, and punch blocks to integrate analog infrastructure with IP platform.
2. Each Gateway will have 5 watts of power per port and 25 watts total per device.
3. Supports 24 classrooms that utilize 25 Volt speakers and all current Telecenter call switches for front office notification.
4. Supports minimum of 5 call switch priorities per classroom, capable of lockdown check-in functionality, while reusing existing shielded two-pair classroom field wiring.
5. Classroom intercom volume adjustable from Software interface.
6. Classroom paging volume adjustable from Software interface.
7. Configured to the school network and can be used in conjunction with IP Addressable Modules.

E. IP Addressable Administrative Console

1. A full color screen with 64 soft keys, 3 line select, volume control, push to talk, speakerphone mode and left/right and up/down scrolling.
2. Audio paging access from any Console to any single intercom speaker, zone (group) of intercom/paging speakers, or all speakers/paging horns throughout the entire school.
3. Programmable soft key access from any console on the system to initiate alarm signals within the school to all or select locations equipped with speakers. A minimum of 25 separate distinct alarm signals shall be provided. Alarm signals originating from any assigned administrative console shall have priority over all regular system functions.

4. Programmable soft key access from any console to automatically broadcast page emergency instructions throughout an entire school when an alarm (e.g. lockdown, lockout, security, fire) is tripped or manually activated. The emergency instructions are preprogrammed and require no user intervention. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.
5. Ability to perform intercom to any single IP Addressable Speaker Module.
6. Ability to display 3 call-ins at a time on the screen while other call-ins are annunciating and the ability to scroll to view all call-ins.
7. Ability to upgrade a call-in via soft key.
8. Programmable soft key access from any console for activating relays, campus wide.
9. Ability to maintain, along with controller and other IP Modules system functions, including intercom, bells and paging for the local campus in the event of district-wide connection loss.
10. Classrooms that have not 'checked-in' during an emergency are listed on the Administrative Console's screen.
11. The time duration of an emergency is shown on the screen of the administrative console. The check-in timer is shown on the screen of the administrative console.

F. Audio Paging/Program Amplifiers

1. Power amplifier(s) shall be provided to provide a minimum of 2 watts of power to all paging speakers, and 15 watts of power to all paging horns.
2. The maximum load on the paging/program amplifiers shall be 80% of the rated maximum output of the amplifiers.

G. Normal/Emergency Call Switch – Rauland Dual Level Call In Switch

1. Normal/Emergency Call Switches indicated on the drawings shall provide the following functions and features:

    a. One (1) "Normal" call switch that shall activate a distinctive "NORMAL" level call from single button activation. The button shall be clearly marked "NORMAL" and will route the call-in to any one or more Administrative Consoles and/or Marquee Displays for quick and easy response from an Administrative Console.
    b. One (1) "Emergency" call switch that shall activate a distinctive "EMERGENCY" level call from single button activation. The button shall be red in color and shall be clearly marked "EMERGENCY" and will route the call-in to any one or more Administrative Consoles and/or Displays for quick and easy response from an Administrative Consoles.

H. Emergency/Check-In Call Switch – Rauland Check-In Call In Switch

1. Emergency/Check-In Call Switched indicated on the drawings shall provide the following functions and features:

    a. One (1) "Emergency" call switch that shall activate a distinctive "EMERGENCY" level call from single button activation. The button shall be red in color and shall be clearly marked "EMERGENCY" and will route the call-in to any one or more Administrative Consoles and/or Displays for quick and easy response from an Administrative Consoles.
    b. One (1) "CHECK-IN" call switch that shall activate a distinctive "CHECK-IN" level call from single button activation. The button shall be blue in color and shall be clearly marked "CHECK-IN" and will route the call-in to

any one or more Administrative Consoles. This button will be used for emergency check-ins during school emergencies, notifying the front office of the classroom occupants' safety during an emergency.

I. Equipment Racks

1. All equipment racks shall provide 44 spaces (77") minimum for mounted system equipment.
2. All equipment racks shall be multi-rack format ("gangable") style, bolted together, and open cavity.
3. All equipment racks will be provided with lockable rear doors.
4. Equipment rack(s) shall be located in climate-controlled areas/rooms as shown on drawings.
5. All head-end, distribution, and source equipment, including data and power, shall be located in racks configured as approved by the Engineer.
6. Rack mounted equipment shall be accessible from front and rear.
7. All unused rack spaces will be covered with appropriate blank/vent panels.

J. Wireless Clock System

1. Provide complete and satisfactorily operating NTP Synchronized Wireless Clock System with analog and/or digital secondary clocks as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated.
2. (NTP) Network Time Protocol is a network standard protocol that assures accurate synchronization to the millisecond of computer clock times in a network of computers. Based on UTC, NTP synchronizes client workstation clocks to the U.S. Naval Observatory Master Clocks in Washington, DC and Colorado Springs, CO. Running as a continuous background client program on a computer, NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust computer clocks.
3. The system shall be easy to learn and operate. All standard system programming shall be user friendly to allow the system administrator the ability to easily program system features.
4. Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information.
5. Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.
6. The NTP Synchronized Wireless System consists of a master transmitter located on the inside of the building, and a NTP receiver connected to a time server. Wireless analog and digital clocks are synchronized to the NTP time. System shall synchronize all clocks to each other. System shall utilize NTP technology to provide atomic time to components.
7. System shall not require hard wiring for its components except for AC Power. Analog Clocks may be battery operated for full portability if required.
8. Analog Clocks shall synchronize to +/- 1 second of the transmitter displayed time.
9. Clocks shall automatically adjust for Daylight Saving per settings on the transmitter
10. The system shall have an internal clock that is continually updated by the NTP receiver. If a NTP failure were to occur, the clocks would continue to be synchronized to the internal clock and would not deviate from each other. Once NTP time is restored, all clocks would once again be synchronized to the NTP time.
11. The system must have a failsafe design so that if a power interruption were to occur, the clocks will continue to operate. If a sync signal is not received by the

analog clocks for 48 hours, the second hand will double pulse to indicate this condition. Upon restoration of power, the transmitter will once again communicate with the clocks and normal operation will resume.

12. Battery Powered Analog Clocks shall require 2 “D” cell batteries.
13. System shall be 100% programmable from the front operational panel with lights that indicate power status and NTP reception. Panel programming will also include Time Zone, Frequency, 12 or 24 hour operation and DST on/off.
14. The wireless backbone must support expansion of the system to include wireless alphanumeric displays for emergency crisis communications for district-wide communications.
15. The system may be modified to use GPS instead of NTP as the time source without the need to replace the transmitter. A GPS receiver would need to be added with access to the outside of the building.
16. The system shall lend itself to expansion by simple addition of wireless secondary clocks and their required power source.

K. Interior Ceiling Speakers

1. Provide Ceiling Speaker Assembly consisting of 8 Ohm, 8” speaker mounted in a 2 foot by 2 foot, or 2 foot by 1 foot, lay-in baffle, with an integrated back box that covers the full area of the baffle.
2. The speaker shall be connected by inserting an 8-pin RJ45 terminated CAT 5e or Cat 6 cable.
3. The speaker shall include provisions to allow attachment of a safety cable if required.

L. Wall Mounted Horns

1. Provide double re-entrant type horn loudspeakers with integral driver. The horn loudspeaker shall be impervious to weather and vandalism. Horn shall be constructed of heavy-duty ABS plastic. Horn loudspeaker drivers shall be rated at 15 watts with a frequency response of 480 Hz to 14 KHz. Sensitivity shall be 106 dB 1 watt, 1 meter. Transformer assembly shall be dual voltage multi-tap type suitable for 25 or 70-volt installations. Dispersion pattern shall be 180 degrees conical. The horn loudspeaker shall be constructed of treated heavy gauge aluminum, with all exposed parts potted and a sealed driver. Wiring terminal shall be fully enclosed. The speaker flange and mounting surface shall have a cork-rubber gasket. The horn loudspeakers finish shall be gray baked on enamel.
2. The recessed back box shall be of heavy gauge cold-rolled steel, spot welded for stability with a rust-retardant gray primer finish. Acoustically treat the interior to eliminate mechanical resonance. The back box shall be 10-3/4”x10-3/4”x6” deep.
3. The baffle shall be vandal proof, the faceplate constructed of 14-gauge carbon steel with a minimum tensile strength of 55,000 PSI. A lattice grid sub-plate shall deny access to the horn but be acoustically transparent for sound projection. Provide tamper proof, stainless steel mounting hardware. The baffle shall a mar/scratch baked epoxy rust inhibitive finish.

M. Uninterruptible Power Supplies (UPS)

1. UPS equipment provided for this system will include Power Conditioning to smooth current and voltage fluctuations.
2. UPS equipment will be sized in accordance with the system manufacturer’s recommendations.

3. Provide an individual UPS for EACH SYSTEM CONTROLLER (Gateway) furnished with the system.
4. Provide additional UPS(s) for protection of all other equipment furnished with the system and housed in the equipment racks.
5. All UPS equipment shall be rack mounted.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine conditions, with the Installer present, for compliance with requirements and other conditions affecting the performance of the School Communications and School Safety Network.

B. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install system in accordance with NFPA 70 and other applicable codes. Install equipment in accordance with manufacturer's written instructions.

B. Furnish and install all material, devices, components and equipment for a complete operational system.

C. Impedance and Level Matching: Carefully match input and output impedance’s and signal levels at signal interfaces. Provide matching networks where required.

D. Control Circuit Wiring: Install control circuits in accordance with NFPA 70 and as indicated. Provide number of conductors as recommended by system manufacturer to provide control functions indicated or specified.

E. All housings are to be located as indicated.

F. The contractor shall provide necessary transient protection on the AC power feed, all copper station lines leaving or entering the building, and all central office trunks. All protection shall be as recommended by the equipment supplier and referenced to earth ground.

G. Wiring within Enclosures: Provide adequate length of conductors. Bundle, lace, and train the conductors to terminal points with no excess. Provide and use lacing bars.

H. Provide physical isolation from speaker-microphone, telephone, line-level wiring, and power wiring. Run in separate raceways, or where exposed or in same enclosure, provide 12 inch minimum separation between conductors to speaker-microphones, telephone wiring and adjacent parallel power. Provide physical separation as recommended by equipment manufacturer for other system conductors.

I. Identification of Conductors and Cables: Use color coding of conductors and apply wire and cable marking tape to designate wires and cables so all media are identified in coordination with system wiring diagrams.

J. Weatherproofing: Provide weatherproof enclosures for items to be mounted outdoors or exposed to weather.

3.3 GROUNDING

A. Provide equipment grounding connections for Integrated Electronic Communications Network systems as indicated. Tighten connections to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounds.

B. Ground equipment, conductor, and cable shields to eliminate shock hazard and to minimize to the greatest extent possible, ground loops, common mode returns, noise pickup, cross talk, and other impairments. Provide 5-ohm ground at main equipment location. Measure, record, and report ground resistance.

C. Provide all necessary transient protection on the AC power feed and on all copper station lines leaving or entering the building. Note in system drawings, the type and location of these protection devices as well as all wiring information.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Inspection: Make observations to verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Provide a list of final tap settings of paging speaker line matching transformers.

C. Testing: Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Contractor's expense. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

3.5 FINAL ACCEPTANCE TESTING

A. The Final Acceptance Testing shall be provided to the Owner or the Owners designated representative only. Final acceptance testing to any other trade or service provider for the project will not comply with the requirements of this section.

B. The contractor will provide a Final Acceptance Test record document signed by both the contractor and the Owner or designated Owner’s Representative establishing the “In Warranty” date. The warranty period will not commence until the Final Acceptance Test is completed.

C. Be prepared to verify the performance of any portion of the installation by demonstration, listening and viewing test, and instrumented measurements. Make additional adjustments within the scope of work and which are deemed necessary by the Owner because of the acceptance test.

3.6 COMMISSIONING

A. The contractor shall train the Owner's maintenance personnel in the procedures and schedules involved in operating, troubleshooting, servicing, and preventative maintenance of the system. This training will be in accordance with the training as outlined in Section 1.6 of these specifications. In addition to the Training Materials provided, the contractor will also furnish Operators Manuals and Users Guides at the time of this training.

B. Schedule training with Owner through the owners representative, with at least seven days advance notice.

3.7 OCCUPANCY ADJUSTMENTS

A. The contractor shall provide Occupancy Adjustments in accordance with Section 1.6 of these specifications. A response scenario amenable to both the owner and the contractor will be established and followed for the first year of service.

3.8 CLEANING AND PROTECTION

A. Prior to final acceptance, the contractor shall vacuum, wipe down and clean all system components and protect them from damage and deterioration. All blank spaces in equipment cabinets will be covered with blank panels. Top and side panels, and all cabinet doors will be installed. All general areas within and around all equipment rack/cabinets in the facility will be swept, vacuumed, and cleaned up. No cabinets will be left unlocked and all cabinet keys will be turned over to the owner or designated owner's representative.

END OF SECTION 275113

SECTION 275129 - EMERGENCY COMMUNICATIONS SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. The Contractor shall provide all equipment, materials, labor, and services necessary to complete the emergency 2-way communication system between the 2nd floor elevator landing and the main entry administrative office, and to ensure that it is in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

B. This section includes minimum requirements for the following:

1. Flush Mounted Master Station located in Administrative Office.
2. Master Station recess wall mount kit.
3. Master Station power supply.
4. Master Station battery backup.
5. Master Station Cellular Dialer.
6. Elevator landing flush mount emergency call station with clear cover.
7. Elevator landing call station recess mount kit.
8. Area of Rescue sign.
9. Plenum rated shielded 22/4 twisted pair communication cabling between master station and call station.
10. Plenum rated 18/2 power cabling between master station and call station.
11. Installation, configuration and commissioning of system.
12. Testing and demonstration of the system to the local Fire Marshall or local Fire Code Official.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications
4. 27 15 00: Communications Horizontal Cabling

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 CERTIFICATIONS AND STANDARDS

A. The command unit shall be designed to meet the following standards:

1. Accessibility

a. ADA: Standards for Accessible Design – 2010 §7
b. ANSI ICC A117.1 (2009): Accessible and Usable Buildings and Facilities
c. IBC (2018) §1009

d. NFPA 72: National Fire Alarm and Signaling Code – 2016 §24.10

2. Safety

a. UL 60950-1

3. Direct connection of Terminal Equipment (TE) to cellular network for system dial out and monitoring.

a. FCC (47 C.F.R. Part 68)

1.4 QUALITY ASSURANCE

A. All command unit installation, configurations, setup, program and related work shall be performed by electronic technicians thoroughly trained by the manufacturer in the installation and service of the equipment provided.

B. All equipment shall be warrantied against any defects in material and workmanship under normal use for a period of twenty-four (24) months from date of installation, provided that manufacturer receives a completed "Installation Certification" certifying the date on which the system has been installed. An "Installation Certification" card shall be enclosed with every unit. In the event that no "Installation Certification" is received by manufacturer, the twenty-four (24) months will commence on the date of shipment by the manufacturer.

1.5 SUBMITTALS

A. Submit manufacturer product data sheets for all system components and cabling.

B. Product Data Sheet Submittals shall comply with the following:

1. Product data submittals must be submitted to and approved prior to release of order for equipment and prior to installation.
2. Submit product data sheets in PDF format.
3. Submittals must include all items identified in each specification section. Partial submittals will not be accepted.
4. Where product data sheets cover more than one distinct item, clearly indicate by arrows or brackets precisely what is being submitted including optional accessories. Delete or cross-out non-applicable data.

C. Shop drawings:

1. Submit shop drawings for all equipment showing:

a. Location and layout of all field devices.
b. Location and layout of all equipment.
c. Oneline wiring/cabling diagrams for devices, equipment and components. Oneline diagrams shall identify all devices and equipment and shall include all interconnecting wiring, cable types and sizing. Provide manufacturers wire/cable type as required.
d. Elevations of all equipment mounting enclosures showing equipment mounting locations, electrical outlet locations, termination equipment.
e. Drawings for each field device type detailing wiring and mounting instructions.
f. Point-to-point wiring data, utilizing a combination of AutoCAD generated drawings and device/equipment Excel schedules.

D. Calculations:

1. Battery Backup Calculations:

a. Provide battery backup calculations to verify that uninterruptable power supplies are sized to provide backup of the entire 2-way communications system for a duration of not less than 4 hours.

E. Operation and Maintenance Manuals

1. Format:

a. PDF.

2. Content:

a. Functional Design Manual: Includes a detailed explanation of the operation of the system.

3. Hardware Manual which includes:

a. Pictorial parts list and part numbers.
b. Pictorial and schematic electrical drawings of wiring systems, including devices and equipment.
c. Telephone numbers for the authorized parts and service distributors.
d. Include all service bulletins.

4. Operator’s Manual which full explains all procedures and instructions for the operation of the system and includes:

a. System start up and shut down procedures.
b. Use of system.
c. Equipment recovery and restart procedures.
d. Software and firmware backup procedures (where applicable).

5. Maintenance Manual which includes:

a. Manufacturer’s warranty certificates.

PART 2 - PRODUCTS

2.1 GENERAL

A. The command unit shall:

1. Be an indoor-rated emergency communications system device comprised of a local command unit phone, a monitoring panel and an uninterruptible power supply (UPS).
2. Be programmable through the local command unit phone.
3. Be programmable from a remote location if a connection to the public switched telephone network (PSTN) is made available.
4. Support and provide power to each analog call station for up to five (5) units as an area of rescue assistance station used for emergency communications.

5. Provide analog call stations with the ability to establish communication with either an attendant at the local command unit phone or an attendant through a Cellular connection at the master station.
6. Provide an audible and visual indication of a system ground fault.
7. Provide an audible and visual indication of open faults and short faults that occur on an analog call station conductive pathway.
8. Have a monitoring panel that provides a visual indication on the activation status and trouble status of the analog call stations.

2.2 HARDWARE

A. The command unit enclosure shall:

1. Be constructed of 16 Ga. cold-rolled steel (CRS).
2. Be powder coated black with a textured finish.
3. Have mounting holes on the rear and two sides of the enclosure.
4. Have multiple 3/4" and 1” conduit knockouts for wiring access.
5. Have a hinged door.

B. The local command unit phone compartment shall:

1. Have a door with a magnetic latch.
2. Have a door with an acrylic window so that the local command unit phone light-emitting diodes (LEDs) are visible.

C. The command unit shall have a monitoring panel to provide a visual indication on the activation status of analog call stations. The monitoring panel shall:

1. Have one (1) LED for each analog call station to indicate activation status.
2. Have one (1) LED for each analog call station to indicate trouble status in the event an open fault or a short fault occurs on an analog call station conductive pathway.
3. Have one (1) LED to indicate the power status.
4. Have one (1) LED to indicate the status of a connection to the PSTN.
5. Have one (1) LED to indicate the status of a connection to the local command unit phone.
6. Have one (1) LED to indicate a fault when there is a loss in primary power provided to the UPS.
7. Be protected by an acrylic window.

D. The local command unit phone shall:

1. Have a handset with a coiled cord.

2.3 FUNCTIONALITY

A. Local Command Unit Phone

1. Receive calls from one (1) of five (5) analog call stations.
2. When an incoming call has been received, the local command unit phone shall audibly ring.
3. When an incoming call has been received, the assigned line indicator button LED shall illuminate and flash.
4. Originate calls selectively to one (1) of the five (5) analog call stations.

B. Call Routing

1. The command unit shall be configurable with the following call routing procedures:

    a. Route calls to the local command unit phone as primary, PSTN/Cellular connection as secondary;
        (1) First, route a call to the local command unit phone.
        (2) Secondly, if there is no answer or there is a busy signal from the local command unit phone, then route a second call to the local command unit phone.
        (3) Thirdly, if there is no answer or there is a busy signal from the local command unit phone, then route a third call through a PSTN/Cellular connection.
        (4) Fourthly, if there is no answer or there is a busy signal from the PSTN/Cellular connection, then route a fourth call through a PSTN/Cellular connection.
        (5) Finally, if there is no answer or there is a busy signal from the PSTN/Cellular connection, then continue routing the call in order and as described in the aforementioned cycle until the call is answered or the call conversation timer expires.

2. The command unit shall be capable of queueing calls on a “first in, first out” (FIFO) basis.

    a. When a call is in session, subsequent calls shall be placed into a FIFO queue.
    b. When a call is completed, the next call in queue shall be automatically placed to either an attendant at the local command unit phone or an attendant through a PSTN/Cellular connection.

3. When the attendant terminates a call, the analog call station shall automatically return to an on-hook condition.

C. Visual Indicators (Monitoring Panel)

1. Power Status LED

    a. When the command unit is powered, the power status LED shall be solidly illuminated.
    b. When there is a power fault, the power status LED shall be unlit.

2. Analog Call Station LEDs

    a. When an analog call station has been activated but not connected to either an attendant at the local command unit phone or an attendant through a PSTN connection, the respective analog call station LED shall be solidly illuminated.
    b. When an analog call station has been activated and the call has been answered by either an attendant at the local command unit phone or an attendant through a PSTN connection, the respective analog call station LED shall be solidly illuminated.
    c. Queued calls shall be indicated through the respective flashing analog call station LED.

3. Trouble LEDs

a. When an open fault or short fault occurs on an analog call station conductive pathway, the respective trouble LED shall be solidly illuminated.
b. When a system ground fault occurs, all trouble LEDs shall flash simultaneously.

4. PSTN LEDs

a. When there is a call connection attempt through the PSTN port, the PSTN LED shall flash.
b. When there is an active call connection through the PSTN port, the PSTN LED shall be solidly illuminated.

5. Local Command Unit Phone LEDs

a. When there is a call connection attempt through the local command unit phone port, the local command unit phone LED shall flash.
b. When there is an active call connection through the local command unit phone port, the local command unit phone LED shall be solidly illuminated.

6. Primary Power Status LED

a. When there is a loss in primary power provided to the UPS, a dedicated LED shall be solidly illuminated.

2.4 INTERFACES

A. Analog Call Station Interface

1. Each command unit shall be equipped with five (5) analog call station ports in order to support up to five (5) analog call stations.
2. The command unit shall be equipped with a terminal block for the analog call station interface.

B. Public Switched Telephone Network (PSTN) Interfaces

1. The command unit shall be equipped with one (1) PSTN port.
2. The PSTN port shall interface through a terminal block.
3. The PSTN port shall be connected to a cellular network module.

2.5 POWER REQUIREMENTS

A. The command unit shall be powered by a built-in Uninterruptible Power Supply (UPS).

B. The command unit UPS shall:

1. Be powered by a primary power source.
2. Provide up to four (4) hours of backup time in the event of power source failure.

2.6 ACCEPTABLE PRODUCTS

A. Master Station Command Unit: Rath SmartRescue 5 P/N 2500-205FM.
B. Power Supply: Rath 2500-PWR24U.
C. Elevator Landing Call Station: Rath P/N 2100-958SSRC2.
D. Elevator Landing Signage: Rath P/N 7049SS.

E. Plenum rated shielded 22/4 twisted pair audio cable: Belden P/N 6502UE.
F. Plenum rated 18/2 power cable: Belden P/N 6300UE.
G. Cellular Dialer: Rath P/N 2100-LTEVER4 4G Verizon Cellular Gateway.
H. Or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. The installer shall carefully follow instructions in documentation provided by the manufacturer to ensure all steps have been taken to provide a reliable, easy-to-operate system.

B. All equipment shall be tested and configured in accordance with instructions provided by the manufacturer prior to installation.

C. Test and demonstrate the system to the local Fire Marshall or local Fire Code Official.

D. The master station command unit shall support flush recess wall mounting.

END OF SECTION 275129

SECTION 275313 - WIRELESS CLOCK SYSTEM

PART 1 – GENERAL

1.1 GENERAL REQUIREMENTS

A. All bids shall be based on the equipment as specified herein. The catalog numbers and model designations are that of the RAULAND-BORG CORPORATION. The specifying authority must approve any alternate system.

B. Bidders wishing to submit alternate equipment shall submit to the specifying authority, at least 10 days prior to bid opening, the equipment proposed to provide a precise functional equivalent system to meet specifications. Bidder shall provide adequate information prior to bid date such as specification sheets, working drawings, shop drawings, and a demonstration of the system.

C. Final approval of the alternate system shall be determined at the time of job completion. Failure to provide the "precise functional equivalent" shall result in the removal of the alternate system at the contractor's expense.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 SUMMARY

A. This Section includes a NTP Synchronized Wireless Clock System. It includes requirements for a NTP Synchronization system components including, but not limited to, the following:

1. Transmitter
2. NTP Receiver module
3. Wireless Analog Clocks (Battery/AC Powered)
4. Wireless Digital Clocks (AC Powered)

1.4 RELATED SECTIONS:

A. The following Division 16 Section may contain requirements that relate to this Section:

1. "Electrical Boxes and Fittings," for boxes, cabinets and fittings used for installation of transmitter for system
2. Intercom/Public Address for interface to bell system

1.5 SYSTEM DESCRIPTION

A. Furnish and install all equipment, accessories, and materials in accordance with these specifications and drawings to provide a complete and operating NTP Synchronized Wireless Clock system.

1.6 SUBMITTALS

A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections:

1. Submit equipment drawings with precise locations of transmitter, NTP receiver and all locations of clocks.
2. Submit product data sheets on each component, describing its operational and physical characteristics along with method of installation.
3. The system must operate in accordance with a “Radio Station Authorization” form FCC 601 granted by the Federal Communication Commission (FCC). Submit evidence of application for operating license prior to installing equipment. Furnish the license, or if the license has not been received, a copy of the application for the license, to the Owner prior to operating of the equipment. Upon receipt of license, deliver original license to owner.
4. Provide complete installation, set-up and maintenance instructions and submit a certificate of completion of installation and service training.

1.7 QUALITY ASSURANCE

A. All items of equipment including wire and cable shall be designed by the manufacturer to function as a complete system and shall be accompanied by the manufacturer's complete service notes and drawings detailing all interconnections.

B. The manufacturer must be a company specializing in the manufacturer of commercial timekeeping products with a minimum 30 continuous years of documented experience.

C. The contractor shall be an established electronics contractor that has had and currently maintains a locally run and operated business for at least 10 years. The contractor shall utilize a duly authorized distributor of the equipment supplied for this project location with full manufacturer's warranty privileges.

D. The contractor shall show satisfactory evidence, upon request, that the supplier maintains a fully equipped service organization capable of furnishing adequate inspection and service to the system. The supplier shall maintain at his facility the necessary spare parts in the proper proportion as recommended by the manufacturer to maintain and service the equipment being supplied.

E. Electrical Component Standard: Provide work complying with applicable requirements of NFPA 70 "National Electrical Code" including, but not limited to:

1. Article 250, Grounding.
2. Article 300, Part A. Wiring Method.
3. Article 310, Conductors for General Wiring.
4. Article 725, Remote Control, Signaling Circuits.

5. EIA Compliance: Comply with the following Electronics Industries Association Standards:

6. Racks, Panels, and Associated Equipment, EIA-310-A.

F. Installation and start up of all systems shall be under the direct supervision of a local agency regularly engaged in installation, repair, and maintenance of such systems. The supplier shall be accredited by the proposed equipment manufacturers and be prepared to offer a service contract for system maintenance.

G. Contractor providing equipment shall be responsible for providing all specified equipment and mentioned services for all equipment as specified herein. Contractor must be a local authorized distributor of all specified equipment for single source of responsibility and shall provide documents proving such. Contractor must provide written proof that they are adequately staffed with factory-trained technicians for all of the specified equipment. Contractor must have established business for and currently be providing all services for the equipment to be provided for a minimum of 5 years.

H. The contractor shall guarantee availability of local service by factory-trained personnel of all specified equipment from an authorized distributor of all equipment specified under this section. On-the-premise maintenance shall be provided at no cost to the purchaser for a period of one (1) year (parts and labor) from date of acceptance unless damage or failure is caused by misuse, abuse, neglect, or accident. Additionally, all manufacturer supplied products must be covered by a five (5) year (parts only) limited warranty from the date of acceptance. The warranty period shall begin on the date of acceptance by the owner/engineer.

I. The contractor shall, at the owner's request, make available a service contract offering continuing factory authorized service of the system after the initial warranty period.

J. The supplier shall visit the sites and familiarize himself with the existing conditions and field requirements prior to submitting a proposal.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver products in factory containers. Store products in a clean and dry space in original containers. Protect products from fumes and construction traffic. Handle carefully to avoid damage.

1.9 IN-SERVICE TRAINING

A. The contractor shall provide a minimum of 2 hours of in-service training with this system. Operators Manuals shall be provided at the time of this training.

1.10 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide the following system:

1. Telecenter manufactured by Rauland

a. Authorized Rauland Distributor contact:
(1) Jeff Bowers
Innovative Communications Systems, Inc.

775-825-2011

jbowers@innovativecomsys.com

PART 2- PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide one of the following systems:

1. Synchronized Wireless Clock System and secondary clocks manufactured by Rauland-Borg Corp.

B. The intent of this specification is to establish a standard of quality, function and features. It is the responsibility of the bidder to ensure that the proposed product meets or exceeds every standard set forth in these specifications.

C. The functions and features specified are vital to the operation of this facility, therefore, the acceptance of alternate manufacturers does not release contractor from strict compliance with the requirements of this specification.

D. Any proposed system that operates on an unlicensed frequency or has the FCC license in the name of someone other than the building owner will not be accepted.

E. The Contractor for this work shall be held to have read all the Bidding Requirements, the General Requirements of Division 1, and Contract Proposal Forms; and in the execution of this work, he will be bound by all of the conditions and requirements therein.

F. The contractor shall be responsible for providing a complete functional system including all necessary components whether included in this specification or not.

G. In preparing the bid, the bidder should consider the following:

1. No claim will be made against the owner for any costs incurred by the bidder for any equipment demonstrations which the owner requests.

H. Any prior approval of an alternate system does not automatically exempt the supplier from meeting the intent of these specifications. Failure to comply with the operational and functional intent of these specifications may result in the total removal of the alternate system at the expense of the contractor.

I. Alternate equipment shall be considered if submitted to the specifying authority at least ten (10) days prior to bid date. Submission of an alternate shall contain engineering drawings of the system with specification sheets covering all components of the system as well as all items of Section 1 "SUBMITTALS." The system and equipment drawings and specifications sheet shall meet all items of the specification.

J. The specifying authority must approve any alternate supplier.

2.2 SYSTEM REQUIREMENTS

A. GENERAL:

1. The system shall be easy to learn and operate. All standard system programming shall be user friendly to allow the system administrator the ability to easily program system features.
2. Provide complete and satisfactorily operating NTP Synchronized Wireless Clock System with analog and/or digital secondary clocks as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated.
3. (NTP) Network Time Protocol is a network standard protocol that assures accurate synchronization to the millisecond of computer clock times in a network

of computers. Based on UTC, NTP synchronizes client workstation clocks to the U.S. Naval Observatory Master Clocks in Washington, DC and Colorado Springs, CO. Running as a continuous background client program on a computer, NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust computer clocks.

4. Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information.
5. Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.

B. SYSTEM DESCRIPTION AND OPERATION

1. The NTP Synchronized Wireless System consists of a master transmitter located on the inside of the building, and a NTP receiver connected to a time server. An unlimited number of wireless analog and digital clocks are synchronized to the NTP time.
2. System shall synchronize all clocks to each other. System shall utilize NTP technology to provide atomic time to components.
3. System shall not require hard wiring for its components except for AC Power. Analog Clocks may be battery operated for full portability if required.
4. Analog Clocks shall synchronize to +/- 1 second of the transmitter displayed time.
5. Clocks shall automatically adjust for Daylight Saving per settings on the transmitter
6. The system shall have an internal clock that is continually updated by the NTP receiver. If a NTP failure were to occur, the clocks would continue to be synchronized to the internal clock and would not deviate from each other. Once NTP time is restored, all clocks would once again be synchronized to the NTP time.
7. The system must have a failsafe design so that if a power interruption were to occur, the clocks will continue to operate. If a synch signal is not received by the analog clocks for 48 hours, the second hand will double pulse to indicate this condition. Upon restoration of power, the transmitter will once again communicate with the clocks and normal operation will resume.
8. Battery Powered Analog Clocks shall require 2 "D" cell batteries.
9. System shall be 100% programmable from the front operational panel with lights that indicate power status and NTP reception. Panel programming will also include Time Zone, Frequency, 12 or 24 hour operation and DST on/off.
10. The wireless backbone must support expansion of the system to include wireless alphanumeric displays for emergency crisis communications.

C. The system may be modified to use GPS instead of NTP as the time source without the need to replace the transmitter. A GPS receiver would need to be added with access to the outside of the building.

D. The system shall lend itself to expansion by simple addition of wireless secondary clocks and their required power source.

2.3 EQUIPMENT AND MATERIALS

A. WIRELESS TRANSMITTER

1. Rauland Model # WCXATRAN

a. FCC Part 90 Approved, 467.2125-467.4375 MHz frequency range

b. Radio Technology (Narrowband FM, 12.5 KHz bandwidth)
c. 10 selectively available channels
d. 5 watt transmitter
e. Daylight Savings Time pre-programmed
f. Time Zone Pre-set
g. Non-Volatile Memory
h. LCD Display for time, date, year, power, time zone and signal reception
i. Operating Range (32 degrees F to 158 degrees F)
j. Rack or Shelf Mount
k. Power Supply Input: 120-volt AC, Output: 12-volt DC, 3 Amps
l. 7” Rear Mounted Antenna
m. Dimensions: 12”L x 6”W x 1.75”H Weight: 2 lbs
n. NTP Receiver Model # WCXRVRNTP
o. Optional External Antenna
p. For use in large campus applications. Up to 2 miles radius

B. SECONDARY 13” ANALOG CLOCK

1. Rauland Model # WCA1312B

a. 13” Analog Clock (Battery Powered using 2”D” Cell batteries).
b. Maintenance Free.
c. Five year manufacturer’s warranty.
d. Microprocessor based with built-in wireless receiver
e. Heavy Duty Construction
f. Durable ABS Casing
g. Clock numbering graphics shall be Standard Arabic Format (12HR-60 Minute)
h. Face of clock is white
i. Hour and Minute hands shall be black, second hand is red
j. The clock lens shall use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.
k. The clock shall have a low–profile, semi–flush design
l. Wire Guard Model #WCANA13WG in areas where protection is required as indicated on drawings or by owner.

C. SECONDARY 16” ANALOG CLOCK

1. Rauland Model # WCA1612B

a. 16” Analog Clock (Battery Powered using 2”D” Cell batteries).
b. Maintenance Free.
c. Five year manufacturer’s warranty.
d. Microprocessor based with built-in wireless receiver
e. Heavy Duty Construction
f. Durable ABS Casing
g. Clock numbering graphics shall be Standard Arabic Format (12HR-60 Minute)
h. Face of clock is white
i. Hour and Minute hands shall be black, second hand is red
j. The clock lens shall use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.
k. Wire Guard Model #WANA16WG in areas where protection is required as indicated on drawings or by owner.

l. The clock shall have a low–profile, semi–flush design

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine conditions, with the Installer present, for compliance with requirements and other conditions affecting the performance of the NTP Synchronized Wireless Clock system.

B. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:

1. Install system in accordance with NFPA 70 and other applicable codes. Install equipment in accordance with manufacturer's written instructions.

B. Wiring Methods:

1. Install wiring in raceway except within consoles, desks, and counters, and except in accessible ceiling spaces, and in gypsum board partitions, where cable wiring method may be used. Use UL listed plenum cable in environmental air spaces including plenum ceilings. Conceal wiring except in unfinished spaces.

C. Control Circuit Wiring:

1. Install control circuits in accordance with NFPA 70 and as indicated. Provide number of conductors as recommended by system manufacturer to provide control functions indicated or specified.
2. All housings are to be located as specified and shown on drawings.
3. Make installation in strict accordance with approved manufacturer's drawings and instructions.
4. The contractor shall provide necessary transient protection on the AC power feed. All protection shall be as recommended by the equipment supplier and referenced to earth ground.

D. Weatherproofing:

1. Provide weatherproof enclosures for items to be mounted outdoors or exposed to weather.

E. Repairs:

1. Wherever walls, ceilings, floors, or other building finishes are cut for installation, repair, restore, and refinish to original appearance.

3.3 GROUNDING

A. Provide equipment grounding connections for NTP Synchronized Wireless Clock systems as indicated. Tighten connections to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounds.

B. Ground equipment, conductor, and cable shields to eliminate shock hazard and to minimize to the greatest extent possible, ground loops, common mode returns, noise pickup, cross talk, and other impairments. Provide 5-ohm ground at main equipment location. Measure, record, and report ground resistance.

C. The contractor shall provide all necessary transient protection on the AC power feed leaving or entering the building.

D. The contractor shall note in his system drawings, the type and location of these protection devices as well as all wiring information.

E. The contractor shall furnish and install a dedicated, isolated earth ground from the central equipment rack and bond to the incoming electrical service ground buss bar.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Services:

1. Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Inspection:

1. Make observations to verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Provide a list of final Atomic Clock Synchronized Master Clock system configuration.

C. Testing:

1. Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Contractor's expense. Verify by the system test that the total system meets the specifications and complies with applicable standards.

3.5 COMMISSIONING

A. Train Owner's maintenance personnel in the procedures and schedules involved in operating, troubleshooting, servicing, and preventative maintenance of the clock system. Provide a minimum of 2 hours training. Operators Manuals and Users Guides shall be provided at the time of this training.

B. Schedule training with Owner through the Architect, with at least seven days advance notice.

3.6 OCCUPANCY ADJUSTMENTS:

A. When requested by the Architect within one year of date of Substantial Completion, provide on-site assistance in adjusting NTP Synchronized Wireless Clock system and adjusting controls to suit actual occupied conditions. Provide up to three visits to the site for this purpose.

3.7 CLEANING AND PROTECTION

A. Prior to final acceptance, clean system components and protect from damage and deterioration.

END OF SECTION 275313

SECTION 27 53 19 – EMERGENCY RESPONDER RADIO SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Contractor shall be responsible for the complete design of the Emergency Responder Radio Communication System (ERRCS).

B. Contractor shall submit the ERRCS design to the Washoe County Regional Communications System (WCRCS) Radio Division for technical design review and retransmission authorization.

C. Contractor shall submit the ERRCS design to the local Fire Code Official for review, approval and deferred permit.

D. Contractor shall test the radio signal strength and delivered audio quality (DAQ) inside the building prior to installing the radio system to determine if the system is required by code. Test shall be conducted in accordance with the acceptance test procedures outlined in Section 510.5.3 of the 2018 International Fire Code. Prior to testing, the building shell (roof, exterior walls, exterior windows, exterior doors, architectural wire mesh) must be completed in addition to interior work (interior walls and doors). Test results shall be submitted to the Engineer and to the County Radio Division.

E. If testing indicates the system is not required, Contractor shall credit back the costs of the system to the Owner including equipment, devices, cabling and installation costs.

F. The Emergency Responder Radio System shall be designed, installed and tested in accordance with the 2018 International Fire Code Section 510 and the 2022 NFPA 1225.

G. Final acceptance, approval and permit sign off are required in writing from the local Fire code official Department prior to contract closeout.

H. Provide all labor, materials, equipment, tools, transportation, storage costs, permits, programming, testing, adjusting, tuning and all necessary and related items as required to provide complete and operational Emergency Responder Radio Systems as shown on the Drawings and described in the Specifications.

I. Contractor shall furnish and install an Emergency Responder Radio System to amplify the SMR (Specialized Mobile Radio) 700 MHz and 800 MHz frequency bands so that emergency responders to the facility will have 2-way radio communications inside the building. The 700 MHz frequencies shall include 769 to 775 MHz downlink and 799 to 805 MHz uplink frequencies. The 800 MHz frequencies shall include 806 to 816 MHz uplink and 851 to 861 MHz downlink frequencies. Contractor shall confirm downlink and uplink radio frequencies with WCRCS Radio Division.

J. The Emergency Responder Radio System signal levels shall exceed -95 dbm in 95% of all areas on each floor of the building.

K. Provide Uninterruptable Power Supplies (UPS’s) to backup the entire Emergency Responder Radio System for a duration of not less than 12 hours in accordance with 2018 International Fire Code Section 510.4.2.3.

L. All Emergency Responder signal booster components and UPS’s shall be mounted in NEMA 4 or NEMA 4X type waterproof enclosures in accordance with 2018 International Fire Code Section 510.4.2.4.

M. Antenna cabling routed from the building distribution amplifier (BDA) to the roof mounted donor antenna shall be 2-hour rated or routed in a 2-hour rated enclosure (EMT conduit wrapped with a 2-hour rated endothermic wrap).

N. All Emergency Responder signal booster components, power supplies and battery backups shall be monitored by a dedicated annunciator panel in accordance with 2022 NFPA 1225. Annunciator panel shall be mounted adjacent to the existing fire alarm control panel (FACP) located in the baggage claim sound equipment room 111.

O. All Emergency Responder signal booster components, power supplies and battery backups shall be supervised by the fire alarm system in accordance with 2022 NFPA 1225.

P. At a minimum, the Contractor shall furnish and install the following Emergency Radio System components:

1. Roof mounted 700/800 MHz donor antenna and associated non-penetrating galvanized steel support mast and frame.
2. 2-hour rated plenum antenna cabling routed within the building from the BDA to the donor antenna.
3. Outdoor rated antenna cabling routed on the roof from the BDA to the donor antenna (cable routed in conduit).
4. Bonding and grounding equipment including isolated ground bar, antenna cable shield ground kit, surge protector (PolyPhaser), and related bonding/grounding conductors.
5. Class “A” building distribution amplifier (BDA) wall mounted in NEMA 4 or 4X enclosure. BDA to have alarm contacts monitored by a dedicated annunciator panel. BDA cabinet to be bonded to the ground bar with #6 green insulated bonding conductor.
6. Dedicated Emergency Responder Radio System annunciator panel mounted adjacent to the main fire alarm control panel (FACP). Multi-pair cable from the annunciator panel to the BDA.
7. Fire alarm supervision of all “points” monitored by the dedicated annunciator panel.
8. 50-Ohm ½” diameter plenum rated coax antenna distribution cabling and related raceway, boxes, supports, connectors, couplers and taps. Provide fire stop assemblies at penetrations through rated walls and floors. Coax cabling routed in accessible ceiling spaces shall be supported by j-hooks. All exposed coax cabling to be routed in EMT conduit (no exposed cabling is permitted).
9. Labeling of all system cabling.
10. Coax couplers, directional couplers and attenuators. Note – cable splitters are not allowed by the WCRCS Radio Division and shall not be used on the project.
11. 120VAC to 48VDC batter backup mounted in NEMA 3R or 4 enclosures capable of backing up all equipment for a minimum of 12 hours. Battery backups to have alarm contacts monitored by a dedicated annunciator panel. UPS cabinets to be bonded to the ground bar with #6 green insulated bonding conductor.
12. Surface ceiling mounted indoor 700/800 MHZ omni-directional antennas.
13. Miscellaneous Equipment interconnect jumper cables as required.
14. Signage at exterior Knox Box location and on door to room with emergency responder radio BDA equipment indicating building is equipped with radio repeater system.
15. Labeling on the BDA per FCC requirements.

Q. At the completion of the project, the contractor shall verify minimum radio signal strength and delivered audio quality (DAQ) inside the building. Acceptance tests shall be

conducted in accordance with 2018 IFC Section 510.5.3, 2022 NFPA 1225 sections 18.9 and 20.

R. Contractor shall provide a system certification report in PDF format. Report shall be submitted to the Owner and posted at the fire alarm control panel (FACP). Report shall include the following information:

1. Test procedure.
2. Test equipment used.
3. Certificate(s) of test equipment calibration
4. Floor plans divided into grids indicating radio signal strength/DAQ with pass/fail results.
5. Certified cable sweep test results.
6. Pictures of electronic equipment.
7. Equipment configuration settings.

S. Final acceptance, approval and permit sign off are required in writing from the local Fire code official and Washoe County Radio Division.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 28: Interior Communications Pathways.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

1. NFPA-70, 2017 -- National Electrical Code (NEC).
2. NFPA-72, 2019 – National Fire Alarm And Signaling Code.
3. NFPA-1225, 2022 – Standard for Emergency Services Communications.
4. 2018 International Fire Code.
5. FCC Regulations:
   a. Part 15 – Radio Frequency Devices & Radiation Limits
   b. 47 CFR Part 90.219.
6. Underwriter’s Laboratories, Inc. (UL).
7. Electronic Industry Association (EIA) testing standards
8. American Standard Code for Information Interchange (ACSI)
9. American Society for Testing and Materials (ASTM)
10. National Electrical Manufacturers' Association (NEMA)

1.4 QUALITY ASSURANCE

A. Contractor Qualifications:

1. The minimum qualifications of the system designer and lead installation personnel shall include both of the following in accordance with 2018 International Fire Code Section 510.5.2:

    a. A valid FCC-issued general radio operators license.
    b. Certification of in-building system training issued by a nationally recognized organization, school or a certificate issued by the manufacturer of the equipment being installed.
    c. The above qualifications shall not be required where demonstration of adequate skills and experience satisfactory to the fire code official is provided.

2. The contractor shall be licensed by the Nevada State Contractors Board.
3. The Contractor shall have a minimum of five (5) years experience in the installation, integration and testing of Emergency Responder Radio Systems of similar size and scope.
4. The Contractor shall be a firm normally engaged in the design, installation and maintenance of Emergency Responder Radio Systems. The Contractor shall provide details of at least three (3) projects of similar size and scope involving the design, installation and testing of Emergency Responder Radio Systems in the last 5 years. Names, addresses and telephone numbers of references for the three projects shall be included.
5. The Contractor shall have service facilities within 4 hours of the project site and shall respond to service phone calls within one (1) business day of receipt. The Contractor shall provide an on-site response time of one (1) business day for critical system items during regular business hours.

B. UL Listing and Labeling: Unless specific equipment specified within the radio system Specifications is not listed or labeled by UL, provide components listed and labeled by UL.

C. All work shall conform to the National Electrical Code (NEC) and to applicable National Fire Protection Association (NFPA) and International Fire codes.

D. Compliance with Local Requirements: Comply with the applicable building code, state and local ordinances, and regulations and the requirements of the authority having jurisdiction.

E. All equipment supplied shall be listed by a nationally recognized test laboratory where applicable.

F. All equipment and accessories to be the product of a manufacturer regularly engaged in its manufacture.

G. All items of a given type shall be the products of the same manufacturer.

H. All items shall be of the latest technology; no discontinued models or products are acceptable.

I. The manufacturer, or their Authorized Representative, shall confirm that within 300 miles of the project site there is an established agency which:

1. Stocks a full complement of parts.

2. Offers service during normal working hours as well as emergency service on all equipment to be furnished.
3. Will supply parts and service without delay and at reasonable cost.
4. Contractor shall be capable of performing service or maintenance work on these specified or accepted systems. Contractor shall be factory-certified where such certification is available or required.

1.5 INTENT OF DRAWINGS

A. Layout: Follow the general layout shown on the Drawings except where other work may conflict with the Drawings.

B. Accuracy: The Drawings show a diagrammatic representation of the system. Field verify all dimensions and locations.

1.6 REVIEW OF SPECIFICATIONS

A. The Contractor shall carefully study and compare the Drawings and Specifications and shall at once report to the Owner or Owner's Representative any error, inconsistency or omission discovered. If the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission in the Specifications without such notice to the Owner or Owner's Representative, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the cost for any correction.

1.7 EXAMINATION OF THE PREMISES

A. The Contractor shall visit the Site to become familiar with the local conditions under which the work is to be performed and correlate observations with the requirements of the Drawings and Specifications. No allowance will be made for claims of concealed conditions which the Contractor learned or should have learned in exercising due diligence in its observations of the site and review of the local conditions.

B. Before ordering any materials or performing any work, the Contractor shall verify all measurements and be responsible for correctness of same. No extra charge or compensation will be allowed for duplicate work or material required because of an unverified difference between an actual dimension and the measurement indicated in the Drawings. Any discrepancies found shall be submitted in writing to the Owner or Owner's Representative for consideration before proceeding with the work.

1.8 SUBMITTALS

A. Submit manufacturer product data sheets in electronic PDF format for all system components and cabling.

B. Product Data Sheet Submittals shall comply with the following:

1. Product data submittals must be submitted to and approved by the Owner prior to release of order for equipment and prior to installation.
2. Provide the following information in the submittal:
   a. Client Name.
   b. Project Number and Contract Number.
   c. Project Name and Address.
   d. Contractor's Submittal Number.
   e. Submittal Title.
   f. Specification Section Number.

g. Date of Submittal.
h. Contractor Name and contact information.

3. Provide a table of contents indicating the products submitted.
4. Products listed in the table of contents should be in the same order as they appear in the Specifications.
5. Submittals must include all items identified in each specification section. Partial submittals will not be accepted.
6. Where product data sheets cover more than one distinct item, clearly indicate by arrows or brackets precisely what is being submitted including optional accessories. Delete or cross-out non-applicable data.

C. Shop drawings:

1. Shop drawings generated for this project shall be created utilizing AutoCAD 2018 or newer file format.
2. Drawings shall be drafted on 24” x 36” sheets to match the contract drawings.
3. Submit shop drawings for all equipment showing:
   a. Location and layout of all field devices including donor antennas, omni-directional antennas, directional couplers and taps.
   b. Location and layout of all equipment including building distribution amplifiers, remote units, surge protectors, uninterruptable power supplies, annunciator panel, etc.
   c. Oneline wiring/cabling diagrams for devices, equipment and components. Oneline diagrams shall identify all devices and equipment and shall include all interconnecting wiring, cable types and sizing. Provide manufacturers wire/cable type as required.
   d. Block diagram(s) depicting system integration details including fire alarm monitoring locations.
   e. Elevations of all equipment mounting enclosures showing equipment mounting locations, electrical outlet locations, termination equipment.
   f. Drawings for each field device type detailing wiring and mounting instructions.
   g. Point-to-point wiring data, utilizing a combination of AutoCAD generated drawings and device/equipment Excel schedules.

D. Calculations:

1. Building Radio Signal Strength Coverage Calculations:

   a. Provide color “heat maps” indicating required radio signal strength coverage of -95 dBm in 95% of the building in accordance with 2018 IFC Section 510.4.1. Contractor to adjust quantity and location of indoor antennas as required to meet the IFC signal coverage requirements.

2. Donor Antennas Gain and Placement Calculations:

   a. Contractor to measure signal strength from the remote “distant” emergency responder radio site to verify the required gain, placement and aiming of the outdoor donor roof antennas.

3. Battery Backup Calculations:

   a. Provide battery backup calculations to verify that uninterruptable power supplies are sized to provide backup of the entire emergency responder radio system for a duration of not less than 12 hours.

4. RF Cable dB Loss Calculations:

    a. Submit RF cable dB loss calculations from the signal amplifiers to the omni-directional distribution antennas. Based on the calculated RF cable and jumper losses, the contractor shall design the required RF cable taps and directional couplers to balance the RF signal strength at each antenna throughout the building. Submit proposed cable taps and directional couplers for approval and provide calculations indicating the resulting signal strength at each indoor omni-directional antenna.

E. Radio System Certification Report:

1. Submit radio system certification report in PDF and printed 8 ½" x 11" format. Report shall be submitted to the Owner and posted at the fire alarm control panel (FACP). Report shall include the following information:

    a. Test procedure.
    b. Test equipment used.
    c. Certificate(s) of test equipment calibration
    d. Floor plans divided into grids indicating radio signal strength/DAQ with pass/fail results.
    e. Certified cable sweep test results.
    f. Pictures of electronic equipment.
    g. Equipment configuration settings.

F. Operation and Maintenance Manuals

1. Provide O&M Manuals in PDF format.
2. Include Table Of Contents listing contents.
3. O&M's shall include the following content:
    a. Functional Design Manual: Includes a detailed explanation of the operation of the system.
    b. Operator's Manual which explains procedures and instructions for the operation of the system including:
        (1) System start up and shut down procedures.
        (2) Use of system.
        (3) Equipment recovery and restart procedures.
        (4) Software and firmware backup procedures (where applicable).
    c. Manufacturer's warranty certificates.

G. As-Built Drawings

1. Content:
    a. Fully represent actual installed conditions and incorporate all revisions made during the course of construction.
    b. Include drawings submitted as part of the Shop Drawing package, plus any additional information required to accurately document installed conditions.
    c. Floor plans shall show:
        (1) Locations and identifiers of all devices.
        (2) Size, quantity, location, and routes of all pathways (such as cable trays, conduits, J-hangers, and other cable support devices).

1.9 COUNTY TECHNICAL DESIGN REVIEW AND RETRANSMISSION AUTHORIZATION

A. After all submittal items listed in section 1.08 above have been submitted and approved by the engineer, the contractor shall submit the ERRCS design to the WCRCS Radio Division for technical review and retransmission authorization.

B. Design shall include bill of materials, equipment specification sheets, design diagrams, floor plans indicating equipment and antenna layouts, color coded heat maps indicating signal strength throughout the building.

1.10 DEFERRED PERMIT SUBMITTAL TO LOCAL FIRE CODE OFFICIAL

A. After the WCRCS Radio Division has completed their technical design review and the contractor has made all required corrections, the contractor shall submit the design to the local fire code official for deferred permit. Contractor shall be responsible for permit fees related to the system.

1.11 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery.

1. Do not deliver products to the site until protected storage space is available. Coordinate delivery of materials with scheduled installation date to allow minimum storage time at jobsite.
1. Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels (name of the manufacturer, product name, type, grade, UL classification, etc.) intact.
2. Replace materials damaged during shipping at no cost to the Owner.

B. Storage.

1. Store materials in clean, dry, ventilated space free from temperature and humidity conditions (as recommended by manufacturer) and protected from exposure to harmful weather conditions.
2. Comply with manufacturer's requirements for each product. Comply with recommended procedures, precautions or remedies as described in the Material Safety Data Sheets (MSDS) as applicable.
3. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
4. Storage outdoors covered by rainproof material is not acceptable.
5. Provide heat where required to prevent condensation or temperature related damage.

C. Handling.

1. Handle in accordance with manufacturer's written instructions.
2. Damaged equipment shall not be installed.
3. Replace damaged equipment at no cost to the Owner.
4. Handle with care to prevent internal component damage, breakage, denting, and scoring.

1.12 SUBSTITUTIONS

A. No material substitutions will be allowed except by written acceptance from the Owner’s Representative. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples are provided.

B. Approval of alternate or substitute equipment or material in no way voids the Specification requirements.

C. Under no circumstances shall the Owner's Representative be required to prove that an item proposed for substitution is not equal to the specified item. It shall be mandatory that the Contractor submit to the Owner or Owner's Representative all evidence to support the contention that the item proposed for substitution is equal to the specified item. The Owner's decision as to the equality of substitution shall be final and without further recourse.

1.13 WARRANTY

A. The warranty period will begin after substantial completion of the project.

B. The complete Emergency Responder Radio System including all devices, equipment, software and programming shall be guaranteed to be free from defects in workmanship and materials for a minimum period of one (1) year from date of substantial completion. Promptly remedy such defects and any subsequent damage caused by the defects or repair thereof at no expense to the Owner.

C. Provide maintenance of systems and equipment for a period of one (1) year from date of substantial completion.

D. Emergency Responder Radio System equipment shall have a three (3) year warranty. Defective or damaged equipment shall be replaced by the manufacturer during this three (3) year warranty period at no cost to the Owner. Replacement equipment shall be delivered to the project site. During year one (1) of this warranty period, the contractor shall provide all labor to replace the equipment at no cost to the owner. During years two (2) and three (3) of this warranty period, the Owner will be responsible for the Contractor's labor costs to replace the equipment.

E. The Contractor shall demonstrate that they maintain a service organization capable of providing all necessary service and maintenance of the systems. This includes providing replacement parts and making additions or changes to the software systems used in the project.

F. During the warranty period, all service (including equipment, labor, travel, expenses, etc.) is to be provided during normal working hours at no cost to the Owner. The Contractor shall provide the Owner with a phone number for service. The Contractor shall provide the Owner a phone response within one (1) business day of receipt of service call. The Contractor shall provide an on-site response time of two (2) business days for system critical items during regular business hours.

G. The guarantee shall exclude acts of God, vandalism, physical abuse or operator misuse.

PART 2 -PRODUCTS

2.1 GENERAL REQUIREMENTS

A. All equipment shall have FCC certification prior to installation in accordance with 2018 International Fire Code Section 510.4.2.4.

B. All products must be new and unused and without blemish or defect.

C. All products used in parts replacement shall meet the specifications for the original equipment.

D. Materials and equipment furnished shall be of current production by manufacturers regularly engaged in the manufacture of such items, for which replacement parts are available.

E. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that a complete and fully operational system will result.

F. The contractor shall download and install the most current “stable” firmware version from the manufacturer’s website for each device and piece of equipment (where applicable).

2.2 PRODUCTS

A. See drawings for equipment list which provide the description, manufacturer and part number for each Emergency Responder Radio System component.

B. The Contractor may propose alternate components that are equivalent to the specified components. Substitutions will be reviewed in accordance with the Substitutions section above. The contractor will be responsible for integrating all alternate system components into an overall operational system.

PART 3 -EXECUTION

3.1. INSTALLATION

A. Install systems and equipment in accordance with applicable codes. Install, mount, connect tune, adjust and test all equipment in accordance with manufacturer's written instructions. Systems shall be complete and operational in all respects.

B. Furnish and install in-building ceiling and wall mounted omni-directional antennas as required to meet the signal strength coverage requirements required by Section 510 of the 2018 International Fire Code and 2022 NFPA 1225.

C. Coordinate the mounting of all equipment in the telecommunication and electrical rooms with existing equipment.

D. Install alarm monitoring cabling from the BDA, remote units, power supplies and battery backups to the dedicated annunciator panel.

E. Install cabling from the existing fire alarm control panel to the dedicated annunciator panel to supervise all alarm points. Program existing fire alarm panel as required to supervise alarm points.

F. All roof mounted antenna supports, masts, frames, fasteners, etc. shall be pre-galvanized or hot dipped galvanized steel. Provide pad between support frame and existing roofing surface.

G. Cabling routed within the building from the BDA to the donor roof antenna shall be 2-hour rated.

H. Roof penetrations shall be installed by a certified roofing contractor. The certified roofing contractor shall provide all materials and labor necessary to properly seal all penetrations.

I. Terminate indoor and outdoor coax antenna cabling with "N" type RF connectors.

J. All raceway shall be run perpendicular to building grid lines UON.

K. Install, support and seismic brace all raceway and cabling.

L. Install raceway so that the following minimum clear distances are maintained from sources of electro-magnetic interference (EMI). 6" clear from power cables, 12" clear from fluorescent lighting and 36" clear from transformers and motors.

M. Seal all penetrations through rated walls and floors with UL fire stopping assemblies. Fire stopping assemblies shall be UL listed and shall meet or exceed the rating of the wall or floor being penetrated.

N. Bond and ground all raceways, exterior antennas, antenna supports, exterior antenna cabling, surge arrestors and equipment enclosures.

O. Label all components of the emergency responder radio system. In-building antenna cables shall be labeled at both ends indicating the antenna number and at all pull box locations. All antenna cabling shall be tested and certified.

P. Sweep test all coax antenna cabling over the frequency ranges to be utilized.

3.2. SYSTEM TESTING AND COMMISSIONING

A. Test and demonstrate all equipment and system functionality at the completion of the project.

B. The Emergency Responder Radio System shall be tested in accordance with the acceptance test procedure outlined in Section 510.5.3 of the 2018 International Fire Code and the 2022 NFPA 1225.

C. Submit certified test results to the Owner and WCRCS Radio Division.

D. Final acceptance and approval is required from the WCRCS Radio Division and local Fire Code Official in writing prior to contract closeout.

3.3. CLEANING AND PROTECTION

A. Prior to final acceptance, the contractor shall vacuum, wipe down and clean all system components and protect them from damage and deterioration. Top and side panels, and all cabinet doors shall be installed. No cabinets will be left unlocked and all cabinet keys will be turned over to the Owner or designated Owner’s representative.

END OF SECTION 275319

SECTION 280000 – COMMON WORK RESULTS FOR ELECTRONIC SAFETY AND SECURITY

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Include all labor, materials, tools, transportation, storage costs, excavation, training, equipment, insurance, temporary protection, permits, inspections, taxes and all necessary and related items required to provide complete and operational electronic safety and security systems as shown on the Drawings and described in the Specifications.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 05 00: Conductors and Cables for Electronic Safety & Security.
2. Section 28 05 26: Grounding and Bonding for Electronic Safety & Security.
3. Section 28 05 28: Conduits and Backboxes for Electronic Safety and Security.
4. Section 28 05 53: Identification for Electronic Safety & Security.
5. Section 28 10 00: Access Control.
6. Section 28 20 00: Video Surveillance.
7. Section 28 30 00: Security Detection, Alarm & Monitoring.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 QUALITY ASSURANCE

A. The Contractor installing the Electronic Safety and Security systems shall have a minimum of (5) years experience installing commercial security systems of similar size and scope.

B. See individual Division 28 specifications for additional requirements.

1.4 REGULATIONS AND CODE COMPLIANCE

A. The Contractor will comply with all applicable governmental regulations including Federal, State, City, and Local applicable codes and ordinances.

B. References to codes and standards called for in the Specifications refer to the latest edition, amendments, and revisions to the codes and standards in effect on the date of these Specifications.

C. All work and materials shall conform to and be installed, inspected and tested in accordance with the governing rules and regulations as well as federal, state and local governmental agencies, including, but not limited to the following:

1. NFPA-70, 2011 -- National Electrical Code (NEC).

2. Underwriters Laboratories (UL):

   a. UL 50 - Enclosures for Electrical Equipment.
   b. UL 294 – Access Control Systems
   c. UL 365 – Police Station Connected Burglar Alarm Units and Systems
   d. UL 609 – Local Burglar Alarm Units and Systems
   e. UL 611 – Central Station Burglar-Alarm Units
   f. UL 636 – Hold up alarms
   g. UL 1076 – Proprietary Burglar Alarm Units and Systems
   h. UL 1610 – Central Station Burglar-Alarm Units
   i. UL 60950-1 - Information Technology Equipment - Safety.

3. Federal Communications Commission (FCC):

   j. Code of Federal Regulations Title 47 - Part 15 – Radio Frequency Devices.
   k. Code of Federal Regulations Title 47 - Part 68 – Connection of Terminal Equipment to the Telephone Network.

4. Americans with Disabilities Act (ADA).

1.5 DEFINITIONS

A.	Accessible Ceiling	Space above a ceiling constructed of removable tiles (clipped or unclipped). Acoustical ceiling grid with removal tiles would be considered an accessible ceiling. A gypboard ceiling would not be considered an accessible ceiling.
B.	Approved/Approval	Written permission to use a material or system.
D.	As Called For	Materials, equipment including the execution specified/shown in the Specifications.
D.	Code Requirements	Minimum requirements.
E.	Concealed	Work installed in pipe and duct shafts, chases or recesses, inside walls, above ceilings, in slabs or below grade.
F.	Exposed	Work not identified as concealed.
G.	Final Acceptance	Owner acceptance of the project from the Contractor upon certification by the Owner's Representative.
H	Furnish	Supply and deliver to installation location.
I.	Furnished by Others	Receive delivery at job site or where called for and install.
J.	Inspection	Visual observations by Owner or Owner's Representative.
K.	Install	Mount and connect equipment and associated materials ready for use.

L.	Listed	Refers to classification by a standards agency.
M.	Or Approved Equal	Approved equal or equivalent as determined by Owner or Owner's Representative.
N.	Owner's Representative	Design professional or Consultant representing the Owner.
O.	Provide	Furnish, install and connect ready for use.
P.	Relocate	Disassemble, disconnect, and transport equipment to new locations: then clean, test, and install ready for use.
Q.	Replace	Remove and provide new item.
R.	Review	A general contractual conformance check of specified products.
S.	Satisfactory	As specified in Specifications.

1.6 INTENT OF DRAWINGS

A. All drawings are diagrammatic unless otherwise noted as detailed dimensioned drawings. Drawings show approximate locations of equipment and devices. Exact locations are subject to the approval of the Owner or Owner's Representative. The Contractor shall verify dimensions and shall be responsible for their accuracy

B. Items mentioned in the Specifications and not shown in the Drawings or shown in the Drawings and not mentioned in the Specifications, shall be of like effect as if shown and mentioned in both. In the case of differences between the Drawings and the Specifications, the stricter provision as determined by the Owner or Owner's Representative shall govern.

C. Omissions from the Drawings or Specifications, or the incorrect description of details of Work which are necessary to carry out the intent of the Drawings and Specifications, or work which is customarily performed, shall not relieve the Contractor from performing such omitted or incorrectly described work.

D. No exclusion from, or limitations in, the language used in the Project Documents shall be interpreted as meaning that ancillary or accessory items necessary to complete any required system or item of equipment are to be omitted.

1.7 REVIEW OF SPECIFICATIONS

A. The Contractor shall carefully study and compare the Drawings and Specifications. Any error, inconsistency or omission discovered shall be immediately reported to the Owner or Owner's Representative. If the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission without such notice to the Owner or Owner's Representative, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the cost for any correction.

1.8 EXAMINATION OF THE PREMISES

A. The Contractor shall visit the Site to become familiar with the local conditions under which the work is to be performed and correlate the observations with the requirements of the Drawings and Specifications. No allowance will be made for claims of concealed conditions which the Contractor learned or should have learned in exercising due diligence in its observations of the site and review of the local conditions.

B. Before ordering any materials or performing any work, the Contractor shall coordinate the installation with the work of other trades and shall verify all measurements. No extra charge or compensation will be allowed for duplicate work or material required because of an unverified difference between an actual dimension and the measurement indicated in the Drawings. Any discrepancies found shall be submitted in writing to the Owner or Owner's Representative for consideration before proceeding with the work.

1.9 COORDINATION OF CABLING PATHWAYS AND EQUIPMENT ROOMS

A. Drawings are diagrammatic in depicting the routing of security cabling pathways and the layout of security equipment.

B. The contractor shall coordinate the installation of all work with other trades including Mechanical, Electrical, Plumbing, Sprinkler, Structural and Architectural.

C. The contractor shall participate in coordination meetings with other trades prior to the installation of the work. For a specific space/area, the security contractor shall coordinate the routing and installation of all work with all other trades that have work in that specific space/area.

D. Prior to the installation of security cabling pathway including conduit, sleeves, etc., the contractor shall coordinate the routing of this pathway to avoid conflicts with and provide necessary clearances from the work of other trades. The contractor shall provide all horizontal offsets, vertical offsets and radius bends as necessary to coordinate the routing of the security pathways with the work of other trades and building structure.

E. Prior to the installation of equipment and/or cabling in the communication rooms, the contractor shall coordinate the layout of all equipment and cable pathways with the Telecom Contractor.

1.10 WARRANTY AND SERVICES

A. See individual Division 28 Specifications for warranty requirements.

PART 2 – PRODUCTS

2.1 EQUIPMENT AND MATERIALS MINIMUM REQUIREMENTS

A. Electrical equipment and systems shall meet UL Standards and requirements of the National Electric Code. This listing requirement applies to the entire assembly. Any modifications to equipment to suit the intent of the Specifications shall be performed in accordance with these requirements.

B. Equipment shall meet all applicable FCC Regulations.

C. All materials, unless otherwise specified, shall be new and be the standard products of the manufacturer. Used equipment or damaged material will be rejected.

D. The listing of a manufacturer as “acceptable” does not indicate acceptance of a standard or cataloged item of equipment. All equipment and systems must conform to the Specifications.

2.2 WORKMANSHIP, SUBSTITUTIONS, WARRANTY

A. Materials and workmanship shall meet or exceed industry standards and be fully guaranteed for a minimum of one (1) year from the date of final acceptance. Cable integrity and associated terminations shall be thoroughly inspected, fully tested and guaranteed free from defects, transpositions, open shorts, tight kinks, damaged jacket insulation, etc.

B. All labor must be thoroughly competent, skilled and trained, and all work shall be executed in strict accordance with the best practice of the trades.

C. The Contractor shall be responsible for and make good, without expense to the Owner, any and all defects arising during this warranty period that are due to imperfect materials, improper installation or poor workmanship.

D. After the Contract is awarded, requests to substitute for specified materials shall be submitted by the Contractor to the Owner or Owner’s Representative within thirty (30) days, complete with reasons for the substitution and savings which accrue to the Owner if the substitutions are approved. Substitutions after Contract award will be considered only if the substitutions are equal or superior to the products specified.

E. No material substitutions will be allowed except by written acceptance from the Consultant. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples are provided.

F. Approval of alternate or substitute equipment or material in no way voids the Specification requirements.

G. Under no circumstances shall the Owner be required to prove that an item proposed for substitution is not equal to the specified item. It shall be mandatory that the Contractor submit to the Owner or Owner’s Representative all evidence to support the contention that the item proposed for substitution is equal to the specified item. The Owner’s decision as to the equality of substitution shall be final and without further recourse.

2.3 FACTORY ASSEMBLED PRODUCTS

A. Manufacturers of equipment assemblies that include components made by others shall assume complete responsibility for the final assembled unit.

1. All components of an assembled unit need not be products of the same manufacturer.
2. Component parts, which are alike, shall be from a single manufacturer.
3. Components shall be compatible with each other and with the total assembly for the intended service.
4. Components of equipment shall bear the manufacturer’s name or trademark model number and serial number on a name plate securely affixed in a conspicuous place, or cast integral with, stamped or otherwise permanently marked upon the components of the equipment.

B. Major items of equipment that serve the same function must be the same make and model.

C. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that a complete and fully operational system will result.

D. Maximum standardization of components shall be provided to reduce spare part requirements.

PART 3 – EXECUTION

3.1 ROUGH-IN

A. Before construction work commences, the Contractor shall visit the site and identify the exact routing of horizontal and backbone cable pathways.

B. All equipment locations and cabling pathway shall be coordinated with other trades and existing conditions to eliminate interference with required clearances for equipment maintenance and inspections.

C. Coordinate work with other trades and existing conditions to determine exact location of equipment and routing of cable pathways.

1. Where more than one trade is involved in an area, space or chase, all shall cooperate and install their own work to utilize the space equally between them in proportion to their individual requirements. If, after installation of any equipment, piping, ducts, conduit, etc., it is determined that adequate space has not been provided for passage or maintenance, rearrange the work. Any changes in the size or location of the material or equipment supplied or proposed, which may be necessary in order to meet field conditions or in order to avoid conflicts between trades, shall be brought to the immediate attention of the Owner's Representative and approval received before such alterations are made.

D. Provide easy, safe and code mandated clearances at equipment racks and enclosures.

3.2 CUTTING, CORING AND PATCHING

A. The Contractor shall be responsible for all cutting, patching, coring and associated work to complete the security cabling pathway system.

B. Protect existing finishes from water damage during core/cutting work and cleanup all related water and debris. Patch adjacent work disturbed by installation of new work including insulation, walls and wall covering, ceiling and floor covering or other finished surfaces.

C. Contractor to submit all proposed concrete wall or floor penetrations to the Structural Engineer for approval prior to performing the work. Contractor shall locate and avoid cutting concrete reinforcing steel using current x-ray or pachometer equipment.

3.3 FIRESTOPPING

A. All penetrations through fire-rated building structures (walls and floors) shall be sealed with an appropriate fire stop system. This requirement applies to through penetrations

(complete penetration) and membrane penetrations (through one side of a hollow fire rated structure). Any penetrating item i.e., riser slots and sleeves, cables, conduit, cable tray, and raceways, etc. shall be properly fire stopped.

B. Firestopping assemblies shall meet or exceed the rating of the wall or floor being penetrated.

C. Fire stopping References:

1. ASTM E814, Standard Method of Fire Tests of Through-Penetration Fire Stops.
2. ASTM E 119, Fire Tests of Building Construction and Materials (for fire-rated architectural barriers).
3. 2002 NFPA National Electrical Code, Section 800-52, Paragraph 2(b), Spread of Fire and Products of Combustion.

3.4 CONCEALMENT

A. Security cabling pathways including conduit, sleeves and tray shall be concealed above ceilings, in walls, below slabs, and elsewhere throughout building. If concealment is impossible or impractical, or in areas without ceilings, the Owner’s Representative shall be notified of the proposed routing prior to starting that portion of the work.

B. All CAT 6 security cabling must be routed concealed above accessible ceilings or in conduit. No exposed security cabling is permitted with the exception of CAT 6 security cabling routed within the telecom rooms.

C. All intrusion detection system cabling must be routed in conduit from the field devices to the controllers located in the telecom rooms.

3.5 CONDUIT SEALING

A. All penetrations through slab-on-grade and concrete-filled metal decks to be sealed watertight. See Section 07 92 00 – Joint Sealants.

3.6 GENERAL INSTALLATION REQUIREMENTS

A. Coordinate ordering and installation of all equipment with long lead times or having a major impact on work by other trades so as not to delay the job or impact the schedule.

B. Where mounting heights are not dimensioned, install systems, materials and equipment to provide the maximum headroom possible.

C. Set all equipment to accurate line and grade, level all equipment and align all equipment components.

D. Provide all scaffolding, rigging, hoisting and services necessary for erection and delivery of equipment and apparatus furnished into the premises.

E. No equipment shall be hidden or covered up prior to inspection by the Owner's Representative. All work that is determined to be unsatisfactory shall be corrected immediately.

F. All work shall be installed level and plumb, parallel and perpendicular to other building systems and components.

G. The Contractor shall replace all ceiling tiles damaged by work performed as part of the communications contract.

H. Storage and security of material and equipment shall be the responsibility of the Contractor.

END OF SECTION 280000

SECTION 280500 - CONDUCTORS AND CABLES FOR ELECTRONIC SAFETY AND SECURITY

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs, testing, training and all necessary and related items required to provide a complete and operational Access Control, Video Surveillance and Intrusion Detection System Cabling System as shown on the Drawings and described in the Specifications.

B. Provide all necessary wiring, cabling and termination equipment required for the entire Access Control, Video Surveillance and Intrusion Detection System.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety & Security.
2. Section 28 05 28: Conduits and Backboxes for Electronic Safety and Security.
3. Section 28 05 53: Identification for Electronic Safety & Security.
4. Section 28 10 00: Access Control.
5. Section 28 20 00: Video Surveillance.
6. Section 28 30 00: Security Detection, Alarm & Monitoring.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

1. NFPA-70, 2011 -- National Electrical Code (NEC).
2. FCC Regulations:
   a. Part 15 – Radio Frequency Devices & Radiation Limits
3. Underwriter's Laboratories (UL): Applicable listing and ratings.
   a. UL 294: Access Control System Units
   b. UL 1076: Proprietary Burglar Alarm Units and Systems
4. Electronic Industry Association (EIA) testing standards
5. American Society for Testing and Materials (ATSM)
6. National Electrical Manufacturers' Association (NEMA)

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's product data sheets for the following items:

1. Wire and Cable for each system identified in the Division 28 Specifications.

PART 2 - PRODUCTS

2.1 WIRE AND CABLE

A. Install Category 6 cabling to access control door controllers and video surveillance cameras as shown on the Drawings. Category 6 cabling shall be installed, terminated and tested by the Telecom Contractor in accordance with the Division 27 Specifications.

B. All other electronic safety and security cabling shall be routed in conduit. No exposed cabling is permitted. Conduit shall be sized so as not to exceed 40% fill rate. Outdoor exposed conduit shall be rigid or IMC. Concealed conduit routed in walls or above ceilings shall be EMT.

C. Provide cable type, conductor size, conductor quantity and shielding as recommended by the manufacturer of the equipment.

D. Do not share conduits with fire alarm or electrical systems.

E. Provide required wire and cable sized to allow for voltage drop on long runs and effectively shielded as required to allow the routing of 12 & 24V power and signal cable in the same conduit without interference or signal noise.

F. Cable installed outdoors or in underground conduit shall contain a PVC or Polyethylene jacket, flooded to prevent water intrusion.

G. Acceptable Manufacturers:

1. Belden.
2. Commscope.
3. Honeywell Genesis
4. Tappan.
5. Westpenn.
6. Or approved equal.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Identify and label all wire and cable clearly with permanent labels. Indicate the number designated on the associated field or shop drawings or run sheet, as applies. Assign wire or cable designations consistently throughout a given system; i.e., each wire or cable shall carry the same labeled designation over its entire run, regardless of intermediate terminations.

B. Secure all wire and cable run vertically in conduit for continuous distances greater than thirty (30) feet at the vertical run terminations. Non-coaxial cables shall be secured by screw-flange nylon cable ties or similar approved devices, Thomas and Betts or equal. Symmetrical clamping devices with split, circular or other wire conforming, nonmetallic bushings shall be provided for all other cables.

C. All wire and cable shall be continuous and splice-free for the entire length of run between designated connections or terminations.

D. Make all connections to screw-type barrier strips on panels and with insulated crimp-type spade lugs when appropriate. Size all lugs properly to assure high electrical integrity, i.e., low resistance connections.

E. Lace, tie or harness wire or cable as required herein, and in accordance with accepted professional practice. Dress, lace or harness all wire and cable to prevent mechanical stress on electrical connections; no wire or cable shall be supported by a connection point.

F. Wiring for shielding certain conductors from others or routing in separate raceways, shall be as recommended by the manufacturer's current requirements.

G. All wiring shall be installed in conduit and shall be of the size recommended by the equipment supplier.

H. Provide all necessary tie wires.

I. Follow manufacturers recommended guidelines for installation.

END OF SECTION 28 05 00

SECTION 280526 - GROUNDING AND BONDING FOR ELECTRONIC SAFETY AND SECURITY

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs, testing, and all necessary and related items required to provide a complete and operational grounding and bonding system for the Electronic Safety and Security System as shown on the Drawings and described in the Specifications.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety and Security.
2. Section 28 10 00: Access Control.
3. Section 28 20 00: Video Surveillance.
4. Section 28 30 00: Security Detection, Alarm and Monitoring.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

1. American Society for Testing and Materials (ASTM):

a. B1-07 Standard Specification for Hard-Drawn Copper Wire.
b. B3-07 Standard Specification for Soft or Annealed Copper Wire.
c. B8-04 Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.

2. Institute of Electrical and Electronics Engineers, Inc. (IEEE):

a. 81-1983 IEEE Guide for Measuring Earth Resistivity, Ground Impedance, and Earth Surface Potentials of a Ground System.
b. C2-07 National Electrical Safety Code.

3. National Fire Protection Association (NFPA):

a. NFPA-70, 2011 -- National Electrical Code (NEC).

4. Underwriters Laboratories, Inc. (UL):

   a. 44-05 Thermoset-Insulated Wires and Cables
   b. 83-08 Thermoplastic-Insulated Wires and Cables
   c. 467-07 Grounding and Bonding Equipment
   d. 486A-486B-03 Wire Connectors

1.4 SUBMITTALS

A. Product Data: Submit manufacturer's product data sheets for the following items:

1. Ground Bars.
2. Ground Lugs.
3. Specialty Equipment Grounding Connectors
4. Grounding and Bonding Conductors.

B. Shop Drawings: Submit shop drawings indicating the following:

1. Include the location of ground bar. Show the location of equipment to be grounded to the ground bars and the size of the ground conductors. Show the routing and size of ground conductors from the ground bars to electrical panels, building steel, etc.

C. Test Reports: Provide certified test reports of ground resistance.

D. Certifications: Submit the following grounding certifications at the completion of the project:

1. Certification that the materials and installation are in accordance with the drawings and specifications.
2. Certification by the Contractor that the complete installation has been properly installed and tested.

PART 2 - PRODUCTS

2.1 GROUNDING AND BONDING CONDUCTORS

A. Equipment grounding conductors shall be UL 83 insulated stranded copper, except that sizes 10 AWG and smaller shall be solid copper. Insulation color shall be continuous green for all equipment grounding conductors, except that wire sizes 4 AWG and larger shall be permitted to be identified per NEC.

B. Bonding conductors shall be ASTM B8 bare stranded copper, except that sizes 10 AWG and smaller shall be ASTM B1 solid bare copper wire.

2.2 SPLICES AND TERMINATION COMPONENTS

A. Components shall meet or exceed UL 467 and be clearly marked with the manufacturer, catalog number, and permitted conductor size(s).

2.3 GROUND CONNECTIONS

A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.

B. Below Grade: Exothermic-welded type connectors.

C. Above Grade:
1. Bonding Jumpers: Compression-type connectors, using zinc-plated fasteners and external tooth lockwashers.
2. Connection to Building Steel: Exothermic-welded type connectors.
3. Ground Busbars: Two-hole compression type lugs, using tin-plated copper or copper alloy bolts and nuts.
4. Rack and Cabinet Ground Bars: One-hole compression-type lugs, using zinc-plated or copper alloy fasteners.
5. Bolted Connectors for Conductors and Pipes: Copper or copper alloy, pressure type with at least two bolts.
6. Pipe Connectors: Clamp type, sized for pipe.
7. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

2.4 GROUND TERMINAL BLOCKS

A. At any equipment mounting location (e.g., backboards and hinged cover enclosures) where rack-type ground bars cannot be mounted, provide screw lug-type terminal blocks.

2.5 SPLICE CASE GROUND ACCESSORIES

A. Splice case grounding and bonding accessories shall be supplied by the splice case manufacturer when available. Otherwise, use 6 AWG insulated ground wire with shield bonding connectors.

PART 3 – EXECUTION

3.1 GENERAL

A. Ground in accordance with the NEC, as shown on drawings, and as specified herein.

B. System Grounding:

1. Secondary service neutrals: Ground at the supply side of the secondary disconnecting means and at the related transformers.
2. Separately derived systems (transformers downstream from the service entrance): Ground the secondary neutral.

3.2 INACCESSIBLE GROUNDING CONNECTIONS

A. Make grounding connections, which are buried or otherwise normally inaccessible (except connections for which periodic testing access is required) by exothermic weld.

3.3 CORROSION INHIBITORS

A. When making ground and ground bonding connections, apply a corrosion inhibitor to all contact surfaces. Use corrosion inhibitor appropriate for protecting a connection between the metals used.

3.4 CONDUCTIVE PIPING

A. Bond all conductive piping systems, interior and exterior, to the building to the grounding electrode system. Bonding connections shall be made as close as practical to the equipment ground bus.

3.5 SECURITY EQUIPMENT ROOM GROUNDING

A. Conduit: Ground and bond metallic conduit systems as follows:

1. Ground metallic service conduit and any pipes entering or being routed within the computer room at each end using 6AWG bonding jumpers.
2. Bond at all intermediate metallic enclosures and across all joints using 6 AWG bonding jumpers.

3.6 WIREWAY GROUNDING

A. Ground and Bond Metallic Wireway Systems as follows:

1. Bond the metallic structures of wireway to provide 100 percent electrical continuity throughout the wireway system by connecting a 6 AWG bonding jumper at all intermediate metallic enclosures and across all section junctions.
2. Install insulated 6 AWG bonding jumpers between the wireway system bonded as required in paragraph 1 above, and the closest building ground at each end and approximately every 50 feet.
3. Use insulated 6 AWG bonding jumpers to ground or bond metallic wireway at each end at all intermediate metallic enclosures and cross all section junctions.
4. Use insulated 6 AWG bonding jumpers to ground cable tray to column-mounted building ground plates (pads) at each end and approximately every 50 feet.

3.7 FIELD QUALITY CONTROL

A. Tests and Inspections:

1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.

B. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Owner promptly and include recommendations to reduce ground resistance.

END OF SECTION 280526

SECTION 28 05 28 - CONDUITS AND BACK BOXES FOR ELECTRONIC SAFETY AND SECURITY

PART 1 - GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs, testing, training and all necessary and related items required to provide a complete and operational raceway system for the Access Control, Intrusion Detection and Video Surveillance systems cabling as shown on the Drawings and described in the Specifications.

B. Provide a complete end-to-end raceway system for the Access Control, Intrusion Detection and Video Surveillance systems including conduit, fittings, back boxes, cover plates, j-boxes, pullboxes, fittings, supports, braces, pull string and firestopping.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety & Security.
2. Section 28 05 00: Conductors and Cables for Electronic Safety & Security.
3. Section 28 05 26: Grounding and Bonding for Electronic Safety & Security.
4. Section 28 05 53: Identification for Electronic Safety & Security.
5. Section 28 10 00: Access Control.
6. Section 28 20 00: Video Surveillance.
7. Section 28 30 00: Security Detection, Alarm and Monitoring.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

1. National Electrical Manufacturers Association (NEMA):

   a. TC-3-04 PVC Fittings for Use with Rigid PVC Conduit and Tubing
   b. FB1-07 Fittings, Cast Metal Boxes and Conduit Bodies for Conduit, Electrical Metallic Tubing and Cable

2. National Fire Protection Association (NFPA):

   a. 70-11 National Electrical Code (NEC)
   b. D. Underwriters Laboratories, Inc. (UL):

c. 1-05 Flexible Metal Conduit
d. 5-04 Surface Metal Raceway and Fittings
e. 6-07 Rigid Metal Conduit
f. 50-07 Enclosures for Electrical Equipment
g. 360-09 Liquid-Tight Flexible Steel Conduit
h. 467-07 Grounding and Bonding Equipment
i. 514A-04 Metallic Outlet Boxes
j. 514B-04 Fittings for Cable and Conduit
k. 514C-02 Nonmetallic Outlet Boxes, Flush-Device Boxes and Covers
l. 651-05 Schedule 40 and 80 Rigid PVC Conduit
m. 651A-07 Type EB and A Rigid PVC Conduit and HDPE Conduit
n. 797-07 Electrical Metallic Tubing
o. 1242-06 Intermediate Metal Conduit

3. ASTM International:

a. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
b. ASTM E119 - Standard Test Methods for Fire Tests of Building Construction and Materials.
c. ASTM E814 - Standard Test Method for Fire Tests of Through-Penetration Fire Stops.
d. ASTM E1966 - Standard Test Method for Fire-Resistive Joint Systems.

4. Underwriters Laboratories Inc.:

a. UL 1479 - Fire Tests of Through-Penetration Firestops.
b. UL - Fire Resistance Directory.

1.4 SUBMITTALS

A. See Specification Section 28 00 00 for additional submittal requirements including quantity and format of submittals.

B. Product Data: Submit manufacturer’s product data sheets for the following items:

1. EMT (Electrical Metallic Tubing) Conduit.
2. IMC (Intermediate Metal Conduit)
3. RMC (Rigid Metal Conduit).
4. Schedule 40 PVC.
5. Back boxes.
6. Pull boxes.
7. Hinged cover enclosures and cabinets.
8. Fittings.
9. Firestopping.

C. Shop Drawings: Submit shop drawings indicating the following:

1. Show size and routing of all conduits 2” and larger including the location of pullboxes.
2. Show the size and location of conduit penetrations through fire rated and smoke partitions.

3. Show the size and location of penetrations through structural items including beams, columns and floors. Structural penetrations must be reviewed and approved by the Structural Engineer prior to installing.
4. Show the location of flexible conduit required at expansion joints and seismic joints.

1.5 APPLICABLE PUBLICATIONS

A. Publications listed below (including amendments, addenda, revisions, supplements and errata) form a part of this specification to the extent referenced. Publications are referenced in the text by the basic designation only.

1.6 QUALITY ASSURANCE

A. Through Penetration Firestopping of Fire Rated Assemblies: UL 1479 or ASTM E814 with 0.10 inch water gage (24.9 Pa) minimum positive pressure differential to achieve fire F-Ratings and temperature T-Ratings as indicated on Drawings, but not less than 1-hour.

1. Wall Penetrations: Fire F-Ratings as indicated on Drawings, but not less than 1-hour.

2. Floor and Roof Penetrations: Fire F-Ratings and temperature T-Ratings as indicated on Drawings, but not less than 1-hour.

a. Floor Penetrations Within Wall Cavities: T-Rating is not required.

B. Through Penetration Firestopping of Non-Fire Rated Floor and Roof Assemblies: Materials to resist free passage of flame and products of combustion.

1. Noncombustible Penetrating Items: Noncombustible materials for penetrating items connecting maximum of three stories.
2. Penetrating Items: Materials approved by authorities having jurisdiction for penetrating items connecting maximum of two stories.

C. Fire Resistant Joints in Fire Rated Floor, Roof, and Wall Assemblies: [ASTM E1966 or] UL 2079 to achieve fire resistant rating as indicated on Drawings for assembly in which joint is installed.

D. Fire Resistant Joints Between Floor Slabs and Exterior Walls: ASTM E119 with 0.10 inch water gage (24.9 Pa) minimum positive pressure differential to achieve fire resistant rating as indicated on Drawings for floor assembly.

E. Surface Burning Characteristics: 25/450 flame spread/smoke developed index when tested in accordance with ASTM E84.

PART 2 – PRODUCTS

2.1 GENERAL

A. Conduit Size: In accordance with the NEC, but not less than 3/4 inch unless otherwise shown.

2.2 CONDUIT

A. Rigid galvanized steel: Shall Conform to UL 6, ANSI C80.1.

B. Rigid intermediate steel conduit (IMC): Shall Conform to UL 1242, ANSI C80.6.

C. Electrical metallic tubing (EMT): Shall Conform to UL 797, ANSI C80.3. Maximum size not to exceed 105 mm (4 inches) and shall be permitted only with cable rated 600 volts or less.

D. Flexible galvanized steel conduit: Shall Conform to UL 1.

E. Liquid-tight flexible metal conduit: Shall Conform to UL 360.

F. Direct burial plastic conduit: Shall conform to UL 651 and UL 651A, heavy wall PVC or high density polyethylene (PE).

2.3 CONDUIT FITTINGS

A. Rigid steel and IMC conduit fittings:

1. Fittings shall meet the requirements of UL 514B and ANSI/ NEMA FB1.
2. Standard threaded couplings, locknuts, bushings, and elbows: Only steel or malleable iron materials are acceptable. Integral retractable type IMC couplings are also acceptable.
3. Locknuts: Bonding type with sharp edges for digging into the metal wall of an enclosure.
4. Bushings: Metallic insulating type, consisting of an insulating insert molded or locked into the metallic body of the fitting. Bushings made entirely of metal or nonmetallic material are not permitted.
5. Erickson (union-type) and set screw type couplings: Approved for use in concrete are permitted for use to complete a conduit run where conduit is installed in concrete. Use set screws of case hardened steel with hex head and cup point to firmly seat in conduit wall for positive ground. Tightening of set screws with pliers is prohibited.
6. Sealing fittings: Threaded cast iron type. Use continuous drain type sealing fittings to prevent passage of water vapor. In concealed work, install fittings in flush steel boxes with blank cover plates having the same finishes as that of other electrical plates in the room.

B. Rigid aluminum conduit fittings:

1. Standard threaded couplings, locknuts, bushings, and elbows: Malleable iron, steel; Zinc or cadmium plate iron or steel fittings. Locknuts and bushings: As specified for rigid steel and IMC conduit.
2. Set screw fittings: Not permitted for use.

C. Electrical metallic tubing fittings:

1. Fittings shall meet the requirements of UL 514B and ANSI/ NEMA FB1.
2. Only steel or malleable iron materials are acceptable.
3. Couplings and connectors: Concrete tight and rain tight, with connectors having insulated throats. Use gland and ring compression type couplings and connectors for conduit sizes 2 inches and smaller. Use set screw type couplings with four set screws each for conduit sizes over 2 inches. Use set screws of case-hardened steel with hex head and cup point to firmly seat in wall of conduit for positive grounding.

4. Indent type connectors or couplings are prohibited.
5. Die-cast or pressure-cast zinc-alloy fittings or fittings made of "pot metal" are prohibited.

D. Flexible steel conduit fittings:

1. Conform to UL 514B. Only steel or malleable iron materials are acceptable.
2. Clamp type, with insulated throat.

E. Liquid-tight flexible metal conduit fittings:

1. Fittings shall meet the requirements of UL 514B and ANSI/ NEMA FB1.
2. Only steel or malleable iron materials are acceptable.
3. Fittings must incorporate a threaded grounding cone, a steel or plastic compression ring, and a gland for tightening. Connectors shall have insulated throats.

F. Direct burial plastic conduit fittings:

1. Fittings shall meet the requirements of UL 514C and NEMA TC3.
2. As recommended by the conduit manufacturer.

G. Expansion and deflection couplings:

1. Conform to UL 467 and UL 514B.
2. Accommodate, 0.75 inch deflection, expansion, or contraction in any direction, and allow 30 degree angular deflections.
3. Include internal flexible metal braid sized to guarantee conduit ground continuity and fault currents in accordance with UL 467, and the NEC code tables for ground conductors.
4. Jacket: Flexible, corrosion-resistant, watertight, moisture and heat resistant molded rubber material with stainless steel jacket clamps.

2.4 CONDUIT SUPPORTS

A. Parts and hardware: Zinc-coat or provide equivalent corrosion protection.

B. Individual Conduit Hangers: Designed for the purpose, having a pre-assembled closure bolt and nut, and provisions for receiving a hanger rod.

C. Multiple conduit (trapeze) hangers: Not less than 1-1/2 by 1-1/2 inch, 12 gage steel, cold formed, lipped channels; with not less than 3/8 inch diameter steel hanger rods.

D. Solid Masonry and Concrete Anchors: Self-drilling expansion shields, or machine bolt expansion.

2.5 OUTLET, JUNCTION, AND PULL BOXES

A. UL-50 and UL-514A.

B. Cast metal where required by the NEC or shown, and equipped with rustproof boxes.

C. Nonmetallic Outlet and Device Boxes: NEMA OS 2.

D. Metal Floor Boxes: Cast or sheet metal, semi-adjustable, rectangular.

E. Sheet metal boxes: Galvanized steel, except where otherwise shown.

F. Flush mounted wall or ceiling boxes shall be installed with raised covers so that front face of raised cover is flush with the wall. Surface mounted wall or ceiling boxes shall be installed with surface style flat or raised covers.

2.6 CABINETS

A. NEMA 250, Type 1 or 4, galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.

B. Hinged door in front cover with flush latch and concealed hinge.

C. Key latch to match panelboards.

D. Metal barriers to separate wiring of different systems and voltage.

E. Accessory feet where required for freestanding equipment.

2.7 WIREWAYS

A. Equip with hinged covers, except where removable covers are shown.

2.8 WARNING TAPE

A. Standard, 4-Mil polyethylene 3 inches wide tape non-detectable type, red with black letters, and imprinted with “CAUTION BURIED ELECTRONIC SAFETY AND SECURITY CABLE BELOW”.

2.9 HANDHOLES AND BOXES FOR EXTERIOR UNDERGROUND WIRING

A. Description: Comply with SCTE 77.

1. Color of Frame and Cover: Gray.
2. Configuration: Units shall be designed for flush burial and have closed bottom, unless otherwise indicated.
3. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
4. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
5. Cover Legend: Molded lettering, as indicated for each service.
6. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
7. Handholes 2 inches wide by 24 inches long and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

B. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel or fiberglass or a combination of the two.

2.10 SLEEVES FOR RACEWAYS

A. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, galvanized steel, plain ends.

B. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

C. Sleeves for Rectangular Openings: Galvanized sheet steel with minimum 0.052- or 0.138-inch thickness as indicated and of length to suit application.

2.11 FIRESTOPPING

A. Manufacturers:

1. Dow Corning Corp.
2. 3M fire Protection Products.
3. Specified Technology, Inc.
4. Or Approved Equal.

B. Product Description: Different types of products by multiple manufacturers are acceptable as required to meet specified system description and performance requirements; provide only one type for each similar application.

1. Silicone Firestopping Elastomeric Firestopping: Single component silicone elastomeric compound and compatible silicone sealant.
2. Foam Firestopping Compounds: Single component foam compound.
3. Formulated Firestopping Compound of Incombustible Fibers: Formulated compound mixed with incombustible non-asbestos fibers.
4. Fiber Stuffing and Sealant Firestopping: Composite of mineral fiber stuffing insulation with silicone elastomer for smoke stopping.
5. Mechanical Firestopping Device with Fillers: Mechanical device with incombustible fillers and silicone elastomer, covered with sheet stainless steel jacket, joined with collars, penetration sealed with flanged stops.
6. Intumescent Firestopping: Intumescent putty compound which expands on exposure to surface heat gain.
7. Firestop Pillows: Formed mineral fiber pillows.

C. Color: Dark gray.

2.12 FIRESTOPPING ACCESSORIES

A. Primer: Type recommended by firestopping manufacturer for specific substrate surfaces and suitable for required fire ratings.

B. Installation Accessories: Provide clips, collars, fasteners, temporary stops or dams, and other devices required to position and retain materials in place.

C. General:

1. Furnish UL listed products.
2. Select products with rating not less than rating of wall or floor being penetrated.

D. Non-Rated Surfaces:

1. Stamped steel, chrome plated, hinged, split ring escutcheons or floor plates or ceiling plates for covering openings in occupied areas where conduit is exposed.
2. For exterior wall openings below grade, furnish modular mechanical type seal consisting of interlocking synthetic rubber links shaped to continuously fill annular space between conduit and cored opening or water-stop type wall sleeve.

PART 3 – EXECUTION

3.1 PENETRATIONS

A. Cutting or Holes:

1. Locate holes in advance where they are proposed in the structural sections such as ribs or beams. Obtain the approval of the Owner prior to drilling, cutting or coring through structural sections.
2. Cut holes through concrete and masonry in new and existing structures with a diamond core drill or concrete saw. Pneumatic hammer, impact electric, hand or manual hammer type drills are not allowed, except where permitted by the Owner required by limited working space.

B. Fire Stop: Where conduits, wireways, and other electronic safety and security raceways pass through fire partitions, fire walls, smoke partitions, or floors, install a fire stop that provides an effective barrier against the spread of fire, smoke and gases with rock wool fiber or silicone foam sealant only. Completely fill and seal clearances between raceways and openings with the fire stop material.

C. Waterproofing: At floor, exterior wall, and roof conduit penetrations, completely seal clearances around the conduit and make watertight.

3.2 INSTALLATION, GENERAL

A. Install conduit as follows:

1. In complete runs before pulling in cables or wires.
2. Flattened, dented, or deformed conduit is not permitted. Remove and replace the damaged conduits with new undamaged material.
3. Assure conduit installation does not encroach into the ceiling height head room, walkways, or doorways.
4. Cut square with a hacksaw, ream, remove burrs, and draw up tight.
5. Mechanically continuous.
6. Independently support conduit at 8 foot on center. Do not use other supports i.e., (suspended ceilings, suspended ceiling supporting members, lighting fixtures, conduits, mechanical piping, or mechanical ducts).
7. Support within 12 inches of changes of direction, and within 12 inches of each enclosure to which connected.
8. Close ends of empty conduit with plugs or caps at the rough-in stage to prevent entry of debris, until wires are pulled in.
9. Secure conduits to cabinets, junction boxes, pull boxes and outlet boxes with bonding type locknuts. For rigid and IMC conduit installations, provide a locknut on the inside of the enclosure, made up wrench tight. Do not make conduit connections to junction box covers.
10. Do not use aluminum conduits in wet locations.
11. Unless otherwise indicated on the drawings or specified herein, all conduits shall be installed concealed within finished walls, floors and ceilings.

B. Conduit Bends:

1. Make bends with standard conduit bending machines.

2. Conduit hickey may be used for slight offsets, and for straightening stubbed out conduits.
3. Bending of conduits with a pipe tee or vise is prohibited.

C. Layout and Homeruns:

1. Install conduit with wiring, including homeruns, as shown.

3.3 CONCEALED WORK INSTALLATION

A. In Concrete:

1. Conduit: Rigid steel, IMC or EMT. Do not install EMT in concrete slabs that are in contact with soil, gravel or vapor barriers.
2. Align and run conduit in direct lines.
3. Make couplings and connections watertight. Use thread compounds that are UL approved conductive type to insure low resistance ground continuity through the conduits. Tightening set screws with pliers is prohibited.

B. Furred or Suspended Ceilings and in Walls:

1. Conduit for conductors 600 volts and below:

a. Rigid steel, IMC, rigid aluminum, or EMT. Different type conduits mixed indiscriminately in the same system is prohibited.

2. Align and run conduit parallel or perpendicular to the building lines.
3. Tightening set screws with pliers is prohibited.

3.4 EXPOSED WORK INSTALLATION

A. Unless otherwise indicated on the drawings, exposed conduit is only permitted in mechanical and electrical rooms.

B. Conduit for Conductors 600 volts and below:

1. Rigid steel, IMC, or EMT. Different type of conduits mixed indiscriminately in the system is prohibited.

C. Align and run conduit parallel or perpendicular to the building lines.

D. Install horizontal runs close to the ceiling or beams and secure with conduit straps.

E. Support horizontal or vertical runs at not over eight foot intervals.

F. Surface metal raceways: Use only where shown.

G. Painting:

1. Refer to division 09.

3.5 EXPANSION JOINTS

A. Conduits 3 inches and larger, that are secured to the building structure on opposite sides of a building expansion joint, require expansion and deflection couplings. Install the couplings in accordance with the manufacturer's recommendations.

B. Provide conduits smaller than 3 inches with junction boxes on both sides of the expansion joint. Connect conduits to junction boxes with sufficient slack of flexible conduit to produce 5 inch vertical drop midway between the ends. Flexible conduit shall have a copper green ground bonding jumper installed. In lieu of this flexible conduit, expansion and deflection couplings as specified above for 15 inches and larger conduits are acceptable.

C. Install expansion and deflection couplings where shown.

D. Seismic Areas: In seismic areas, provide conduits rigidly secured to the building structure on opposite sides of a building expansion joint with junction boxes on both sides of the joint. Connect conduits to junction boxes with 15 inches of slack flexible conduit. Flexible conduit shall have a copper green ground bonding jumper installed.

3.6 CONDUIT SUPPORTS, INSTALLATION

A. Safe working load shall not exceed 1/4 of proof test load of fastening devices.

B. Use pipe straps or individual conduit hangers for supporting individual conduits.

C. Maximum distance between supports is 8 foot on center.

D. Support multiple conduit runs with trapeze hangers. Use trapeze hangers that are designed to support a load equal to or greater than the sum of the weights of the conduits, wires, hanger itself, and 200 pounds. Attach each conduit with U-bolts or other approved fasteners.

E. Support conduit independently of junction boxes, pull boxes, fixtures, suspended ceiling T-bars, angle supports, and similar items.

F. Fasteners and Supports in Solid Masonry and Concrete:

1. New Construction: Use steel or malleable iron concrete inserts set in place prior to placing the concrete.

2. Existing Construction:

a. Steel expansion anchors not less than 1/4 inch bolt size and not less than 1-1/8 inch embedment.
b. Power set fasteners not less than 1/4 inch diameter with depth of penetration not less than 3 inches.
c. Use vibration and shock resistant anchors and fasteners for attaching to concrete ceilings.

G. Hollow Masonry: Toggle bolts are permitted.

H. Bolts supported only by plaster or gypsum wallboard are not acceptable.

I. Metal Structures: Use machine screw fasteners or other devices specifically designed and approved for the application.

J. Attachment by wood plugs, rawl plug, plastic, lead or soft metal anchors, or wood blocking and bolts supported only by plaster is prohibited.

K. Chain, wire, or perforated strap shall not be used to support or fasten conduit.

L. Spring steel type supports or fasteners are prohibited for all uses except: Horizontal and vertical supports/fasteners within walls.

M. Vertical Supports: Vertical conduit runs shall have riser clamps and supports in accordance with the NEC and as shown. Provide supports for cable and wire with fittings that include internal wedges and retaining collars.

3.7 BOX INSTALLATION

A. Boxes for Concealed Conduits:

1. Flush mounted.
2. Provide raised covers for boxes to suit the wall or ceiling, construction and finish.

B. In addition to boxes shown, install additional boxes where needed to prevent damage to cables and wires during pulling in operations.

C. Remove only knockouts as required and plug unused openings. Use threaded plugs for cast metal boxes and snap-in metal covers for sheet metal boxes.

D. Outlet boxes in the same wall mounted back-to-back are prohibited. A minimum 24 inch, center-to-center lateral spacing shall be maintained between boxes).

E. Minimum size of outlet boxes for ground fault interrupter (GFI) receptacles is 4 inches square by 2-1/8 inches deep, with device covers for the wall material and thickness involved.

F. Stencil or install phenolic nameplates on covers of the boxes identified on riser diagrams; for example "SIG-FA JB No. 1".

G. On all Branch Circuit junction box covers, identify the circuits with black marker.

3.8 ELECTRONIC SAFETY AND SECURITY CONDUIT

A. Contractor shall design and install a complete end-to-end raceway system for the entire Door Access Control and Intrusion Detection Systems.

B. Minimum conduit size of 3/4 inch, but not less than the size shown on the drawings.

C. All conduit ends shall be equipped with insulated bushings.

D. All four inch conduits within buildings shall include pull boxes after every two 90 degree bends. Size boxes per the NEC.

E. Vertical conduits/sleeves through closets floors shall terminate not less than 3 inches below the floor and not less than 3 inches below the ceiling of the floor below.

F. Terminate conduit runs to/from a backboard in a closet or interstitial space at the top or bottom of the backboard. Conduits shall enter communication closets next to the wall and be flush with the backboard.

G. Where drilling is necessary for vertical conduits, locate holes so as not to affect structural sections such as ribs or beams.

H. All empty conduits located in communications closets or on backboards shall be sealed with a standard non-hardening duct seal compound to prevent the entrance of moisture and gases and to meet fire resistance requirements.

I. Conduit runs shall contain no more than four quarter turns (90 degree bends) between pull boxes/backboards. Minimum radius of communication conduit bends shall be as follows (special long radius):

Sizes of Conduit Trade Size	Radius of Conduit Bends mm, Inches
¾	(6)
1	(9)
1-1/4	(14)
1-1/2	(17)
2	(21)
2-1/2	(25)
3	(31)
3-1/2	(36)
4	(45)

J. Furnish and install 3/4 inch thick fire retardant plywood on the wall of communication closets where shown on drawings . Mount the plywood with the bottom edge 6 inches above the finished floor.

K. Furnish and pull wire in all empty conduits. (Sleeves through floor are exceptions).

3.9 INSTALLATION – FIRESTOPPING

A. Install material at fire rated construction perimeters and openings containing penetrating sleeves, piping, ductwork, conduit and other items, requiring firestopping.

B. Apply primer where recommended by manufacturer for type of firestopping material and substrate involved, and as required for compliance with required fire ratings.

C. Apply firestopping material in sufficient thickness to achieve required fire and smoke rating, to uniform density and texture.

D. Place foamed material in layers to ensure homogenous density, filling cavities and spaces. Place sealant to completely seal junctions with adjacent dissimilar materials.

E. Fire Rated Surface:

1. Seal opening at floor, wall, partition, ceiling, and roof as follows:

a. Install sleeve through opening and extending beyond minimum of 1 inch (25 mm) on both sides of building element.
b. Size sleeve allowing minimum of 1 inch (25 mm) void between sleeve and building element.
c. Pack void with backing material.
d. Seal ends of sleeve with UL listed fire resistive silicone compound to meet fire rating of structure penetrated.

2. Where cable tray, conduit, wireway, and cable penetrates fire rated surface, install firestopping product in accordance with manufacturer's instructions.

F. Non-Rated Surfaces:

1. Seal opening through non-fire rated wall, partition, floor, ceiling and roof opening as follows:

a. Install sleeve through opening and extending beyond minimum of 1 inch (25 mm) on both sides of building element.
b. Size sleeve allowing minimum of 1 inch (25 mm) void between sleeve and building element.
c. Install type of firestopping material recommended by manufacturer.

2. Install floor plates or ceiling plates where conduit, penetrates non-fire rated surfaces in occupied spaces. Occupied spaces include rooms with finished ceilings and where penetration occurs below finished ceiling.
3. Exterior wall openings below grade: Assemble rubber links of mechanical seal to size of conduit and tighten in place, in accordance with manufacturer's instructions.
4. Interior partitions: Seal pipe penetrations at computer rooms and data rooms. Apply sealant to both sides of penetration to completely fill annular space between sleeve and conduit.

END OF SECTION 28 05 28

SECTION 280553 - IDENTIFICATION FOR ELECTRONIC SAFETY AND SECURITY

PART 1 - GENERAL

1.01 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs and all necessary and related items required to provide a complete identification system for the Electronic Safety and Security (ESS) Systems including the Access Control, Intrusion Detection and Video Surveillance systems as shown on the Drawings and described in the Specifications.

1.02 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety and Security.
2. Section 28 05 00: Conductors and Cables for Electronic Safety and Security.
3. Section 28 10 00: Access Control.
4. Section 28 20 00: Video Surveillance.
5. Section 28 30 00: Security Detection, Alarm and Monitoring.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.03 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

6. National Electric Code (NEC), NFPA 70.

1.04 SUBMITTALS

A. Product Data: Submit manufacturer’s product data sheets for the following items:

1. Equipment cabinet and equipment enclosure labels.
2. Wire and cable labels.

B. Samples: Submit samples of the following items:

1. Include physical samples of each labeling material.

PART 2 - PRODUCTS

2.01 LABELS

A. Phenolic two tone for exterior mounting on equipment enclosures. White lettering on black background.

2.02 WIRE AND CABLE LABELS

A. Provide self-laminating adhesive laser labels.

B. Labels shall be machine printable with a laser printer.

C. Text Attributes:

1. Black
2. 1/8” high, minimum, or #12 font size
3. Font: Verdana preferred, SansSerif, or Arial acceptable
4. Printable area: 1.0” X .375” and 1.0” X 0.50”.
5. Cable size: 0.16 – 0.32” OD
6. Color: White

D. Manufacturer:

1. Brady wire marking labels WML–211-295 and WML-311-292.
2. Brother.
3. Thomas and Betts.
4. Or approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Physically label all of the ESS Systems components including but not limited to the following:

1. Cables:
   a. Label at all termination points.
   b. Label at pullboxes, junction boxes and outlet boxes.
2. Label Access Control and Intrusion Detection System Cabinets.
3. Label Field equipment cabinets.
4. Label equipment within the cabinets and enclosures indicating its function.
5. Label equipment with its IP address (where applicable).
6. Label Terminal blocks.
7. Label Relays.
8. Label Patch panels, and the termination positions within the patch panels.

B. Identify wire and cable clearly with permanent labels wrapped about the full circumference within one (1) inch of each connection. Indicate the number designated on the associated field or shop drawings or run sheet, as applicable. Assign wire or cable designations consistently throughout a given system; i.e., each wire or cable shall carry the same labeled designation over its entire run, regardless of intermediate terminations. Label cables where cable first enters and exits from conduit, junction or distribution boxes; labels shall be located within six (6) inches of the point of exit.

C. Label all equipment mounted in the equipment enclosures indicating its function. This includes servers, switches, controllers, power supplies, batteries, etc.

D. Components, such as racks and patch panels, must be permanently marked with machine-generated labels, according to current practices and as approved by the Owner before installation.

E. Labels shall coincide with device id's use on the record drawings.

F. Equipment Enclosures.

1. Label all Enclosures, alarm monitoring, and powers supply enclosures associated with the security system with an adhesive backed phenolic label. Use 12 point text.
2. Labels shall be represented in and match the security system record drawings.

G. Security Devices.

1. Label all equipment associated with the security system with a permanent machine generated, laminated, label. Use 12 point text with a clear background. Use white or black lettering depending upon the color of the device.
2. Label device in a concealed location with the system point number and address.
3. Label power supply batteries with the month and year they were installed.

H. Wire and Cable.

1. Label all wire and cable associated with the security system with permanent machine generated, laminated, labels. Use 12 point, black text on a white label.
2. All wire and cable labels shall be clearly visible without the need to remove wire management or any other obstructions.

END OF SECTION 280553

SECTION 28 10 00 - ACCESS CONTROL

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes access control field devices, intelligent controllers, power supplies, equipment enclosures, cabling, software and licenses.

1.2 DESCRIPTION OF WORK

A. Washoe County School District has an existing door access control system including head-end server, software and licensing. The existing access control system software is Genetec Security Center v5.6. Washoe County School District has installed the Genetec Synergis Pro Package w/256 readers and 10 clients. The contractor will be responsible for integrating the door access control at this site with this existing system. The contractor shall follow the established naming convention for sites, doors and card holder security groups.

B. Include all equipment, materials, labor and all necessary and related items required to provide a complete and operational access control system as shown on the drawings and described in the specifications.

C. Furnish, install, program and test access control system head-end software, gateways, intelligent controllers, door controllers, I/O boards, add-in boards, power supplies, battery chargers, batteries, relays, software and licensing as identified on the drawings.

D. Furnish and install door access control field devices including POE+ door controllers, card readers, magnetic door position contacts, request to exit motion detectors, etc. as shown on the drawings.

E. Furnish and install a video intercom system for the main exterior entry door including door station and master station. Install cabling and program the door access control system as required to allow the video intercom master station to unlock the electrified door hardware at the main exterior entry door.

F. Furnish and install access control for the interior single point of entry door including manual push button door release, wireless push button door release, wireless receiver and interface with the electrified door hardware.

G. Prep existing door frames to receive access control devices.

H. Electrified door hardware including electric strikes, power transfer hinges and electric locks are specified in the Architectural door hardware schedule and installed by the door hardware contractor. The Division 28 contractor is responsible for connecting the electrified door hardware to the access control system. Coordinate installation and connection of power supplies and electrified door hardware with the door installer.

I. Furnish, install, terminate and label signal and power cabling for all door access control devices.

J. Furnish and install end-to-end raceway system for access control cabling.

K. Furnish and install Category 6 network cabling to the POE+ based door controllers located above the doors. Network cabling to be installed and tested in accordance with

the Division 27 specifications. POE+ network switches will be provided, installed and programmed by the Owner.

L. Configure existing access control system head-end software and licensing to integrate access control system installed at the elementary school.

M. Assign Microsoft Active Directory group security accounts to local door controllers as directed by WCSD.

N. Furnish, install and configure access control software and access control software licenses as described in these specifications. Provide training to the Owner on the use of the software.

O. Furnish, install and configure access control monitoring software on (1) client workstation as directed by the Owner. Provide training to the Owner on the operation of the monitoring software and printing reports.

P. Furnish and install relays, input devices and cabling to interface the access control system panel with the existing fire alarm system. In the event of a fire alarm, egress doors shall fail open.

Q. Perform system testing and commissioning of all security devices shown on the drawings.

R. Meet with the Owner to determine the required operation and functionality of the system. Program the security system in accordance with the Owner's requirements including user/group access rights and schedules on a per door basis.

S. Demonstrate the entire security system to the Owner at the completion of the project. Provide four (4) hours of training to the admin staff on the operation and maintenance of the system.

1.3 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety & Security.
2. Section 28 05 00: Conductors and Cables for Electronic Safety & Security.
3. Section 28 05 26: Grounding and Bonding for Electronic Safety & Security.
4. Section 28 05 28: Conduits and Back Boxes for Electronic Safety and Security.
5. Section 28 05 53: Identification for Electronic Safety & Security.
6. Section 28 30 00: Security Detection, Alarm & Monitoring.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.4 REGULATIONS AND CODE COMPLIANCE

A. The Contractor will comply with all applicable governmental regulations including Federal, State, City, and local applicable codes and ordinances.

B. References to codes and standards called for in the Specifications refer to the latest edition, amendments, and revisions to the codes and standards in effect on the date of these Specifications.

C. All work and materials shall conform to and be installed, inspected and tested in accordance with the governing rules and regulations of the security industry, as well as federal, state and local governmental agencies, including, but not limited to the following

1. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
2. Underwriter's Laboratories, Inc. (UL) 294 – Access Control Systems.
3. Underwriter's Laboratories, Inc. (UL) 1076 – Burglar Alarm and Systems.
4. Federal Communications Commission (FCC).
5. Americans with Disabilities Act (ADA).

1.5 CONTRACTOR QUALIFICATIONS

A. The Contractor installing the access control system shall have a minimum of five (5) years experience installing access control systems of similar size and scope.

B. The Contractor installing the access control system must be a firm normally engaged in the design, installation and maintenance of integrated security systems including access control, intrusion detection and video surveillance.

C. The Contractor shall be a Genetec Certified Partner and have the necessary certifications to purchase, install and configure the specified access control system equipment and software.

D. The Contractor's system programmer shall have attended manufacturer training and obtained certification in Genetec™ Security Center - Synergis™ Technical Certification.

E. Contractor must be capable of responding to service calls within four (4) business hours of receipt and providing an onsite response time of one (1) business day for repair of critical system items.

F. The Contractor must be licensed by the Nevada State Contractors Board.

G. Formal, written evidence of the following may be requested at any point during the Bid or installation:

1. If requested, the Contractor, including any subcontractor, shall show proven expertise in the implementation of access control projects. This expertise can be illustrated through the inclusion of details of at least three (3) projects involving the design and installation of access control systems within the past three (3) year period of similar size and scope. Names, addresses, and telephone numbers of references for the three projects shall be included.
2. In the event subcontractors are used for any portion of the installation or acceptance testing, the Contractor shall be responsible for any subsequent corrective action required on that portion of the work.

1.6 SUBMITTALS

A. Manufacturer's Data Sheets: Submit manufacturer's data sheets in electronic PDF format for the following items:

1. Access control system equipment enclosures.

2. Access control system gateways, intelligent controllers, POE+ based door controllers & I/O boards.
3. Relays.
4. Power supplies & battery chargers.
5. Batteries.
6. Contactless smart card readers.
7. Card stock.
8. Magnetic door position contacts.
9. Request to exit motion detectors.
10. Manual door release push buttons.
11. Wireless door release pendants and wireless receivers.
12. Main entry door video intercom door station and admin console.
13. Access control system software and licenses.

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

C. Shop Drawings: Submit shop drawings in electronic PDF format that include the following items:

1. Submit floor plans indicating all security devices installed at each door.
2. Provide a spreadsheet for each security device and its ID (point) within the security system.
3. Submit point-to-point wiring diagrams and block diagrams showing all door security devices, power supplies, relays, card reader panels, security panel I/O boards, battery backups, etc.
4. Submit layout drawings of the components mounted in the equipment enclosures located in the telecom rooms including system controllers, card reader boards, I/O boards, relays, power supplies, battery chargers, cable management wireways, overhead gutters, data outlets, electrical outlets, etc.
5. Submit security panel battery calculations (batteries shall backup the entire system for a minimum of 4 hours).

D. Naming Convention Scheme for Access Control Doors and Security Groups:

1. Contractor to submit a naming convention scheme for the site, doors and card holder security groups. Naming convention shall match existing. The proposed naming scheme to be reviewed and approved by School Police prior to implementing.

1.7 DELIVERY, STORAGE & HANDLING

A. Protect all controllers, devices and equipment from moisture, dust and debris prior to installation.

1.8 WARRANTY

A. See Division 1 Specifications and General Conditions regarding Guarantee and Warranty requirements which apply to this Specification Section.

B. The Contractor shall provide the following warranty for the Door Access Control System described in this specification section:

1. Warranty Start Date: The warranty period will begin after substantial completion of the project.

2. Complete System Warranty: The complete Access Control System including all devices, equipment, cabling, software and programming shall be guaranteed to be free from defects in workmanship and materials for a minimum period of one (1) year from date of substantial completion. Promptly remedy such defects and any subsequent damage caused by the defects or repair thereof at no expense to the Owner.

3. Labor Warranty: Contractor to provide all labor as necessary to complete warranty repairs for a period of one (1) years from the date of substantial completion. During this labor warranty period, all services including equipment, labor, travel, expenses, etc., shall be provided during normal working hours at no cost to the Owner. The Contractor shall provide the Owner with a phone number for service. The Contractor shall respond within four (4) business hours of receipt of a service call. The Contractor shall provide an on-site response time of one (1) business day for repair of critical system items during normal business hours.

4. Equipment Warranty: The Access Control System equipment shall carry a one (1) year manufacturer warranty. Damaged or defective equipment shall be replaced by the manufacturer during this one (1) year warranty period at no cost to the Owner.

5. Software Warranty: The Access Control System software and licenses shall carry a five (5) year manufacturer warranty. During the warranty period, the manufacturer shall provide telephone based technical support and shall provide software upgrades free of charge.

6. Warranty Exclusions: The guarantee shall exclude acts of God, vandalism, physical abuse or operator misuse.

PART 2 – PRODUCTS

2.1 ACCESS CONTROL SYSTEM EQUIPMENT ENCLOSURES

A. Provide minimum 36” wide x 36” high x 8” deep equipment enclosure where shown on the drawings.

B. Provide a separate lockable equipment enclosure to house the batteries and power supplies immediately adjacent or below the security panel.

C. Equipment enclosures shall have a lockable hinged door. Lock shall be keyed alike with other security enclosures on the project.

D. Install plastic slotted duct to route cabling within the enclosure.

E. Ground security equipment enclosures to ground bar in telecom room with #6 green insulated ground conductor.

F. Label outside of enclosure with an engraved plate.

G. Provide the following accessories inside the enclosures.

1. Tamper switch on each equipment enclosure door.
2. 5” electric fan with thermostat to cool enclosure.

H. Acceptable Products:

1. Hoffman Concept CSD36368 Enclosure, CP3636 Panel, A4AXFNGQ Fan, ABRKT4 Fan Mounting Bracket and ATEMNO Thermostat.
2. Or Approved Equal.

2.2 ACCESS CONTROL SYSTEM GATEWAY APPLIANCE, INTELLIGENT CONTROLLER AND I/O BOARDS

A. Furnish and install site gateway, intelligent controller and input/output (I/O) boards as shown on the drawings. Devices will control all doors with access control on the project.

B. Mount all devices in the equipment enclosure located in the main telecom room.

C. Gateway and intelligent controller shall be assigned IP addresses as directed by WCSD IT department. Contractor will be responsible for providing a list of devices requiring an IP address including a description of the device, its location, MAC address and patch panel port that it is connected to.

D. Configure gateway appliance to communicate with the remote access control system head-end server software. Configure intelligent controller to communicate with the site gateway appliance and the local POE+ based door controllers at each site.

E. Intelligent controllers shall meet the following physical specifications

1. UL 294 recognized.
2. CE Compliant
3. NIST Certified Encryption
4. Manages up to 64 Card Readers.
5. 2 onboard reader ports.
6. 4 Form C Relays, 5A 30VDC output.
7. 1 Ethernet connection.

F. Acceptable Products:

1. Site gateway appliance (Provide 1 gateway per site):

   a. Synergis Cloud Link Appliance (Genetec P/N SY-CLOUDLINK).
   b. No Substitutions.

2. Intelligent Controller (Provide 1 controller per site):

   a. Mercury Security P/N SY-MP1502.
   b. No Substitutions.

3. 16-Input Card (Provide 1 input card per site):

   a. Mercury Security P/N SY-MR16IN-S3.
   b. No Substitutions.

4. 16-Output Card (Provide 1 output card per site).

   a. Mercury Security SY-MR16OUT-S3.
   b. No Substitutions.

2.3 POE+ DOOR CONTROLLERS

A. Provide POE+ based door controllers where shown on the drawings.

B. Door controllers shall be installed in a lockable enclosure above each door. All enclosures to be keyed alike.

C. Provide plenum CAT 6 network cable from each POE+ door controller to the telecom serving the area. Category 6 cable shall be installed, terminated and tested in accordance with the Division 27 specifications.

D. POE+ based door controllers shall be assigned IP addresses as directed by WCSD IT department. Contractor will be responsible for providing a list of devices requiring an IP address including a description of the device, its location, MAC address and patch panel port that it is connected to.

E. Configure POE+ door controllers to communicate with the intelligent controllers at each site.

F. POE+ door controllers shall have the following physical characteristics:

1. UL 294 recognized.
2. CE Compliant.
3. NIST Certified Encryption.
4. 1.25 Amp Power at Door for card reader, lock and REX.
5. 1 Ethernet Port.
6. 2 card reader ports (controls up to 2 readers at 1 door).
7. OSDP Protocol between reader and controller.
8. Local cardholder database with 240,000 cardholder capacity.

G. Acceptable Products:

1. POE+ Door Controller:

   a. Mercury Security P/N MP1501.
   b. No Substitutions.

2. POE+ Door Controller (at Main Entrance A101 Door):

   a. Mercury Security P/N MR62E.
   b. No Substitutions.

3. Lockable Enclosure for POE+ Door Controller:

   a. Life Safety Power FlexPower E5M Enclosure.
   b. Or Approved Equal.

2.4 RELAYS

A. Provide DIN rail mounted relays for all equipment requiring relay activation. Mount relays in lockable equipment enclosures.

B. Provide 24V plug-in type relays with LED lights that indicate when the relay is energized.

1. Acceptable Manufacturers:

   a. IDEC.
   b. Or Approved Equal.

2.5 POWER SUPPLIES & BATTERY CHARGERS

A. Provide UL listed supervised power supplies for access control equipment located in the main telecom room including intelligent controllers, gateways, I/O boards, etc. Provide quantity of power supplies to accommodate all equipment.

B. Power supply input shall be 120v. Output shall be 12V or 24V as required by the specific equipment.

C. Power supplies shall have integrated battery charger.

D. Mount power supplies / battery chargers in lockable enclosures.

1. Acceptable Products:

a. Altronix Maximal 11E. Size as required to accommodate all devices.
b. Or Approved Equal.

2.6 BATTERIES

A. Provide UL listed rechargeable batteries to backup all security power supplies. Mount batteries in power supply enclosure.

B. Provide 12V 12Ah, leak proof lead acid batteries.

C. Batteries shall be equipped with safety release valves designed to operate between and 2 and 5 psi and shall automatically reseal.

D. The Contractor shall perform calculations to determine the number of batteries required to backup each power supply. In the case of a power failure, the batteries shall provide a minimum of 2 hours of continuous backup for the entire door access control system.

E. Note – POE+ based door controllers to be backed up by UPS’s connected to the POE+ switches in the telecom rooms. POE+ switches and UPS’s will be provided and installed by the Owner.

F. Acceptable products:

1. Altronix BT1212.
2. Or Approved Equal.

2.7 CONTACTLESS SMART CARD READERS

A. Provide contactless smart card readers as shown on the drawings.

B. Readers shall be color black.

C. Provide narrow mullion mount readers where required at storefront doors.

D. Provide readers with a 12V operating voltage and 4” read range.

E. Readers shall communicate via the OSDP protocol.

F. Connect card readers to the POE+ based door controller located above each card reader door.

1. Acceptable Products:

a. Standard Size Readers:

(1) HID Signo 40 (verify compatibility with existing HID iClass SE readers installed throughout the district).
(2) No Substitutions.

b. Narrow Mullion Mount Readers:

(1) HID Signo 20 (verify compatibility with existing HID iClass SE readers installed throughout the district).
(2) No Substitutions.

2.8 MAGNETIC DOOR POSITION CONTACTS

A. Provide recessed magnetic door contacts where indicated on the drawings.

B. Door contacts shall be double pole, double throw type. The first set of leads will be connected to the access control system and the second set of leads will be connected to the intrusion detection system.

C. Connect door position contacts to the POE+ based door controller located above each card reader door.

D. Acceptable Products:

1. GE/Sentrol 1078.
2. Or Approved Equal.

2.9 REQUEST TO EXIT MOTION DETECTORS

A. Provide UL listed 24V request to exit motion detectors as shown on the drawings (color white).

B. Devices shall have 2 form “C” contacts adjustable up to 60 seconds.

C. Devices shall have programmable fail safe and fail secure modes.

D. Provide device trim plates as necessary.

E. Connect request to exit to the POE+ based door controller located above each card reader door.

F. Acceptable Products:

1. Bosch P/N DS160.
2. Or Approved Equal.

2.10 ELECTRIFIED DOOR LOCKS AND STRIKES

A. Electrified door hardware is specified in the Architectural door hardware schedule and installed by the door contractor.

B. Connect electrified door hardware to the POE+ based door controller located above each card reader door as required.

2.11 MANUAL DOOR RELEASE PUSH BUTTON (SINGLE POINT OF ENTRY DOOR)

A. Provide remote push button for manual release of electrified door hardware at the single point of entry door located in the entry vestibule. Push button shall be momentary.

B. Remote push button should be surface mounted below the admin reception desk. Coordinate mounting location with WCSD admin staff.

C. Push button shall have a green lens. Label button to correspond to the door being unlocked.

D. Acceptable products.

1. Securitron PB3-ER.
2. Or Approved Equal.

2.12 WIRELESS DOOR RELEASE PUSH BUTTONS (INTERIOR SINGLE POINT OF ENTRY DOOR)

A. Provide remote wireless push buttons for manual release of electrified door hardware at the single point of entry door located in the entry vestibule.

B. Remote push buttons should be battery operated pendant mount style and shall communicate with a wireless receiver mounted in the admin office.

C. Provide qty one (1) wireless receiver and qty two (2) wireless push buttons.

D. Provide conduit and wiring to the wireless receiver as shown on the drawings and as required for a complete and operable system.

E. Acceptable products.

1. Qty (1) Wireless receiver:

a. Inovonics P/N EN4204R.
b. Or Approved Equal.

2. Qty (2) Wireless 1-button pendant:

a. Inovonics P/N EN1223S.
b. Or Approved Equal.

2.13 VIDEO INTERCOM SYSTEM (MAIN EXTERIOR ENTRY DOOR)

A. Provide video intercom system for the main entry door consisting of a video/intercom door station and remote video/intercom admin console.

B. Door station shall be flush mounted, vandal resistant and constructed of stainless steel. Door station shall have call button, microphone, speaker and camera.

C. Admin console shall be desk mounted in the admin office. Provide power supply as required. Admin console shall have a button to release the electrified door hardware at the main entry door.

D. Provide conduit and wiring as shown on the drawings and as required for a complete and operable system.

E. Acceptable Products:

1. Vandal Resistant Door Station & flush back box:

a. Aiphone P/N JP-DVF.
b. Or Approved Equal.

2. Admin Console:

a. Aiphone P/N JP-4MED.
b. Or Approved Equal.

3. Admin Console desk stand:

a. Aiphone P/N MCW-S/B.
b. Or Approved Equal.

4. Power Supply:

a. Aiphone P/N PS2420UL.
b. Or Approved Equal.

2.14 ACCESS CONTROL CABLING

A. Install plenum rated Category 6 cable (jacket color gray) from the POE+ door controller above each card reader door to the telecom room serving the area. Category 6 cabling to be installed, terminated and tested in accordance with the Division 27 specifications.

B. Install 18/6 shielded twisted pair cable from smart card readers to the POE+ door controller located above each card reader door.

1. Acceptable Products:

a. Alpha Wire 5386C.
b. Or Equal by Belden, CommScope or WestPenn.

C. Install 18/2 stranded twisted pair from request to exit devices, door contacts and remote audible alarms to the POE+ door controller located above each card reader door.

1. Acceptable Products:

a. Belden 8461.
b. Or Equal by Alpha Wire, CommScope or Westpenn.

D. Install 18/2 stranded twisted cables to provide power to locks, request to exits and local alarms from the POE+ door controller located above each card reader door.

1. Acceptable Products:

a. Belden 8461.
b. Or Equal by Alpha Wire, CommScope or Westpenn.

2.15 CABLE SHEATH LABELS

A. Label cable sheaths at the point of termination with laser printed self-laminating wrap around vinyl labels.

B. Labels shall be white with black type. Label size shall be 1.0” wide by 1.5” high.

1. Acceptable Manufacturers:

a. Brady.
b. Belden.
c. Hellermann Tyton.
d. Or Approved Equal.

2.16 ACCESS CONTROL SYSTEM CARD STOCK

A. Provide qty (100) composite cards compatible with the smart card readers.

B. Contractor to enroll the cards in the access control system and shall train the owner on assigning the enrolled cards to specific users.

C. Acceptable Products:

1. Qty (100) HID iCLASS SE composite cards (P/N 3000PGGMN).
2. No Substitutions.

2.17 ACCESS CONTROL SYSTEM SOFTWARE

A. Washoe County School District has an existing door access control system including head-end server, software and licensing. The existing access control system software is Genetec Security Center v5.6. Washoe County School District has installed the Genetec Synergis Pro Package w/256 readers and 10 clients.

B. The contractor shall provide one (1) card reader license with five (5) year product maintenance agreement for each card reader on the project.

C. Acceptable Products;

1. Card Reader License with 5-year license – Provide Qty (1) license for each card reader on the project (Genetec P/N ADV-RDR-P-5Y).
2. No Substitutions.

PART 3 – EXECUTION

A. SECURITY CABLE ROUTING AND TERMINATION

1. Roughin conduit at doors with access control as shown on the drawings.
2. Prep door frames as required for access control devices.
3. Connect electrified door hardware provided by the door hardware installer to the access control system.
4. Route all cabling in conduit from the access control field devices at each door to the POE+ door controller located above each door. Terminate conduit at the lockable enclosure housing the POE+ door controller.
5. Route Category 6 cable from the POE+ based door controller located above each card reader door to the telecom room serving the area. Category 6 cabling

shall be installed, terminated and tested in accordance with the Division 27 specifications.

6. All conduit shall be routed concealed. Where this is not possible, notify the Architect and provide proposed routing of exposed conduit for review and approval. Paint exposed conduit to match existing surfaces.
7. Install access doors as necessary to provide reasonable access to POE+ door controllers, security cable and junction boxes located above inaccessible ceilings.
8. Ten feet of cable slack shall be stored in the security cable above the security panel enclosure.
9. Cables shall be installed in continuous lengths from origin to destination (no splices are permitted).
10. The cable's minimum bend radius and maximum pulling tension shall not be exceeded. Refer to manufacturer’s requirements and reference documents.
11. Any cable damaged or exceeding recommended installation parameters during installation shall be replaced by the Contractor prior to final acceptance at no cost to the Owner.
12. Cables shall be labeled with self-adhesive labels. At the security panel, each cable shall be clearly labeled on the cable jacket 1” from the termination location.
13. When installing conduit, the Contractor shall maintain the following minimum clearance from sources of electro-magnetic interference (EMI).
    a. 6” clear from power conductors.
    b. 12” clear from fluorescent lighting fixtures and ballasts.
    c. 36” clear from transformers and motors.

3.2 LABELING

A. Label all gateways, intelligent controllers and POE+ door controllers indicating their function and IP address.

B. Label all security devices. Labels shall be placed in a concealed location and shall identify the ID of the device.

C. Label all equipment enclosures, power supplies and relays.

D. Label all batteries with the date that the batteries were installed.

E. Label all cables at the equipment enclosures. Affix labels a minimum of 1 inch from the point of termination. Labels shall be placed so that they are clearly visible. Labels shall identify the ID of the device.

F. Install engraved name plate on the equipment enclosure in the main telecom room.

3.3 SYSTEM PROGRAMMING

A. Meet with the Owner to determine the required naming convention for sites, doors and card holder security groups. Meet with the Owner to determine the required system operation, functionality, user/group access rights and scheduling.

B. Provide list of equipment requiring an IP address to the WCSD IT Department prior to starting the work. The list shall include a description of the device, its location, MAC address and patch panel port in the telecom room that it is connected to. Assign IP addresses to devices as directed by WCSD.

C. Configure POE+ door controllers to communicate with the intelligent controllers at each site. Configure the intelligent controllers to communicate the gateway device at each site.

Configure the gateway appliance to communicate with the access control head-end server.

D. Integrate access control system at the site with existing head-end server. Work with the Owner to establish access permissions to logon to the software.

E. Program the security system in accordance with the Owner's requirements.

3.4 SYSTEM TESTING AND COMMISSIONING

A. The contractor shall perform 100% testing of the security doors and devices. All deficiencies shall be corrected and the devices re-tested. At a minimum, the following items shall be tested:

1. Card reader door:

a. Valid card read.
b. Invalid card read.
c. Valid request-to-exit.
d. Door forced open.
e. Door held open.
f. Door shunt.

2. Main Exterior Door Video Intercom System:

a. Verify call button.
b. Verify 2-way audio functionality.
c. Verify camera operation.
d. Verify master station door release functionality.

3. Single point of entry Interior Door:

a. Verify manual push button door release.
b. Verify wireless push button door release.

4. Magnetic Door Hold Open Release.

a. Verify interface to paging system emergency code red push button.
b. Verify release of magnetic door hold opens.

3.5 SYSTEM DEMONSTRATION AND TRAINING

A. Provide four (4) hours of training to the Owner's staff on the operation of the system. Training shall consist of two (2) 2-hour training sessions as scheduled by the Owner. Contractor shall provide a sign-in sheet indicating the date, time, location, name of trainer and names of staff personnel trained. A copy of the sign-in sheet shall be included with the O&M submittals at the completion of the project.

END OF SECTION 281000

SECTION 282000 – VIDEO SURVEILLANCE SYSTEM

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs, testing, training and all necessary and related items required to provide a complete and operational video surveillance system as shown on the Drawings and described in the Specifications.

B. Furnish cameras. Provide MAC address information to WCSD Project Manager. Assign IP addresses to cameras as provided by WCSD Project Manager. Provide temporary camera login credentials to WCSD Project Manager.

C. Install, mount, secure, aim, focus and adjust all IP video surveillance cameras. Aim cameras as directed by WCSD Project Manager.

D. Install CAT 6 cabling from each camera to patch panels as shown on the drawings. All CAT 6 cabling to be installed and tested in accordance with the Division 27 Specifications.

E. Furnish CAT 6 patch cords at the patch panel to connect the camera patch panel ports to owner furnished POE switches. WCSD Project Manager will provide designated pre-configured POE switch port numbers to the contractor. Contractor shall install patch cords and cross connect the cameras to the designated switch ports.

F. WCSD IT will furnish and install Milestone cameras licenses.

G. WCSD IT will furnish and configure Milestone software.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety & Security.
2. Section 28 05 00: Conductors and Cables for Electronic Safety & Security.
3. Section 28 05 28: Conduits and Backboxes for Electronic Safety and Security.
4. Section 28 05 53: Identification for Electronic Safety & Security.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 QUALITY ASSURANCE

A. The Contractor installing the IP video surveillance cameras and video recording software must have a minimum of (5) years experience installing video surveillance systems of similar size and scope.

B. The Contractor installing the IP video surveillance system must be a firm normally engaged in the design, installation and maintenance of integrated security systems including access control, intrusion detection and video surveillance.

C. The contractor installing the Category 6 cabling to the cameras must comply with the qualification requirements and installation requirements listed in the Division 27 Specifications.

D. The Contractor must be licensed by the Nevada State Contractors Board.

E. Formal, written evidence of the following may be requested at any point during the Bid or installation processes:

1. If requested, the Contractor, including any subcontractor, shall show proven expertise in the implementation of video surveillance projects. This expertise can be illustrated through the inclusion of details of at least three (3) projects involving the design and installation of video surveillance systems within the past three year period of similar size and scope. Names, addresses, and telephone numbers of references for the three projects shall be included.
2. In the event subcontractors are used for any portion of the installation or acceptance testing, the Contractor shall be responsible for any subsequent corrective action required on that portion of the work.

1.4 SUBMITTALS

A. Manufacturer Product Data Sheets

1. Submit product data sheets in electronic PDF (portable document format).
2. Provide a table of contents for each submittal indicating the items being submitted. Products listed in the table of contents should be in the same order as they appear in the Specifications.
3. Provide product data sheets for all items listed in each specification section. Partial submittals will not be accepted.
4. Where product data sheets include more than one distinct item, clearly mark data sheet with arrow or other identifying means to clearly indicate the items being submitted for approval. Delete or cross-out non-applicable data.
5. Provide manufacturer data sheets for the following equipment and software:

    a. Indoor fixed vandal resistant dome cameras.
    b. Outdoor fixed vandal resistant dome cameras.
    c. Indoor fixed 2-sensor vandal resistant dome cameras.
    d. Outdoor fixed 4-sensor vandal resistant dome cameras.
    e. Camera supports including wall mount kits, corner mount kits, pole mount kits, gooseneck support arms, ceiling pendant kits, back boxes, etc.
    f. CAT 6 Cabling – Indoor Plenum Rated.
    g. CAT 6A Field Mount Plugs.
    h. 48-Port CAT 6A Patch Panels.
    i. CAT 6 Patch Cords.

1.5 REGULATIONS AND CODE COMPLIANCE

A. The Contractor will comply with all applicable governmental regulations including Federal, State, City, and local applicable codes and ordinances.

B. References to codes and standards called for in the Specifications refer to the latest edition, amendments, and revisions to the codes and standards in effect on the date of these Specifications.

C. All work and materials shall conform to and be installed, inspected and tested in accordance with federal, state and local governmental agencies, including, but not limited to the following:

1. ANSI/NFPA-70, 2017 -- National Electrical Code (NEC).
2. Underwriter's Laboratories, Inc. (UL).
3. Federal Communications Commission (FCC).
4. Americans with Disabilities Act (ADA).

1.6 INTENT OF DRAWINGS

A. All drawings are diagrammatic unless otherwise noted as detailed dimensioned drawings. Drawings show approximate locations of equipment and devices. Exact locations are subject to the approval of the Owner or Owner's Representative. The Contractor shall verify dimensions and shall be responsible for their accuracy

B. Items mentioned in the Specifications and not shown in the Drawings, or shown in the Drawings and not mentioned in the Specifications, shall be of like effect as if shown and mentioned in both. In the case of differences between the Drawings and the Specifications, the stricter provision as determined by the Owner or Owner's Representative shall govern.

C. Omissions from the Drawings or Specifications, or the incorrect description of details of Work which are necessary to carry out the intent of the Drawings and Specifications, or work which is customarily performed, shall not relieve the Contractor from performing such omitted or incorrectly described work.

D. No exclusion from, or limitations in, the language used in the Project Documents shall be interpreted as meaning that ancillary or accessory items necessary to complete any required system or item of equipment are to be omitted.

1.7 REVIEW OF SPECIFICATIONS

A. Prior to submitting a bid for the Project, the Contractor shall carefully study and compare the Drawings and Specifications and shall at once report to the Owner or Owner's Representative any error, inconsistency or omission discovered. During construction, if the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission in the Specifications without such notice to the Owner or Owner's Representative, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the cost for any correction.

B. The Contractor shall not deviate from the specified scope of work as indicated in the Project Documents. Deviations include (but are not limited to):

1. Alteration of video surveillance camera locations from those specified in Plans.
2. Installation of horizontal cables to a different Telecom Room than indicated on the Plans.

1.8 EXAMINATION OF THE PREMISES

A. The Contractor shall visit the Site(s) to become familiar with the local conditions under which the work is to be performed and correlate his observations with the requirements of

the Drawings and Specifications. No allowance will be made for claims of concealed conditions which the Contractor learned or should have learned in exercising due diligence in its observations of the site and review of the local conditions.

B. Before ordering any materials or performing any work, the Contractor shall verify all measurements and be responsible for correctness of same. No extra charge or compensation will be allowed for duplicate work or material required because of an unverified difference between an actual dimension and the measurement indicated in the Drawings. Any discrepancies found shall be submitted in writing to the Owner or Owner's Representative for consideration before proceeding with the work.

1.9 DELIVERY, STORAGE AND HANDLING

A. All items to be installed as a component of the IP video surveillance system for the Project shall be stored according to manufacturer's recommendations. In addition, all items must be stored in a location protected from vandalism and weather. Items shall not be stored outside. If air temperature at the storage location shall be below 40 degrees F, the equipment shall be moved to a heated 50 degrees F (minimum) location. If necessary, equipment shall be stored off site at The Contractor's expense.

1.1 WARRANTY

A. See Division 1 Specifications and General Conditions regarding Guarantee and Warranty requirements which apply to this Specification Section.

B. The Contractor shall provide the following warranty for the Video Surveillance System described in this specification section:

1. Warranty Start Date: The warranty period will begin after substantial completion of the project.

2. Complete System Warranty: The complete Video Surveillance System including all devices, equipment, cabling, software and programming shall be guaranteed to be free from defects in workmanship and materials for a minimum period of one (1) year from date of substantial completion. Promptly remedy such defects and any subsequent damage caused by the defects or repair thereof at no expense to the Owner.

3. Labor Warranty: Contractor to provide all labor as necessary to complete warranty repairs for a period of one (1) year from the date of substantial completion. During this labor warranty period, all services including equipment, labor, travel, expenses, etc., shall be provided during normal working hours at no cost to the Owner. The Contractor shall provide the Owner with a phone number for service. The Contractor shall respond within one (1) business day of receipt of a service call. The Contractor shall provide an on-site response time of two (2) business day for repair of critical system items during normal business hours.

4. Warranty Exclusions: The guarantee shall exclude acts of God, vandalism, physical abuse or operator misuse.

1.10 FINAL ACCEPTANCE

A. General

1. All cameras mounted in accordance with the drawings.

2. IP address assigned to cameras and temporary login credentials provided to WCSD IT. Contractor to provide camera hardware MAC addresses to WCSD IT and WCSD IT will provide camera IP addresses to be assigned.
3. All CAT 6 cables installed, terminated, labeled and tested. Certified test reports submitted to WCSD.
4. All cameras properly aimed and focused as directed by WCSD IT.
5. All Punchlist items completed.

B. Inspection Of Work

1. WCSD Project Manager shall perform an inspection of all Contractor work prior to final acceptance. Any items that are found to be in error at this time shall be documented.
2. Documentation shall then be provided to the Contractor, who shall provide a date (within 30 days of WCSD Project Manager inspection) by which all items shall be corrected. The Contractor has the option to coordinate a site visit with the WCSD Project Manager in order to clarify and/or dispute the issues.
3. WCSD Project Manager shall perform a re-inspection of all Contractor work. Any remaining or additional items that are found to be in error shall again be documented. WCSD/IT reserves the right at this point to employ a separate contractor to make corrections at a cost to The Contractor.

PART 2 – PRODUCTS

2.1 FIXED INDOOR VANDAL RESISTANT 2MP DOME CAMERAS

A. Provide cameras meeting the following requirements:

1. The camera shall be of manufacturer’s official product line, designed for commercial/industrial 24/7/365 use.
2. The camera shall be based upon standard components and proven technology using open and published protocols.
3. Minimum 3MP, 1920x1080 Resolution.
4. RJ-45 Ethernet Connector. 10/100 Base-T.
5. IEEE 802.3af Compliant.
6. Mini-Dome.
7. Auto Zoom and Focus via Web Browser.
8. Vandal Resistant IK10 Rated.
9. H.264 video compression at 30fps.

B. Acceptable Products

1. Camera:
   a. Axis P/N P3265-V.
   b. No substitutions.

2. Recess ceiling mount.
   a. Provide recess ceiling mount kit where shown on drawings (Axis P/N TP3201-E).
   b. No substitutions.

3. Pendant Mount:
   a. Provide pendant mount kit where shown on drawings including ceiling mount (Axis P/N T91B51), camera shroud (Axis P/N T94K01D) and

custom length 1.5 NPT extension column to clear ceiling obstructions (color white).
b. No substitutions.

2.2 FIXED INDOOR AND OUTDOOR VANDAL RESISTANT 5MP DOME CAMERAS

A. Provide cameras meeting the following requirements:

1. The camera shall be of manufacturer's official product line, designed for commercial/industrial 24/7/365 use.
2. The camera shall be based upon standard components and proven technology using open and published protocols.
3. Minimum 3MP, 2952x1944 Resolution.
4. RJ-45 Ethernet Connector. 10/100 Base-T.
5. IEEE 802.3af Compliant.
6. Mini-Dome.
7. Auto Zoom and Focus via Web Browser.
8. Vandal Resistant IK10 Rated.
9. H.264 video compression at 30fps.

B. Acceptable Products

1. Camera:
   a. Axis P/N P3267-LV (Indoor) and P3267-LVE (Outdoor).
   b. No substitutions.

2. Recess ceiling mount.
   a. Provide recess ceiling mount kit where shown on drawings (Axis P/N TP3201-E).
   b. No substitutions.

3. Pendant Mount:
   a. Provide pendant mount kit where shown on drawings including ceiling mount (Axis P/N T91B51), camera shroud (Axis P/N T94K01D) and custom length 1.5 NPT extension column to clear ceiling obstructions (color white).
   b. No substitutions.

2.3 FIXED 10-MEGAPIXEL DUAL-SENSOR VANDAL RESISTANT DOME CAMERA

A. Provide fixed dome cameras meeting the following requirements:

1. Camera shall consist of two (2) individual 5MP image sensors integrated into a single vandal-resistant dome housing.
2. Each image sensor shall be independently repositionable within the dome via a perimeter-mounted rotational support track, allowing flexible field of view placement.
3. Each sensor shall support independent pan and tilt adjustments to achieve the desired field of view.
4. Each sensor shall support remote focus and zoom capabilities over the IP network via standard web browser interface.
5. Each sensor shall provide a minimum resolution of 2592 x 1944 pixels (5MP).
6. Camera shall support dual-stream encoding in H.264, H.265, and MJPEG formats.
7. Entire camera assembly shall utilize a single RJ-45 10/100/1000Base-T Ethernet connection.

8. Entire assembly shall consume only one (1) camera license within the Video Management System (VMS).
9. Power shall be provided via Power over Ethernet (PoE+), compliant with IEEE 802.3at Type 2 standard.
10. Dome housing shall be vandal resistant and rated IK10.
11. Camera shall be rated IP66/IP67 for protection against dust and water ingress.
12. Suitable for both indoor and outdoor installations.
13. Support video frame rates up to 30 frames per second (FPS) at full resolution per sensor.
14. Support configurable privacy masking.
15. Operating temperature range shall be -30˚C (-22˚F) to +50˚C (122˚F).

B. Acceptable Products

1. Camera:
   a. Axis P/N P4707-PLVE
   b. No Substitutions

2.4 FIXED 20 MEGAPIXEL 4-IMAGE SENSOR 4-CAMERA VANDAL RESISTANT DOME CAMERAS

a. Provide cameras meeting the following requirements:

1. Camera will consist of 4 individual 5MP fixed cameras installed in a single vandal resistant dome.
2. Each of the 4 cameras within the dome shall be capable of being repositioned within the dome by moving it around the perimeter of a circular support track.
3. Each of the 4 cameras within the dome shall be capable of being independently aimed up and down, side to side.
4. Each of the 4 cameras within the dome shall be capable of being remotely focused and zoomed over the IP network via a web browser.
5. Each of the 4 cameras will have a minimum 5MP 2560x1440 Resolution per sensor.
6. Dual encoder (H.264 and MJPEG).
7. The entire camera assembly will one RJ-45 Ethernet Connector, 10/100 Base-T.
8. The entire camera assembly will require 1 software camera license within the VMS software.
9. POE - IEEE 802.3af Compliant.
10. Vandal Resistant and IK10 Rated.
11. IP 66 Ingress and Weather Rated.
12. Indoor/Outdoor rated.
13. Video frame rate (up to) 30FPS @ full resolution.
14. Privacy masking.
15. Operating temperature -30˚C (-22 °F) to +50˚C (122 °F).

b. Provide corner mount kit, gooseneck support arm and shroud to mount cameras on exterior corners of buildings as shown on the drawings. Provide additional mounting plates, adapters and accessories as necessary for a vandal resistant and weatherproof installation.

c. Acceptable Products

1. Camera:
   1. Axis P/N P3737-PLE.
   2. No known equal.

2. Pendant Mount:

1. Provide pendant mount kit where shown on drawings including ceiling mount (Axis P/N T91B51), camera shroud (Axis P/N T94N01D) and custom length 1.5 NPT extension column to clear ceiling obstructions (color white).
2. No substitutions.

3. Exterior Corner Mount:
   1. Provide corner mount kit, gooseneck support arm, back box and camera shroud as required for exterior corner mounting (Axis T91A64, T91D61 and T94N01D).
   2. No substitutions.

4. Exterior Pole Mount:
   1. Provide pole mount kit where shown on the drawings including stainless steel bands and mount (Axis P/N T91B57), mounting cabinet (Axis P/N T98A18-VE), wall mount arm (Axis P/N T91D61) and camera pendant kit (Axis P/N T94N01D).
   2. No substitutions.

2.5 HORIZONTAL PLENUM RATED CATEGORY 6 CABLE.

A. See Section 271500 for requirements.

2.6 CATEGORY 6A FIELD MOUNT PLUGS

A. See Section 271500 for requirements.

2.7 CATEGORY 6 COPPER PATCH PANELS

d. See Section 271100 for requirements.

2.8 CATEGORY 6 COPPER PATCH CORDS

A. See Section 271100 for requirements.

2.9 VIDEO MANAGEMENT SOFTWARE SYSTEM

a. WCSD IT will provide and install Milestone camera licenses.

b. WCSD IT will provide, install and configure Milestone recording server and client viewing software.

PART 3 – EXECUTION

3.1 CAMERA SYSTEM INSTALLATION SEQUENCE AND COORDINATION WITH WCSD

A. The following is the installation sequence for the camera system. The contractor shall coordinate and schedule all work with WCSD's Project Manager.

1. Contractor shall procure cameras and provide a spreadsheet to WCSD Project Manager indicating the camera number, MAC address and camera name. The camera numbers shall match the numbers in the camera schedule. WCSD will provide IP addresses for each camera. Contractor shall configure the cameras with the provided IP addresses and shall update all cameras with current manufacturer firmware.

2. Contractor shall provide camera and temporary login credentials to WCSD Project Manager.
3. Contractor shall install, terminate and test cabling to the cameras. Contractor shall provide certified cable test results to WCSD Project Manager and provide patch cords for the cameras. WCSD IT will inspect the cabling installation and will issue a punchlist identifying any corrective action required.
4. After the contractor has completed all punchlist items, WCSD IT will install the POE switches and will provide designated pre-configured POE switch port numbers to the contractor. Contractor shall install patch cords and cross connect the cameras to the designated switch ports.
5. Contractor shall connect, aim, focus and adjust the cameras. Each camera view must be reviewed and signed off by WCSD Project Manager.
6. WCSD IT will complete all remaining Milestone Software configuration including:

    a. Installation of Milestone recording server and software at the project site.
    b. Installation of camera licenses. Camera licenses provided and installed by WCSD IT.
    c. Configuration of camera settings including frame rate, compression, motion detection, privacy masking, recording, etc.
    d. Installation of Milestone Smart Client software on workstation computers at the project site.

3.2 ROUGH-IN

A. Before construction work commences, the Contractor shall visit the site and identify the exact location and mounting of all cameras.

B. Camera mounting locations shall be coordinated with the work of other trades including ductwork, return and supply grills, lights, switches, exit signs, fire sprinklers, smoke detectors and structure. Cameras, mounts, raceway and cabling shall be installed so as not to interfere with required clearances for maintenance and inspection of equipment.

C. Notify the Owner’s Representative of any obstructions that may block the camera views shown on the Drawings.

D. The contractor shall minimize the amount of exposed conduit and boxes exposed to view. Paint all interior and exterior conduit exposed to view to match adjacent surfaces. All exterior conduit shall be rigid RMC with water tight boxes and fittings.

E. All exposed screws and fasteners used for camera mounting hardware, conduit supports, j-boxes and pull boxes shall be vandal resistant (Torx Pin-Head Style).

3.3 CUTTING AND PATCHING

A. The Contractor shall be responsible for all cutting, patching, coring and associated work to complete the camera installation. Patch adjacent work disturbed or damaged by installation of new work including insulation, walls and wall covering, ceiling and floor covering or other finished surfaces.

B. The contractor shall be responsible for repairing any ceiling tile, ceiling grid, ceiling supports or adjacent surfaces damaged during the installation of the cameras.

C. All penetrations through the building envelope shall be sealed and made water tight.

D. All penetrations through fire rated walls, floors and ceilings shall be fire stopped with a UL listed fire stop system meeting or exceeding the rating of the assembly being penetrated.

E. No roof penetrations are permitted.

3.4 GENERAL INSTALLATION REQUIREMENTS

A. Coordinate ordering and installation of all equipment with long lead times or having a major impact on work by other trades so as not to delay the job or impact the schedule.

B. Set all cameras and associated supports to accurate line and grade, level all equipment and align all equipment components.

C. Provide all scaffolding, rigging, hoisting and services necessary for installation of equipment.

D. Storage and security of material and equipment prior to installation shall be the responsibility of the Contractor.

3.5 CEILING DOME CAMERA MOUNTING AND NETWORK CONNECTION

A. Install ceiling mounted dome cameras and support brackets in accordance with the Manufacturer’s instructions.

B. Verify ceiling mounted camera locations shown on the drawings. The contractor shall verify that adequate clearances exist above the camera to allow installation at the locations shown. The contractor shall make minor adjustments to the camera locations to avoid clearance conflicts.

C. Secure cameras to structure with mount kit called out in the camera schedule.

D. Furnish, install and terminate Category 6 cabling from the IP camera to the telecom room identified on the Drawings.

E. Terminate CAT 6 cable at the camera on CAT 6A Field Mount Plug and connect directly to the camera.

F. The contractor shall work with the WCSD IT department to cross connect the cameras to the POE switches in the telecom rooms.

G. The contractor shall assign static IP addresses to the camera with the IP address scheme specified by WCSD IT.

H. Verify that the camera has the most current firmware version. If not, download and install the latest firmware version from the manufacturer’s website.

3.6 EXTERIOR GOOSENECK CAMERA MOUNTING AND NETWORK CONNECTION

A. Notify the Owner’s representative where obstructions exist that may block the view from the camera prior to installing the camera.

B. Install fixed dome cameras, corner mount kits, gooseneck supports and shrouds in accordance with the Manufacturer’s instructions.

C. Core drill exterior building and install rigid conduit to feed the camera via the support bracket.

D. Route conduit to minimize the amount of conduit exposed to view. Install rigid (RMC) conduit at all exterior locations.

E. Paint exposed conduit to match existing surfaces.

F. Securely anchor corner mount kit and/or gooseneck support bracket to structure.

G. Install camera shroud and connect camera to shroud.

H. Verify that camera and mounts are level and plumb.

I. Verify that all components are secure to prevent vibrating or unstable images caused by wind or vibration.

J. All exposed screws and fasteners shall be vandal resistant (Torx Pin-Head Style).

K. Furnish, install and terminate Category 6 cabling from the IP camera to the telecom room identified on the Drawings.

L. Terminate CAT 6 cable at the camera on CAT 6A Field Mount Plug and connect directly to the camera.

M. The contractor shall coordinate and work with the WCSD IT department to cross connect the cameras to the POE switches in the telecom rooms.

N. The contractor shall assign static IP addresses to the camera with the IP address scheme specified by WCSD IT.

O. Verify that the camera has the most current firmware version. If not, download and install the latest firmware version from the manufacturer’s website.

3.7 FIXED CAMERA SETUP, FOCUSING AND ADJUSTMENT

A. Contractor shall connect, aim, focus and adjust the cameras. Each camera view must be reviewed and signed off by WCSD IT.

END OF SECTION

SECTION 28 30 00 – SECURITY DETECTION, ALARM AND MONITORING

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes Intrusion Detection System (IDS) head-end control panel, automatic cellular dialer for central station monitoring, controllers, power supplies, batteries, magnetic door position contacts, passive infrared motion detectors, keypads, conduit and back boxes, signal and control wiring, system configuration, programming, testing, demonstration and training.

1.2 DESCRIPTION OF WORK

A. The Contractor shall furnish and install all equipment, materials, labor, and services necessary to provide a complete and operable intrusion detection system and to insure that the system is in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

B. Provide all equipment, cabling and ancillary items as normally provided for a complete and operational security intrusion detection system.

C. Furnish and install intrusion detection control panel including control panel, lockable enclosure, tamper switch, controllers, relay boards, add-in boards, power supplies, batteries, battery chargers, automatic dialer, etc. Connect panel to phone lines and data network as required.

D. Furnish and install addressable intrusion detection devices including magnetic door position contacts, magnetic rollup door position contacts, magnetic roof hatch position contacts and combination keypad/annunciators.

E. Provide 120VAC power at security panels.

F. Provide automatic cellular dialer for remote central station monitoring. Provide plug-in supervised cellular interface.

G. Prep door frames as necessary to receive intrusion detection devices.

H. Furnish, install, terminate, test and label signal and power cabling for all intrusion detection devices.

I. Furnish and install raceway for access control cabling including conduit and back boxes. All intrusion detection cabling to be routed in conduit from the devices to the control panel located in the telecom room.

J. Perform system testing and commissioning of the entire intrusion detection system including all devices shown on the drawings.

K. Meet with the Owner to determine the required operation, zoning and functionality of the system. Program the security system in accordance with the Owner’s requirements.

L. Demonstrate the entire security system to the Owner at the completion of the project. Provide two (2) hours of training to the admin staff on the system.

1.3 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety & Security.
2. Section 28 05 00: Conductors and Cables for Electronic Safety & Security.
3. Section 28 05 26: Grounding and Bonding for Electronic Safety & Security.
4. Section 28 05 28: Conduits and Backboxes for Electronic Safety and Security.
5. Section 28 05 53: Identification for Electronic Safety & Security.
6. Section 28 10 00: Access Control.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.4 REGULATIONS AND CODE COMPLIANCE

A. Comply with all applicable governmental regulations including Federal, State, City, and local applicable codes and ordinances. All work shall comply with local building codes, local and State fire marshal regulations and OSHA.

B. References to codes and standards called for in the Specifications refer to the latest edition, amendments, and revisions to the codes and standards in effect on the date of these Specifications.

C. All work and materials shall conform to and be installed, inspected and tested in accordance with the governing rules and regulations of the security industry, as well as federal, state and local governmental agencies, including, but not limited to the following

D. Underwriters Laboratories (UL):

1. UL 50 - Enclosures for Electrical Equipment.
2. UL 365 – Police Station Connected Burglar Alarm Units and Systems
3. UL 609 – Local Burglar Alarm Units and Systems
4. UL 611 – Central Station Burglar-Alarm Units
5. UL 636 – Hold up alarms
6. UL 1076 – Proprietary Burglar Alarm Units and Systems
7. UL 1610 – Central Station Burglar-Alarm Units
8. UL 60950-1 - Information Technology Equipment - Safety.

E. Federal Communications Commission (FCC):

1. Code of Federal Regulations Title 47 - Part 15 – Radio Frequency Devices.
2. Code of Federal Regulations Title 47 - Part 68 – Connection of Terminal Equipment to the Telephone Network.

A. ANSI/NFPA-70, 2011 -- National Electrical Code (NEC).

F. Americans with Disabilities Act (ADA).

1.5 QUALITY ASSURANCE

A. The Contractor installing the intrusion detection security system shall have a minimum of (5) years experience installing commercial intrusion detection / burglar alarm systems of similar size and scope.

B. The Contractor installing the intrusion detection system must be a firm normally engaged in the design, installation and maintenance of integrated security systems including access control, intrusion detection, fire alarm and video surveillance.

C. The Contractor must be licensed by the Nevada State Contractors Board.

D. Formal, written evidence of the following may be requested at any point during the Bid or installation processes:

1. If requested, the Contractor, including any subcontractor, shall show proven expertise in the implementation of intrusion detection systems on commercial projects. This expertise can be illustrated through the inclusion of details of at least three (3) projects involving the design and installation of intrusion detection systems within the past three year period of similar size and scope. Names, addresses, and telephone numbers of references for the three projects shall be included.
2. In the event subcontractors are used for any portion of the installation or acceptance testing, the Contractor shall be responsible for any subsequent corrective action required on that portion of the work.

E. Provide new and un-used devices, equipment and cabling. Comply with all manufacturers' installation instructions.

F. All cable, raceways and equipment shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the Specifications shall be subject to the control and approval of the Owner's Representative.

G. All work shall be supervised on a daily basis by qualified and competent personnel. The contractor shall keep the same foreman and workman on the job throughout the duration of the project.

H. The manufacturer of the intrusion detection security system equipment shall be certified as being compliant with ISO 9001.

1.6 SUBMITTALS

A. Manufacturer's Data Sheets: Submit manufacturer's data sheets in electronic PDF format for the following items:

1. Intrusion Control Panel, Automatic Cellular Dialer, Zone Expansion Modules, Add-in Boards, Relays.
2. Power Supplies & Battery Chargers.
3. Batteries.
4. Lockable Equipment Enclosures with Tamper Switch.
5. Addressable Magnetic Door Position Contacts.
6. Addressable Magnetic Rollup Door Position Contacts.
7. Addressable Magnetic Roof Hatch Position Contacts.
8. Addressable Passive Infrared Motion Detectors.
9. Touch Screen Keypad/Annunciators.
10. Security System Cabling.
11. Labels.

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

C. Shop Drawings:

1. Submit floor plans indicating the location of all intrusion field devices, control panels and keypads.
2. Provide a spreadsheet for each security device and its ID (point) within the security system.
3. Submit point-to-point wiring diagrams and block diagrams showing all intrusion detection, controllers, power supplies, relays, I/O boards, battery backups, etc.
4. Submit layout drawings of the components mounted in the lockable security enclosures including controllers, dialers, I/O boards, relays, power supplies, battery chargers, batteries, cable management devices, overhead wiring gutters, phone outlets, data outlets, electrical outlets, etc.
5. Submit security panel battery calculations.
6. Drawings shall be submitted in electronic PDF format.

1.7 DELIVERY, STORAGE & HANDLING

A. Deliver materials to the job site in OEM's original unopened containers, clearly labeled with the OEM's name, equipment model and serial identification numbers, and UL logo.

B. Protect all security panels, devices and cabling from moisture, dust and debris prior to installation.

1.8 COORDINATION

A. Coordinate arrangement, mounting, and support of intrusion detection system equipment:

1. To allow maximum possible headroom unless specific mounting heights that reduce headroom are indicated.
2. To provide for ease of disconnecting the equipment with minimum interference to other installations.
3. To allow right of way for piping and conduit installed at required slope.
4. So connecting raceways, cables, wireways, cable trays, and busways will be clear of obstructions and of the working and access space of other equipment.

B. Coordinate installation of required supporting devices and set sleeves in cast-in-place concrete, masonry walls, and other structural components as they are constructed.

C. Coordinate location of access panels and doors for electronic safety and security items that are behind finished surfaces or otherwise concealed.

1.9 WARRANTY

A. See Division 1 Specifications and General Conditions regarding Guarantee and Warranty requirements which apply to this Specification Section.

B. The Contractor shall provide the following warranty for the Intrusion Detection System described in this specification section:

1. Warranty Start Date: The warranty period will begin after substantial completion of the project.

2. Complete System Warranty: The complete Intrusion Detection System including all devices, equipment, cabling, software and programming shall be guaranteed to be free from defects in workmanship and materials for a minimum period of one (1) year from date of substantial completion. Promptly remedy such defects and any subsequent damage caused by the defects or repair thereof at no expense to the Owner.

3. Labor Warranty: Contractor to provide all labor as necessary to complete warranty repairs for a period of one (1) year from the date of substantial completion. During this labor warranty period, all services including equipment, labor, travel, expenses, etc., shall be provided during normal working hours at no cost to the Owner. The Contractor shall provide the Owner with a phone number for service. The Contractor shall respond within four (4) business hours of receipt of a service call. The Contractor shall provide an on-site response time of one (1) business day for repair of critical system items during normal business hours.

4. Warranty Exclusions: The guarantee shall exclude acts of God, vandalism, physical abuse or operator misuse.

5. Routine Site Visits During Warranty Period: Provide one routine maintenance visit at the end of the one (1) year labor warranty period at a time coordinated with the Owner. Adjust and replace defective parts and components with original manufacturer's replacement parts, components, and supplies.

6. Labor Warranty and Maintenance Service Renewal: No later than 60 days prior to the expiration of the one (1) year labor warranty period, deliver to the Owner a proposal to provide contract maintenance and repair services for an additional one-year term. The Owner will be under no obligation to accept maintenance service proposal.

PART 2 – PRODUCTS

2.1 INTRUSION DETECTION SYSTEM (IDS) MANUFACTURERS

A. Acceptable Manufacturer:

1. Bosch Security Systems.
2. No Substitutions.

2.2 GENERAL DESCRIPTION

A. Control Panel and Features:

1. The Intrusion Detection System (IDS) control panel shall be Bosch Security Systems, Inc. model B9512G comprising a fully integrated intrusion, fire, and access control system. The control panel shall support the following:

   a. The IDS system is capable of being utilized as a combination Intrusion and Commercial Fire system per code. Fully integrated intrusion and fire functions allow users to interface with 1 system instead of 2
   b. Optional Telephone Line Module, programmable for signaling and supervision.
   c. Integrated Conettix IP based communication provides high-speed, secure alarm transport and control.
   d. 32 programmable areas with perimeter and interior partitioning.

e. 8 on-board, hardwired points with expansion capability for a total of 599 using a combination of wired or wireless points.
f. Compatibility with Color Graphic Touch Screen, 2-line alpha numeric capacitive touch, ATM style LCD or 2-line LCD style Alarm Keypads.
g. Local or remote programming, test, and diagnostic capability via a computer running the Remote Programming Software (RPS).
h. The system shall include an integrated USB port for local programming and diagnostics using a computer running Remote Programming Software (RPS) and a male USB2.0 to male USB 2.0 cable with no additional hardware modules required.
i. The system shall support the use of an Apple iOS device and/or Android device for control. Functions to include arming, disarming and control of outputs and access door, viewing of connected IP cameras. This application shall connect directly to the IDS using internet, wifi or cellular communications and shall not require a third party server of network operations center (noc).
j. The IDS will allow integration with up to 16 Bosch IP video cameras using the built-in Ethernet connection, allowing the cameras to act as inputs and outputs.
k. The IDS shall support integration with the Bosch Video Management System (BVMS) using the built-in Ethernet adapter.
l. The IDS shall support up to thirty-two (32) custom functions allowing the installer to combine up to 6 functions into one command. These custom functions shall be operated by keypad command, point activation, keyfob button, or programmable schedule
m. The IDS shall support up to 32 keypad shortcuts which allow the installer to define which commands are available at each keypad.
n. The system shall offer multiple language support that can be assigned per keypad. Languages supported must include English, Latin American Spanish, Portuguese and/or Canadian French.
o. The IDS shall support flash firmware upgrades of systems firmware for the control panel and peripherals, allowing for future updates.
p. Integrated real time clock, calendar, test timer and programmable scheduling capability for relay control and automatic execution of system functions based on a time / event.
q. Provide 1.4 amps of power for standby operation and 2.0 amps of alarm power, both rated at 12 VDC.
r. 3 configurable form ‘C’ wet or dry-contact relay outputs with expansion capability for up to an additional 472 dry-contact relay outputs.
s. Integrated battery charger with reverse hook up protection, battery supervision and battery deep discharge protection.
t. Supervision of peripheral devices and communications interface(s).

B. Point Functionality and Expansion:

1. Each point in the system shall be programmable to provide the following type of response in the system:

a. Always on (24 hour response).
b. On when the system is Master Armed.
c. Only on when the system is Perimeter Armed.
d. Displays / Does Not Display at the ACC when the point is activated.
e. Provides / Does Not Provide entry warning tone.
f. Sounds / Does Not Sound audible alarm indication.
g. The Point is bypassable / not bypassable.
h. Alarm Verification with programmable verification time.

i. Relay activation by Point.
j. Provides / Does Not Provide "watch point" capability.
k. Provides Swinger Bypass.
l. Defers Bypass Report.
m. Can return to the system after being force armed and then restoring.
n. Can return to the system after being bypassed and then restoring.

2. The IDS shall be capable of supporting "group zoning." Group zoning refers to the combining of points into a separately identifiable and separately annunciated (programmable text) areas.
3. The IDS shall be capable of allowing variable point response times via programming. Point response times shall be programmable over a range of 300 milliseconds to 4.5 seconds.
4. The IDS shall have the capability to expand up to 246 separately identifiable points, of which 8 are on-board and 238 are off-board wired or wireless addressable points connected to multiplexed backbone trunks via wired modules and/or wireless receivers.

    a. The 8 on-board points shall be able to accommodate powered class B functionality using a powered loop interface module.
    b. Point Expansion Modules (Wired and Wireless) shall be able to be located remote to the main panel to a maximum distance of 1000 feet.

5. The IDS shall have the capability to expand up to 75 separately identifiable points, of which 8 are on-board and 67 are off-board addressable points connected to multiplexed backbone trunks via wired modules and/or wireless receivers.

    a. The 8 on-board points shall be able to accommodate powered class B functionality using a powered loop interface module.
    b. Point Expansion Modules (Wired and Wireless) shall be able to be located remote to the main panel to a maximum distance of 1000 feet.

6. Capability to expand up to 40 separately identifiable points, of which 8 are on-board and 32 are off-board addressable points connected to multiplexed backbone trunks via wired modules and/or wireless receivers.

    a. The 8 on-board points shall be able to accommodate powered class B functionality using a powered loop interface module.
    b. Point Expansion Modules (Wired and Wireless) shall be able to be located remote to the main panel to a maximum distance of 1000 feet.

7. Capability to expand up to 40 separately-identifiable points of which 8 are on-board points and 32 are off-board addressable points connected to point expansion modules and/or wireless receivers.
8. Capability to expand up to 24 separately-identifiable points of which 8 are on-board points and 16 are off-board addressable points connected to point expansion modules and/or wireless receivers.

C. Areas/Accounts:

1. The IDS shall support 32 independent areas. Each of the 32 areas shall have custom text associated with the armed state, disarmed state and point-off-normal state.
2. The IDS shall be capable of assigning 1 to 4 account identifiers to the areas depending on the distribution of areas per account.

3. The IDS shall be capable of assigning 1 to 2 account identifiers to the areas depending on the distribution of areas per account.
4. All of the areas must be capable of Master (All) and/or Perimeter (Part) arming (excluding predefined Interior protection).
5. The IDS shall be capable of logically grouping 1 or more points into an area, or conversely, dividing 2 or more points into two or more areas.
6. Any area shall be configurable to allow arming by specific users when a programmable number of devices are faulted or bypassed.
7. Areas shall be independently controlled by their corresponding ACC.
8. Area(s) shall accommodate assignment of independent account numbers to define annunciation, control, and reporting functions.
9. The IDS shall be capable of linking multiple areas to a shared area which may be automatically controlled (hallway or lobby).
10. The IDS shall accommodate conditional area arming dependent on the state of other areas (master or associate). Any area can be configured for perimeter and interior arming, not requiring a separate area for this function.

D. Output Relay Expansion: The IDS shall provide the capability for output relay expansion using relay expansion modules. Independent control of relay functions by area shall be possible through programming assignments.

1. The IDS shall be capable of activating 472 additional relay outputs for auxiliary functions based on its classifications (area vs. panel wide). Output Expansion Modules shall be able to be located remote to the main panel to a maximum distance of 1000 feet. 8 relays (Form C) are to be provided per octo-relay module.
2. The IDS shall be capable of activating 64 additional relay outputs for auxiliary functions based on its classifications (area vs. panel wide). Output Expansion Modules shall be able to be located remote to the main panel to a maximum distance of 1000 feet. 8 relays (Form C) are to be provided per octo-relay module.
3. The IDS shall be capable of controlling relays and automatically executing system functions based on a time / event scheduling program. The program can be hour, day of week or day of month based.
4. Relays and other outputs may be programmed to follow up to 14 different area conditions or up to 12 panel conditions. Relays may also be programmed to follow individual points or groups of points.
5. The IDS shall support 5 different types of alarm output selections: Steady, Pulsed, California Standard, Temporal Code 3 and Temporal Code 4.

E. Scheduling: The IDS shall support scheduling capabilities with the following characteristics:

1. Arm / Disarm specific area(s) based on open/close windows.
2. Bypass / Unbypass point(s).
3. Activate / Deactivate relay(s).
4. Send test reports.
5. Up to 4 programmable holiday schedules of 366 days each (includes leap year). Based on the holiday settings, different time windows for open/close and other system functions can be executed.
6. Automatic adjustment of system clock for daylight savings time.

F. Alarm Keypads:

1. The IDS shall accommodate connection with up to 32 ACCs, each capable of displaying custom English, Latin American Spanish, Portuguese or Canadian French text on a liquid crystal display.
2. The Alarm Keypads shall accommodate viewing and configuration of system parameters including:

    a. Network Parameters:

        (1) DHCP Enable/Disable for the selected network module.
        (2) UPnP Enable/Disable for the selected network module.
        (3) IP Address for the selected network module
        (4) Subnet Mask for the selected network module.
        (5) Default Gateway for the selected network module.
        (6) Port Number for the selected network module - The module's port number shall range from 0 to 65,535.
        (7) DNS Server Address for the selected module's DNS server IP address
        (8) DNS Host Name for the selected module. The DNS host name shall contain up to 63 characters.
        (9) AES Encryption Key Size – Enable/Disable encryption by selecting the AES encryption key size for the selected network module.
        (10) AES Encryption Key String - The user shall be able to display, add and modify the AES encryption string based upon the key size previously configured for the selected network module.

    b. Point Parameters:

        (1) Point Selection between one and the maximum number of points in the control panel.
        (2) Point Registration to allow system response from a specific physical point on any one of the expansion modules; On-board or Point expansion modules (wired or wireless)
        (3) Wireless points shall be able to be enrolled in the system via an auto enrollment feature.

    c. Event Routing Parameters to allow programming of up to 4 report routing groups as well as configuration of primary and secondary paths.

G. User Passcodes and Authority: Passcodes shall be programmable with authority levels to allow users to operate any or all areas.

1. Up to 2000 different passcodes shall be accommodated.
2. Each passcode shall be 3 to 6 digits (variable) and be assigned a 32-character user name.
3. User access to System features and functions shall be configurable based on 14 individually programmable levels of authority assigned to the user passcode. Additionally, the system shall have the capability to assign to the user passcode, a different authority level in each of the areas. A service passcode can be assigned to the servicing agent allowing the agent limited access to system functions. User-programmable / activated functions include:

    a. Arming the system: All areas, specific area(s) only, perimeter instant, perimeter delayed, perimeter partial, watch mode, and arming the system with a duress passcode.

b. Disarming the system: All areas, specific area(s) only and disarming with a duress passcode.
c. Viewing system status: Faulted points, event memory, bypassed points, area status and point status.
d. Implementation functions: Bypass a point, unbypass a point, reset sensors, silence bell, activating relays, initiating the remote programming function locally to allow programming the system from a remote location.
e. Testing the system: Local Walk test, Service Walk test, Fire test, send report to remote IDS controllers to check the telephone link, and programming the time and date for the next test report transmission.
f. Change system parameters: ACC display brightness, system time and date, and add/delete/change passcodes.
g. Extend the closing time of the system.
h. Transmitting special alerts and activating audible and visible signals.
i. Executing multiple commands / ACC keystrokes from a single Menu / Command List item. This function shall be able to have a 32 character (alphanumeric) title to identify it on the ACC display.
j. Editing of time / event based scheduling program from the ACC.
k. The IDS shall also provide a "service menu" to implement functions such as viewing and printing the system log, displaying the system firmware revision number, and defaulting (toggling) text displays between custom and default text displays for troubleshooting.

4. The IDS shall allow users to change their own user passcode from the Alarm Keypad (ACC). Managers shall be capable of changing the user passcodes and authority assignments by area of other users from the ACC.
5. The IDS shall incorporate a programmable "Passcode Follows Scope" feature to allow users to arm or disarm only the area they are entering with one simple command or control all areas from one ACC.

H. Communication: The IDS shall be capable of reporting system events and supervisory reports including alarm, trouble, missing modules, restorals, system status, AC failure, battery status to primary and secondary off-site remote IDS controllers. The following features shall be supported.

1. The IDS shall be capable of communicating via dial-up analog telephone lines, over a LAN/WAN/Internet using a wired network interface module, or over a cellular network using a CDMA Cellular interface module.
2. The Bosch Modem4 communications format shall be utilized for optimum system performance. The Modem4 format provides the maximum data information to the receiver for alarms, troubles, restorals, bypasses, relay activation, opening/closings, and card access. The detailed information includes the point numbers with text, peripheral device numbers, user numbers with text, and area information. As an alternative format, Contact ID may be used although it will include less detailed information like point or user text.
3. The IDS shall be capable of sending text (SMS) messages to compatible devices without requiring that these message are sent to a monitoring center.
4. The IDS shall have the capability of communicating with up to 8 different remote IDS controllers using up to 4 different phone numbers, up to 24-digits in length and/or 4 URL/IP addresses over a network.
5. The IDS shall report to a Commercial Central Station that is using a Bosch D6600 Receiver/Gateway or a Bosch D6100i Receiver using Modem4 as a preferred format or Contact ID as an alternate format.
6. The remote IDS controllers shall provide the transmission information sent from the IDS that includes alarms, troubles, restorals, bypasses, relay activation, opening/closings, and card access. When using the ModemIIIa² format the

detailed information includes the point numbers with text, peripheral device numbers, user numbers with text, and area information.

7. The IDS reports shall be classified, by event, into eleven subcategories or "report groups." Each group represents similar types of events. Individual events within each group shall be selectively enabled or disabled for transmission. The eleven report groups shall be as follows:

    a. Fire Reports.
    b. Burglar Reports.
    c. User Reports.
    d. Test Reports.
    e. Diagnostic Reports.
    f. Relay Reports.
    g. Auto Function Reports.
    h. RPS Reports.
    i. Point Reports.
    j. User Change Reports.
    k. Access Reports.

8. The IDS shall have the capability to verify the integrity of the remote communications path and switch to alternate paths when a communications failure occurs.
9. The IDS shall be capable of unattended mode of operation whereby programming and configuration updates are automatically transferred using the Remote Programming Software (RPS). These updates can initiate from either the control panel or the remote computer using RPS.

I. Network Communication: The IDS shall be capable of network communications over a LAN, WAN, Intranet, or the Internet. The system shall include supervision of the network communication utilizing configurable periodic heartbeats to the Digital Alarm Communications Receiver (remote IDS controllers). The remote IDS controllers shall provide notification of the loss of communications from a networked system after a programmable timeframe since the last communication. The notification options shall be programmable and include local annunciation or indication to automation software.

1. The network interface module shall be capable of supporting Dynamic Host Communication Protocol (DHCP) to obtain an IP Address.
2. The system shall support a method of authentication between the control panel and the receiver to ensure that the control panel has not been compromised or replaced.
3. The network interface modules shall be capable of supporting encryption using a minimum of 256-bit AES Encryption (Rijndael) certified by NIST (National Institute of Standards and Technology) utilizing the Cipher Block Chaining (CBC) method.
4. The network interface module shall support a 10/100BaseT connection to an Ethernet network.
5. The control panel shall be capable of network communication with a programmable poll time to send periodic heartbeats to the receiver, programmable ACK Wait time, and programmable retry time. In the situation where a communication path is unsuccessful, the control panel shall be capable of attempting backup communication through an available communication method to the same receiver or a backup receiver.

    a. The control panel shall have the ability to automatically adjust the heartbeat rate of a backup path that is using cellular to the heartbeat rate of the primary path in case of a primary path failure. Upon restoral of the

primary path, the heartbeat rate of the backup path shall automatically restore to the original rate. This allows a system utilizing cellular communications to keep the wireless charges low.

b. The network communication between the control panel and the receiver shall use Modem4 or Contact ID.
c. The control panel shall be capable of two-way communication using a wired network interface module with a 10/100BaseT on a LAN/WAN/Internet configuration or with a cellular module on the Internet.
d. The control panel shall be capable of configuring the destination of the receiver using a URL or static IP Address.
e. The control panel shall be capable of using DNS to lookup the IP Address of the receiver when programmed with a URL.
f. The control panel shall support UPnP for automated Port Forward configuration in the router where the control panel is installed.
g. The control panel shall support AutoIP to enable the RPS software to connect to the control panel locally using an IP Direct connection.
h. The control panel shall support configuration of the IP parameters from the keypad eliminating the need for a PC to configure the IP device.
i. The control panel shall support network diagnostics from a keypad to allow local testing of network connectivity. The diagnostics should include, Ethernet cable connected, gateway configuration ok, DNS lookup operational, and external network connectivity (such as the Internet) operational.
j. The system shall be capable of meeting DCID 6/9 and UL 2050 standards.

J. Event Log: The IDS shall maintain a log of events indicating time, day, month, year type of event, account number, area number, user ID, point text, user text and primary/secondary event route. The system shall allow the following characteristics:

1. The IDS shall be capable of storing up to 10,000 events
2. The IDS shall support viewing of logs locally at the ACC and remotely via an upload to a remote central station computer running the RPS software.
3. The IDS shall provide notification via a report to the remote IDS controllers when the event log reaches a programmable “percent full capacity". This allows retrieval of stored events via RPS to prevent any loss of event history.
4. Group, signal type and area can route events to specific receivers.
5. Each remote IDS controllers shall be designated as a primary, backup, or duplicate destination for each report group. Assigning an event to multiple routing groups provides for duplicate destinations for the event. The transmission of grouped events allows the reporting of different types of information to different remote IDS controllers.

K. Testing, Diagnostic, and Programming Facilities: The IDS shall be capable of sending (manually or automatically) test and status reports to remote IDS controllers.

1. The IDS shall be capable of sending automatic tests daily, weekly or once every 28 days. Automatic test times shall be programmable to provide an offset of up to 24 hours from the current time.
2. Automatic test reports shall be programmable to be deferred by one test interval if any other report is transmitted in the current interval.
3. Automatic test reports and remote system access for diagnostics shall be supported via a remote central station computer with Remote Programming Software (RPS).

4. The IDS shall be programmable locally or remotely. Programming shall be accomplished via a Keypad or a computer with a remote programmer and diagnostic software package (RPS).
5. The IDS shall allow an on-site user to initiate remote programming while on-line with the servicing location. The remote programming device must provide a compare feature and allow for downloading either the stored program or the (un)modified program copied from the panel.
6. The IDS shall allow the local programming option to be disabled and must provide a method to program a panel while no one is on premises, when the panel shares a line with an answering machine.
7. The IDS shall accommodate IP Diagnostic to verify settings and operation of the network interface modules; Host name, MAC address, IPV4 address assignment. The IP Connection test shall include; Link test to verify physical cable integrity, Ping test to verify gateway response, ping test to verify address on the internet.
8. Wireless point diagnostics shall include signal strength and device states of registered wireless points in the system.
9. The number of system testing and programming sessions shall be restricted via the use of program locking features and passwords. Passcode protection in excess of sixteen million combinations is required.
10. New modules support enhanced diagnostics through RPS.

L. Miscellaneous Features: Programmable alarm output timer, 4 programmable entry delay times, exit delay programmable by area, individually programmable point of protection text, point bypassing, key switch arming capability with LED outputs, and fire verification.

M. Area Re-Arm: The System shall support programmable area re-arm time of 1 minute to 24 hour.

N. User-Programmable Features: The IDS shall provide a menu driven interface to provide a user-friendly command structure for programming / customizing the system to the operational criteria of the application. The IDS shall be capable of being operated via:

1. The Command Structure.
2. Menu / Command List.

2.3 SYSTEM INTERFACE REQUIREMENTS

A. Grounding: The Contractor shall properly earth ground the IDS to prevent electrostatic charges and other transient electrical surges from damaging the IDS panel.

B. Primary power: The Contractor shall provide a dedicated 120 VAC power circuit to the IDS system. This circuit shall be connected to the emergency power system. The 120 VAC is stepped down to power the IDS panel using a class two, plug-in transformer. This power circuit shall be properly rated to continuously power all points and functions indefinitely in full alarm condition.

C. Primary power supervision: When the primary power source fails, the system can be configured to report an "AC Fail" message to a commercial central station.

1. The message can also be programmed to "tag-along" with another message transmitted to the central station.
2. The system will always display a loss of primary power on the ACC and may be configured to provide additional audible warning.
3. The transmission delay of this message is programmable from 5 seconds to 86 minutes with an optional 6 to 12 hour transmission delay.

D. Secondary power (standby battery): The Contractor shall provide adequate battery power as defined by the relevant application criteria, (UL 864 and UL 985 for alarm installations or NFPA 72 chapters for fire applications). Appropriate battery chargers shall be provided consistent with the battery back-up capacity. The most current accepted version of NFPA 72 and any applicable local codes or AHJ requirements must be met accordingly.

E. Secondary power supervision: When the secondary power source experiences a 85 percent depletion of its standby capacity, the system can be configured to report a "Low Battery" message to a commercial central station. The system will always display a low battery condition on the ACC and may be configured to provide additional audible warning.

F. Cellular telephone interface: The control panel in the IDS shall be equipped with a cellular dialer for dial out monitoring of alarms.

G. Ethernet Interface: The IDS may use an Ethernet interface module as the primary, or back-up means of communicating to a remote IDS controllers.

1. The telephone line interface shall conform with FCC rules (Title 47 C.F.R. part 68).

H. Cellular interface: The IDS may use a cellular radio module as the primary, or backup, means of communicating to a remote IDS controllers. Up to 4 IP Addresses shall be available for routing system events. The supervision time shall be programmable with a range of 5 to 65,535 seconds. The module shall accommodate 128 and 256-bit AES encryption using CBC (Cipher Block Chaining) mode.

I. Auxiliary function control interfaces: The IDS shall accommodate auxiliary functions such as activating bells, strobes, or lights and shall be accomplished using the optional application specific relay modules. These auxiliary interfaces shall be electrically isolated to avoid inter-system interferences or damage to the system.

J. Wiring: The contractor shall provide cables consistent with the manufacturer's recommendations. The following general guidelines shall be followed for wiring installation:

1. Wiring shall be appropriately color-coded with permanent wire markers. Copper conductors shall be used.
2. All signal cables provided under this contract shall be Class II, plenum-rated cable where required. Where subject to mechanical damage, wiring shall be enclosed in metal conduits or surface metallic raceway.
3. Data wires shall not be enclosed in conduit or raceways containing AC power wires.

K. Environmental Conditions: The IDS shall be designed to meet the following environmental conditions:

1. The system shall be designed for a storage temperature of -10° C to 70°C (14° F to 158°F).
2. The system shall be designed for an operating temperature of 0° C to 50°C (32° F to 120°F).
3. The system shall be designed for normal operation in an 85% relative humidity environment.
4. The system shall meet or exceed the requirements of FCC rules Title 47 C.F.R. Part 15, Class B devices, and Part 68, IEC EMC directive

2.4 ACCEPTABLE PRODUCTS

A. Intrusion Detection System Panel, Accessories and Field Devices. Provide quantity of field devices as shown on the drawings.

1. Intrusion Detection Control Panel & Components:

a. Control Panel: Bosch B9512G.
b. Verizon Compatible Cellular Dialer Card: Bosch B444-V2.
c. Universal Enclosure: Bosch B8103.
d. Lock and Key Set: Bosch D101.
e. Enclosure Tamper Switch: Bosch D110.
f. Transformer: Bosch D1640.
g. Power Supply: Bosch B520.
h. Battery Backup: Bosch D1218.
i. No Substitutions.

2. Addressable 8-Input Modules:

a. Bosch B208.
b. No Substitutions.

3. Addressable Polling Modules:

a. Bosch B299.
b. No Substitutions.

4. Addressable “POPIT” Modules:

a. Bosch D9127U.
b. No Substitutions.

5. Magnetic Door Position Contacts.

a. Monitored Doors: GE 1078.
b. Doors with Access Control: GE1076D.
c. No Substitutions.

6. PIR Motion Detectors:

a. Motion Detector: Bosch ISC-PPR1-WA16G.
b. Mounting Bracket: Bosch B328.
c. No Substitutions.

7. Touch Panel Keypads:

a. Bosch B942W.
b. No Substitutions.

8. Programming Software:

a. Bosch RPS-LITE.
b. No Substitutions.

9. 8-Output Relay Module.

a. Bosch B308.
b. No Substitutions.

B. Cabling:

1. Install riser rated (CMR) 18/4 cable from the security control panel to all devices.

a. Acceptable Manufacturers:

(1) Alpha Wire, Belden, CommScope, Tappan or WestPenn.
(2) Or approved equal.

2. Install OSP rated 18/4 cable suitable for underground duct installation from the main security control panel to all remote sub-panels.

a. Acceptable Manufacturers:

(1) Alpha Wire, Belden, CommScope, Tappan or WestPenn.
(2) Or approved equal.

PART 3 – EXECUTION

3.1 EXAMINATION OF SITE

A. The site shall be visited on a regular basis to appraise ongoing progress of other trades and contracts, make allowances for all ongoing work, and coordinate the requirements of this contract in a timely manner.

B. INTRUSION DETECTION CABLE ROUTING AND TERMINATION

1. Route all cable in conduit. No exposed cabling is permitted. Conduit from the field devices to be terminated on a 4” high x 4” deep x 30” wide wiring gutter mounted above the security equipment enclosure in the telecom room.
2. Installation of networking cabling to the main control panel shall follow the installation and testing requirements of the Division 27 specifications.
3. All conduit shall be routed concealed. Where this is not possible, notify the Architect and provide proposed routing of exposed conduit for approval. Paint exposed conduit to match existing surfaces.
4. Install access panels as necessary to provide reasonable access to security cable and junction boxes located above inaccessible ceilings.
5. Ten feet of cable slack shall be stored in the security cable above the security panel enclosure.
6. Cables shall be installed in continuous lengths from origin to destination (no splices).
7. The cable's minimum bend radius and maximum pulling tension shall not be exceeded. Refer to manufacturer’s requirements and reference documents.
8. Any cable damaged or exceeding recommended installation parameters during installation shall be replaced by the Contractor prior to final acceptance at no cost to the Owner.
9. Cables shall be labeled with self-adhesive labels. At the intrusion detection panels, each cable shall be clearly labeled on the cable jacket 1” from the termination location.
10. Terminate security cables with insulated crimp type lugs.

11. When installing conduit, the Contractor shall maintain the following minimum clearance from sources of electro-magnetic interference (EMI).
    a. 6” clear from power conductors.
    b. 12” clear from fluorescent lighting fixtures and ballasts.
    c. 36” clear from transformers and motors.

3.2 LABELING

A. Label all intrusion detection system components and devices. Labels shall be placed in a concealed location and shall identify the ID of the device.

B. Label all intrusion detection system enclosures, power supplies and relays.

C. Label all batteries with the date that the batteries were installed.

D. Label all cables at the intrusion detection panels. Affix labels a minimum of 1 inch from the point of termination. Labels shall be placed so that they are clearly visible. Labels shall identify the ID of the device.

E. Install engraved name plates on all equipment enclosures.

3.3 GROUNDING

A. Ground system components to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.

3.4 SYSTEM CONFIGURATION AND PROGRAMMING

A. Install, configure, program and test the intrusion detection system.

B. Meet with the Owner and determine the required operation, functionality, zoning and scheduling of the system. Program the system in accordance with the Owner’s requirements.

C. Program system configuration parameters (hardware and software, zone/circuit numbers, communication parameters).

D. Program operational parameters such as opening/closing reports and windows, system response text (custom English) displays of events, activation of relays that drive auxiliary devices, and identifying types of zones/loops.

E. Program passcodes according to the authorities and functions defined by the Owner.

3.5 TESTING AND COMMISSIONING

A. The Contractor shall demonstrate the functionality of the System upon completion of installation, documenting the result of all tests and providing these results to the Owner. The System shall be tested in accordance with the following:

1. The contractor shall perform 100% testing of the security intrusion detection devices. All deficiencies shall be corrected and the devices re-tested.
2. The Contractor shall conduct a complete inspection and test of all installed equipment. This includes testing and verifying connection to equipment of other Divisions.
3. The Contractor shall provide staff to test all devices and all operational features of the System for witness by the Owner’s representative and the Authority having

jurisdiction. The Contractor shall provide two-way radio communications to assist in the testing. All testing must be witnessed by the owner's representative, prior to acceptance.

4. The testing and certification shall take place as follows:
   a. System shall be tested in conjunction with the manufacturer's representative.
   b. All deficiencies noted in the above test shall be corrected.
   c. Test results shall be submitted to the consultant or owner's representative.
   d. System test witnessed by owner's representative and correction of any deficiencies noted.
   e. The owner's representative shall accept the System.
   f. System test shall be witnessed by the Authority having Jurisdiction, and any deficiencies that are noted shall be corrected.
5. A letter of certification shall be provided to indicate that the tests have been performed and all devices are operational.

3.6 SYSTEM TRAINING

A. Provide qty two (2) hours of training to the Owner's staff on the operation of the system at the completion of the project.

END OF SECTION 283000

SECTION 28 31 00 - FIRE DETECTION AND ALARM

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes fire alarm control panels, manual fire alarm stations, automatic smoke and heat detectors, fire alarm signaling appliances, and auxiliary fire alarm equipment and power and signal wire and cable.

B. Related Sections:
1. Section 08 71 00 - Door Hardware: Door closers, electric locks, electric releases.
2. Section 21 12 00 - Fire-Suppression Standpipes: Flow detection and alarm devices.
3. Section 21 13 13 - Wet-Pipe Sprinkler Systems: Flow detection and alarm devices.
4. Section 23 33 00 - Air Duct Accessories: Smoke dampers.
5. Section 25 50 00 - Integrated Automation Facility Controls.
6. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.
7. Section 26 05 26 - Grounding and Bonding for Electrical Systems.
8. Section 28 05 53 - Identification for Electronic Safety and Security.

1.2 REFERENCES

A. National Fire Protection Association:
1. NFPA 72 - National Fire Alarm Code.

1.3 SYSTEM DESCRIPTION

Division 28 31 00 is a performance specification. The Contractor shall include all labor and materials to design and complete the entire fire alarm work as herein specified and/or indicated.

The fire alarm system shall be a voice alarm communications system.

The Contractor is to serve as the complete system designer and installer. A complete fire alarm system shall be designed, furnished, and installed by the Contractor including locations, types, and quantities of all devices, monitoring devices, and equipment required. Contractor's design shall be based on all bid documents, including but not limited to Electrical, Telecom, Mechanical, Fire Sprinkler, Kitchen, Architectural, and Structural documents. Contractor shall provide all devices, modules, etc. for a complete operating system as required by all applicable Codes and AHJ requirements. Therefore, it is the Contractor's responsibility to include in the bid price the complete design and installation of all devices (whether shown or not), wiring, head-end equipment, etc. to meet the applicable code and AHJ requirements. The Fire Alarm System is indicated on the drawings and specifications in either criteria or schematic form only.

The Contractor shall refer to Telecom drawings for information regarding Code Red system integration and monitoring of all emergency communication/code red systems. Submit shop drawing indicating code red strobe device locations to Engineer of Record and Owner for review prior to installation.

A. Fire Alarm System: NFPA 72, addressable and automatic local fire alarm system with connections to central station.

B. Alarm Sequence of Operation: Actuation of initiating device causes the following system operations:
   1. Local fire alarm signaling devices sound and display with signal.
   2. Non-coded signal transmits to central station.
   3. Location of alarm zone indicates on fire alarm control panel and on remote annunciator panel.
   4. Signal transmits to building elevator control panel, initiating return to main floor or alternate floor and lockout for fire service.
   5. Signal transmits to building mechanical controls, shutting down fans and operating dampers.
   6. Signal transmits to release door hold-open devices.
   7. Signal releases magnetic door hold opens.
   8. Signal releases electric door locks.

C. Drill Sequence of Operation: Manual drill function causes alarm mode sequence of operation.

D. Trouble Sequence of Operation: System or circuit trouble causes the following system operations:
   1. Visual and audible trouble alarm indicates at fire alarm control panel.
   2. Visual and audible trouble alarm indicates at remote annunciator panel.
   3. Trouble signal transmits to central station.

1.4 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Shop Drawings: Indicate system wiring diagram showing each device and wiring connection; indicate annunciator layout, and design calculations. Provide separate shop drawing for review of Code Red amber strobe locations.

C. Product Data: Submit catalog data showing electrical characteristics and connection requirements.

D. Test Reports: Indicate procedures and results for specified field testing and inspection.

E. Manufacturer's Field Reports: Indicate activities on site, adverse findings, and recommendations.

F. Contractor shall submit to the AHJ. Include all associated costs, fees, drawings, cut sheets, calculations for a complete submittal in bid price.

G. Contractor shall submit copies of installing company licensure, and individuals responsible on project site responsible for installation of all fire alarm devices and cabling. All individuals on site shall be at a minimum, NICET II certified and State of Nevada ‘F-card’ holders.

1.5 CLOSEOUT SUBMITTALS

A. General Conditions: Closeout procedures.

B. Project Record Documents: After construction “as-built” drawings shall be provided to the WCSD Plant Facilities and Capital Projects & Planning Departments. “As-built” drawings shall be as specified in Part 1 of these Guidelines. No marked “jobsite copies” will be allowed. As-built drawings shall show all horn/strobes, heat and duct detectors, splitter points, pull stations, and their specific addresses. As-built shall also show floor to floor penetrations. In addition, door magnets (and their power source), burglar alarm devices, HVAC connections, dampers and

contractors shall be shown. All other devices both electrical and mechanical not previously designated that are tied to Fire Alarm Panels or are a part of the Fire System Operation shall be shown.

C. Operation and Maintenance Data: Submit manufacturer's standard operating and maintenance instructions.

1.6 QUALITY ASSURANCE

A. Provide wiring materials located in plenums with peak optical density not greater than 0.5, average optical density not greater than 0.15, and flame spread not greater than 5 feet (1.5 m) when tested in accordance with NFPA 262.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience, and with service facilities within 100 miles of project.

B. Installer: Certified fire alarm installer with service facilities within 100 miles of Project.

C. Design fire alarm under direct supervision of Professional Engineer or NICET II certification experienced in design of this Work and licensed in State of NV.

1.8 MAINTENANCE SERVICE

A. General Conditions: Maintenance service.

B. Furnish service and maintenance of fire alarm equipment for one year from Date of Substantial Completion.

1.9 MAINTENANCE MATERIALS

A. General Conditions: Spare parts and maintenance products.

B. Furnish five manual station break-glass rods.

C. Furnish two keys of each type.

1.10 EXTRA MATERIALS

A. General Conditions: Spare parts and maintenance products.

B. Furnish one of each type of automatic smoke detector without base.

PART 2 - PRODUCTS

2.1 CONTROL PANEL

A. Manufacturers – per WCSD Standards:
1. GE EST-4, no exceptions.

B. Product Description: Modular addressable fire alarm control panel with flush surface wall-mounted enclosure.

C. Power supply: Adequate to serve control panel modules, remote detectors, remote annunciators, smoke dampers, relays, and alarm signaling devices. Include battery-operated emergency power supply with capacity for operating system in standby mode for 24 hours followed by alarm mode for 15 minutes.

D. System Supervision: Component or power supply failure places system in trouble mode.

E. Initiating Device Circuits: Supervised zone module with alarm and trouble indication; occurrence of single ground or open condition place's circuit in trouble mode.

F. Indicating Appliance Circuits: Supervised signal module, sufficient for signal devices connected to system; occurrence of single ground or open condition places circuit in trouble mode.

G. Remote Station Signal Transmitter: Electrically supervised digital alarm communicator transmitter, capable of transmitting alarm and trouble signals over telephone lines to central station receiver. Provide and install cellular dialer communicator listed for fire alarm panel monitoring. Locate equipment and antenna as required for optimal cell signal reception on premises.

H. Auxiliary Relays: Sufficient SPDT auxiliary relay contacts to provide accessory functions specified.

2.2 MANUAL FIRE ALARM STATIONS

A. Product Description: Manual double-action station with break-glass rod. Manual Pull Stations shall be constructed of metal and double-action (not break-glass type). Provide with STI Stopper® II with Horn or equivalent (clear, tamperproof polycarbonate cover with sounder) unless noted otherwise on plans.

B. Mounting: Semi-Flush.

C. Type: Coded.

D. Backbox: Manufacturer's standard.

2.3 SPOT HEAT DETECTOR

A. Product Description: Addressable combination rate-of-rise and fixed temperature, spot heat detector.

B. Temperature Rating: 135 degrees F (57 degrees C).

C. Rate-of-Rise: 15 degrees F (8.3 degrees C).

2.4 CEILING SMOKE DETECTOR

A. Product Description: NFPA 72, addressable photoelectric type ceiling smoke detector with the following features:
1. Adjustable sensitivity.
2. Plug-in base.
3. Auxiliary relay contact.
4. Integral thermal element rated 135 degrees F (57 degrees C).
5. Visual indication of detector actuation.

B. Mounting: 4 inch (102 mm) outlet box.

C. Furnish two-wire detector with common power supply and signal circuits.

2.5 DUCT-MOUNTED SMOKE DETECTOR

A. Product Description: NFPA 72, addressable with the following features:
1. Auxiliary SPDT relay contact.
2. Key-operated normal-reset-test switch.
3. Duct sampling tubes extending width of duct.
4. Visual indication of detector actuation.
5. Duct-mounted housing.

B. Furnish two-wire detector with common power supply and signal circuits.

C. See mechanical plans for additional information.

2.6 ALARM STROBE

A. Provide low profile wall mounted. Low profile strobes shall mount in a North American 1-gang box, and protrude less than 1” from the finished wall. The word FIRE shall be prominently displayed on the housing. All devices shall be WHITE with RED lettering (confirm with architect).

B. The strobes shall be EDWARDS Genesis G1 Series.

2.7 REMOTE ANNUNCIATOR

A. Product Description: Remote annunciator including audible and visual indication of fire alarm by zone, and audible and visual indication of system trouble. Provide microphone for system input where shown, all other annunciators shall be LCD display only.

B. Mounting: Semi-flush mounting in factory provided backbox with lockable door and viewing window.

2.8 DOOR RELEASE

A. Product Description: See architectural hardware specifications. Provide all required connections/wiring, relays, modules, and transformers as required.

2.9 WIRE AND CABLE

A. Cable located in Plenums: Power limited fire-protective signaling cable classified for fire and smoke characteristics, copper conductor, 300 volts insulation rated 105 degrees C, suitable for use in air handling ducts, hollow spaces used as ducts, and plenums.

B. All fire alarm conductors routed underground shall be wet location rated.

C. Fire alarm circuit conductors have insulation color or code as follows:
1. Power Branch Circuit Conductors: Black, red, white.
2. Initiating Device Circuit: Black, red.
3. Detector Power Supply: Violet, brown.
4. Signal Device Circuit: Blue (positive), white (negative).
5. Door Release: Gray, gray.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Coordination and project conditions.

B. Verify products and systems receiving devices are ready for installation.

3.2 INSTALLATION

A. Install manual station with operating handle 48 inches above floor.

B. Install audible and visual signal devices 80 inches above floor to bottom of device.

C. Install 14 AWG minimum size conductors for fire alarm detection and signal circuit conductors in conduit.

D. Mount end-of-line device box with last device or separate box adjacent to last device in circuit.

E. Mount outlet box for electric door holder to withstand pulling force of specified door holder.

F. Connect conduit and wire to door release devices, sprinkler flow switches, sprinkler valve tamper switches, fire suppression system control panels, and duct smoke detectors.

G. Automatic Detector Installation: Conform to NFPA 72.

H. Install engraved plastic nameplates in accordance with Specifications.

I. Ground and bond fire alarm equipment and circuits in accordance with Section 26 05 26.

J. Fire Alarm Junction Boxes shall be painted RED with labeling indicating circuiting inside junction box, such as “FIRE ALARM – STROBE - BPS 2 CIRCUIT 1”.

K. Addressable devices shall be provided with labels indicating device address. Relays, control modules, monitor modules or other devices of similar type shall be labeled with their function and address, such as “HP-19 SHUTDOWN RELAY”.

L. All devices subject to physical damage where installed shall be provided with a manufacturer’s protective device cage.

3.3 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Test in accordance with NFPA 72 and local fire department requirements.

3.4 MANUFACTURER'S FIELD SERVICES

A. General Conditions: Manufacturer’s field services.

B. Include services of certified technician to supervise installation, adjustments, final connections, and system testing.

3.5 DEMONSTRATION AND TRAINING

A. Furnish 4 hours of instruction each for two persons, to be conducted at project site with manufacturer's representative.

END OF SECTION 28 31 00

SECTION 311000 – SITE CLEARING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 SUMMARY

A. The project requirements for Site Clearing shall be those specified in Section 300, Clearing and Grubbing and Section 301, Removal of Existing Improvements, of the Standard Specifications for Public Works Construction, Latest Edition, the requirements stated herein and the requirements shown on the contract documents.

PART 2 - PRODUCTS (NOT APPLICABLE)

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. The project requirements for Site Clearing shall be those specified in Section 300, Clearing and Grubbing and Section 301, Removal of Existing Improvements, of the Standard Specifications for Public Works Construction, Latest Edition.

END OF SECTION 311000

SECTION 312000 - EARTH MOVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

D. SUMMARY

E. The project requirements for Rough Grading and Site Earthwork shall be those specified in Sections.

1. 302 – Subgrade Preparation
2. 303 – Unclassified Excavation
3. 304 – Unclassified Fill
4. 305 – Trench Excavation and Backfill

of the Standard Specifications for Public Works Construction, Latest Edition, contract documents and the Geotechnical Investigation Report, Geotechnical Evaluation Echo Loder Elementary School, dated November 25, 2024, prepared by Geotechnical & Environmental Services, Incorporated.

, the requirements stated herein and the requirements shown on the contract documents.

1.2 SUBMITTALS

A. Test Reports: Testing laboratory will submit the following reports directly to the architect and shall copy the contractor:

1. Analysis of soil materials, whether procured on or off site, and including fill, backfill, and barrow materials.
2. Verification of each footing subgrade.
3. Comprehensive strength or bearing test reports.

1.3 QUALITY ASSURANCE

A. Testing Laboratory Services: The owner will secure and pay for the services of a geotechnical engineer to classify existing soil materials, to recommend and to classify proposed borrow materials when necessary, to verify compliance of materials with specified requirements, and to perform required field and laboratory testing.

1.4 SITE CONDITIONS

A. Traffic: Do not interfere with or close public ways without permission of governing authorities. Do not interfere with adjacent private facilities.

B. Site Utilities:

1. Advise utility companies of excavation activities before starting excavations. Locate and identify underground utilities passing through work area before starting work
2. Protect existing utilities indicated to remain.
3. Do not interrupt existing utilities without advance notice to and written approval from the owner.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Where sufficient approved materials are not available from required excavations on site, obtain and pay for materials from approved sources off site without charge to the owner.

B. Before each soil material proposed for use as fill or backfill, whether obtained on or off site, testing laboratory shall classify soil material, develop Proctor curve, and perform any other tests required.

C. Obtain approval of the architect for each soil material.

D. Backfill and Fill Materials: Materials classified as satisfactory.

E. Satisfactory Soils: Those complying with Geotechnical Inspection Requirements.

F. Unsatisfactory Soils: Those not complying with Geotechnical Inspection Requirements.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protection: Provide markers indicating limits of work and clear identification of items and areas requiring protection.

B. Provide barricades, warning signs, and warning lights around open excavations as necessary to prevent injury to persons.

C. The contractor is solely responsible for determining the potential for injury to persons and damage to property.

1. Where such potential is present, take appropriate protective measures. Protect persons from injury and protect existing and new improvements from damage caused directly or indirectly by construction operations.

3.2 EROSION CONTROL

A. To the maximum extent practicable, prevent erosion or displacement of soils and discharge of soil-bearing water runoff to adjacent properties and waterways.

B. Provide erosion control during the entire project in accordance with applicable regulations.

C. The contractor shall file a Notice of Intent with the Nevada Department of Environmental Protection and provide the required Storm Water Pollution Prevention Plan.

3.3 PROTECTION OF TREES

A. Provide temporary guards to protect trees and vegetation to remain. Place guards so as to prevent all forms of vehicular traffic or parking within drip lines.

1. Do not allow excess foot traffic within drip lines.
2. Do not stockpile construction materials, soil, or aggregates within drip lines.
3. Water trees and other vegetation to remain within limits of the area of construction activities as required maintaining their health during course of construction operations.

3.4 DEWATERING

A. Do not allow surface or ground water to flow into or accumulate in excavations.

B. Do not allow water to flow in an uncontrolled fashion across the project site or to erode slopes or to undermine foundations. Do not allow water to be diverted onto adjacent properties. Arrange excavation operations so as to provide continual and effective drainage of excavations.

C. Provide and maintain temporary diversion ditches, dikes, and grading as necessary; do not use trench excavations for this purpose. When required by surface or subsurface water conditions, provide sumps, well points, french drains, pumps, and other control measures necessary to keep excavations free of water. When existence of ground water near or above final excavation level is indicated or suspected, provide control measures prior to excavating to water level and maintain water level continuously below working level.

3.5 EXCAVATION

A. Explosives: Do not use explosives.

B. General: Excavation includes the removal of any materials necessary to achieve the required subgrade elevations and includes re-use or disposal of such materials.

1. Excavation will not be classified for payment purposes to distinguish between earth, rock, obstructions, or other materials.

C. Unnecessary Excavation: The expense of excavation of materials outside of limits indicated or ordered in writing by the architect and the correction thereof to the satisfaction of the architects shall be borne by the contractor.

1. Unnecessary excavation under footings: Either deepen footings to bear on actual subgrade elevation without changing top elevations or place concrete fill up to required elevation, as required by the architect.
2. Unnecessary excavation other than under footings: Either place compacted fill or otherwise correct conditions, as required by the architect.

D. Approval of Subgrade: Notify the architect when required elevations have been reached.

1. When required by the architect due to the unforeseen presence of unsatisfactory materials or other factors, perform additional excavation and replace with approved compacted fill material in accordance with the architect’s instructions.

2. Payment for unforeseen additional work will be made in accordance with provisions for changes in the work. No payment will be made for correction of subgrades improperly protected against damage from freeze-thaw or accumulation of water, or for correction of otherwise defective subgrades.

E. Excavation for Pavements: Excavate, shape, and compact to the lines, subgrade elevations, and cross sections indicated.

3.6 STORAGE

A. Stockpile materials to be used for filling and backfilling, including excavated materials classified as satisfactory soil materials, at locations indicated or as directed. Stockpile in a manner to freely drain surface water: cover if necessary to prevent wind-blown dust.

1. Store soil materials without intermixing. Protect from contamination with other soils or debris.
2. Do not stockpile materials inside of drip line of trees to remain.

3.7 BACKFILLING

A. Installation: Place approved soil materials in layers to required elevations.

1. Do not place material on muddy or frozen surfaces or on surfaces containing frost.

B. Installation: Place satisfactory soils materials in layers to required subgrade elevations.

3.8 FILLING

A. Preparation: Verify that area has been stripped of vegetation including roots below grade. Remove and dispose of any unsatisfactory soils.

1. When filling slopes steeper than 1 in 4 rise, plow, step, or break up surfaces to promote bond of new to existing material.
2. Should density of subgrade to receive fill be less than specified for fill, break up and pulverize subgrade to a depth of at least 6 inches, moisture condition if necessary, and recompact to required density at optimum moisture content.

3.9 Pavement and Building Subbase Course Placement

A. Place lifts such that compaction true to grade and level is accomplished with a minimum of surface disturbance and segregation of degradation of materials. Maintain grade control and cross section by means of line and grade stakes. Maintain moisture content within prescribed limits during placing and compacting.

B. When the total thickness of subbase is less than the maximum lift thickness permitted, place material in a single lift. When the total thickness of subbase is greater than the maximum lift thickness permitted, place materials in two or more lifts of uniform thickness with no lift less than 3 inches in thickness.

C. Place materials along the edges of the subbase course so as to maintain compaction of the subbase course. Construct at least a foot width of shoulder simultaneously with each lift of the subbase course.

D. Cut any overbuild to grade. Should top elevation be lower that allowable tolerances, scarify to a depth of 3 inches, add new material, and recompact to bring to grade within required tolerances.

3.10 COMPACTION

A. Place materials used in backfilling and filling in layers not exceeding loose depths as follows:

1. Heavy equipment compaction: 8 inches.
2. Hand-operated tampers: 4 inches.

B. Place material simultaneously on opposite sides of walls, small structures, utility lines, etc. to avoid displacement or overstressing.

C. In-Place Density Requirements: Compact soil to not less than the values given within the soils report prepared by Black Eagle Consulting, expressed as a percentage of maximum density at optimum moisture content.

D. Moisture Control: During compaction, control moisture of subgrades and subsequent lifts to within tolerances from optimum moisture content as recommended by testing laboratory. Wet surface with water when additional moisture is required. Aerate soil to aid in drying or replace soil when excessive moisture is present.

3.11 GRADING

A. General: smooth grade to a uniform surface that complies with compaction requirements and required lines, grades, and cross sections and is free from irregular surface changes.

B. Provide smooth transition between existing adjacent grades and changed grades. Cut out soft spots, fill low spots, and cut down high spots to conform to required surface tolerances.

C. Slope grades to direct water away from structures and to prevent ponding. Finish subgrade to required elevations within the following tolerance:

1. Paved areas: Plus or minus 0.05 foot.
2. Exterior steps and ramps: Plus or minus 0.05 foot.

3.12 PROOFROLLING

A. After completion of required compaction and immediately prior to proceeding with subsequent construction, proofroll in the presence of testing laboratory representative.

B. Proofroll using a heavy pneumatic-tired vehicle having four tires abreast, each tire loaded to 30,000 pounds and tire inflated to 150 psi. Provide 30 coverage's of the area to be proofrolled, one coverage being defined as the application of one tire print over the entire area. Maintain optimum moisture content during proofrolling. In areas which show pumping or which are otherwise unsatisfactory, undercut fill material and replace with compacted fill, or stabilize in place, as required by the architect.

C. Proofroll areas to receive:

1. Pavement.
2. Building slabs on grade.

3.13 FIELD QUALITY CONTROL

A. Testing Laboratory Services: Provide timely notice to testing laboratory, Do not proceed with construction until testing of each subgrade and lift of fill or backfill has been performed and required inspections and approvals have been obtained.

B. Maximum Density at Optimum Moisture Content: Determine in accordance with ASTM D-1557 (Modified Proctor).

C. In-Place Density Tests: ASTM D-1556 (sand cone method), ASTM D-2167 (rubber balloon method), or ASTM D-2922 (nuclear method), as applicable.

D. If testing service reports indicate that subgrade or fills are below specified density, scarify or remove and replace to the required depth, recompact, and retest at no cost to the owner.

3.14 MAINTENANCE

A. Completed Areas: Protect from damage by pedestrian or vehicular traffic, freezing, erosion, and contamination with foreign materials.

1. Repair and re-establish grades to specified tolerances in settled, eroded, or rutted areas.

B. Damaged Areas: Where completed or partially competed surfaces become eroded, rutted, settled, or lose compaction and whether due to subsequent construction operations or weather conditions, restore materials to required conditions: Scarify or remove and replace to the required depth, return to optimum moisture content, and compact materials to the required density before continuing construction.

C. Correction: Should settling occur within the project correction period, remove finished surfacing, add additional approved material, compact material, and reconstruct surfacing. Construct surfacing to match and blend in with adjacent surfacing as nearly as practicable.

3.15 DISPOSAL OF EXCESS WASTE AND MATERIALS

A. Remove any material not required for use on the project (including organic strippings, trash, and debris) and legally dispose of it off the owner’s property.

END OF SECTION 312000

SECTION 31 22 01 - STRUCTURAL EARTHWORK

PART 1 - GENERAL

1.1 DESCRIPTION

A. This Section is intended to apply to portions of the Work which are directly below or adjacent to the building structure. Provide all site stripping, excavation, fill, backfill, and grading, as specified therein, and as noted on or required by the Structural Drawings.

B. The geotechnical requirements noted herein are minimums. Where differences between these requirements and those specified in the Geotechnical Investigation occur, the more stringent requirement shall govern.

1.2 QUALITY ASSURANCE

A. Geotechnical Engineer: The Owner will retain and pay the expenses of a Geotechnical Engineer for performing testing, Special Inspection, material approval, soils verification, observation, and other functions as specified in the Contract Documents. The Geotechnical Engineer shall communicate only with the Owner and the Architect, and with the Contractor as directed by the Architect. The Architect shall relay any appropriate instructions to the Contractor within the provisions of the Contract Documents.

B. Testing Agency: Local testing laboratory with a minimum of three years experience in testing soil materials. All reports prepared by the Testing Agency shall be signed by a Professional Engineer registered to practice as a Civil Engineer in the state of Nevada.

C. Testing Laboratory shall have the same required qualifications as the Testing Agency but shall be retained by the Owner. Testing laboratory will make field tests as directed of the "in place" materials to assure conformance with Contract Documents.

D. Source Quality Control: Prior to delivery to site, the Testing Agency shall test all imported soil material for conformance with Contract Documents. Also, on-site fill materials shall be approved by the Geotechnical Engineer prior to placing.

E. Use adequate numbers of skilled workmen who are thoroughly trained and experienced in the necessary crafts and who are completely familiar with the specified requirements and the methods needed for proper performance of the Work of this Section.

F. Use equipment adequate in size, capacity, and numbers to accomplish the Work of this Section in a timely manner.

G. In addition to complying with the requirements of governmental agencies having jurisdiction, comply with the directions of the Geotechnical Engineer, as approved by the Architect.

H. Reference Standards:

1. ASTM - American Society for Testing and Materials.
    a. D 6913 - Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis.

   a. 2540 C
   b. 4500-SO_4^{2-} E
   c. 4500-Cl B

1.3 SUBMITTALS

A. Test Reports: Submit test reports on proposed import and native materials, and compaction test reports on all compacted materials.

B. Submit manufacturer's product data and installation instructions for proprietary materials including vapor barrier, filter fabric, drain fabric, and the like.

1.4 JOB CONDITIONS

A. Existing Conditions:

1. Soils Data: Geotechnical Investigation (Project No. 8052036), dated November 25, 2024, by Wood Rodgers.
   a. The records of investigation of soil or subsurface conditions and logs of test borings are made available by the Architect but are NOT part of the Contract. It is expressly understood and agreed that the Architect assumes no responsibility whatsoever in respect to the sufficiency or accuracy of the interpretations set forth therein and there is no warranty, either expressed or implied, that the conditions indicated by such investigations or records are representative of those existing throughout such areas or any part thereof, or that material other than, or in proportions different from those indicated, may not be encountered.
   b. The availability or use of the records of investigations of soil or subsurface conditions and/or logs of test borings
      1) shall not be construed as a waiver of the Contractor’s duty to examine the site of the Work as contemplated and the Contractor is cautioned to make such independent investigations and examinations as he deems necessary to satisfy himself as to the subsurface conditions to be encountered in the performance of the Work and
      2) will not relieve the Contractor from the risk of unanticipated soil or subsurface conditions or from properly fulfilling the terms of the Contract for the Contract Sum.
2. Information shown on the Drawings regarding existing site conditions is believed to be correct, but it is not guaranteed. Contractors shall visit the site for necessary information and data regarding present ground levels, ground water level, conditions of property, locations and size of obstructions, and access, etc.
3. There may be underground utilities, storm drains, and other previous improvements throughout the building site requiring removal. Known utilities and improvements are shown on the Civil drawings. Where existing utilities are encountered which are not shown on the Drawings or evident from a site inspection, contact the Architect

immediately for instructions. If such lines are inadvertently broken through no fault of the Contractor's operation, they shall be repaired by the Contractor, and an adjustment will be made in payment by the Owner. Breakage of lines shown on the Drawings or evident by a site inspection will be repaired by the Contractor at no increase in the Contract Sum.

B. Protection:

1. Provide, and maintain all barricades, shoring, bracing, etc., as required by federal and State codes. Contractor shall assume all responsibility for damage to utilities, streets, etc., that may be caused by this Work.
2. Maintain temporary drainage routes during construction so that rainfall or snow-melt will drain from site and not accumulate or pond.

C. Sequencing, Scheduling and Coordination: The Contractor may schedule and sequence his operations as he desires to optimize the Work of this Section.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Structural Fill: Structural fill and backfill shall be approved imported materials from a commercial borrow source which are non-expansive, free of debris, organic materials, and other deleterious materials, and conforming to the following: Material shall be reasonably well graded with 100-percent passing the 6" sieve, 90-percent to 100-percent passing the 4" sieve, 50-percent to 100-percent passing the ¾" sieve, and 5-percent to 30-percent passing the #200 sieve. Resistance, R, value shall be 30 minimum. It shall meet ACI 318 Table 19.3.1.1 sulfate class "S0". Atterberg limits shall conform to the following table:

Maximum Liquid Limit	**Maximum Plasticity Index**
≤50	≤15

All material shall be approved by the Geotechnical Engineer prior to delivery and/or use.

B. Non-structural fill shall be approved by the Geotechnical Engineer prior to delivery and/or use.

C. Drain Rock: Drain rock shall meet the requirements of Section 200.03 (SSPWC) for either a class C or D backfill as specified on the plans.

D. Aggregate Base for interior concrete slabs, exterior concrete slabs, and sidewalk base: Comply with SSPWC Section 200.01 Type 2, Class B, Aggregate Base.

E. Moisture Barrier: A moisture barrier shall be provided under all interior slabs on grade. It shall be placed directly below the aggregate base with edges lapped and sealed in accordance with manufacturer's recommendations. The moisture barrier shall be Mirafi "MCF-1212", Stego Wrap 15 mil, or equal.

F. Filter Fabric: Filter fabric shall have a minimum trapezoid tear strength of 80 lbs. per ASTM D4533, a minimum puncture strength of 500 lbs. per ASTM D4833, a minimum grab strength of 200 lbs. per ASTM D4632, a minimum burst strength of 250 psi per ASTM D3786, a minimum

permittivity of 0.2/sec per ASTM D4491, and an AOS no greater than 0.25 mm per ASTM D4751. Filter fabric shall be Mirafi 180N, Propex Geotex 861 approved equal.

G. Drain Fabric: Where called for in the plans, drain fabric shall be installed behind retaining walls. Drain fabric shall be Mirafi G100W, Master Builders MasterSeal 974 or equal.

H. Provide other materials, not specifically described but required for a complete and proper installation, as selected by the Contractor subject to the approval of the Architect.

PART 3 - EXECUTION

3.1 SURFACE CONDITIONS

A. Examine the areas and conditions under which work of this Section will be performed. Correct conditions detrimental to timely and proper completion of the Work. Do not proceed until unsatisfactory conditions are corrected.

3.2 PREPARATION

A. Lay out the building and all site work in conformance with Contract Documents. Establish necessary benchmarks. Protect them and existing benchmarks shown on the Site Plan, until completion of the Work.

3.3 PERFORMANCE

A. Perform no earthwork during inclement weather, or when excessive moisture is present in the fill material.

B. Should rainfall or snow-melt occur following footing excavation and prior to pouring footing, dry the excavation thoroughly and re-compact the soils below the footing prior to placing footing.

C. Use no frozen fill. Place no fill on frozen ground.

D. Remove and replace in-place fills which are frozen prior to the placement of any additional fill.

E. When rains or snow-melt interrupt fill operations, inspect the surface before more fill is placed to assure that detrimental conditions do not exist.

F. Clearing and Grubbing: The areas to receive compacted fill for support of foundations, paving, and slabs shall be stripped of all debris, fill soils, crop growth, vegetation, surface trash, roots, and incidental topsoils, to a minimum depth of 12” below finished grade, as determined by the Geotechnical Engineer.

G. Stripping: The upper 6"± minimum, as determined by the Geotechnical Engineer, shall be removed from structural areas prior to placement of footings, aggregate base, or structural fill. Also any existing debris and former construction shall be completely removed from the site.

H. Excavation and Over-Excavation:

1. Excavate where necessary to obtain required subgrade elevations. In addition, over-excavate as necessary to remove the full depth undocumented fill, topsoil, surficial loose

and/or disturbed soils fill from the building footprint to the required horizontal extents of engineered fill.
2. Excavate as necessary to allow room for placement and removal of foundation formwork.
3. Form all footings with wood, metal, or earth forms as specified in Section “Cast-in-place Concrete”.

I. Subgrade Stabilization: Dewater and stabilize subgrade where required and as directed by the Geotechnical Engineer.

J. Compaction of Exposed Soils:

1. Clay Soils: Existing clay soils at the bottom of over-excavation shall be scarified to a minimum depth of 12”, moisture conditioned to at least optimum, and compacted to between 88-percent and 92-percent of the maximum dry density.

2. Granular Soils: Existing granular soils at the bottom of over-excavation shall be scarified to a minimum depth of 12”, moisture conditioned to within 3% of optimum, and compacted to at least 90-percent of the maximum dry density.

K. Fill and Backfill:

1. Over-excavate existing soils as required to allow placement of the minimum required thicknesses of structural fill. A minimum of 2’-0” thickness of structural fill is required below footings. A minimum of 1’-0” thickness of structural fill is required below building slabs-on-grade. Thickness of structural fill under slabs-on-grade does not include the aggregate base section. Structural fill shall extend a horizontal distance equal to at least depth of fill beyond the edges of exterior foundations and a distance at least equal to the depth of fill beyond edges of interior foundations.
2. Fill as required to obtain required subgrades.
3. Backfill foundations and stemwalls.
4. Place fill and backfill materials in 12-inch thick maximum loose layers. In general, place in horizontal layers extending uniformly over the area to be filled. Compact each layer as specified prior to placing the subsequent layer.
5. Water or dry fill materials as necessary to obtain moisture content within 3% of optimum and as directed by the Geotechnical Engineer. These soils shall then be compacted to the following minimum densities, based on ASTM D1557 Method A or C.
    a. Structural fill – 95-percent relative compaction for fills under footings and slabs on grade.
    b. Non-structural fill on site – 90-percent relative compaction.

L. Aggregate Base and Drainrock:

1. Provide the aggregate base and compact to at least 95 percent relative compaction under pavement and other exterior and interior slabs. The upper 12” of subgrade below this base shall also be scarified, moisture conditioned and compacted to 90 percent relative compaction.
2. Establish finish grade of base at the required elevation with a level uniform surface varying not more than 1/2-inch when measured in any direction with a 10-foot straight edge.
3. Compact drainrock by five passes at right angles with an approved vibratory compactor.
4. Drainrock shall not be used as a substitute for aggregate base or structural fill.

M. Site Grading:

SECTION 321723 – PAVEMENT MARKINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Road and Bridge Construction (Silver Book), 2014 Edition.

1.2 SUMMARY

A. The project requirements for pavement Markings shall be those specified in Section 632 and 729 of the Standard Specifications for Road and Bridge Construction (Silver Book), 2014 Edition.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Traffic Paint:

1. Traffic Paint material specifications shall follow section 729 of the Standard Specifications for Road and Bridge Construction (Silver Book), 2014 Edition.
2. Blue: Glidden Traffic Paint, All Stripe Traffic Paint or equal.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. Traffic paint applications shall follow section 632, of the Standard Specification of Road and Bridge Construction (Silver Book), 2014 Edition.

END OF SECTION 321723

SECTION 32 18 00 - SYNTHETIC TURF SURFACING

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Playground Resilient Surfacing:

1. Synthetic turf (Pro Play)

1.2 RELATED SECTIONS

A. Section 03 30 00 - Cast-in-Place Concrete.

B. Section 32 13 00 - Rigid Paving

C. Section 33 41 00 - Stormwater Utility Drainage Piping.

1.3 REFERENCES

A. ASTM International (ASTM):
1. ASTM F1292 - Standard specification for Impact Attenuation.
2. ASTM F1551 - Standard test methods for Water Permeability.
3. ASTM D418 - Standard Test Method for Testing Pile Yarn Floor Covering Construction.
4. ASTM F355- Standard Test Method for Shock-Absorbing Properties of Playing Surfaces
5. ASTM D1577 - Standard Test Method for Linear Density of Textile Fiber.

11. ASTM D5848 - Standard Test Method for Mass Per Unit Area of Pile Yarn Floor Covering.
12. ASTM E303 - Standard test method for measuring surfacing frictional properties using the British Pendulum tester.

B. IPEMA Certified. The manufacturer must provide proof of certification. In the interest of public playground safety, IPEMA provides an independent laboratory which validates a manufacturer's certification on conformance to ASTM F1292.

C. STC Suggested Guidelines for the Essential Elements of Synthetic Turf Systems.

1.4 DEFINITIONS

A. EPDM Granules: Ethylene propylene diene monomer or EPDM rubber, M-class, a

type of synthetic rubber, is an elastomer characterized by a wide range of applications. The M refers to its classification in ASTM D1418; the M class includes rubbers having a saturated chain of the polyethylene type.

B. Critical Fall Height: A critical fall height, CFH, is the maximum height of fall from play equipment to the ground. It is important to note that safety surfaces do not prevent injury but aim to lessen the severity of any injury that may occur on falls from height.

C. Fall Height: Fall height is a measurement defined as the vertical distance between a designated play surface and the protective surfacing beneath it.

D. TPV: Thermoplastic vulcanized elastomer, developed using resin and synthetic rubber with higher UV stabilization.

E. SBR: Styrene-butadiene or styrene-butadiene rubber describes families of synthetic rubbers derived from styrene and butadiene.

1.5 SUBMITTALS

A. Submit under provisions of Section 01 30 00 - Administrative Requirements.

B. Product Data:
1. Manufacturer's data sheets on each product to be used.
2. Preparation instructions and recommendations.
3. Storage and handling requirements and recommendations.
4. Typical installation methods.

C. Verification Samples: Two representative units of each type, size, pattern, and color.

D. Shop Drawings: Include details of materials, construction, and finish. Include relationship with adjacent construction.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section with a minimum of five years documented experience.

B. Poured in place surfaces shall be manufactured and installed by trained, experienced company employees or certified installers who have successfully completed the "Certified Installers Training Program" required by Robertson Industries Inc.

C. Testing: Critical Fall Height Four feet through 10 feet have been tested in accordance with Section 15 - Critical Fall Height Test Procedure of ASTM F1292-18.

D. Installer's Qualifications: Interlocking tiles. Installers must have successful experience in installation of playground safety surfacing tiles of similar type to that specified, with a minimum of 20 projects completed within the last 5 years.
1. Employ persons trained for installation of playground safety surfacing tiles and are approved by manufacturer.

E. Applicator Qualifications: Company specializing in performing the work of this section.
1. Minimum five years of documented experience.
2. Approved by manufacturer.

F. Synthetic Turf:
1. Manufacturer Qualifications: Company specializing in manufacturing products

specified in this section.
a. Must be experienced in the manufacturing of tall pile synthetic infill grass systems with the same fiber as specified.
b. Must be a member in good standing with the STC.
c. Must utilize best practices as certified by ISO-9001 and ISO-14001.
d. Must be owned and operated in the U.S.A.
e. Must have no periods of insolvency over the last 25 years.

2. Installer Qualifications: Company specializing in performing the work of this section.
a. The Synthetic Turf Installer must provide competent workmen skilled in this type of synthetic grass installation. All technicians must have installed similar synthetic turf.
b. The Synthetic Turf Installer shall have minimum experience of at least 5 years, actively selling, installing, and maintaining in-fill synthetic turf project of similar size.

G. Source Limitations: Provide each type of product from a single manufacturing source to ensure uniformity.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Materials and equipment shall be delivered and stored in accordance with the manufacturer's recommendations.
1. Store off the ground and covered; handle and protect products from moisture in accordance with manufacturer's instructions.
2. Deliver materials in manufacturer's unopened containers, fully identified with brand, type, and all other qualifying information.
a. Material Safety Data Sheets for each product.
3. Take necessary precautions to keep products clean, dry, and free of damage.

1.8 PROJECT SITE CONDITIONS

A. Synthetic Turf:
1. Coordinate all work with the work of other sections to avoid delay and interference with other work.
2. Protect excavations by shoring, bracing sheeting, underpinning, or other methods as required to prevent cave-ins or loose dirt from entering excavations. Barricade open excavations and post warning lights at work adjacent to public streets and walks.

1.9 WARRANTY

A. Synthetic Turf: The Contractor shall provide a minimum eight (8) year warranty policy by the manufacturer against defects in workmanship of synthetic turf from shipment date. Installations are warranted for one (1) year from the installation date against defects in attenuation layer (if applicable) and seams if maintenance is not performed. Other defects not warranted shall include, but not be limited to ultraviolet ray fading, degradation, or excessive wear of fiber.
1. The warranty shall be for full replacement of any damaged product within the warranty period. The warranty shall be comprehensive and sufficient to replace all turf if necessary.
2. The warranty shall be effective from the date of substantial completion.
3. The Warranty shall contain no usage limits for warranted turf.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Acceptable Manufacturer: Robertson Industries, Inc., which is located at: 2140 E. Cedar St.; Tempe, AZ 85281; Toll Free Tel: 800-858-0519; Tel: 602-340-8873; Fax: 602-340-0402; Email: request info (crobertson@totturf.com); Web: https://www.robertsonsurfaces.com

B. Requests for substitutions will be considered in accordance with the provisions of Section 01 60 00 - Product Requirements.

2.2 SYNTHETIC TURF (ProPlay)

A. Basis of Design:
1. TotTurf Landscape Synthetic Turf System as provided by Robertson Industries, Inc.

B. Turf Fiber:
1. Tufted to the backing with a minimum tuft bind of 10 lbs.
2. Tufted fiber weight: 60 oz per sq yard minimum.
3. Turf fibers: Non-abrasive. Thickness: 100 microns. Less than 100 ppm lead chromate in all colors. Must be from the same dye lots.
   a. Guaranteed for 8 years not to fade or fail (as distinguished from a change in texture) or have a pile height decrease to 50 percent of pile height as result of UV degradation.
   b. Must retain 75 percent of its original fibril width after 10,000 cycles on the Lisport Studded Roll Test Machine.
4. Pile fiber Characteristics:
   a. Linear Density (Denier) per ASTM D1577: 13600.
   b. Yarn Thickness per ASTM D3218: 100 Microns (PE Mono); 100 Microns (PP).
   c. Tensile Strength per ASTM D2256: 71 N (PE Mono);16.5 N (PP).
   d. Pile Weight ASTM D5848: 80 oz per sq yd, plus or minus 5 percent.
   e. Finished Pile Height per ASTM D 5823: 1.75 inches (44 mm).
   f. Product Weight (total) per ASTM D3218: 107 oz per sq yd.
   g. Pile Weight ASTM D5848: 60 oz per sq yd, plus or minus 5 percent.
   h. Finished Pile Height per ASTM D 5823: 1 inches (25 mm).
   i. Product Weight (total) per ASTM D3218: 87 oz per sq yd.
   j. Primary Backing Weight per ASTM D2256: 7.4 oz per sq yd.
   k. Secondary Coating Weight per ASTM D5848: 20 oz per sq yd.
   l. Fabric Width per ASTM D5793: 15 ft (4.57 m).
   m. Tuft Gauge per ASTM D5793: 3/8 inches (10 mm).
   n. Grab Tear Strength per ASTM D5034: 200 lbsf.
   o. Tuft Bind per ASTM D1335: Greater than 10 lbsf.
   p. Infill (Sand): 2 lbs Silica Sand.

C. Backing Material:
1. Primary Backing: Dual layered woven polypropylene. Weight: 7.0 oz per sq yd.
2. Secondary Backing: Heat activated polyurethane coating with no vegetable-based polyols. Weight: 20 oz per sq yd.
   a. Must saturate the primary backing and lock the fiber tufts in place to the primary backing.
   b. Tuft Bind Strength: 10 lbsf.
   c. Drainage Perforations: 3/16 to 1/4 inches (5 to 6 mm) diameter at 4 inches (102 mm) or less on center each way. Non-perforated backing is not acceptable.

D. Turf roll seams: to be sewn or glued on site so that no openings larger than the porous backing mat openings are created. All turf fabric edges to be securely bound

as per the perimeter detail design. Adhesives for joining seams of turf together shall be Nordot 34G Glue, Mapei 2K, Turf Claw, hot melt technology or equivalent. No substitutions.

E. Fabric surface: To be constructed and installed in minimum widths of 15 feet (4.572 m) with no longitudinal or transverse seams.

F. The entire system shall be resistant to weather, including ultra-violet light and heat degradation; insects, rot, mildew, and fungus growth and be non-allergenic and non-toxic.

G. The turf material shall be non-combustible and pass the DIN standard Pill Burn test or ASTM D2859.

H. Synthetic Glue Material:
1. Adhesive products shall be Nordot 34G, Mapei 2K, Turf Claw, hot melt technology or equivalent as approved by the engineer.
2. Any adhesive products required for the installation of a proposed turf system shall be purpose-suited to the system. The material and application methods shall be as recommended by the adhesive manufacturer.
3. Disposal of adhesive containers and unused adhesives as well as any fees resulting from such disposal shall be the responsibility of the Contractor.

I. Synthetic Infill Material: Consists of a blend of graded, silica sand.
   a. Sand: Graded, dust-free silica sand. Placed on turf at 1 lbs per sq ft minimum.
   b. Sand properties:
      1) Color: Tan.
      2) Shape: Round non-angular. Roundness: 0.6+.
      3) Hardness: 0.6 to 0.8 on the Mohs Scale.
      4) Size: 0.04 inches (plus or minus 0.006 inches (1.00 mm plus or minus 0.15 mm).
      5) Density: 90 to 95 lbs per cu ft (1442 to 1522 kg per cu m).
      6) Dust: Less than 0.001 percent.
      7) Angle of Repose: Less than 30 degrees.
      8) Sand to be heavy metal safe.
   c. Envirofill: Infill for synthetic/artificial turf. Silicon dioxide coated with acrylic polymer. Product is not to contain known hazardous materials in reportable levels as defined by the OSHA Hazard Communication Standard 29 CFR 1910.1200. Product to be classified as not being toxic, corrosive, skin or eye irritants, or a strong sensitizer as defined in 16 CFR 1500.3(b)(5), and 1500.3(b)(7) - (9) of the Federal Hazardous Substances Act.
      1) Color: Green.
      2) Odor: Odorless.
      3) pH-Value: Not applicable.
      4) Change in Condition:
         a) Melting point / Melting Range: 3115 degrees F (1713 degrees C).
         b) Boiling point/Boiling Range: 4046 degrees F (2230 degrees C).
      5) Flash point: None.
      6) Flammability (solid, gaseous) - Product is not flammable.
      7) Ignition temperature - Decomposition temperature - Not determined.
      8) Auto igniting - Product is not self-igniting.
      9) Danger of Explosion: Product does not present an explosion

hazard.
a) Lower Explosion Limits: Not determined.
b) Upper Explosion Limits: Not determined.
10) Vapor Pressure at 3150 degrees F (1732 degrees C): 13.5 hPa (10 mm Hg).
11) Density at 68 degrees F (20 degrees C): 24.201 to 25.87 lbs/gal (2.9 to 3.1 g per cu cm).
12) Bulk Density: 110 lbs per cu ft (1762 kg per cu m).
13) Relative Density: Not determined.
14) Vapor Density: Not applicable.
15) Evaporation Tate: Not applicable.
16) Solubility in / Miscibility with Water: Insoluble.
17) Partition Coefficient (n-octanol/water): Not determined.
18) Viscosity: Dynamic - Not applicable. Kinematic - Not applicable.
19) Solvent Content: Organic Solvents: 0 percent. Solids: 100 percent.

PART 3 EXECUTION

3.1 EXAMINATION

A. Do not begin installation until the substrates have been properly constructed and prepared.

B. If substrate preparation is the responsibility of another installer, notify Architect in writing of unsatisfactory preparation before proceeding.

3.2 PREPARATION

A. Clean surfaces thoroughly prior to installation.

B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION

A. Install in accordance with manufacturer's instructions, approved submittals, and in proper relationship with adjacent construction.

3.4 FIELD QUALITY CONTROL

A. Field Inspection: Coordinate field inspection in accordance with appropriate sections in Division 01.

3.5 CLEANING AND PROTECTION

A. Clean products in accordance with the manufacturer’s recommendations.

B. Manufacturer installers shall work to minimize excessive adhesive on adjacent surfaces or play equipment. Spills of excess adhesive shall be promptly cleaned.

C. Allow to fully cure in accordance with Manufacturer's instructions. Surface to be protected by the Owner from all traffic during the curing period of at a minimum of 48 hours or as instructed by the Manufacturer.

D. Touch-up, repair or replace damaged products before Substantial Completion.

END OF SECTION 32 18 00

32 18 10 - TEXTURED ACRYLIC COLOR COURT SURFACING

PART 1 - GENERAL

1.1 GENERAL DESCRIPTION

A. Textured acrylic surfacing for athletic courts.

1.2 RELATED SECTIONS

A. Related Work

1. 11 68 33 – MODULAR SPORTS SOLUTION (MINI-PITCH)

B. References

1. United States Tennis Association (USTA)
2. International Tennis Federation (ITF)
3. American Sport Builders Association (ASBA)

1.3 QUALITY ASSURANCE

A. Surfacing shall conform to the guidelines of the ASBA for planarity.

B. All surface coatings products shall be supplied by a single manufacturer.

C. The contractor shall record the batch number of each product used on the site and maintain it through the warranty period.

D. The contractor shall provide the inspector, upon request, an estimate of the volume of each product to be used on the site.

E. The installer shall be an authorized applicator of the specified system.

F. The manufacturer’s representative shall be available to help resolve material questions.

1.4 SUBMITTALS

A. Manufacturer specifications for components, color chart and installation instructions.

B. Authorized Applicator certificate from the surface system manufacturer.

E. ITF classification certificate for the system to be installed.

F. Reference list from the installer of at least 5 projects of similar scope done in each of the past 3 years.

G. Current Material Safety Data Sheets (MSDS).

1.4 MATERIAL HANDLING AND STORAGE

A. Store materials in accordance with manufacturer specifications and SDS.

B. Deliver product to the site in original unopened containers with proper labels attached.

C. All surfacing materials shall be non-flammable.

1.5 GUARANTEE

A. Provide a guarantee against defects in the materials and workmanship for a period of one year from the date of substantial completion.

1.6 INSTALLER QUALIFICATIONS

A. Installer shall be regularly engaged in construction and surfacing of acrylic tennis courts, play courts or similar surfaces.

B. Installer shall be an Authorized Applicator of the specified surface system.

C. Installer shall be a builder member of the ASBA.

1.7 MANUFACTURER QUALIFICATIONS

A. System manufacturer shall provide documentation that the surface to be installed has been classified by the ITF as a medium pace surface.

B. System manufacturer shall be a US owned company.

C. System manufacturer shall be a member of the ASBA.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A .Basis of Design: Subject to compliance with requirements, provide products California Sports Surfaces, a division of the ICP Group, Andover, MA. 01810 / Plexipave System www.plexipave.com , or a comparable product by another manufacturer.

2.2 MATERIALS

A. Patching Mix (California Court Patch Binder) - for use in patching cracks, holes, depressions and other surface imperfections.

B. Crack Filler (California Crack Filler) - for use in filling fine cracks.

C. Acrylic Filler Course (California Acrylic Resurfacer) – for use as a filler for new or existing asphalt surfaces. The acrylic filler shall be blended with approved silica sand at the job

site.

D. Acrylic Color Playing Surface (Plexichrome Ultra Performance/Plexipave Color Base) – for use as the finish color and texture. Plexichrome and Plexipave Color Base are blended at the job site to achieve the correct surface texture. *Factory Fortified Plexipave may be used as an alternative material.

E. Line Paint (California Line Paint) – for use as the line marking on the court/play surface.

F. Water – for use in dilution/mixing shall be clean and potable.

2.3 MATERIAL SPECIFICATIONS

A. Court Patch Binder – acrylic resin blended with Portland Cement and silica sand.

B. Plexipave Crack Filler – acrylic resin heavily filled with sand.

C. California Acrylic Resurfacer – acrylic resin (no vinyl copolymerization constituent). The product shall contain not less than 3.5% attapulgite.

D. Plexichrome Ultra Performance –acrylic resin (no vinyl copolymerization constituent) with selected light fast pigments.

E. Plexipave Color Base – acrylic resin containing no vinyl copolymerization constituent. Contains not more than 63% rounded silica sand.

F. California Line Paint – 100% acrylic resin containing no alkyds or vinyl constituents. Texturing shall be rounded silica sand.

All surfacing materials shall be non-flammable and have a VOC content of not less than 100g/L. Measured by EPA method 24.

Local sands are not acceptable in the color playing surface. Sands must be incorporated at the manufacturing location to ensure quality and stability.

PART 3 - EXECUTION

3.1 WEATHER LIMITATIONS

A. Do not install when rainfall in imminent or extremely high humidity prevents drying.

B. Do not apply unless surface and air temperature are 50°F and rising.

C. Do not apply if surface temperature is in excess of 140°F.

3.2 PREPARATION FOR ACRYLIC COLOR PLAYING SYSTEM

A. Clean surfaces of loose dirt, oil, grease, leaves, and other debris in strict accordance with manufacturer's directions. Pressure washing will be necessary to adequately clean areas to be coated. Any areas previously showing algae growth shall be treated with Clorox or approved product to kill the organisms and then be properly rinsed.

B. Holes and cracks: Cracks and holes shall be cleaned and a suitable soil sterilant, as approved by the owner, shall be applied to kill all vegetation 14 days prior to use of **Court Patch Binder** according to manufacturer's specifications.

C. Depression: Depressions holding enough water to cover a US five-cent piece shall be filled with Court Patch Binder Patching Mix. 3 gallons of Court Patch Binder, 100 lbs. 60-80 silica sand, 1-gallon Dry Portland Cement (Type I). **This step shall be accomplished prior to the squeegee application of Acrylic Resurfacer.** The contractor shall flood all the courts and then allow draining. Define and mark all areas holding enough water to cover a nickel. After defined areas are dry, prime with tack coat mixture of 2 parts water/l part Court Patch Binder. Allow tack coat to dry completely. Spread Court Patch Binder mix true to grade using a straight edge (never a squeegee) for strike off. Steel trowel or wood float the patch so that the texture matches the surrounding area. Never add water to mix. Light misting on surface and edges to feather in is allowed as needed to maintain work ability. Allow to dry thoroughly and cure.

NO WORK FROM THIS STAGE ON SHALL COMMENCE UNTIL AN INSPECTOR HAS ACCEPTED THE SURFACE.

D. Filler Course. (Acrylic Resurfacer): Filler course shall be applied to the clean underlying surface in one application to obtain a total quantity of not less than .06 gallon per square yard based on the material prior to any dilution. Acrylic Resurfacer may be used to pre-coat depression and crack/hole repairs to achieve better planarity prior to filler course application.

1. Over a properly repaired surface of asphalt on existing courts, apply one coat of Acrylic Resurfacer according to the following mix:

Acrylic Resurfacer	55 gallons
Water	20 - 40 gallons
Sand	600-800 pounds / 60-80 mesh
Liquid Yield	112-138 gallons

On new asphalt, two coats of Acrylic Resurfacer shall be used to properly fill all voids in the asphalt surface. Use clean, dry 50-60 mesh sand and clean, potable water to make mixes. The quantity of sand and water in the above mix may be adjusted within above limits to complement the roughness and temperature of the surface.

2. Mix the ingredients thoroughly using accepted mixing devices and use a 70 Durometer rubber bladed squeegee to apply each coat of Acrylic Resurfacer as required.

3. Allow the application of Acrylic Resurfacer to dry thoroughly. Scrape off all ridges and rough spots prior to any subsequent application of Acrylic Resurfacer or subsequent cushion or color surface system.

3.3 APPLICATION OF ACRYLIC COLOR PLAYING SURFACE

A. All areas to be color coated shall be clean, free from sand, clay, grease, dust, salt or other foreign matters. The Contractor shall obtain the Engineer's approval, prior to applying any surface treatment.

B. Blend color base and Plexichrome Ultra Performance with a mechanical mixer to achieve a uniform Fortified Plexipave mixture. The mix shall be:

Color Base	30 gallons
Plexichrome	20 gallons
Water	20 gallons

C. Application shall be made by 50 durometer rubber faced squeegees. The Fortified Plexipave mixture should be poured on to the court surface and spread to a uniform thickness in a regular pattern.

D. A total of 3 applications of Fortified Plexipave shall be made to achieve a total application rate of not less than .15 gal./sy. No application should be made until the previous application is thoroughly dry.

3.4 LINE PAINTING

A. Line shall be 2” wide unless otherwise noted on the drawings. Lines hall be carefully laid out in accordance with ASBA and USTA guidelines. The area to be marked shall be taped to insure a crisp line. The California Line Paint shall have a texture similar to the surrounding play surface. Application shall be made by brush or roller at the rate of 150-200 sg./gal. (3/4 gal. per tennis court).

3.5 PROTECTION

A. Erect temporary barriers to protect coatings during drying and curing.

B. Lock gates to prevent use until acceptance by the owner’s representative.

3.6 CLEAN UP

A. Remove all containers, surplus materials and debris. Dispose of materials in accordance with local, state and Federal regulations.

B. Leave site in a clean and orderly condition.

END OF SECTION 32 18 10

SECTION 32 18 16.13 – RUBBER PLAYGROUND TILES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary
B. Conditions and Division 1 Specifications apply to this section.

1.2 REFERENCES

A. ASTM F1292 Standard Specification for Impact Attenuation of Surface Systems Under and Around Playground Equipment.

1.3 SUBMITTALS

A. General: Submit listed submittals in accordance with Conditions of the Contract and
B. Submittal Procedures Section.
C. Product Data: Submit manufacturer's product data and installation instructions.
D. Verification Samples: Submit manufacturer's sample of 1 full tile
E. Closeout Submittals: Submit BCI Burke Company, LLC's 10-year limited warranty

1.4 QUALITY ASSURANCE

A. Supplier shall be an ISO 9001:2008 certified company
B. Utilize an installer approved and trained by the manufacturer of the playground surfacing system, having experience with other projects of the scope and scale of the work described in this section.
C. Manufactured in the United States

1.5 DELIVERY, STORAGE & HANDLING

A. Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.
B. Store tiles in a dry area prior to installation and prevent exposure to direct sunlight
C. Tiles should not be stored on skids for an extended period of time.
D. Tile adhesive should be stored in a dry area above 40 °F prior to installation
E. Material shall not be subjected to solvents or other damaging chemicals
F. Protect materials during handling to prevent damage

1.6 PROJECT/SITE CONDITIONS

A. Environmental Requirements: Install surfacing system when minimum ambient temperature is 40 °F (1 °C) and maximum ambient temperature is 90 °F (32 °C).
B. Tile installation is not recommended if the temperature is expected to remain below 45 °F for an extended period of time.
C. Do not install in rain

1.7 WARRANTY

A. Provide a 10 year limited product warranty on Burke Tiles from the date of original shipment. The product will be free from materials and manufacturing defects for a period of ten (10) years.
B. Supplier shall warrant that tiles comply with the requirements of the ASTM F1292 Standard Specification for Impact Attenuation of Surface Systems Under and Around Playground Equipment.

PART 2 - PRODUCTS

2.1 INTERLOCKING RUBBER TILES

A. Basis of Design Product: Burke Tiles manufactured by BCI Burke Company, LLC, PO Box 549, Fond du Lac, WI 54936-0549 USA 1-800-266-1250, www.bciburke.com/products/product/burketiles

1. All tiles are produced from 100% commercial waste stream tire rubber buffings
2. Full perimeter interlocking system .

B. 2-1/4" thick tile.
   a. 4 foot critical fall height
   b. Weight: 27 lbs
   c. Tile Dimensions (L x W): 24" x 24"
   d. Tile Colors: To be selected from manufacturer's full line.

2.3 ACCESSORIES

A. 2-1/4" Accessories
   a. Inside Corner
   b. Outside Corner
   c. Beveled Edge
   d. U-Lock
   e. Filler Stick U-Plug
B. Tile Adhesive 30 oz

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine areas to receive playground safety surfacing tiles. Notify responsible parties if areas are not acceptable. Do not begin installation until unacceptable conditions have been corrected.

3.1 PREPARATION

A. Prepare subsurface in accordance with manufacturer's instructions to ensure proper support and drainage for playground safety surfacing tiles.
   a. Subsurface should be specified as concrete.
   b. It is critical that the subsurface have proper drainage or the tile surface may not stay level

and may cause damage to surfacing.

B. Concrete Subsurface:
   a. Concrete subsurface shall be as specified
   b. Apply light broom finish
   c. Ensure concrete is sound with no loose material
   d. Ensure concrete is a minimum of 28 days old
   e. Power wash existing concrete in accordance with manufacturer's instructions and provide adequate time for drying prior to tile install

3.2 INSTALLATION

A. Install tiles in accordance with manufacturer's instructions
B. Ensure prepared subsurface and tiles are dry and clean
C. Layout tile surface in accordance with manufacturer's instructions
D. Install tiles in single installation session, if possible
E. If possible, the tiles on the bottom of a skid should be allowed to relax during the installation process. Installers should work partially through a skid and then move to the top of another skid before returning.
F. Apply adhesive in accordance with manufacturer's instructions for tile-to-tile and perimeter tile-to-base installation.
G. Remove adhesive spills from playground safety surfacing tiles and equipment.
H. Clean tiles in accordance with manufacturer's instructions.
I. Protect tiles from foot traffic for a minimum of 12 hours after installation
J. Protect completed tiles from damage during construction.

END OF SECTION 32 18 16.13

1. After completion of all excavation, fill and backfill, rake surface to a 4-inch depth to remove all rocks and debris in excess of 2-inches in diameter. Remove this material from the site.
2. Grade all areas including excavated and filled sections and transition areas to obtain a finished surface, reasonably smooth, compacted, and free from irregular surface changes. Leave all ditches, swales, and gutters finished to drain readily.

N. Moisture Barrier:

1. Where moisture barrier is required by plans, place moisture barrier beneath aggregate base. If required by ground conditions, a thin layer of clean sand shall be placed over the underlying subgrade soils to protect the barrier from damage.

2. Care shall be taken to avoid puncturing the membrane. No vehicle traffic is allowed directly on the membrane.

O. Drain Fabric:

1. Drain fabric shall be installed per manufacturer's recommendations.

3.4 FIELD QUALITY CONTROL

A. Soil Compaction Test: The Owner will pay the testing Laboratory for the first compaction test at any test location. All retests required because fill materials were not compacted to the required density shall be paid for by the Contractor.

B. The Geotechnical Engineer shall review all sitework and footing excavations before any concrete is cast, and submit a letter of compliance to the Architect. The Geotechnical Engineer shall review all backfill materials prior to placement and observe backfill operations. A letter of compliance shall be submitted to the Architect stating that fills have been constructed per the requirements of these Specifications.

C. Provide at least the following tests to the approval of the Geotechnical Engineer:

1. At paved areas, at least one (1) field density test for every 4000 sq. ft. of paved area, but not less than three (3) tests.
2. In each compacted fill layer, one (1) field density test for every 4000 sq. ft. of overlaying area, but not less than three (3) tests.

D. If, in the Geotechnical Engineer's opinion, based on reports of the testing laboratory, subgrade or fills have been placed below specified density, provide additional compacting and testing.

3.5 MAINTENANCE

A. Protection of newly graded areas:

1. Protect newly graded areas from traffic and erosion, and keep free from trash and weeds.
2. Repair and reestablish grades in settled, eroded, and rutted areas to the specified tolerances.

B. Where completed compacted areas are disturbed by subsequent construction operations or adverse weather, scarify the surface, reshape, and compact to the required density prior to further construction.

C. Moisture levels at completed moisture-conditioned and compacted areas shall be maintained by periodic surface wetting, or other methods, until covered by at least 1 lift of fill. Where such areas are allowed to dry out, scarify to a depth of 8”, moisture condition, and compact to the required density prior to further construction.

END OF SECTION 31 22 01

SECTION 321123 - AGGREGATE BASE COURSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 QUALITY ASSURANCE

A. Manufacturer Qualifications: Obtain required products from a single manufacturer.

1. Accessories: Provide accessory items only as produced or recommended by manufacturer of primary products.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Aggregates for Surfacing and Base:

1. Aggregate shall be Type 2, Class B Aggregate Base as specified in the Standard Specifications.

2.2 SOURCE QUALITY CONTROL

A. Testing: Perform the following testing:

1. In accordance with Section 308 of the reference specifications, the contractor shall submit proof in the form of test results from an approved commercial testing laboratory that the materials proposed meet the quality and gradation requirements.

PART 3 - EXECUTION

3.1 Examination

A. Inspect substrates and conditions under which the work of this section will be performed, and verify that installation properly may commence. Do not proceed with the work until unsatisfactory conditions have been resolved fully.

3.2 Application

A. General: Compaction Requirements:

1. Material shall be compacted to minimum depth of six inches and to the following densities in accordance with ASTM D1557-78: subgrade (pavement areas and roadways): 95 percent relative compaction; base course: 95 percent relative compaction.

B. Sub Grade:

1. Subgrade for base course shall be prepared in accordance with the following sections of the reference specification: 302.02, 302.04, 302.05, 302.06.

3.3 Field Quality Control

A. Testing and Inspection: Perform the following field tests:

1. Owner's testing agency shall submit in the form of test results that compaction standards are being achieved as specified.

END OF SECTION 321123

SECTION 321200 - FLEXIBLE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 SUMMARY

A. The project requirements for Hot-Mixed Asphalt shall be those specified in Sections:

315 - Prime Coat
316 - Tack Coat
317 - Seal Coats (Fog Seal, Sand Seals, and Chip Seals)
318 - Slurry Seal
320 - Plantmix Bituminous Pavement.
323 - Adjustment of New and Existing Manholes, Catch Basins, Electrical Vaults, Water and Gas Valves to Final Grade.
324 – Painting, Pavement Striping and Marking

of the standard specifications for Public Works Construction, Latest Edition, the contract documents, and Geotechnical Investigation Report, Silver Dollar Elementary School, dated June 10th 2024, prepared by Geotechnical & Environmental Services, Incorporated. the requirements stated herein and the requirements shown on the contract documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Materials shall conform to the Geotechnical Investigation Report, Silver Dollar Elementary School, dated June 10th 2024, prepared by Geotechnical & Environmental Services, Incorporated.

B. Site asphalt concrete shall be Type 2 and Type 3. Public roadway asphalt concrete shall be per requirements. The Contractor shall submit an asphalt mix design for approval by the Architect at least 14 days prior to the proposed paving date.

C. Seal Coat: Fog seal consisting of SSI asphaltic emulsion shall be applied to the finished asphalt surface. Immediately remove spilled and splattered materials from adjacent surfaces.

D. Materials shall conform to the plans and Standard Specifications for Public Works Construction, 2012 Editions.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. The project requirements for Flexible Paving shall be those specified in Sections:

315 - Prime Coat
316 - Tack Coat
317 – Seal Coats (Fog Seal, Sand Seals, and Chip Seals)
318 - Slurry Seal
320 - Plantmix Bituminous Pavement
323 – Adjustment of New and Existing Manholes, Catch Basins, Electrical Vaults, Water and Gas Valves to Final Grade.
324 – Painting, Pavement Striping and Marking

of the standard specifications for Public Works Construction and Geotechnical Evaluation Stonebrook Elementary School, dated January 20th 2022, prepared by Geotechnical & Environmental Services, Incorporated.

END OF SECTION 321200

SECTION 321300 -RIGID PAVING

PART 1 - GENERAL

1.1 Related Documents

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 SUMMARY

A. The project requirements for site concrete shall be those specified in Sections 311 - Concrete Structures and Masonry Construction and 312 - Concrete Curb, Gutters, Walks, Driveways, and Alley Returns of the Standard Specifications for Public Works Construction, Latest Edition, the requirements stated herein and the requirements shown on the contract documents.

PART 2 - PRODUCTS

2.1 Materials

A. Portland Cement Concrete (P.C.C.) shall have the following characteristics: 4000 PSI min compressive strength at 28 days with min. of 6.25 sacks of cement per cubic yard of concrete. Air entertainment shall be 4-7%, slump shall range from 1” min. to 4” max. All materials shall conform to SSPWC Sec. 202. All site concrete shall be reinforced with collated, fibrillated, polypropylene fibers as manufactured by Fibermesh or approved equal. Use 1 1/2 lbs. per cubic yard.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. The project requirements of Sections 311 - Concrete Structures and Masonry Construction and 312 - Concrete Curb, Gutters, Walks, Driveways, and Alley Returns of the Standard Specifications for Public Works Construction, Latest Edition.

END OF SECTION 321300

SECTION 321723 – PAVEMENT MARKINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Road and Bridge Construction (Silver Book), 2014 Edition.

1.2 SUMMARY

A. The project requirements for pavement Markings shall be those specified in Section 632 and 729 of the Standard Specifications for Road and Bridge Construction (Silver Book), 2014 Edition.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Traffic Paint:

1. Traffic Paint material specifications shall follow section 729 of the Standard Specifications for Road and Bridge Construction (Silver Book), 2014 Edition.
2. Blue: Glidden Traffic Paint, All Stripe Traffic Paint or equal.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. Traffic paint applications shall follow section 632, of the Standard Specification of Road and Bridge Construction (Silver Book), 2014 Edition.

END OF SECTION 321723

SECTION 333100-SANITARY UTILITY SEWERAGE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 SUMMARY

A. The project requirements for sanitary sewer shall be those specified in Section 306 – Storm Drain, Culvers, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, Latest Edition, the requirements stated herein and the requirements shown on the contract documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Materials shall conform to the Plans and Standard Specifications for Public Works Construction, Latest Edition.

B. PVC pipe to be used for sanitary sewer systems shall meet the requirements of ASTM Specification D-3034, SDR 35 with bell and spigot type rubber-gasket joint.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. The requirements of Section 306 – Storm Drain, Culverts, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, 2016 edition, shall be incorporated into and made part of the project contract documents.

B. Sanitary sewer pipe, 8” and larger, and manholes shall be pressure tested as follows. Pressure testing of storm drain or storm drain manholes will not be required.

1. Sanitary Sewer Piping Air Test:

a. Each section of sewer shall be tested between manholes by plugging and bracing all openings in the main line and the upper ends of all service lateral connections. Prior to any air pressure testing, all pipe plugs shall be checked with soap solution to detect any air leakage. If any leaks are found, the air pressure shall be released, the leaks eliminated and the test procedure started over.
b. Air shall be introduced into the pipeline until 3.0 p.s.i. gauge pressure has been reached, at which time the flow of air shall be reduced and the internal pressure shall be maintained between 2.5 and 3.5 p.s.i. for at least 2 minutes to allow the air temperature to come to equilibrium with the temperature of the pipe walls. Pressure in the pipe shall be constantly monitored by a gauge and hose arrangement separate from the hose used to introduce air into the line. Pressure in the pipe shall not be allowed to exceed 5 psi.
c. After the temperature has stabilized and no air leaks at the pugs have been found, the air pressure shall be permitted to drop to 2.5 p.s.i. When the internal pressure has reached 2.5 p.s.i., the line shall be disconnected from the air source and a stop watch or sweep-second-had watch shall be used to determine the time lapse required for the air pressure to drop to 1.5 p.s.i. If the time lapse required for the air pressure to decrease from 2.5 p.s.i. to 1.5 p.s.i. exceeds the follow times, based on sewer pipe size, the pipe shall be presumed to be within acceptable limits for leakage:

    1) 8” sanitary sewer pipe: 2.5 minutes
    2) 10” sanitary sewer pipe: 3.0 minutes
    3) 12” sanitary sewer pipe: 3.5 minutes
    4) 15” sanitary sewer pipe: 4.5 minutes
    5) 18” sanitary sewer pipe: 5.5 minutes

d. If any section of pipe does not pass the pressure test, leaks shall be repaired and the test repeated.

2. Each new sanitary sewer manhole shall be tested for leakage using a vacuum test method conforming to ASTM test method C 1244.

END OF SECTION 333100

SECTION 323113 - CHAIN LINK FENCES AND GATES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Chain-link fences.
2. Gates: swing.

B. Related Sections:

1. Section 03 30 00 "Cast-in-Place Concrete" for cast-in-place concrete post footings.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for chain-link fences and gates.

1. Fence and gate posts, rails, and fittings.
2. Chain-link fabric, reinforcements, and attachments.
3. Gates and hardware.

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work. Show accessories, hardware, gate operation, and operational clearances.

1.4 PROJECT CONDITIONS

A. Field Measurements: Verify layout information for chain-link fences and gates shown on Drawings in relation to property survey and existing structures. Verify dimensions by field measurements.

PART 2 - PRODUCTS

2.1 CHAIN-LINK FENCE FABRIC

A. General: Provide fabric in one-piece heights measured between top and bottom of outer edge of selvage knuckle or twist. Comply with CLFMI Product Manual and with requirements indicated below:

1. Fabric Height: 6 foot.
2. Steel Wire Fabric: Wire with a diameter of 0.192 inch.

    a. Mesh Size: 2 inches.
    b. Zinc-Coated Fabric: ASTM A 392, Type II, Class 1, 1.2 oz./sq. ft. with zinc coating applied after weaving.

3. Selvage: Knuckled at both selvages.

2.2 NON-SCALABLE SECURITY CHAIN-LINK FENCE FABRIC

A. General: Provide fabric in one-piece heights measured between top and bottom of outer edge of selvage knuckle or twist. Comply with CLFMI Product Manual and with requirements indicated below:

1. Fabric Height: As indicated on drawings.
2. Steel Wire Fabric: 11 gauge wire.

    a. Mesh Size: 5/8 inches.
    b. Zinc-Coated Fabric: ASTM A 392, Type II, Class 1, 1.2 oz./sq. ft. with zinc coating applied after weaving.

3. Selvage: Knuckled at both selvages.

2.3 FENCE FRAMING

A. Posts and Rails: Comply with ASTM F 1043 for framing, including rails, braces, and line; terminal; and corner posts. Provide members with minimum dimensions and wall thickness according to ASTM F 1043 based on the following:

1. Fence Height: As indicated on Drawings.
2. Light Industrial Strength: Material Group IC-L, round steel pipe, electric-resistance-welded pipe.

    a. Line Post: 2.375 inches in diameter.
    b. End, Corner and Pull Post: 2.875 inches.

3. Horizontal Framework Members: top rails complying with ASTM F 1043.

    a. Top Rail: 1.66 inches in diameter.

4. Brace Rails: Comply with ASTM F 1043.
5. Metallic Coating for Steel Framing:

    a. Type A, consisting of not less than minimum 2.0-oz./sq. ft. average zinc coating per ASTM A 123/A 123M or 4.0-oz./sq. ft. zinc coating per ASTM A 653/A 653M.

2.4 TENSION WIRE

A. Metallic-Coated Steel Wire: 0.177-inch- diameter, marcelled tension wire complying with ASTM A 817 and ASTM A 824, with the following metallic coating:

1. Type II, zinc coated (galvanized) by electrolytic process, with the following minimum coating weight:

    a. Matching chain-link fabric coating weight.

2.5 SWING GATES

A. General: Comply with ASTM F 900 for gate posts and single and double swing gate types.

1. Gate Leaf Width: As indicated.
2. Gate Fabric Height: 72 inches or less.

B. Pipe and Tubing:

1. Zinc-Coated Steel: Comply with ASTM F 1043 and ASTM F 1083; protective coating and finish to match fence framing.
2. Gate Posts: Round tubular steel.
3. Gate Frames and Bracing: Round tubular steel.

C. Frame Corner Construction: Welded.

D. Hardware:

1. Hinges: 180-degree outward swing.
2. Latches permitting operation from both sides of gate with provision for padlocking accessible from both sides of gate.
3. Panic hardware to be Von-Duprin model 99 with keyed cylinder dogging.

2.6 FITTINGS

A. General: Comply with ASTM F 626.

B. Post Caps: Provide for each post.

1. Provide line post caps with loop to receive tension wire or top rail.

C. Rail Fittings: Provide the following:

1. Top Rail Sleeves: Pressed-steel or round-steel tubing not less than 6 inches long.

D. Tension Bars: Steel, length not less than 2 inches shorter than full height of chain-link fabric. Provide one bar for each gate and end post, and two for each corner and pull post, unless fabric is integrally woven into post.

E. Truss Rod Assemblies: Steel, hot-dip galvanized after threading rod and turnbuckle or other means of adjustment.

F. Tie Wires, Clips, and Fasteners: According to ASTM F 626.

1. Standard Round Wire Ties: For attaching chain-link fabric to posts, rails, and frames, complying with the following:

a. Hot-Dip Galvanized Steel: 0.106-inch- diameter wire; galvanized coating thickness matching coating thickness of chain-link fence fabric.

G. Finish:

1. Metallic Coating for Pressed Steel or Cast Iron: Not less than 1.2 oz. /sq. ft. zinc.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for site clearing, earthwork, pavement work, and other conditions affecting performance of the Work.

1. Do not begin installation before final grading is completed unless otherwise permitted by Architect.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Stake locations of fence lines, gates, and terminal posts. Do not exceed intervals of 500 feet or line of sight between stakes. Indicate locations of utilities, lawn sprinkler system, underground structures, benchmarks, and property monuments.

3.3 INSTALLATION, GENERAL

A. Install chain-link fencing to comply with ASTM F 567 and more stringent requirements indicated.

3.4 CHAIN-LINK FENCE INSTALLATION

A. Post Excavation: Drill or hand-excavate holes for posts to diameters and spacings indicated, in firm, undisturbed soil.

B. Post Setting: Set posts in concrete at indicated spacing into firm, undisturbed soil.

1. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting with concrete or mechanical devices.
2. Concrete Fill: Place concrete around posts to dimensions indicated and vibrate or tamp for consolidation. Protect aboveground portion of posts from concrete splatter.

a. Exposed Concrete: Where posts are located in asphalt paving areas, extend 2 inches above grade; shape and smooth to shed water.
b. Concealed Concrete: Where posts are located in sidewalk or planter areas, top 2 inches below grade to allow covering with surface material.

C. Terminal Posts: Locate terminal end, corner, and gate posts per ASTM F 567 and terminal pull posts at changes in horizontal or vertical alignment of 30 degrees or more.

D. Line Posts: Space line posts uniformly at 96 inches o.c for fences to receive non-scalable security fabric. Line posts shall be uniformly spaced at 10 foot o.c. where standard fabric is used.

E. Post Bracing and Intermediate Rails: Install according to ASTM F 567, maintaining plumb position and alignment of fencing. Diagonally brace terminal posts to adjacent line posts with truss rods and turnbuckles. Install braces at end and gate posts and at both sides of corner and pull posts.

1. Locate horizontal braces at midheight of fabric 72 inches or higher, on fences with top rail and at two-third fabric height on fences without top rail. Install so posts are plumb when diagonal rod is under proper tension.

F. Tension Wire: Install according to ASTM F 567, maintaining plumb position and alignment of fencing. Pull wire taut, without sags. Fasten fabric to tension wire with 0.120-inch- diameter hog rings of same material and finish as fabric wire, spaced a maximum of 24 inches o.c. Install tension wire in locations indicated before stretching fabric. Provide horizontal tension wire at the following locations:

1. Extended along bottom of fence fabric. Install top tension wire through post cap loops. Install bottom tension wire within 6 inches of bottom of fabric and tie to each post with not less than same diameter and type of wire.

G. Top Rail: Install according to ASTM F 567, maintaining plumb position and alignment of fencing. Run rail continuously through line post caps, bending to radius for curved runs and terminating into rail end attached to posts or post caps fabricated to receive rail at terminal posts. Provide expansion couplings as recommended in writing by fencing manufacturer.

H. Intermediate and Bottom Rails: Install and secure to posts with fittings.

I. Chain-Link Fabric: Apply fabric to outside of enclosing framework. Leave 2 inches between finish grade or surface and bottom selvage unless otherwise indicated. Pull fabric taut and tie to posts, rails, and tension wires. Anchor to framework so fabric remains under tension after pulling force is released.

J. Tension or Stretcher Bars: Thread through fabric and secure to end, corner, pull, and gate posts with tension bands spaced not more than 15 inches o.c.

K. Tie Wires: Use wire of proper length to firmly secure fabric to line posts and rails. Attach wire at one end to chain-link fabric, wrap wire around post a minimum of 180 degrees, and attach other end to chain-link fabric per ASTM F 626. Bend ends of wire to minimize hazard to individuals and clothing.

1. Maximum Spacing: Tie fabric to line posts at 12 inches o.c. and to braces at 24 inches o.c.

L. Fasteners: Install nuts for tension bands and carriage bolts on the side of the fence opposite the fabric side.

3.5 GATE INSTALLATION

A. Install gates according to manufacturer's written instructions, level, plumb, and secure for full opening without interference. Attach fabric as for fencing. Attach hardware using tamper-

resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary.

3.6 ADJUSTING

A. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

END OF SECTION 32 31 13

SECTION 32 33 00 – SITE FURNISHINGS

PART 1 - GENERAL

RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Picnic Tables
2. Exterior Trash Receptacles
3. Owner-Furnished Equipment
4. Aluminum Bleachers

1.3 ACTION SUBMITTALS

A. Product Data: For the following:

1. Manufacturer’s standard submittal for review and approval.

B. Shop Drawings: Indicate materials, dimensions, tolerances, welding, fasteners, hardware, mounting, finish, and accessories. Include manufacturer's installation instructions.

1.4 QUALITY ASSURANCE

A. Manufacturer Qualifications: Minimum five years’ experience in producing site furnishings of the type specified.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver all materials in their original sealed containers bearing the manufacturer’s name and identification of product.

B. Do not store products in a location with conditions outside the manufacturer’s absolute limits.

C. Materials delivered to the site shall be examined for concealed damage or defects in shipping.

D. Defects shall be noted and reported to the Owner's Representative in writing.

1.6 PROJECT CONDITIONS

A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside the manufacturer’s absolute limits.

1.7 WARRANTY

A. Warranty: Manufacturer's standard warranty.

1. Seller warranties to replace, or at seller's option, repair any product or part thereof which is found to be defective in material or workmanship for a period of one year from date buyer accepts products. All parts and labor required under warranty provisions shall be supplied free of charge.
2. Transportation costs of returning the products to and from repair facility or costs involved with contractor personnel traveling to buyer's facility for the purpose of repairing products on site shall be borne by seller during the 1-year warranty period.

PART 2 – PRODUCTS

2.1 PICNIC TABLES

A. Provide the following Basis of Design products or approved equal.

1. Manufacturer: Wabash Valley Manufacturing, Inc., DFW International Commerce Park, 2580 Esters Blvd, Suite 100, DFW Airport, TX 75261 USA. 1-800-253-8619.
   a. Picnic Table 1: Profile/Prestige Series, 6’ portable picnic tables without backs, perforated pattern, in color as chosen by the owner from the manufacturer’s full range of standard colors.
   b. Picnic Table 2: Profile/Prestige Series, 6’ portable picnic ADA accessible table without backs, perforated pattern, in color as chosen by the owner from the manufacturer’s full range of standard colors.
   c. Picnic Table 3: Profile/Prestige Series, 46-inch octagon portable picnic tables with 4 seats without backs, perforated pattern, in color as chosen by the owner from the manufacturer’s full range of standard colors.
   d. Picnic Table 4: Profile/Prestige Series, 46-inch octagon portable, ADA accessible picnic table with 3 seats without backs, perforated pattern, in color as chosen by the owner from the manufacturer’s full range of standard colors.

2. Heat fused poly-vinyl coating, finished on inner-metal structure, to an approximate 3/16” thickness. Framework assemblies finished with powder coating; electrostatically applied and oven cured according to powder manufacturer’s specifications. With all required fasteners, stainless steel to resist corrosion.
3. Table Frame: Main supports constructed of 2-3/8” OD x 12 gage galvanized structural steel tubing. Mounting brackets, on legs, of ¼” plate.
4. Top & Seat: Expanded tops and seats using fabricated ¾” x #9 expanded steel mesh. Top and seat frame/mounting brackets of 10 gage steel. Top center support brace, running the length of the top, of ¼” x 1-1/2” steel flat bar. Ends of the rolled sides, of the top and seat, using a ½” diameter steel rod to add support. Seat using a ¼” x 1-1/2” steel flat bar for added support, on the underside of the seat’s crease, in the contour shape.
5. General: Ground space requirements for 6’ picnic tables are 62-3/8” x 72-1/8”. The benches are 18-1/4” to the highest part in the seat and 30-1/8” to the top of the table.
6. Color to be selected by Architect from Manufacturer’s standard color line.

B. Substitutions: Comparable products of other manufacturers will be considered under standard substitution procedures.

2.2 TRASH RECEPTACLES

A. Basis of Design: Classic Collection trash receptacles as manufactured by Wabash Valley Site Furnishings.

1. Manufacturer: Wabash Valley Manufacturing, Inc., DFW International Commerce Park, 2580 Esters Blvd, Suite 100, DFW Airport, TX 75261 USA. 1-800-253-8619.
2. Description: Steel, with flat top lid secured to container by steel cable. Adjustable feet to stabilize container on uneven surfaces.
3. Mounting: As indicated on Drawings
4. Pattern: Diamond
5. Finishes: Tiger Drylac, triglycidyl isocyanurate (TGIC) polyester powder coatings, 6-8 mils thick.
6. Color to be selected by Architect from Manufacturer's standard color line.
7. Capacity: 55 gallons
8. Lid Style: Flat top.
9 Provide 55 – gallon drum for each receptacle. Drum to be painted black.

B. Substitutions: Comparable products of other manufacturers will be considered under standard substitution procedures.

2.3 ALUMINUM BLEACHERS

A. Basis of Design: Preferred Series Bleachers, Model #BP-0324 as manufactured by Belson Outdoors.

1. Manufacturer: Belson Outdoor Products, 627 Amersale Drive, Naperville, IL 60563, 1-800-323-5664, www.belson.com
2. Description: Non-elevated aluminum 3 row bleachers, anchored to pad.
3. Design Loads:
    a. Live Loads:
        i. Uniform Loading – Structure = 100 psf
        ii. Uniform Loading – Seat and Foot Plank = 120 plf
    b. Sway Loads:
        i. Perpendicular to Seats – 10 plf
        ii. Parallel to Seats = 24 plf
    c. Wind Loads:
        i. Basic design winds speed = 150 mph (Exposure 'B").
4. Angle Frame Bleachers:
    a. Framework: Prefabricated aluminum angle spaced at 6'-0" intervals joined by means of aluminum cross bracing.
    b. Shop Connections: Welded to meet AWS standards and local code requirements.
    c. Joint Sleeve Assembly: Internal splices, where required, shall be two per joint, and shall penetrate the joint a minimum of 8" in each direction and be riveted at one end only to allow for contraction and expansion.
    d. Rise and Depth Dimensions:
        i. 6" vertical rise and 24" tread depth.
        ii. Seat height = 17" above its respective tread.
    e. Treads: Nominal two (2) 2" x 10" mill finish aluminum with anodized end caps on rows 2 and up.
5. Materials/Finishes:
    a. Framework: Aluminum.
        i. Structural fabrication with aluminum alloy 6061-T6 mill finish. Each frame shall be unit-welded, using metal inert gas method, under guidelines by

the American Welding Society. After fabrication all steel is to be hot-dipped galvanized to ASTM A-123 specifications. All crossbracing and horizontal bracing shall be aluminum alloy 6061-T6 mill finish.

b. Extruded Aluminum:
   i. Seat Planks: Aluminum alloy 6063 T-6, clear anodized 204R1, AA-M10C22A31, Class II with a wall thickness nominally .078" for impact and deformation resistance.
   ii. Tread Planks: Aluminum alloy 6063 T-6, mill finish, with a wall thickness nominally .078" for impact and deformation resistance.

c. Accessories:
   i. Channel end Caps: Aluminum alloy 6063-T6 clear anodized 204R1, AA-M10C22A31, Class II.
   ii. Hardware: Bolts and nuts shall be hot-dipped galvanized.
   iii. Hold Down Clip Assembly: Aluminum alloy 6063 T-6, mill finish.
   iv. Joint Sleeve Assembly: Aluminum alloy 6063 T-6, mill finish.

6. Install bleacher unit in accordance with manufacturer's written instructions and shop drawings.

B. Substitutions: Comparable products of other manufacturers will be considered under standard substitution procedures.

2.4 ACCESSORIES

A. Picnic Table Surface Mount Clips: Manufacturer's standard clip for 2-3/8" OD frame legs, with ½" diameter hole for anchorage, and powder coated finish of color to match table. Install clips using 3/8" diameter x 3" Stainless Steel Titen HD anchors as manufactured by Simpson Strong-Tie or approved equal.

2.5 OWNER-FURNISHED, CONTRACTOR INSTALLED EQUIPMENT

A. Exterior Benches
   1. Six (6) outdoor benches shall be bolted to the concrete flatwork. Location to be coordinated with the Owner's personnel.

2.6 FINISHES

1. All products shall be "0 (Zero) Lead", utilizing the lead safe work practices identified in the EPA Guidance Document titled "Steps to Lead Safe Renovation, Repair and Painting", pages 12 thru 23. This document is available electronically by contacting the WCSD RS&A Department at 775- 851-5675.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates upon which site furnishings will be installed. Verify that surfaces are clean, flat and level within manufacturer's recommended installation tolerances.

B. If preparation is the responsibility of another installer, notify Architect of deviations from manufacturer's recommended installation tolerances and conditions.

C. Do not proceed with installation until substrates have been properly prepared and deviations are corrected.

D. Commencement of installation constitutes acceptance of conditions.

3.2 ASSEMBLY

A. Assemble per manufacturer’s instructions, using all supplied fasteners.

3.2 INSTALLATION

A. Coordinate approved layouts and locations with Owner prior to final installation.

B. Install site furnishings in accordance with manufacturer's installation instructions.

B. Install site furnishings level, plumb, square, accurately aligned, correctly located per drawings, and without warp.

C. Mounting: Hardware and fasteners in accordance with manufacturer's instructions

1. For Site Furnishings with Embedded Mounting: Direct embedment of site furnishings to be minimum of 10-1/2 inches (267 mm) in concrete in accordance with manufacturer's instructions.
2 For Surface Flange Mounting Site Furnishings: Anchor site furnishings securely in place with 1/2-inch x 4-inch (13 mm x 102 mm) anchor bolts through flange holes.
3. For Free Standing Site Furnishings: Site furnishings to stand freely. Place in accordance with Drawings.

D. Fasten tables to concrete surface below using manufacturer’s standard picnic table surface mount clips. (4) clips per table; one clip per table leg. Fasten clips to concrete using the specified concrete screw anchors.

END OF SECTION 32 33 00

SECTION 32 84 00- PLANTING IRRIGATION

PART 1—GENERAL

1.01 WORK INCLUDED - Work of this Section generally includes provisions for the installation of an underground and surface installation landscape irrigation system including the following:

A. Static pressure verification and coordination of irrigation system installation with landscape material installation. Verification of a minimum flow of 30gpm @ 40 psi at the point of connection location.

B. Trenching, stockpiling excavation materials, refilling and compacting trenches.

C. Complete irrigation system from existing points of connection, including but not limited to, filter, flow sensor, piping, valves, fittings, emitter heads, controller wiring, and final adjustments to insure proper flow.

D. Water connection to existing system backflow per civil.

E. Replacement of unsatisfactory materials.

F. Clean-up, Owner Reviews, and Project Acceptance.

G. Testing of Irrigation System(s).

1.02 RELATED SECTIONS

A. Examine all sections related to project work.

1.03 REFERENCES

A. Perform Work in accordance with requirements of Conditions of the Contract and Division 01 - General requirements as well as provisions of all applicable laws, codes, ordinances, rules, and regulations.

B. Conform to requirements of reference information listed below except where more stringent requirements are shown or specified in Contract Documents.

1. American Society for Testing and Materials (ASTM) - Specifications and Test Methods specifically referenced in this Section.
2. Underwriters Laboratories (UL) - UL Wires and Cables.

1.04 QUALITY ASSURANCE

A. Installer Qualifications - Installer shall have had considerable experience and demonstrate ability in the installation of irrigation system(s) of specific type(s) in a neat orderly, and responsible manner in accordance with recognized standards of workmanship. To demonstrate ability and experience necessary for this Project, submit if requested by Owner and/or Owner Representative, prior to contract award the following:

1. List of 5 projects completed in the last 2 years of similar complexity to this Project. Description of projects shall include:
   a. Name of project.
   b. Location.
   c. Owner.
   d. Brief description of work and project budget.

e. Reference contact name & telephone number

B. Special Requirements:

1. Work involving substantial plumbing for installation of copper and/or ductile iron piping, backflow preventer(s), and related work shall be executed by licensed and bonded plumber(s). Secure a permit at least 48 hours prior to start of installation.
2. Tolerances - Specified depths of mains and laterals and pitch of pipes are minimums. Settlement of trenches is cause for removal of finish grade treatment, refilling, compaction, and repair of finish grade treatment.
3. Coordination with Other Contractors - Protect, maintain, and coordinate Work with Work under other Section.
4. Damage To Other Improvements - Contractor shall replace or repair damage to grading, soil preparation, seeding, sodding, or planting done under other Sections during Work associated with installation of irrigation system at no additional cost to Owner.

C. Pre-Construction Conference – Per phase Contractor shall schedule and conduct a conference to review in detail quality control and construction requirements for equipment, materials, and systems used to perform the Work. Conference shall be scheduled not less than 10 days prior to commencement of Work. All parties required to be in attendance shall be notified no later than 7 days prior to date of conference. Contractor shall notify qualified representatives of each party concerned with that portion of Work to attend conference, including but not limited to Architect, Owner, Contractor's Superintendent, and Installer.

1. Minutes of conference shall be recorded and distributed by Contractor to all parties in attendance within five days of conference.

1.05 SUBMITTALS - Prepare and make submittals in accordance with conditions of the Contract.

A. Materials List - Submit one digital copy of a complete materials list indicating manufacturer, model number, and description of all materials and equipment to be used.

B. Record Drawings (As-Builts):

1. At onset of irrigation installation secure Autocadd files of original irrigation design from Owner. At the end of every day, revise as-built prints for work accomplished that day in red ink. Irrigation system record/as-built field prints shall be brought up-to-date at the close of the working day every Friday by a qualified draftsperson. A print of record plan(s) shall be available at Project Site. Indicate zoning changes on weekly record drawings. Indicate non-pressure piping changes on record drawings. Upon completion of Project, submit for review, prior to final acceptance, final set of irrigation systems record drawings, and a compact disk containing Autocadd files of record drawings. Dimensions, from two permanent points of reference of buried components (building corners, sidewalk, road intersections or permanent structures), location of following items:
   a. Connection to existing water lines.
   b. Routing of irrigation pressure lines (dimension maximum 50 feet along routing).
   c. Control valves.
   d. Quick coupling valves.
   e. Manual drains
   f. Stop and waste valves.
   g. Drip line blow-out stubs.

h. Control wire routing if not with pressure mainline.
i. Gate valves.
j. Control wire splices
k. Pressure regulating valves
l. PVC lateral header to flexible tubing.
m. Shrub emitter flushing endcaps.

2. Contractor shall provide two bound copies of completed, approved record drawings and CD containing Autocadd file(s) of record drawings(s).

C. Operation Instructions - Submit 3 written operating instructions including winterization procedures and start-up, with cut sheets of products, and coordinate controller/watering operation instruction with Owner maintenance personnel.

1. Controller Charts
   a. Do not prepare charts until Owner has reviewed record (as-built) drawings.
   b. Provide one controller chart for each area installed.
      1) Chart may be reproduction of record drawing, scaled to fit into controller valve box. If reduction prints are required, keep reduction to maximum size possible to retain full legibility.
      2) Chart shall be blackline print of actual "as-built" system, showing area covered by that controller.
   c. Identify area of coverage of each remote control valve, using a distinctly different pastel color drawing over entire area of coverage.
   d. Following review of charts by Owner, they shall be hermetically sealed between two layers of 20-mm thick plastic sheet
   e. Charts shall be completed and reviewed prior to final review of irrigation system.

D. Manufacturer Warranties – Contractor shall provide Owner with two copies of written manufacturer warranties for one year as published by each equipment and material manufacturer for products installed on Project. Manufacturer warranty information shall be provided for controller(s), all valves, piping, heads, backflow preventer(s), enclosures and valve boxes.

E. Operating instructions and manufacturer warranty information shall be contained within three ring binder (one binder per set).

1.06 DELIVERY, STORAGE, AND HANDLING - Deliver, unload, store, and handle materials, packaging, bundling, products in dry, weatherproof, condition in manner to prevent damage, breakage, deterioration, intrusion, ignition, and vandalism. Deliver in original unopened packaging containers prominently displaying manufacturer's name, volume, quantity, contents, instructions, and conformance to local, state, and federal law. Remove and replace cracked, broken, or contaminated items or elements prematurely exposed to moisture, inclement weather, snow, ice, temperature extremes, fire, or jobsite damage.

A. Handling of PVC Pipe - Exercise care in handling, loading and storing, of PVC pipe. All PVC pipe shall be transported in a vehicle which allows length of pipe to lie flat so as not to subject it to undue bending or concentrated external loads. All sections of pipe that have been dented or damaged shall be discarded, and if installed, shall be replaced with new piping.

1.07 JOBSITE CONDITIONS:

A. Protection of Property:

1. Preserve and protect all trees, plants, monuments, structures, and paved areas not to be removed from damage due to Work of this Section. In the event damage does occur, all damage to inanimate items shall be completely repaired or replaced to satisfaction of Owner, and all injury to living plants shall be repaired by Owner. All costs of such repairs shall be charged to and paid by Contractor.
2. Protect buildings, walks, walls, and other property from damage. Flare and barricade open ditches. Damage caused to asphalt, concrete, or other building material surfaces shall be repaired or replaced at no cost to Owner. Restore disturbed areas to original condition.

B. Protection and Repair of Underground Lines:

1. Request proper utility company to stake exact location (including depth) of all underground electric, gas, or telephone lines. Take whatever precautions are necessary to protect these underground lines from damage. If damage does occur, Utility Owner shall repair all damage. Contractor shall pay all costs of such repairs unless other arrangements have been made.
2. Request Owner, in writing, to locate all private utilities (i.e., electrical service to outside lighting) before proceeding with excavation. If, after such request and necessary staking, private utilities that were not staked are encountered and damaged by Installer, Owner shall repair them at no cost to Installer. If Contractor damages staked or located utilities, they shall be repaired by Utility Owner at Contractor's expense unless other arrangements have been made.

C. Protection of Paving and Curbs - Where trenches and lines are near existing roadways, paths, curbing, etc., take whatever precautions are necessary to protect improvements and contractor shall replace or restore to original condition if any damage occurs.

1.08 WARRANTY/GUARANTY: - Contractor shall warrant materials, equipment and workmanship against defects for a period of 12 months from date of Substantial Completion.

A. Settling of backfilled trenches that may occur during guaranty period shall be repaired by Contractor at no expense to Owner, including complete restoration of damaged property.

B. Expenses due to vandalism prior to substantial completion shall be borne by Contractor.

C. Contractor will maintain planting areas during warranty period, so as not to hamper proper operation of irrigation system.

1.09 MAINTENANCE:

A. Furnish the following maintenance items to Owner prior to final Acceptance:

1. Two Sets of special tools required for removing, disassembling, and adjusting each type of irrigation head and valve supplied on this Project.
3. One 4’ foot valve keys for operation of gate valves.
4. One quick coupler keys and one matching hose swivel for each type of quick coupling valve installed.
5. Two aluminum drain valve keys of sufficient length for operation of drain valves.
6. Controller cage & cabinet keys.
7. (1) Rainbird LIMR- KIT remote control hand held kit

B. Winterization - include cost in bid for winterizing complete system at conclusion of irrigation season (in which system received final acceptance) within 3 days notification by the Owner. System shall be voided of water using compressed air or similar method reviewed by Owner. Reopen, operate, and adjust and/or repair system accordingly during April of following season within 3 days of notification by Owner.

PART 2 - PRODUCTS

2.01 MATERIALS:

A. General Piping:

1. Pressure Supply Line (from point of connection through backflow prevention unit) - Type "k" Rigid Copper or Brass.
2. Pressure Supply Lines (downstream of backflow prevention units) – Schedule 40 PVC Solvent Weld purple pipe
3. Non-pressure Lines – Schedule 40 PVC Solvent Weld – 1” minimum diameter.
4. PVC Sleeving – Schedule 40 PVC Solvent Weld. Purple pipe.
5. Drip Tubing - Pepco 3/4" flexible poly tubing or equal.
6. Emitter Distribution Tubing – ¼” As recommended by emitter manufacturer.

B. Copper Pipe and Fittings:

1. Copper Pipe - Type K.
2. Fittings - Wrought copper, solder joint type.
3. Joints - Soldered with solder, 45% silver, 15% copper, 16% zinc, and 24% cadmium and solidus at 1125~F and liquids at 1145~F.

C. Brass Pipe and Fittings:

1. Brass Pipe - 85% red brass, ANSI Schedule 40 screwed pipe.
   a. Teflon Tape – All brass male threaded fittings and nipples shall receive wrapping of Teflon tape applied to threaded surfaces per pipe manufacturer’s recommendations.
2. Fittings - Medium brass, screwed 125-pound class.

D. Plastic Pipe and Fittings:

1. Identification Markings:
   a. Identify all pipe with following indelible markings:
      1) Manufacturer's name.
      2) Nominal pipe size.
      3) Schedule of class.
      4) Pressure rating.
      5) NSF (National Sanitation Foundation) seal of approval.
      6) Date of extrusion.

2. Solvent Weld Pipe - Manufactured from virgin polyvinyl chloride (PVC) compound in accordance with ASTM D2241 and ASTM D1784; cell classification 12454-B, Type 1, Grade 1.
   a. Fittings - Standard Wright, Schedule 40, injection molded PVC; complying with ASTM D1784 and D2466, cell classification 12454-B.
      1) Threads - Injection molded type (where required).

2) Tees and ells - Side gated.

b. Threaded Nipples - ASTM D2464, Schedule 80 with molded threads.

c. Thread Sealant – All PVC male threaded fittings and nipples, excluding marlex fittings, shall receive non-hardening thread sealant/paste containing no petroleum distillates applied to threaded surfaces per pipe manufacturer's recommendations (Spears 75 Blue or equal).

d. Joint Cement and Primer - Type as recommended by manufacturer of pipe and fittings.

E. Drip Irrigation Systems:

1. Drip Tubing - Manufactured of flexible vinyl chloride compound conforming to ASTM D1248, Type 1, Class C, Category 4, P14 and ASTM D3350 for PE 122111C.
2. Fittings - Type and diameter recommended by tubing manufacturer.
3. Drip Valve Assembly – **Rain Bird XCZ-100-PRB-COM**
   a. Wye Strainer - Plastic construction with 200 mesh nylon screen and 1/2 inch blow-out assembly.
   b. Control Valve - 2 way, solenoid pilot operated type made of synthetic, non-corrosive material; diaphragm activated and slow closing. Include freely pivoted seat seal; retained (mounted) without attachment to diaphragm.
   c. Pressure Reducing Valve - Plastic construction, non-adjustable pressure setting of 40 PSI, as detailed.
4. Emitters – Pressure Compensating with insert barb (**Rain Bird XB-10)**

F. Gate Valves:

1. Gate Valves for 1 inch through 2-1/2 Inch Pipe - Brass construction; solid wedge, IPS threads, and non-rising stem with cross-type operating handle **(NIBCO T-113).**

G. Quick Coupling Valves - Brass two-piece body designed for working pressure of 150 PSI; operable with quick coupler. Equip quick coupler with locking rubber cover. **Rain Bird 44 LC**

H. Valve Boxes
1. Gate Valves, Quick Coupling Valves, Drain Valves, Drip Line Blow-out Stubs, and Wire Splice or Stub Box - Carson #910-10 box with lid. 6" round valve boxes are not acceptable.
2. 1 inch through 2 inch Control Valves, Pressure Regulating Valves - Carson Brooks #1220 box with lid.
3. Drip Valve Assemblies, 1 inch through 2 inch Master Valves - Carson #1220 box with lid.
4. ¾" Stop and Waste Valve – Cast iron stop box with adjustable barrel and cover with bolt – Tyler or equal.

I. Electrical Control Wiring:

1. Low Voltage:
   a. Electrical Control Wire - AWG UFUL approved No. 14, direct burial, single conductor, solid copper wire
   b. Electrical Common Wire - AWG UFUL approved No. 14, direct burial, single conductor, solid copper wire
   c. Wire Colors:
      1) Control Wires - Red.

2) Common Wires - White.
3) Master Valve Wires - Blue.
4) Spare Control Wires - Black.
5) Spare Common Wires - Yellow.

d. If multiple controllers are utilized, and wire paths of different controllers cross each other, both common and control wires from each controller shall be different colors approved by Owner.

e. Control Wire connections and splices shall be made with 3M DBY direct bury splice.

2. High Voltage - Type required by local codes and ordinances, of proper size to accommodate needs of equipment serviced.

J. Automatic Controller - Type shall be sized to permit each electric valve to have single, dedicated station on controller. Model(s) **Rainbird ESP LXME2 w/ IQ network cartridge**

K. Master Control Valve - Size and type shown on Drawings having manual flow adjustment and manual operational nut with internal bleed. **Rainbird PESB**

M. Backflow Preventer – Reduced pressure-principle model, exterior installation ; Brass; with 150 psi working pressure. **Existing per civil dwg.**

N. Flow Sensor- Size and type shown on Drawings. **CST FSI-T15-001**

O. Backflow cage per plan and “Bully Bag” cover, color green.

PART 3 - EXECUTION

3.01 SITE CONDITIONS, LANDSCAPE PLAN REVIEW AND COORDINATION

A. Contractor will be held responsible for coordination between landscape and irrigation system installation and coordination of phased demolition and improvements. Landscape material locations shown on the Landscape Plan shall take precedence over the irrigation system equipment locations. If irrigation equipment is installed in conflict with the landscape material locations shown on the Landscape Plan, the Contractor will be required to relocate the irrigation equipment, as necessary, at Contractor’s expense.

B. Contractor is responsible to notify Owner of any field conditions that vary from the conditions shown on the Irrigation Construction Documents. If Contractor fails to notify Owner of these conditions, Contractor will be held responsible for all costs associated with system adjustments required due to the change in field conditions. Contractor shall be responsible for interim watering of exist. trees to remain until new irrigation system is active.

3.02 STATIC PRESSURE & FLOW RATE VERIFICATION **-** Contractor shall field verify the static pressure after installation of the pressure regulator and verify a min. of 30 gpm flow rate at the point of connection, prior to commencing work or ordering irrigation materials, and submit findings, in writing, to Owner. If Contractor fails to verify static water pressure and flow rate prior to commencing work or ordering irrigation materials, Contractor shall assume responsibility for all costs required to make system operational and the costs required to replace any damaged landscape material. Damage shall include all required material costs, design costs and plant replacement costs.

3.03 INSPECTION: - Examine areas and conditions under which Work of this Section is to be performed. Do not proceed with Work until unsatisfactory conditions have been corrected.

SECTION 333100-SANITARY UTILITY SEWERAGE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 SUMMARY

A. The project requirements for sanitary sewer shall be those specified in Section 306 – Storm Drain, Culvers, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, Latest Edition, the requirements stated herein and the requirements shown on the contract documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Materials shall conform to the Plans and Standard Specifications for Public Works Construction, Latest Edition.

B. PVC pipe to be used for sanitary sewer systems shall meet the requirements of ASTM Specification D-3034, SDR 35 with bell and spigot type rubber-gasket joint.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. The requirements of Section 306 – Storm Drain, Culverts, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, 2016 edition, shall be incorporated into and made part of the project contract documents.

B. Sanitary sewer pipe, 8” and larger, and manholes shall be pressure tested as follows. Pressure testing of storm drain or storm drain manholes will not be required.

1. Sanitary Sewer Piping Air Test:

a. Each section of sewer shall be tested between manholes by plugging and bracing all openings in the main line and the upper ends of all service lateral connections. Prior to any air pressure testing, all pipe plugs shall be checked with soap solution to detect any air leakage. If any leaks are found, the air pressure shall be released, the leaks eliminated and the test procedure started over.
b. Air shall be introduced into the pipeline until 3.0 p.s.i. gauge pressure has been reached, at which time the flow of air shall be reduced and the internal pressure shall be maintained between 2.5 and 3.5 p.s.i. for at least 2 minutes to allow the air temperature to come to equilibrium with the temperature of the pipe walls. Pressure in the pipe shall be constantly monitored by a gauge and hose arrangement separate from the hose used to introduce air into the line. Pressure in the pipe shall not be allowed to exceed 5 psi.
c. After the temperature has stabilized and no air leaks at the pugs have been found, the air pressure shall be permitted to drop to 2.5 p.s.i. When the internal pressure has reached 2.5 p.s.i., the line shall be disconnected from the air source and a stop watch or sweep-second-had watch shall be used to determine the time lapse required for the air pressure to drop to 1.5 p.s.i. If the time lapse required for the air pressure to decrease from 2.5 p.s.i. to 1.5 p.s.i. exceeds the follow times, based on sewer pipe size, the pipe shall be presumed to be within acceptable limits for leakage:

    1) 8” sanitary sewer pipe: 2.5 minutes
    2) 10” sanitary sewer pipe: 3.0 minutes
    3) 12” sanitary sewer pipe: 3.5 minutes
    4) 15” sanitary sewer pipe: 4.5 minutes
    5) 18” sanitary sewer pipe: 5.5 minutes

d. If any section of pipe does not pass the pressure test, leaks shall be repaired and the test repeated.

2. Each new sanitary sewer manhole shall be tested for leakage using a vacuum test method conforming to ASTM test method C 1244.

END OF SECTION 333100

supply line trenches, strung as close as possible to main pipe lines with such wires to be consistently located below and to one side of pipe, or in separate trenches.

b. Bundle and tape all 24 volt irrigation wires with electrical tape at 15 foot intervals and lay with pressure supply line pipe to one side of the trench. Irrigation wiring installed above/over pressure supply line is not acceptable.

c. Provide an expansion loop at every pressure pipe angle fitting and every 100 feet. Form expansion loop by coiling wire bundle and lay formed coil in trench prior to backfilling.

d. Provide continuous loop of all spare “maintenance” wires (see below) within every valve box containing electric control valve or drip valve assembly (See item (h) below). Construct loop within valve box by wrapping wire at least 8 times around a 3/4 inch pipe and withdrawing pipe.

e. Make all splices and electric control valve connections using 3M Company DBY waterproof wire splice connector kits.

f. Install all control wire splices not occurring at control valve in a separate splice valve box.

g. Install one control wire for each control valve.

h. Maintenance Spare Wires - Install one spare #14 AWG UFUL control wires to each valve location and one common wire from irrigation controller to the end of each and every leg of mainline and or valve manifolds. Label spare wires at controller and wire stub box.

2. High Voltage Wiring for Automatic Controller and/or Pumps:

a. Provide electric power and connection(s) to automatic controllers and irrigation pumping system(s).

b. All electric work shall conform to local codes, ordinances, and authorities having jurisdiction. All high voltage electrical work shall be performed by licensed electrician.

c. Electrical one-line diagrams required for permitting are to be prepared and paid by Contractor. Drawings shall be submitted to building department by Contractor.

3. Trailer wire: Install (1) green wire from the back of the controller in all mainline & pvc lateral trenches.

E. Automatic Controller:

1. Install controller in accordance with manufacturer's instructions as detailed and where shown on Drawings.
2. Connect electric control valve wiring to controller in numerical sequence as shown on Drawings.
3. Exposed, bare ends of copper wiring connected to terminal strips shall not exceed 3/8” except where longer exposed length is required to complete connection.
4. Use of 18 ga. multi-strand cable within controller is not permitted unless noted on details or approved by Owner prior to installation.
5. Furnish 9 volt back-up battery.
6. Install IQ NCC network card. Verify school district form of IQQ NCC communication.

F. Drip Valve Assemblies - Install cross-handle four inches below finished grade where shown on Drawings as detailed. When grouped together, allow at least 12 inches between valve box sides. When installed adjacent to curbing and walks, allow 24 inches between valve box and walk/curb. Install each remote control valve in a same valve box per controller with box centered over valve assemblies. Install valve box flush with grade.

G. Quick Coupling Valves - Install quick couplers on swing-joint assemblies; plumb to grade. Angled nipple relative to pressure supply line shall be no more than 45 degrees and no less than 10 degrees.

H. Drip Emitters/bubblers - Stake all emitters/bubblers 1”-2” subsurface as detailed and staked with wire staples.

I. Drain Valves - Install one ¾” manual drain valve on pressure supply line directly downstream of backflow prevention device as detailed, In addition, install manual drain valve(s) at low point in pressure mainline(s) as dictated by field conditions. Provide a three cubic foot drainage sump for drain valve as detailed. Install (1) every 40 L.F. of mainline & (1) at every valve manifold.

J. Valve Boxes:

1. Install one curb stop valve box for each valve as detailed. Valve box extensions are not acceptable except for master valves, pressure regulating valves, or other irrigation equipment installed at depth of pressure mainline. Install gravel sump after compaction of all trenches. Place final portion of gravel inside valve box after valve box is backfilled and compacted.

K. Gate Valves - Install where shown on Drawings as detailed.

L. Backflow Prevention Device – Field verify it is in good operating condition.

M. Backfilling - Do not begin backfilling operations until required system tests have been completed. Backfill shall not be done in freezing weather except with review by Owner. Leave trenches slightly mounded to allow for settlement after backfilling is completed. Trenches shall be finish graded prior to walk-through of system by Owner.

1. Materials - Excavated material is generally considered satisfactory for backfill purposes. Backfill material shall be free of rubbish, vegetable matter, frozen materials, and stones larger than 1 inch in maximum dimension. Do not mix subsoil with topsoil. Material not suitable for backfill shall be hauled away. Contractor shall be responsible for providing suitable backfill if excavated material is unacceptable or not sufficient to meet backfill, compaction, and final grade requirements.
2. Do not leave trenches open for a period of more than 48 hours. Open excavations shall be protected in accordance with OSHA regulations.
3. Compact backfill to 90% maximum density, determined in accordance with ASTM D155-7 utilizing the following methods:
   a. Mechanical tamping.
   b. Puddling or ponding. Puddling or ponding and/or jetting is prohibited within 20’-0" of building or foundation walls.

N. Filter: Install self flushing filter after verification of flow rate per mfg. spec. Filter shall be installed with a 2” flush valve with threaded union joint for maintenance. The 2” pipe joint for maintenance. The 2” pipe lateral from flush valve shall not extend more than 15’ from flush vale t sump. Coordinate 110 power source for filter operation with general contractor. Provide a minimum 3’ x 3’ x 3’ sump with ¾” drain rock. Install protective cover over filter for protection.

O. Piping Under Paving:

1. Provide for a minimum cover of 24 inches between the top of the pipe and the bottom of the aggregate base for all pressure and non-pressure piping installed

under asphaltic concrete or concrete paving.

2. Piping located under areas where asphalt or concrete paving will be installed shall be bedded with sand (a layer 6" below pipe and 6" above pipe).
3. Compact backfill material in 6" lifts at 90% maximum density determined in accordance with ASTM D155-7 using manual or mechanical tamping devices.
4. Piping under existing walks or concrete pavement shall be done by jacking, boring, or hydraulic driving, but where cutting or breaking of walks and/or concrete is necessary, it shall be done and replaced at not cost to Owner. Obtain permission to cut or break walks and/or concrete from Owner.

P. Water Supply and Point of Connection - Water supply shall be extended as shown from existing reclaimed water meter supply line.

3.06 FIELD QUALITY CONTROL:

A. Flushing - After piping and valves are in place and connected, but prior to installation of emitter/bubbler heads, quick coupler assemblies, thoroughly flush piping system under full head of water pressure from dead end fittings. Maintain flushing for 5 minutes through furthermost valves. Cap risers after flushing. If nay line breaks occur during construction, open end plugs and flush lines prior to running emitters/bubblers.

B. Testing - Conduct tests in presence of Owner. Arrange for presence of Owner 48 hours in advance of testing. Supply force pump and all other test equipment.

1. After backfilling, and installation of all control valves, fill pressure supply line with water, and pressurize to 40 PSI over the designated static pressure or 120 PSI, whichever is greater, for a period of 2 hours. Pressure testing of pressure supply line utilizing compressed air is not acceptable.
2. Leakage, Pressure Loss - Test is acceptable if no loss of pressure is evident during the test period.
3. Leaks - Detect and repair leaks.
4. Retest system until test pressure can be maintained for duration of test.
5. Before final acceptance, pressure supply line shall remain under pressure for a period of 48 hours.

C. Walk-Through for Substantial Completion:

1. Arrange for Owner's presence 48 hours in advance of walk-through.
2. Entire system shall be completely installed and fully operational prior to scheduling of walk-through. This shall include all control valves capable of being operated via irrigation controller.
3. Electrically operate each zone in its entirety for Owner at time of walk-through and additionally, open all valve boxes if directed.
4. Owner shall generate a list of items to be corrected prior to Final Completion.
5. Furnish all materials and perform all work required to correct all inadequacies of coverage due to deviations from Contract Documents.
6. During walk-through prior to installation of mulches, expose all drip emitters under operation for observation by Owner to demonstrate that they are performing and installed as designed, prior to placing of all mulch material. Schedule separate walk-through if necessary.
7. Supply Owner with one set of full-size prints (not original drawings) of completed contractor-prepared irrigation as-built field drawings prior to start of substantial completion walk-through.

D. Walk-Through for Final Completion: After 1 year maintenance period.

1. Arrange for Owner's presence 48 hours in advance of walk-through.
2. Show evidence to Owner that Owner has received all accessories, charts, record drawings, and equipment as required before Final Completion walk-through is scheduled.
3. Electrically operate each zone, in its entirety for Owner at time of walk-through to insure correction of all incomplete items.
4. Items deemed not acceptable by Owner shall be reworked to complete satisfaction of Owner.
5. If after request to Owner for walk-through for Final Completion of irrigation system, Owner finds items during walk-through which have not been properly adjusted, reworked, or replaced as indicated on list of incomplete items from previous walk-through, Contractor shall be charged for all subsequent walk-throughs. Funds will be withheld from final payment and/or retainage to Contractor, in amount equal to additional time and expenses required by Owner to conduct and document further walk-throughs as deemed necessary to insure compliance with Contract Documents.

3.07 ADJUSTING - Upon completion of installation, "fine-tune" entire system by regulating valves, adjusting emitters/bubblers, and setting pressure reducing valves at proper and similar pressure to provide optimum and efficient coverage and per soil infiltration capacity.

A. If it is determined that irrigation adjustments will provide proper coverage, and improved water distribution as determined by Owner, contractor shall make such adjustments prior to Final Acceptance, as directed, at no additional cost to Owner. Adjustments may also include changes in nozzle sizes, degrees of arc, and control valve throttling.

B. Areas which do not conform to designated operation requirements due to unauthorized changes or poor installation practices shall be immediately corrected at no additional cost to the Owner.

3.08 CLEANING - Maintain continuous cleaning operation throughout duration of work. Dispose of, off-site at no additional cost to Owner, all trash, debris and excess soil generated by installation of irrigation system

3.09 Instruct owner on operation of irrigation components.

END OF SECTION

SECTION 32 93 00 - PLANTS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Plants.
2. Planting soils.

1.2 DEFINITIONS

A. Backfill: The earth used to replace or the act of replacing earth in an excavation.

B. Duff Layer: The surface layer of native topsoil that is composed of mostly decayed leaves, twigs, and detritus.

C. Finish Grade: Elevation of finished surface of planting soil.

D. Manufactured Topsoil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

E. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. This includes insecticides, miticides, herbicides, fungicides, rodenticides, and molluscicides. It also includes substances or mixtures intended for use as a plant regulator, defoliant, or desiccant.

F. Pests: Living organisms that occur where they are not desired, or that cause damage to plants, animals, or people. These include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.

G. Planting Soil: existing, native surface topsoil; existing, in-place surface soil; imported topsoil; or manufactured topsoil that is modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

H. Root Flare: Also called "trunk flare." The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.

I. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

J. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.

K. Surface Soil: Soil that is present at the top layer of the existing soil profile at the Project site. In undisturbed areas, the surface soil is typically topsoil; but in disturbed areas such as urban environments, the surface soil can be subsoil.

L. Plants: Container grown stock only, no bare root.

1.3 SUBMITTALS (1 digital copy)

A. Product Data: For each type of product indicated, including soils and plant list nursery photos of plants to be purchased for approval..

B. Samples of mineral mulch, topsoil, playground bark, rock cobble.

C. Product certificates.

D. Soil Analysis Reports

E. Maintenance Instructions: Recommended procedures to be established by Owner for maintenance of plants during a calendar year from date of substantial completion.

1.4 QUALITY ASSURANCE

A. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.

1. Pesticide Applicator: State licensed, commercial.

B. Soil Analysis: For each soil type, furnish soil analysis and a written report by a qualified soil-testing laboratory after import topsoil installation(if req.) and/or site grading has been completed. Onsite blended topsoil in planter areas shall be submitted to Full Circle Soil & Compost following their soil analysis process. 775-267-5305.

1. Report suitability of tested soil for plant growth of turf and container material.

a. State recommendations for nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce satisfactory planting soil suitable for healthy, viable plants.
b. Report presence of problem salts, minerals, or heavy metals; if present, provide additional recommendations for corrective action.

C. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI Z60.1.

D. Preinstallation Conference: Conduct conference at site dictated by owner.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver container plants to site, keep root system moist until planting.

B. Do not prune trees and shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.

C. Handle planting stock by container.

D. Store bulbs, corms, and tubers in a dry place at 60 to 65 deg F (16 to 18 deg C) until planting.

E. Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.

1.6 WARRANTY

A. Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.

1. Failures include, but are not limited to, the following:

a. Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner, or incidents that are beyond Contractor's control.
b. Structural failures including plantings falling or blowing over.

2. Warranty Periods from Date of Planting Substantial Completion:

a. Shrubs, Vines, and Ornamental Grasses: 12 months.
b. Ground Covers, Biennials, Perennials, and Other Plants: 12 months.
c. Trees: 24 months.

1.7 MAINTENANCE SERVICE

A. Initial Maintenance Service: Provide maintenance by skilled employees of landscape Installer. Maintain as required in Part 3. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established but for not less than maintenance period below.

1. Maintenance Period for Trees and Shrubs: 12 months from date of planting substantial completion.
2. Maintenance Period for Ground Cover and Other Plants: Twelve months from date of planting substantial completion.

PART 2 - PRODUCTS

2.1 PLANT MATERIAL

A. General: Furnish nursery-grown container plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant Schedule or Plant Legend shown on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

B. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which shall begin at root flare according to ANSI Z60.1. Root flare shall be visible before planting.

2.2 INORGANIC SOIL AMENDMENTS

A. Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:

1. Class: T, with a minimum of 99 percent passing through No. 8 (2.36-mm) sieve and a minimum of 75 percent passing through No. 60 (0.25-mm) sieve.
2. Class: O, with a minimum of 95 percent passing through No. 8 (2.36-mm) sieve and a minimum of 55 percent passing through No. 60 (0.25-mm) sieve.

B. Sulfur: Granular, biodegradable, and containing a minimum of 90 percent sulfur, with a minimum of 99 percent passing through No. 6 (3.35-mm) sieve and a maximum of 10 percent passing through No. 40 (0.425-mm) sieve.

C. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.

D. Aluminum Sulfate: Commercial grade, unadulterated.

E. Perlite: Horticultural perlite, soil amendment grade.

F. Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through No. 50 (0.30-mm) sieve.

G. Sand: Clean, washed, natural or manufactured, and free of toxic materials.

H. Diatomaceous Earth: Calcined, 90 percent silica, with approximately 140 percent water absorption capacity by weight.

I. Zeolites: Mineral clinoptilolite with at least 60 percent water absorption by weight.

2.3 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch (25-mm) sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:

B. Sphagnum Peat: Partially decomposed sphagnum peat moss, finely divided or granular texture, with a pH range of 3.4 to 4.8.

C. Muck Peat: Partially decomposed moss peat, native peat, or reed-sedge peat, finely divided or of granular texture, with a pH range of 6 to 7.5, and having a water-absorbing capacity of 1100 to 2000 percent.

D. Wood Derivatives: Decomposed, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture and free of chips, stones, sticks, soil, or toxic materials.

E. Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, debris, and material harmful to plant growth.

2.4 FERTILIZERS

A. Bonemeal: Commercial, raw or steamed, finely ground; a minimum of 4 percent nitrogen and 20 percent phosphoric acid.

B. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.

C. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:

1. Composition: 1 lb/1000 sq. ft. (0.45 kg/92.9 sq. m) of actual nitrogen, 4 percent phosphorous, and 2 percent potassium, by weight.

D. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:

1. Composition: 20 percent nitrogen, 10 percent phosphorous, and 10 percent potassium, by weight.

E. Planting Tablets: Tightly compressed chip type, long-lasting, slow-release, commercial-grade planting fertilizer in tablet form. Tablets shall break down with soil bacteria, converting nutrients into a form that can be absorbed by plant roots.

1. Size: 10-gram tablets.
2. Nutrient Composition: 20 percent nitrogen, 10 percent phosphorous, and 5 percent potassium, by weight plus micronutrients.

2.5 PLANTING SOILS

A. Planting Soil: Existing, native surface soil formed under natural conditions with the duff layer retained during excavation process. Landscape contractor shall test onsite soil and provide an agricultural soil lab suitability report and submit for approval prior beginning landscape and irrigation work. Soil report amendments shall be incorporated into planter area native soil prior to irrigation work. In drip line of existing trees amendments shall be surface applied. Clean soil of roots, plants, clods, clay lumps, pockets of coarse sand, concrete slurry, concrete layers or chunks, cement, plaster, building debris, and other extraneous materials harmful to plant growth. In addition to amending planter soil prior to planting amend plant pit backfill material per soil analysis recommendations.

PART 3 - EXECUTION

3.1 PLANTING AREA ESTABLISHMENT

A. Loosen blended planter area soils to a minimum depth of 12 inches (300 mm) if soil has become compacted. Remove sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.
1. Planter area: Spread amendment on top of planter soil to a depth per soil analysis and incorporate into exist. soil (with exception of ex. drip line areas). Do not spread if soil or subgrade is frozen, muddy, or excessively wet.

B. Finish Grading: Grade planting areas and or to a smooth, uniform surface plane with loose, uniform texture. Planters shall drain per civil grading plan.

3.2 EXCAVATION FOR TREES AND SHRUBS

A. Planting Pits and Trenches: Excavate circular planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are not acceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit smeared or smoothed during excavation.

1. Excavate a minimum of three times as wide as ball or container diameter.
2. Excavate at least 12 inches (300 mm) wider than root spread and deep enough to accommodate vertical roots for bare-root stock.
3. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball. Incorporate soil amendments into plant pit excavations prior to backfilling plant.

B. Mounding: Mounding per landscape plan is to be installed by the landscape contractor. Mounding shall be amended topsoil to follow general layout per landscape plan. Mounding is to be rounded at the top. Coordinate mounding with retaining wall construction. Final shaping and contouring of mounds to be approved by landscape architect. Provide drainage around mound away from building per civil grading plan intentions.

A. Subsoil removed from excavations may be used as planting soil. Plant pit backfill shall be amended per a soil analysis.

3.3 TREE, SHRUB, AND VINE PLANTING

A. Before planting, verify that root flare is visible at top of root ball according to ANSI Z60.1.

B. Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.

C. Set stock plumb and in center of planting pit or trench with root flare flushwith adjacent finish grades.

1. Use native amended plant excavation soil in all areas for backfill.
2. Container-Grown: Carefully remove root ball from container without damaging root ball or plant.
3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
4. Place planting tablets in each planting pit when pit is approximately one-half filled; in amounts recommended in soil reports from soil-testing laboratory. Place tablets beside the root ball about 1 inch (25 mm) from root tips; do not place tablets in bottom of the hole.
5. Continue backfilling process. Water again after placing and tamping final layer of soil.

D. When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the

surrounding soil. Apply enough soil to cover the downhill side of the root ball, maintain with rock rip rap as required to maintain plant basin.

3.4 TREE, SHRUB, AND VINE PRUNING

A. Remove only dead, dying, or broken branches. Do not prune for shape.

B. Prune, thin, and shape trees, shrubs, and vines according to standard professional horticultural and arboricultural practices. Unless otherwise indicated by Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.

3.5 GROUND COVER AND PLANT PLANTING

A. Set out and space ground cover and plants other than trees, shrubs, and vines as indicated in even rows with triangular spacing.

B. Use amended and excavated planting soil in all landscape areas for backfill of plant pits.

C. Dig holes 3x larger than container to allow spreading of roots.

D. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.

E. Water thoroughly after planting, taking care not to cover plant crowns with wet soil.

F. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.6 PLANTING AREA MULCHING

A. Mulch backfilled surfaces of planting areas and other areas indicated.
   1. Compost Mulch in Plant Basins: Apply 2” for 5 gal. or less and 3” for greater than 5 gal. thickness of compost mulch over whole surface of individual plant watering basin area, and finish level with adjacent finish grade of mineral mulch. Do not place mulch within 4” of trunks or stems. Place after rock and or d.g. mulch is installed.
   2. Mineral Mulch: Provide a minimum of 4” minimum depth of rock or decomposed granite mulch per plan.

3.7 PLANT MAINTENANCE

A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings. Spray or treat as required to keep trees and shrubs free of insects and disease.

B. Fill in as necessary soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.

C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use practices to minimize the use of pesticides and reduce hazards.

D. Apply pesticides and other chemical products and biological control agents in accordance with authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.

E. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.

END OF SECTION 32 93 00

SECTION 331100-WATER UTILITY DISTRIBUTION PIPING

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. The Echo Loder Elementary School water is supplied from the Truckee Meadows Water Authority (TMWA).

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2012 Edition, as adopted by City of Reno.

1.3 CODE COMPLIANCE AND STANDARDS

A. American Water Works Association –AWWA

B. Truckee Meadows Water Authority – TMWA

1.4 QUALITY ASSURANCE

A. All materials shall be certified new from factory. Pipe, fittings, and valves shall be made in the USA or Canada to AWWA and ANSI standards and suitably stamped. Piping components made in other countries shall not be used unless specifically approved in advance by the Project Coordinator.

1. Acceptable suppliers for AWWA C900 and C905 pressure water pipe are:

a) CertainTeed Corporation
b) Diamond Plastics Corporation
c) PW Eagle Inc.
d) Other equal alternates

B. Backflow prevention devices and installations shall conform to all requirements of Truckee Meadows Water Authority.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Storage:

1. Contractor shall be responsible for inspecting materials delivered to site for damage.
2. Materials shall be stored on-site in enclosures or under protective coverings.
3. Joint materials, fittings, valves, and gaskets shall be stored under cover out of direct sunlight.

B. Handling:

1. Pipe, fittings, valves and other accessories shall be handled in such a manner as to ensure delivery to the trench in sound, undamaged condition.
2. Special care shall be taken to avoid injury to coatings and linings on pipe and fittings. Damaged coatings and linings shall be repaired by the Contractor to the satisfaction of the Project Coordinator.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Pipes 4 inches and larger:

1. AWWA C900 PVC, Class 235, bell and spigot
2. AWWA C151 ductile iron pipe, cement mortar lined, Class 150

B. Fitting:

1. 4 to 12 inch shall be AWWA C153 ductile iron, 350 psi working pressure, cement motar lined, 1 mill thick exterior petroleum asphaltic coating. Mechanical joints with concrete thrust blocks or Mega-Lug joints with thrust blocks.

C. Polyethylene pipe for water services shall meet the requirements of AWWA C901-88, Pressure Rated for 200 psi.

D. Polyethylene wrap to be used on all ductile iron pipe and fittings per AWWA Standard C105.

E. Valves:

1. Gate valves to be 200 psi working pressure, factory coated, iron body, resilient wedge gate valves. Non-rising stem. Mueller A-60 series, American AVK series 25, or equal.

PART 3 - EXECUTION

3.1 TRENCHING, BACKFILLING AND COMPACTING

A. Trenching:

1. The owner may limit the amount of trench to be opened at any time.
2. Minimum depth from finished grade to top of pipe is 36”.

B. Bedding:

1. Ditch bedding shall be accurately graded with a minimum of six inches (6”) of sand. Sand shall pass a ¼ inch screen with mot more than fifteen percent (15%) passing a No. 200 sieve. Sand shall be backfilled to a minimum of six inches (6”) above the pipe casing. Bedding shall be laid to firmly support the piping along its entire length.

C. Backfilling: Backfilling of trenches shall progress as rapidly as construction, testing, and acceptance of word permits.

D. Damage Repair: Utilities, wall, piping, and other improvements damaged during the course of work shall be repaired to their original condition or replaced by the contractor.

E. Excess Material: Excess material and debris shall be removed and disposed of at an approved disposal site, within one week after final approval of installation.

3.2 PIPING INSTALLATION

A. Cleaning and disinfection:

1. Reference TMWA Appendix 9C for cleaning and disinfection procedures. Flush line before disinfecting. After disinfection, hydrostatically test piping. Owner must witness flushing, disinfection and hydrostatically testing before acceptance.

3.3 FIELD QUALITY CONTROL

A. The project coordinator or his representative will conduct field inspections and shall witness all field tests specified in this section. The contractor shall perform field tests and provide labor, equipment, and incidentals required for testing. The contractor shall produce evidence, when required by the project coordinator, that any item of work has been constructed properly in accordance with the contract drawings and specifications.

B. Field Test:

1. All anchor blocks and restraints shall be complete prior to testing. Concrete supports shall be fully cured. Disinfection completed. All Joints exposed for testing.
2. Piping Hydrostatic Pressure Tests:

a. Test pressure gauges for a specific test shall have dials indicating not less than one and one half (1-1/2) times nor more than two (2) times the test pressure.
b. After installation of insulation, anchor blocks, and backfill, hydrostatic pressure shall be applied to 150 psig and allowed to stabilize to ground temperature while maintaining 150 psig, +/- 10 psi. After stabilization, pressure source shall be removed. Piping must hold 150 psig, +/- 10 psi, for at least four (4) hours. Leaks shall be repaired and the test repeated if the pressure does not hold.

END OF SECTION 331100

SECTION 333100-SANITARY UTILITY SEWERAGE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 SUMMARY

A. The project requirements for sanitary sewer shall be those specified in Section 306 – Storm Drain, Culvers, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, Latest Edition, the requirements stated herein and the requirements shown on the contract documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Materials shall conform to the Plans and Standard Specifications for Public Works Construction, Latest Edition.

B. PVC pipe to be used for sanitary sewer systems shall meet the requirements of ASTM Specification D-3034, SDR 35 with bell and spigot type rubber-gasket joint.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. The requirements of Section 306 – Storm Drain, Culverts, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, 2016 edition, shall be incorporated into and made part of the project contract documents.

B. Sanitary sewer pipe, 8” and larger, and manholes shall be pressure tested as follows. Pressure testing of storm drain or storm drain manholes will not be required.

1. Sanitary Sewer Piping Air Test:

a. Each section of sewer shall be tested between manholes by plugging and bracing all openings in the main line and the upper ends of all service lateral connections. Prior to any air pressure testing, all pipe plugs shall be checked with soap solution to detect any air leakage. If any leaks are found, the air pressure shall be released, the leaks eliminated and the test procedure started over.
b. Air shall be introduced into the pipeline until 3.0 p.s.i. gauge pressure has been reached, at which time the flow of air shall be reduced and the internal pressure shall be maintained between 2.5 and 3.5 p.s.i. for at least 2 minutes to allow the air temperature to come to equilibrium with the temperature of the pipe walls. Pressure in the pipe shall be constantly monitored by a gauge and hose arrangement separate from the hose used to introduce air into the line. Pressure in the pipe shall not be allowed to exceed 5 psi.
c. After the temperature has stabilized and no air leaks at the pugs have been found, the air pressure shall be permitted to drop to 2.5 p.s.i. When the internal pressure has reached 2.5 p.s.i., the line shall be disconnected from the air source and a stop watch or sweep-second-had watch shall be used to determine the time lapse required for the air pressure to drop to 1.5 p.s.i. If the time lapse required for the air pressure to decrease from 2.5 p.s.i. to 1.5 p.s.i. exceeds the follow times, based on sewer pipe size, the pipe shall be presumed to be within acceptable limits for leakage:

    1) 8” sanitary sewer pipe: 2.5 minutes
    2) 10” sanitary sewer pipe: 3.0 minutes
    3) 12” sanitary sewer pipe: 3.5 minutes
    4) 15” sanitary sewer pipe: 4.5 minutes
    5) 18” sanitary sewer pipe: 5.5 minutes

d. If any section of pipe does not pass the pressure test, leaks shall be repaired and the test repeated.

2. Each new sanitary sewer manhole shall be tested for leakage using a vacuum test method conforming to ASTM test method C 1244.

END OF SECTION 333100

SECTION 334100-STORM UTILITY DRAINAGE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Standard Specifications for Public Works Construction, 2016 Edition, as adopted by the City of Reno.

C. Geotechnical Investigation Report, titled Echo Loder Elementary School by Wood Rodgers dated November 25,2024.

1.2 SUMMARY

A. The project requirements for storm utility drainage piping shall be those specified in Section 306 – Storm Drain, Culverts, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, latest edition, the requirements stated herein and the requirements shown on the contract documents.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Materials shall conform to the Plans and Standard Specifications for Public Works Construction, Latest Edition.

B. PVC pipe to be used for storm utility drainage piping systems shall meet the requirements of ASTM Specification D-3034, SDR 35 with bell and spigot type rubber-gasket joint.

C. Ductile iron pipe used for storm utility drainage piping shall meet the requirements of ANSI/AWWA C151/A21.51, Pressure Class 150. Ductile iron pipe shall be poly encased per ANSI/AWWA C105, Method A.

D. Corrugated high density polyethylene (CHDPE) pipe ASTM specification D-3350 Type S (smooth interior lining)

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. The requirements of Section 306 – Storm Drain, Culverts, and Sanitary Sewer Construction, of the Standard Specifications for Public Works Construction, Latest Edition, shall be incorporated into and made part of the project contract documents.

EXECUTIVE SUMMARY

The project consists of razing the existing school building and campus amenities and constructing a new school with supporting infrastructure. The school structure is anticipated to be two stories, masonry block with slab-on-grade flooring, and conventional spread foundations. Foundation loads are anticipated to be moderate. Porte-chocheres are anticipated at school entrances and drop-off zones. No significant below-grade improvements (wet-wells, elevator pits, etc.) are anticipated for the project. Grading information was not available at the time of this report; however, due to the need for clay mitigation, maximum cuts and fills are anticipated to be on the order of ±5 feet.

The site is located in Reno, Washoe County, Nevada and encompasses an area of approximately 6.85 acres. The development area is located at a central latitude and longitude of 39.5033°N and -119.7918°E, respectively. Currently, the western portion of the site is occupied by the existing campus. The eastern portion of the site is currently soccer field/park. The landscaped areas of the site feature trees and shrubs. During site clearance, existing utilities were identified to be located within the proposed building footprint.

Based on the preliminary revised geologic maps of the Reno urban area, Nevada (Ramelli, Henry, Walker, 2011), the site is mapped in an area of younger alluvial deposits (Qay) generally consisting of granular soils with some intermittent zones of gravels, sandy clays, and sandy silts. The soils encountered in our explorations typically consisted of 7 ½ to 12 ½-feet of medium to high plasticity clay soil (SC/CL) overlying medium dense to very dense sand to silty sand (SP-SM/SM) intercalated with layers of low to medium plasticity clay (CL) and clayey sand (SC) to the depths explored. With the exception of the presence of the near surface clay soils, subsurface conditions encountered are generally consistent with the geologic map.

Groundwater was encountered at an average depth of 10.8-feet, or approximate elevation of 4418.4-feet.

A liquefaction analysis has been performed as a part of this study by advancing boring B-1 to a depth of approximately 45-feet below existing ground surface. A maximum magnitude of 6.7 from the Mount Rose Fault Zone was estimated based on the USGS deaggregation application. ASCE 7-16 indicates a modified site peak ground acceleration of 0.8 g. Based on our analyses, liquefaction settlement is not modeled to occur.

Sulfate test results on the native soils yielded results in the S0 negligible range (ACI 318, < 0.10 percent SO_4^{2-} by mass). Per the American Concrete Institute and the Standard Specifications for Public Works Construction, no special concrete provisions are required to address sulfate resistance. Therefore, Type II cement may be used. ACI should be consulted to address concrete subject to deicing salts.

1. INTRODUCTION

Presented herein are the results of Wood Rodgers' geotechnical exploration, laboratory testing, and associated geotechnical design recommendations for construction of the new Echo Loder Elementary School. The assessments and recommendations presented in this geotechnical report have been determined, in part, around the surface and subsurface conditions identified by our exploration program which was developed to be consistent with locally accepted industry practices regarding exploratory means and methods for geotechnical investigations of similar projects. The proposed structural elements, topography, grading design, soils, and geology are all unique; therefore, the engineering judgment employed by those in responsible charge of geotechnical design is in general conformance with the accepted standards of care for engineering analyses as defined by the Nevada State Board of Engineers and Land Surveyors.

This report has been prepared in consideration of the applicable provisions of the International Building Code (IBC, 2018), ASCE 7-16, and the amendments and modifications adopted by the City of Reno. These documents establish the minimum requirements to safeguard the public health, safety and general welfare of the occupants as well as the minimum level of structural integrity, life safety, and fire safety for inhabitants of new and existing structures. Geotechnical considerations for public improvements have been formulated around the requirements of the City of Reno Public Works Design Manual and the Standard Specifications for Public Works Construction (SSPWC). Performance standards around which our primary recommendations have been framed are based upon the requirements of the referenced documents. Any expectations of performance inconsistent with, outside the purview of, or exceeding the requirements of the referenced documents are subjective and, therefore, a function of materials, design, workmanship, and ownership. Unless these expectations of performance are specifically stipulated or quantified herein, they are considered in excess to the scope and design standards of this report.

The objectives of this study were to:

1. Explore, test, and assess general soil, geology, and ground water conditions pertaining to design and construction considerations for the proposed development as required by the referenced IBC.
2. Provide recommendations for the design and construction of the project, as related to the identified geotechnical conditions and the stipulated design levels and performance standards established herein, and the requirements of the IBC.

2. SCOPE OF SERVICES

As indicated in our proposal, upon completion of our field and office studies, a geotechnical investigation report consistent with the requirements of the 2018 International Building Code (IBC) will be completed for the project and will present the following:

- Description of the project site with the approximate locations of our explorations, shown on a Site Plan.
- Descriptive logs of the explorations performed for this study.
- General summary of the site soils and geology.
- Summary of surface and ground water conditions encountered.
- Seismic Design values based on the most current IBC amendments adopted by the City of Reno and includes a discussion regarding site seismicity and parameters for design.
- A liquefaction analysis based on the 50-foot boring, and a discussion of related code literature as it pertains to liquefaction.
- Site preparation and grading recommendations developed for standard spread foundations.
- Foundation design parameters, including minimum depth, width, and anticipated settlements.
- Lateral earth pressures and design parameters, as applicable for retaining walls and planned structures.
- Concrete and concrete slab-on-grade support options.
- Drainage considerations that may affect foundation and concrete slab-on-grade performance.
- Structural pavement sections.
- Recommendations for additional exploration as appropriate.

Our study included field exploration, laboratory testing, and engineering analyses to identify the physical and mechanical properties of the various on-site materials. Results of our field exploration and testing programs are included in this report. In consideration of the stated design levels and performance standards, these results form the basis for our conclusions and recommendations.

3. PROJECT CHARACTERIZATION

3.1. Project Description

The project consists of razing the existing structure and campus improvements and constructing a new two-story school with ancillary infrastructure. The proposed structure is anticipated to be masonry block with structural reinforcement, slab-on-grade flooring, and conventional spread foundations. Foundation loads are anticipated to be moderate. Grading information was not available at the time this report was prepared. However, due to the need for clay mitigation, maximum cuts and fills are anticipated to be on the order of ±5 feet.

3.2. Site Conditions

The overall site, located in Reno, Washoe County, Nevada, encompasses an area of approximately 6.85 acres. The development area is located at a central latitude and longitude of 39.5033°N and -119.7918°E, respectively, and is bordered by Yori Avenue to the west, Apple Street to the north, commercial buildings to the east, and a multi-family residential development to the south (Figure 1).

The western portion of the site is currently occupied by the existing school campus. The eastern portion of the site is currently being used as a soccer field/park. The landscaped areas of the site feature trees and shrubs. Underground utilities, extending into the proposed building footprint, were identified during site clearance (Figure 2 – Improvement Plan and Approximate Exploration Locations).

3.3. Exploration

3.3.1. Drilling and Sampling

The project was explored in September 2024 by advancing a series of eight test borings with a CME 55 drill rig using flight auger and mud rotary techniques (Figure 3 – Site Map and Approximate Exploration Locations, Appendix A). Maximum depth of boring advance extended to 44.9-feet.

Standard Penetration Test (SPT) sampling consisted of driving a spilt spoon sampler into the ground and measuring the number of blows to advance the sampler a vertical distance of 18-inches. A drop weight system, utilizing a 140-pound hammer falling 30-inches, is used to drive three successive 6-inch increments. The first increment is considered “seating” the sampler, and the subsequent number of blows recorded to advance the second and third increments are the N-value blow counts or SPT-resistance. Uncorrected SPT blow counts are presented on B-1 in Appendix B of this report.

In addition to SPT sampling, soils were also sampled in-place with a 3-inch outer diameter (OD), 2 ½-inch inner diameter (ID) split-spoon sampler driven by a standard 140-pound drive hammer with a 30-inch stroke (California Modified Sampler, MC). Thin-walled brass liners, 2 ½ -inch OD by 2.42-inch ID, were used within the split-spoon sampler to collect disturbed samples. Per published Caltrans’ soil correlations, the reported MC blow counts were multiplied by a factor 0.65 to correlate to N-value (Standard Penetration Test (SPT), ASTM D1586).

Wood Rodgers' personnel examined and classified soils in the field in general accordance with ASTM D2488 (Description and Identification of Soils). As reported on the Logs of Borings (B-1a through B-1h in Appendix B of this report) blow counts, both SPT and MC, have not been corrected for overburden, hole diameter, nor hammer energy efficiency.

3.3.2. Geophysical Methods

Seismic refraction microtremor methods (ReMi ™) were performed to measure shear wave velocity and to establish $V_{S\ 100}$. Shear wave velocity measurements have been relied upon to aid in the determination of an appropriate Site Class (ASCE 7). B-3 (Appendix B) presents the shear wave geophysical profile.

3.4. Sampling, Classification and Reporting

Wood Rodgers' personnel examined and classified soils in the field in general accordance with ASTM D2488 (Description and Identification of Soils). During exploration, representative bulk samples were placed in sealed plastic bags and returned to our Reno, Nevada laboratory for testing.

Additional soil classifications, as well as verification of the field classifications, were performed in accordance with ASTM D2487 (Unified Soil Classification System [USCS]) upon completion of laboratory testing as described in the Laboratory Testing section. Logs of the explorations are presented as B-1a through B-1h in Appendix B. The USCS explanatory chart of soil unit symbols and related descriptions has been included as B-2 - Unified Soil Classification and Key to Soil Descriptions.

It should be noted that ASTM D2488 and ASTM D2487 are specific to geotechnical engineering characterization of soils and do not meet the scientifically based quantitative sampling protocols necessary for consideration in bidding.

3.5. Laboratory Testing

Soil testing performed in the Wood Rodgers' laboratory was conducted in general accordance with the standards and methods described in Volume 4.08 (Soil and Rock; Dimension Stone; Geosynthetics) of the ASTM Standards. Samples of significant soil types were analyzed to determine in-situ moisture contents (ASTM D2216), grain size distributions (ASTM D6913), plasticity indices (ASTM D4318), and R-Value (ASTM D2844). Test results were used to classify the soils according to the USCS (ASTM D2487) and to verify the field logs which were then updated. Test results are presented in Appendix C on C-1a through C-1f. Table 1 also presents a summary of the test data.

Table 1 - Summary of Test Data

Test Hole	Depth (Ft.)	Moisture (%)	%Gravel (+ #4)*	% Sand (#4-#200)	%Fines (-#200)	Liquid Limit	Plastic Index	R-Value	USCS

B-8	5.5-6.5	13.6	0.7	54.9	44.4	30	15	---	SC

* Since ASTM D2487 is limited by a maximum particle size of 3", the gradation test data presented is based on a maximum particle size of 3". Larger particles (i.e., 8 to 12" in diameter) if observed in our test holes would be documented on the logs and should be anticipated as part of grading.

Chemical testing was performed to indicate the potential for corrosion to concrete and steel elements has been presented on C-2a and C-2b.

Wood Rodgers, Inc. is not a corrosion engineering firm. Therefore, a corrosion engineer or structural engineer knowledgeable in the project steel specifications should be consulted for final assessments of corrosion potential at the site.

3.6. Geologic and General Soil and Groundwater Conditions

Based on the preliminary revised geologic maps of the Reno urban area, Nevada (Ramelli, Henry, Walker, 2011) presented in Figure 4 – Geologic Map, the site is mapped in an area of younger alluvial deposits (Qay) generally consisting of granular soils with some intermittent zones of gravels, sandy clays, and sandy silts.

The soils encountered in our explorations typically consisted of 7 ½ to 12 ½ -feet of medium plasticity clay soil (SC/CL) overlying medium dense to very dense granular sand (SP-SM/SM) intercalated with layers of low to medium plasticity clay (CL) and clayey sand (SC) to the depths explored.

Groundwater was encountered at an average depth of 10.8-feet, or approximate elevation of 4418.4-feet. Moist soils, i.e. soils near or above optimum were encountered as shallow as 2 ½-feet.

4. SEISMIC HAZARDS

The International Building Code (IBC) requires that structures assigned to Seismic Design Category D, E, or F be evaluated for the following potential geologic and seismic hazards: surface rupture or displacement due to faulting, slope instability, liquefaction including the potential for seismically induced spreading or lateral flow, and slope instability. The following sections present our discussion and assessments of the stipulated hazards. Discussions regarding total and differential settlement are incorporated with the foundation design considerations.

4.1. Surface Rupture

4.1.1. Evaluation Guidelines

In 1998, the Nevada Earthquake Safety Council formulated guidelines for evaluating potential surface rupture due to faulting. The intent of the guidelines is to provide *a standardized minimum level of investigation for fault rupture in Nevada*. It is our understanding that these guidelines will continue to be adopted with the 2018 Northern Nevada Amendments of the IBC. Specifically, the guidelines state that investigation of sites for potential surface rupture or hazards shall be included in all geotechnical investigations. Further, if any Quaternary age surface rupture is mapped or otherwise interpreted to be present on the site, the feature is to be investigated further.

In addition to establishing the minimum level of investigation for fault rupture, the guidelines also offer recommendations for dealing with or mitigating identified hazards, including:

- Holocene active faults (evidence of movement within the past 10,000 years) shall be set-back a minimum distance of 50-feet for occupied structures.
- Late Quaternary (evidence of movement within the past 130,000 years) faults shall not be spanned by any critical facilities (hospitals, schools, fire stations, etc.). Per the guidelines, the facility under investigation meets the requisite requirement to be considered critical.

These guidelines allow for set-back distances to be adjusted by the competent professional. No additional constraints regarding fault-structure location are presented in the guidelines.

4.1.2. Investigation

MyHAZARDS - Nevada was accessed to determine the presence of any mapped features transecting the property. The closest mapped Quaternary fault is approximately 0.5 miles west of the property. This fault has been identified as part of the Mount Rose Fault Zone and has been dated as late Quaternary (i.e. < 130,000 years) regarding recency of movement. This fault structure is sufficiently distant that offsets or additional considerations are not recommended nor required by the Guidelines. Surface rupture due to the identified structure is considered remote.

4.2. Soil Profile Type Amplification Factors

Seismic design values were determined on a representative latitude and longitude of 39.5033°N and -119.7918°E, respectively. The measured shear wave velocity profile, in tandem with ASCE 7-16 (Table 20.2-1) and the Northern Nevada Amendments of the 2018 IBC, resulted in Site Class CD being assigned to the project. In addition, the nature of occupancy results in Risk Category III for the structure. Soil profile type amplification factors were determined from the ASCE 7 Seismic Hazard tool as presented in Appendix D. Per the ASCE 7-16, the site's modified Peak Ground Acceleration (PGA_M) to be used for engineering analyses is 0.8 g.

4.3. Liquefaction

Liquefaction is a loss of soil shear strength that can occur during a seismic event as excessive pore water pressure between the soil grains is induced by cyclic shear stresses. This phenomenon is limited to poorly consolidated (Standard Penetration Test less than 30, overburden stress corrected shear wave velocity less than 700 fps) clean to silty sand/sandy silt lying below the ground water table (typically less than 50 feet deep). A liquefaction analysis has been performed as a part of this study by advancing boring B-1 to a depth of approximately 45-feet below the existing ground surface.

- A design magnitude of 6.7 from the Mount Rose Fault Zone (USGS Deaggregation Platform) was modeled for the project area.
- GeoLogismiki's LiqSVs software was used in our liquefaction analysis following the NCEER 1998 method. CMS blow counts with liners were corrected in the liquefaction analysis to reflect the SPT samplers without liners by multiplying the measured SPT N-Value by a factor of 0.65 (Caltrans, 2021).
- Based on our analyses, liquefaction settlement is not modeled to occur when considering percentage of clay fines, relationship between moisture content and the soil's liquid limit, and stiffness/consistency of the soil layers.

4.4. Seismic Compression

- Seismic compression is an accrual of volumetric strains during seismic events in unsaturated soil and is typically confined to poorly compacted engineered fills and Holocene soils. Therefore, the settlement potential due to seismic compression is considered negligible.
- Significant slopes and deep, loose engineered fills are not planned for the project. Therefore, the potential for significant settlement due to seismic compression is considered limited.

5. DISCUSSION AND RECOMMENDATIONS

5.1. General Information

- *Conformance with the Geotechnical Report:* The recommendations provided herein, particularly under Site Preparation, Grading and Filling, Foundations, Site Drainage, and Construction Observations and Testing Services are intended to reduce risks of structural distress related to consolidation or expansion of native soils and/or structural fills. These recommendations, along with proper design and construction of the planned structure(s) and associated improvements, work together as a system to improve overall performance. If any aspect of this system is ignored or poorly implemented, the performance of the project will suffer.

- *Clarification of Structural Areas:* Structural areas referred to in this report include all areas of buildings, concrete slabs, asphalt pavements, as well as pads for any minor structures or retaining walls. Areas which extend behind or under rockery or other retaining structures are considered structural zones. In addition, the structural zone shall be considered to extend at a 1:1 (H:V) slope out from the edge of the structural footprint. All compaction requirements presented in this report are relative to ASTM D 1557 (ASTM D Volume 4, 2022).

- *Hazardous Materials:* Any evaluation of the site for the presence of surface or subsurface hazardous substances is beyond the scope of this study. When suspected hazardous substances are encountered during routine geotechnical investigations, they are noted in the exploration logs and reported to the client. No such substances were identified during our exploration.

- *Backfill of Exploration Locations:* Explorations were advanced at the approximate locations shown in Figure 3 – Site Map & Approximate Exploration Locations. Each boring was backfilled upon completion of the field portion of our study with bentonite chips and/or cuttings.

- *SWPPP Requirements:* The site-specific Stormwater Pollution Prevention Plan (SWPPP), as required by the State of Nevada, will be the responsibility of the general contractor and/or owner. Recommendations presented herein regarding moisture conditioning are for the benefit of creating a targeted fill behavior. Moisture conditioning recommendations are not intended to direct the contractor in their means and methods for dust and SWPPP control.

- *Public Improvements:* Recommendations for paved improvements in right-of-way areas will be consistent with City of Reno standards. On-site parking and driveway recommendations are in general conformance with AASHTO's Low Volume Road design protocols, the Portland Cement Association (PCA) and American Concrete Institute (ACI) recommendations. Underground utilities will be provided by a variety of public and private companies; trenching and backfill recommendations presented herein are generally consistent with OSHA and City of Reno's requirements, respectively.

5.2. Earthwork

5.2.1. Clarification of Geomaterials

The following definitions characterize terms utilized in this report:

- Clay soil possesses more than 30 percent by weight passing the number 200 sieve and exhibits a plasticity index greater than 15.
- Granular soil does not meet the above criteria and has a maximum particle size less than 6-inches.

It should be noted these definitions have been formulated around anticipated soil behavior and may not coincide with classifications provided by the Unified Soil Classification System.

5.2.2. Clearing and Grubbing

All vegetation and topsoil should be cleared and grubbed from structural areas. A minimum stripping depth of 0.3 to 0.5 feet is anticipated especially within the soccer field/park area. Localized deeper areas of clearing may be required in areas of large brush and trees or where large root balls are encountered. Vegetation and organic debris should be disposed offsite.

5.2.3. Removal of Existing Improvements

Debris and remnants from the demolished structures and pavements should be removed from the site. The entire site should then be proof rolled with a fully loaded water truck or scraper and observed for deflection indicative of uncontrolled or undocumented fill or pre-existing improvements. Wood Rodgers' personnel should monitor demolition and site clearing activities to document unsuitable materials, structures, or utilities indicated by the proof rolling program. Where existing utilities are to be abandoned, abandonment shall be performed in accordance with the standards of utility owner.

5.2.4. Undocumented Fill

Any undocumented fill encountered during demolition and/or site grading must be dozed up, stockpiled, and qualified prior to use as fill. Refer to Section 5.2.7 Mass Grading for placement limitations of undocumented fill, as well as material quality and compaction requirements for reuse of undocumented fill.

5.2.5. Subgrade Preparation

As presented in Table 2, separation from clay soils is required for structural improvements. Clay soils shall be excavated to the depths indicated below base or footing grade for the specified improvements. The over-excavation shall begin at least 1-foot beyond building pad limits and begin at least 6-inches beyond site-work and parking and driveway right-of-way limits. Over-excavation shall extend at a 1:1 (H:V) away from the improvement until the separation requirement is met or granular soils are encountered.

Table 2 - Separation Requirements for Clay Soils from Structural Improvements

Improvement	Minimum Separation (ft)
Standard Spread Footings (Residential and Retaining Walls)	2.0
Slab-on-Grade Flooring	1.0[2]
Site Work (curbs, gutter, sidewalk, exterior slabs)	1.0[2]
Structural Pavement Sections	1.0[2]

[1] Refer to Section 5.2.1 for definition of clay soil.

[2] Separation indicated is below base grade.

Insitu clay soils exposed at the bottom of the over-excavation should be scarified for a minimum depth of 12-inches, moisture conditioned at least optimum and compacted to between 88 and 92-percent of the soil's maximum dry density (ASTM D1557) prior to placing fill or constructing improvements. Insitu granular soil, where encountered, should be scarified for a minimum depth of 12-inches, moisture conditioned to within 3-percent of optimum and compacted to not less than 90-percent of the soil's maximum dry density (ASTM D1557) prior to placing fill or constructing improvements. In all cases, the final subgrade shall be smooth, firm, and relatively unyielding as determined by the testing agencies' qualified representative.

5.2.6. Subgrade Stabilization

Due to historic irrigation associated with the park, the clay soils encountered within the project may tend to pump and or destabilize where moisture content exceeds optimum. Care should be taken during grading to assure irrigation water, precipitation, or construction activities do not lead to an increase in or ponding of water on exposed grade. Pumping soils may be scarified and allowed to dry or removed and replaced with a layer of clean, angular, 12-inch minus rock fill or stabilized with a geogrid. The size of the rock could vary depending on the soil's consistency and depth of soft, saturated soils. Typically, a stabilization depth of 12 to 18-inches is adequate to develop a firm and relatively unyielding subgrade, but variations may exist.

The rock zone should be separated from the adjacent soils by encasing the rock in a geomembrane such as Mirafi 180N installed per the manufacturer's instructions. As an alternative, the use of a stabilizing geogrid (such as Tensar TX160), complemented by an aggregate layer to bridge unstable and/or pumping subgrade, may be used to stabilize subgrade. Subgrade stabilization is a trial-and-error process, and it is recommended that a test section of suitable depth and length be conducted. The contractor should propose a stabilization protocol that is consistent with their readily available means and methods, and this proposal presented for review, by the owner, the general contractor, and grading inspector.

Subgrade stabilization is considered adequate if the subgrade is firm and relatively unyielding (as approved by the engineer's representative) when proof-rolled with a fully loaded water truck or if adequate compaction can be achieved in subsequent fill lifts.

5.2.7. Mass Grading

Native soils and existing fills, generated from cut, may not be placed within the separation zone indicated in Table 2. Import structural fill, meeting the requirements of Table 3, shall be obtained from a commercial borrow source. Prior to importing material to the site, a submittal verifying import quality shall be received and approved by Wood Rodgers.

Table 3 - Guideline Specification for Import Structural Fill

Sieve Size (ASTM D6913)	Percent by Weight Passing Sieve
6 Inch	100
4 Inch	90 - 100
¾ Inch	50 - 100
No. 200	5 - 30
Maximum Liquid Limit (ASTM D4318)[2]	50
Maximum Plasticity Index (ASTM D4318)[2]	15
Soluble Sulfate Level (ACI 318, Table 4.3.1)	Negligible
R-Value (ASTM D2844)[3]	30 Min.

Structural fill shall be moisture conditioned to within 3-percent of optimum, placed in 12-inch maximum loose lifts, and compacted to not less than 90-percent of the soil's maximum dry density.

5.2.8. Trenching and Excavations

OSHA - Regulations amended in Part 1926, Volume 54, Number 209 of the Federal Register (Table B-1, October 31, 1989) require that the temporary sidewall slopes be limited to maintain trench stability. Minimum sidewall slopes and acceptable trench configurations are also presented in the referenced register.

Groundwater and seepage were noted as shallow as 10-feet; elevated moisture was encountered as shallow as 2 ½-feet. Groundwater and seepage can lead to instability within trench sidewalls and excavations and, therefore, should be appropriately considered by the contractor's person of knowledge.

Based on the results of our exploration program, it is our opinion that the upper 8-feet of the native soil profile is predominately Type B, although variations exist. Deeper soils, and soils within influence of groundwater, are predominately type C. Any fills should conservatively be considered Type C unless directed otherwise by the contractor's competent individual trained in trench safety.

All trenching should be performed and stabilized in accordance with local, state, and OSHA standards. Bank stability is the responsibility of the contractor or contractor's qualified representative who is present at the site, able to observe changes in ground conditions, and has control over personnel and equipment.

Pipe bedding, initial backfill, and trench backfill shall be consistent with the approved civil and/or utility plans.

5.2.9. Earthwork Testing and Observation

Verification of subgrade and fills should be performed by a firm that is AMRL accredited in ASTM E329. Special inspection of fill soils is required during mass grading for the project; the Special Inspector should be ICC certified in soils or NAQTC certified in Sampling and Density disciplines. The special inspector shall verify and document that placement of fill is consistent with the requirements of Mass Grading (5.2.7). Density testing of fills should be in accordance with ASTM D6938 (Standard Test Methods for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods) or ASTM D1556 (Standard Test Method for Density and Unit Weight of Soil in Place by Sand-Cone Method).

Subgrade should be density tested approximately every 500 square yards. Fill should be density tested once for every 1,000 square yards per lift of material placed during mass grading and one test per 300 feet of footing trenches or over-excavation of footings. One density test should be performed for each 500 square yards or per lift for smaller, localized fill zones. Full time construction observation is required for mass graded fills. Testing frequency should be increased if the contractor is having difficulty achieving and maintaining the required moisture levels.

Utility bedding and trench backfill should be density tested per the requirements of the governing agency. Typically, agencies prescribe density testing per foot of bedding/backfill thickness, at a frequency of one test between manholes or valves, or one test every 500 lineal feet, including laterals.

5.3. Structures

The following sections have been developed based on the understanding and expectation that the requirements specified in Section 5.2 Earthwork have been met.

5.3.1. Standard Spread Foundations

The following table and supporting statements present design values and considerations for use in the development of standard spread foundation design.

Table 4 - Allowable Foundation Bearing Pressures for Standard Spread Foundations

Loading Condition	Maximum Net Allowable Bearing Pressure (PSF)[1]
Dead Load Plus Full Time Live Load	4,000
Dead Load Plus Live Loads, Plus Transient Wind or Seismic Loads	5,200

[1] Net allowable bearing pressure is that pressure at the base of the footing is in addition to the adjacent overburden pressure.

For frost protection, footings should be founded at least two feet below adjacent outside or unheated interior finish grades. Interior footings not located within frost prone areas should be founded at least 12 inches below surrounding ground or slab level for confinement. Regardless of loading, individual pad

foundations and continuous spread foundations should be at least 18 and 12 inches wide, respectively, or as required by code. The minimum footing sizes recommended are based on the ability to develop bearing capacity. Footing dimensions should be determined by the engineer responsible for structural design.

Lateral loads, such as wind or seismic, may be resisted by passive soil pressure and friction on the bottom of the footing. A coefficient of base friction of 0.45 is typical to structural fills. Design values for active and passive equivalent fluid pressures of 37 and 350 pounds per square foot per foot of depth, respectively, can be utilized. When designing for passive pressure, the upper one foot of the soil profile should not be included unless confined by a concrete slab, or pavement.

The integrity of the foundation support soils shall be maintained until concrete is placed. Total post-construction settlement for the structure is anticipated to be on the order of 1-inch, or less. Differential settlement between foundations with similar loads and sizes is anticipated to be half of the total settlement.

5.3.2. Porte-Chocheres

Standard spread foundations or cast-in-drill-hole (CIDH) piers may be used to support covers for school entrances and drop off zones. Table 5 presents design values for CIDH alternatives. The design values presented in Table 5 have been based on a pier diameter of 2-feet and an embedment depth between 6 and 10-feet. Axial design values may be increased by a factor of 1.33 when considering dynamic loading such as wind or seismic.

Table 5 - Design Values for Drilled Shafts

Embedment Depth (FT)	Allowable Skin Friction (PSF)	Allowable End Bearing (PSF)	Lateral Bearing (PSF/F)[1, 2]
$6 \leq D \leq 10$	200	3,000	350

[1]Surface foot should be ignored unless confined by slab-on-grade or pavement.
[2]Limiting maximum design value, 1,400 psf/f.

Values presented in Table 2 have been based on modeled displacements of ½-inch for uplift (skin friction + weight), and up to ½-inch for end bearing. Actual displacement may be more closely modeled when specific design considerations are presented.

5.3.3. Site Drainage

Adequate surface drainage must be constructed and maintained away from the structure. The permanent finish slopes away from the structure should be constructed to allow water to drain away quickly from and prevent any ponding of water adjacent to the structure per code requirements. Runoff should be collected within permanent drainage paths that can convey water off the property or to designated collection facilities.

Foundation and stem wall backfill should be densified to at least 90 percent relative compaction in accordance with the requirements given in the Grading and Filling Section. Compacting the backfill material decreases permeability and reduces the amount of irrigation and storm water available to enter under floor areas.

5.4. Concrete

The American Concrete Institute (ACI) considers three different exposure classes to address the degree of severity for environmental conditions: freezing and thawing (Exposure Category F), concrete in contact with soil that contains water soluble sulfate ions (Exposure Category S), and Exposure Class W for concrete in contact with water. Exposure categories F and S, and potential mitigation, are discussed in Section 5.4.1.

5.4.1. Materials

The concrete material recommendations vary between Exposure Class F and Exposure Class S. Therefore, those specifying concrete subject to both freezing and thawing and water-soluble sulfate ions should consider the potential exposure conditions for Class F and Class S and select the most appropriate.

5.4.1.a. Exposure Class F (Exterior Slabs-on-Grade)

- The potential exists for some portions of concrete to absorb sufficient water to be saturated prior to freezing (Exposure Class F2).
- Where deicing chemicals are anticipated to be used (civil improvements), exposure Class F3 would be assigned.
- As presented in the Standard Specifications for Public Works Construction concrete requirements for Portland cement concrete exposed to freeze-thaw cycles, should include air entrainment (4 – 7%), maximum water: binder ratio of 0.45, and a minimum 28-day compressive strength of 4,000 psi.

5.4.1.b. Exposure Class S

The summary below presents excerpts from ACI and SSPWC. Refer to the referenced standards in their entirety when specifying sulfate resistance exceeding the presented geotechnical or civil considerations.

- Sulfate test results on the native soils yielded results in the S0 negligible range (ACI 318, < 0.10 percent SO_4^{2-} by mass).
- Type II cement may be utilized for project concrete unless specified otherwise by the structural engineer.

5.4.1.c. Chlorides

- Chemical test results on the native soils presented chloride ion concentrations of 14 mg/kg.

- The structural engineer should be consulted for any required mitigation due to the presence of chlorides.

5.4.2. Construction

Slabs-on-grade should be supported on a 6-inch, minimum, layer of Type 2, Class B aggregate base layer compacted to not less than 95-percent of the soil's maximum dry density unless subject solely to foot traffic. Concrete slabs-on-grade subject solely to foot traffic should be supported on a 4-inch, minimum, layer of Type 2, Class B aggregate based compacted to not less than 95-percent of the soil's maximum dry density.

A moisture vapor retarder (Stego Wrap 15 mil) should be considered for slab areas covered by moisture sensitive floor coverings, equipment, or environments. Moisture vapor layers should be placed in accordance with the manufacturer's instructions and below the base layer on a properly prepared subgrade.

All concrete placement and curing should be performed in accordance with procedures outlined by the American Concrete Institute. Special consideration should be given to concrete placed and cured during hot or cold weather conditions.

Western Nevada is a region with absorptive aggregates and exceptionally low relative humidity. Therefore, concrete flatwork will shrink and curl in a manner which is not typical of many other US regions. The occurrence of concrete shrinkage cracking may be reduced and/or controlled by limiting the amount of water within the mix (water cement ratio of 0.45 or less), the incorporation of crack control joints and proper concrete placing and curing practices including ACI 318 provisions for areas subject to freeze thaw conditions. Proper curing, finishing, control joints and reinforcing should be provided to minimize any damage resulting from shrinkage including cracks and slab curling.

Joint spacing, locally, is typically on 10-to-12-foot centers for large slabs and no more than five feet for sidewalks. Cracking that occurs within the slab-on-grade floors will often reflect through overlying improvements even if adequate substrate preparation has occurred. Control of the rate of moisture loss in concrete slab-on-grade improvements by using curing compounds, fogging, or other suitable means is imperative to protecting the slab from excessive curling. Slabs-on-grade will still exhibit some cracking and curling. The occurrence of concrete shrinkage cracks is independent of the soil supporting characteristics.

5.5. Public Improvements

Unless noted otherwise, public improvements shall be designed and constructed in accordance with the approved civil plans, the Standard Specifications for Public Works Construction, and the Washoe County School District's (WCSD)standard details.

5.5.1. Structural Pavement Sections

Materials and workmanship shall be consistent with the requirements of the Standard Specifications for Public Works Construction. Table 6 presents recommended minimum structural pavement sections for the project based on planned use. Minimum sections required by WCSD shall govern if more than specified in Table 6.

Table 6 - Structural Pavement Sections[1]

Road Type	Pavement Thickness (In.)	Pavement Type[1]	Type II Class B Base Course Thickness (In.)[2]
Bus Zones and Main Access Drives	4	2" Type 3 + Lime / 2" Type 2	6
Parking and Automobile Traffic Driveways	3	Type 3 + Lime	6
Dumpster Aprons[3]	6	Reinforced Portland Cement Concrete	6

[1] Per the Standard Specifications for Public Works Construction
[2] Base Course thickness is in addition to structural fill separation requirements presented in Table 2.
[3] Dumpster aprons should extend far enough from the trash enclosure so that the wheel loads are confined to the reinforced concrete pad.

The Contractor should submit a pavement mix design to the Owner or Engineer, for approval, at least five working days prior to paving. When pavement is placed directly adjacent to concrete flatwork, the finish compacted grade of the pavement should be at least ½ of an inch higher than the edge of adjacent concrete surface to allow adequate compaction of the pavement without damaging the concrete.

5.5.2. Pavement Design Life

Maintenance is mandatory to ensure long-term pavement performance and to meet or exceed the assumed 20-year design life. Maintenance refers to any activity performed on the pavement that is intended to preserve its original service life or load-carrying capacity. Examples of maintenance activities include patching, crack or joint sealing, and seal coats. If these maintenance activities are ignored or deferred, premature failure of the pavement will occur.

Premature failure of asphaltic concrete frequently occurs adjacent to poorly graded ponding areas and/or landscape areas. Failures may occur due to excessive precipitation, irrigation and landscaping water infiltrating into the subgrade soils causing subgrade failure.

In areas where saturation of the subgrade soils beneath asphaltic pavement may occur, it is strongly recommended the owner/project manager include provisions by design for a subdrain system to eliminate the potential for saturation of subgrade soils. The subdrain system should discharge into a permanent drainage area that will not impede drainage flow to cause the system to back-up and/or clog. Appropriate maintenance procedures should be implemented to ensure the subdrain system does not plug and allow

for proper drainage of surface and subsurface water beneath paved areas. Subdrain location and configuration should be evaluated once final grading and landscaping plans have been prepared.

The cost associated with proper maintenance is generally much less than the cost for reconstruction due to the premature failure of the pavement. Therefore, it is strongly recommended the owner/project manager implement a pavement management program.

6. CONSTRUCTION OBSERVATION AND TESTING SERVICES

The recommendations presented in this report assume that the contractors perform their work as required by the project documents and that owner/project manager provides for sufficient field-testing and construction review during each phase of construction.

Prior to construction, the owner/project manager should schedule a pre-construction conference including, but not limited to representatives of the owner, architect, civil engineer, the general contractor, earthwork and materials subcontractors, building official, and geotechnical engineer. The conference will allow parties to review the project plans, specifications, scheduling and recommendations presented in this report and discuss applicable material quality and mix design requirements.

Quality control reports should be submitted to the owner/project manager for review and distributed to the appropriate parties. It is essential that any changes or revisions to project plans be provided to Wood Rodgers in a timely fashion to ensure contractor compliance and avoid construction delays or the need to remove completed work.

During construction, Wood Rodgers Incorporated should have the opportunity to provide sufficient on-site observation of site preparation and grading, over-excavation, fill placement, foundation installation, and paving. These observations would allow us to document that the geotechnical conditions are as anticipated, and that the contractor's work meets the criteria stipulated in the approved plans and specifications. Verification of horizontal and vertical control must be provided by whoever was responsible for establishing those boundaries and constructing associated improvements.

7. STANDARD LIMITATION CLAUSE

This report has been prepared in accordance with generally accepted local geotechnical practices. The analyses and recommendations submitted are based upon field exploration performed at the specific locations identified and the conditions encountered, as discussed in our report. No guarantee or warranty as to the continuity of soil conditions between exploration points is implied or intended.

Therefore, this report does not reflect soil or water variations that may become evident during the construction period, at which time re-evaluation of the recommendations may be necessary. Final plans and specifications should be reviewed by the design engineer responsible for this geotechnical report to determine if they have been prepared in accordance with the recommendations contained in this report prior to submitting to the building department for review.

This report is issued with the understanding that it is the responsibility of the owner or their representative to ensure that the information and recommendations contained herein are brought to the attention of the design team for the project and incorporated into the plans and specifications, and that the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

We recommend our firm be retained to perform construction observation in all phases of the project related to geotechnical factors to document compliance with our recommendations. The owner/project manager is responsible for distribution of this geotechnical report to all designers and contractors whose work is related to geotechnical factors.

It is the contractor's responsibility for the grading and construction of the designed improvements. This responsibility includes the means, methods, techniques, sequence, and procedures of construction and safety of construction at the site. All construction shall conform to the requirements of the most recently adopted version of the Standard Specifications for Public Works Construction and the requirements of the City of Reno and Washoe County, Nevada.

Failure to inspect the work shall not relieve the contractor from their obligation to perform sound and reliable work as described herein and as described in the Standard Specifications for Public Works Construction. In the event of changes in the design, location, or ownership of the project after presentation of this report, our recommendations should be reviewed and possibly modified by the Geotechnical Engineer.

If the Geotechnical Engineer is not afforded the privilege of making this recommended review, we can assume no responsibility for misinterpretation or misapplication of our recommendations or their validity in the event changes have been made in the original design concept without our prior review. The engineer makes no other warranties, either expressed or implied, as to the professional advice provided under the terms of this agreement and included in this report.

This report was prepared by Wood Rodgers, Inc. for the benefit of WCSD Capital Projects and their duly assigned agents or other responsible parties. The material in this report reflects Wood Rodgers' best judgment considering the information available to it at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. Wood Rodgers accepts no responsibility for damages, if any, suffered by any third party because of decisions made by third parties or actions based on this report without consultation with Wood Rodgers and written approval for such actions.

				SC	CLAYEY SANDS WITH OR WITHOUT GRAVEL
FINE-GRAINED SOILS MORE THAN HALF IS FINER THAN NO. 200 SIEVE	SILT AND CLAY LIQUID LIMIT 50% OR LESS			ML	INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTS WITH SANDS AND GRAVELS
				CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY CLAYS WITH SANDS AND GRAVELS, LEAN CLAYS
				OL	ORGANIC SILTS OR CLAYS OF LOW PLASTICITY
	SILT AND CLAY LIQUID LIMIT GREATER THAN 50%			MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SANDY OR SILTY SOLID, ELASTIC SILTS
				CH	INORGANIC CLAYS OR HIGH PLASTICITY, FAT CLAYS
				OH	ORGANIC SILTS OR CLAYS MEDIUM TO HIGH PLASTICITY
HIGHLY ORGANIC SOILS				Pt	PEAT AND OTHER HIGHLY ORGANIC SOILS

CONSISTENCY		RELATIVE DENSITY	
SILTS & CLAYS	SPT BLOW* COUNTS (N)	SANDS & GRAVELS	SPT BLOW* COUNTS (N)
VERY SOFT	0 - 2	VERY LOOSE	0 - 4
SOFT	3 - 4	LOOSE	5 - 10
MEDIUM STIFF	5 - 8	MEDIUM DENSE	11 - 30
STIFF	9 - 15	DENSE	31 - 50
VERY STIFF	16 - 30	VERY DENSE	50 +
HARD	30 +		

* The Standard Penetration Resistance (N) In blows per foot is obtained by the ASTM D1585 procedure using 2" O.D., 1 3/8" I.D. samplers.

EXPLORATION PLASTICITY (PI) DESCRIPTIONS			
DESCRIPTION	RANGE	DESCRIPTION	RANGE
Nonplastic	<5	Medium	10-20
Low	< 10	Medium - High	15 - 25
Low - Medium	5 - 15	High	>25

DESCRIPTION OF ESTIMATED PERCENTAGES OF GRAVEL, SAND, AND FINES	
TRACE	Particles are present but est. < 5%
FEW	5% - 10%
LITTLE	15% - 20%
SOME	30% - 45%
MOSTLY	50% - 100%

NOTE: Percentages are presented within soil description for soil horizon with laboratory tested soil samples.

DEFINITIONS OF SOIL FRACTIONS	
SOIL COMPONENT	PARTICLE SIZE RANGE
BOULDERS	> 12 INCHES
COBBLES	3 to 12 Inches
GRAVEL	3 IN. TO NO. 4 SIEVE
COARSE GRAVEL	3 IN. TO 3/4 IN.
FINE GRAVEL	3/4 IN. TO NO. 4 SIEVE
SAND	NO. 4 TO NO. 200
COARSE SAND	NO. 4 TO NO. 10
MEDIUM SAND	NO. 10 TO NO. 40
FINE SAND	NO. 40 TO NO. 200
FINES (SILT OR CLAY)	MINUS NO. 200 SIEVE

WASHOE COUNTY SCHOOL DISTRICT

MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT

FACILITY AND MATERIAL LOCATION: Echo Loder ES **MDP #25-175**

DESCRIPTION OF WORK TO BE PERFORMED: Replacement

IT IS THE RESPONSIBILITY OF THE CONTRACTOR/WORKER TO IDENTIFY MATERIAL TYPE PRIOR TO DISTURBANCE. ONLY MATERIALS LISTED ON THIS PERMIT MAY BE DISTURBED. ANY NEW MATERIAL DISCOVERED OR ANY MATERIAL WHOSE EXACT NATURE OR CHARACTER IS UNCERTAIN REQUIRES A NEW PERMIT PRIOR TO DISTURBANCE. ANY CITATIONS OR ASBESTOS/LEAD CONTAMINATION RESULTING FROM THE IMPROPER OR UNAUTHORIZED DISTURBANCE OF ASBESTOS OR LEAD MATERIALS IS SOLELY THE RESPONSIBILITY OF THE CONTRACTOR. A COPY OF THIS PERMIT MUST BE SIGNED BY THE CONTRACTOR AND SUBMITTED TO THE DISTRICT PRIOR TO STARTING THE PROJECT.

ALL ITEMS	MATERIAL DESCRIPTION: **SEE FACS REPORT**
AHERA MATERIAL NUMBER: N/A	CONTAINS ASBESTOS ?: **SEE FACS REPORT**
MATERIAL DISTURBANCE INSTRUCTIONS: MATERIAL DISTURBANCE INSTRUCTIONS: THE PLANNING DEPARTMENT USED AN OUTSIDE CONSULTING COMPANY (FACS) TO CREATE AN ASBESTOS AND LEAD ASSESSMENT FOR THIS PROJECT. FOR LEAD AND ASBESTOS INFORMATION REFER TO THE FACS REPORT DATED 2/20/25. ANY QUESTIONS RELATED TO ASBESTOS AND LEAD CONTENT, OR DISTURBANCE REQUIREMENTS SHOULD BE ADDRESSED TO THE PLANNING DEPARTMENT, PROJECT MANAGER, OR FACS.	

NOTE: THE ASBESTOS MATERIAL DISTURBANCE INSTRUCTIONS LISTED ABOVE ARE BASED ON THE AHERA REGULATION. THERE MAY EXIST OTHER REGULATIONS THAT MAY BE MORE STRINGENT THEN THESE RECOMMENDATIONS. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO ENSURE COMPLIANCE WITH ALL REGULATIONS THAT ARE APPLICABLE TO THE DISTURBANCE OF ASBESTOS/LEAD CONTAINING MATERIALS. ASBESTOS IS A MICROSCOPIC FIBER AND THE CLEANING OF ASBESTOS DEBRIS MUST BE CONDUCTED TO A MICROSCOPIC LEVEL. IN THE EVENT THAT ANY VISIBLE DEBRIS IS DISCOVERED FROM A DISTURBANCE OR AIR SAMPLING RESULTS ARE NOT PROVIDED TO THE DISTRICT, THE DISTRICT WILL IMMEDIATELY HIRE A THIRD PARTY LEAD/ASBESTOS CONSULTANT TO INVESTIGATE POSSIBLE LEAD/ASBESTOS CONTAMINATION AND AN LEAD/ASBESTOS ABATEMENT CONTRACTOR TO PERFORM ANY RECOMMENDED CLEAN-UP. THE CONTRACTOR WILL BE REQUIRED TO REIMBURSE THE DISTRICT FOR ALL COSTS INCURRED. IF AIR MONITORING IS REQUIRED, AIR MONITORING MUST BE CONDUCTED THROUGHOUT THE PROJECT. AIR MONITORING RESULTS FAXED DIRECTLY FROM THE LAB TO THE ES&A DEPARTMENT @ 851-5695, WITHIN 48 HOURS OF THE DISTURBANCE

DATE ISSUED: October 14.2025

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE

Material Water & Lead Disturbance Permit, Water System Disturbance Permit Appendix Page #1

Contractors, their sub-contractors or workers are responsible in completing all work without impacting the water quality of District facilities and the domestic water supplies which feed district facilities. This Water System Disturbance Permit identifies the minimum requirements that Contractors, their sub-contractors and all workers will utilize to perform disturbance to the Districts water systems.

The following general requirements shall apply to any person who will be disturbing a District water system. In addition, they must contact the Environmental, Safety and Assessment Department (ES&A Dept) prior to any disturbance at 325-8494. This phone number has an answering machine and can be accessed 24 hours a day. These disturbances will be logged in and documented by the ES&A department.

All requirements for isolation are designed to protect the facility's potable water source from existing as well as potential cross-connections and to prevent any backflow occurrences in the form of backpressure or backsiphonage. The Water Disturbance Procedures listed are not site or incident specific and great care must be taken by technicians during all valving and isolation activities within a facility to prevent a potential backflow occurrence. There may be additional requirements that must be utilized to prevent any cross-connection or backflow occurrence, and each entity performing the disturbance is responsible for ensuring none occur and utilizing any additional steps as necessary to ensure none result from the completion of this project.

Any costs to correct any cross-connections and/or any backflow occurrences that result from the performance of this project are solely the responsibility of the Contractor, their sub-contractor and workers and the signing of this ES&A Department Disturbance Permit on acknowledges and agrees to this requirement.

FACILITY ISOLATION MINIMUM REQUIREMENTS

MECHANICAL ROOMS:

When turning off or disrupting the water service to a mechanical room all applicable requirements below must be conducted per this permit

1. **Remove all hoses from custodial faucets and bibs in location to be effected.**
2. **Shut down all boiler and chiller circulating pumps. Heating, Cooling and Domestic.**
3. **Shut down boiler, chiller and cooling tower if present.**
4. **Isolate boiler, cooling tower, chiller and relieve pressure from boiler.**
5. **Shut down hot water return pump, isolate any hot water heaters and turn off heating source.**
6. **Isolate domestic service to mechanical room.**
7. **Re-establish service to mechanical room in reverse order.**

BASIC WING:

When turning off or disrupting the water service to a facility wing all applicable requirements below must be conducted per this permit

1. **Remove all hoses from custodial, art and science faucets along with bibs in location to be effected.**
2. **Isolate all water utilizing chemical dispensers in location to be effected.**
3. **Shut down and isolate any water using equipment if applicable. Hot water heaters, domestic make ups for heat exchangers, photo labs, etc.**
4. **Isolate domestic cold water main to wing.**
5. **Re-establish service to wing in reverse order. Flush system at the end of each lateral to remove any and all foreign material and air.**

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE

Material Water & Lead Disturbance Permit, Water System Disturbance Permit Appendix Page #2

FACILITY:

When turning off or disrupting the water service to a facility all applicable requirements below must be conducted per this permit. Turning off or disturbing the waters services to a facility should only be done as a last resort. If it is possible to isolate the area of disturbance without disrupting facilities entire water service that is the way the project is to be accomplished. This will also keep the contractor, his sub-contractors or workers from having to perform all the listed requirements.

1. **Remove all hoses from custodial, art and science faucets along with bibs in entire facility.**
2. **Isolate mechanical room. See above requirements.**
3. **Isolate each individual wing where possible. See above requirements.**
4. **Isolate all irrigation laterals connected to the domestic potable water supply.**
5. **Isolate domestic cold water main at all locations present to allow as little drain back as possible.**
6. **Re-establish service to facility in reverse order. Flush system at the end of each lateral to remove any foreign material and air.**

PAINTS AND COATINGS – Material Disturbance Permit Appendix - Lead in Paints and Coatings in WCSD Facilities

Lead containing paints and coating are present in WCSD facilities. Bidders/Contractors that disturb lead containing or potentially lead containing paints or coatings, by law, are required to know all applicable regulations applicable and comply with all state and federal regulations that apply to the disturbances to lead paints and coating they are conducting. The regulations that requires by a contractor to be properly trained and knowledgeable, related to lead disturbance includes, but is not limited to the following:

- **OSHA Regulation CFR 1926.62 – Lead & Appendix A, B, C, & D – Lead Construction Standard.**
- **OSHA Regulation CFR 1910. 1025 - Lead & Appendix A, B, C, & D – General Industry Standard.**
- **EPA, 40 CFR Part 745 – Lead; Renovation, Repair, and Painting Regulation.**

Bidders/Contractors accept and acknowledge by signing this Material Disturbance Permit, the existence of lead related regulations, and accept all liability related to the disturbance of lead containing materials, citation resulting from, or any other costs the District may incur by the action of all parties of the bidders company or companies hired by the successful bidder to complete this project.

LEAD CATEGORY #N/A	**PAINTS, COATINGS & CERAMIC TILE IN BUILDINGS**
CONTAINS LEAD?: **SEE FACS REPORT**	**Buildings:** ALL

Lead Containing or Assumed Lead Containing Paints and Coatings Disturbance Instructions

The planning department used FACS to create an asbestos and lead assessment for this project. For lead and asbestos information refer to the FACS report dated 2/20/25.

OSHA Requirements

All persons performing any disturbance to coatings or paints to paints and coating in and on the buildings listed above must have taken an OSHA lead action level training class from a WCSD, ES&A department approved training provider, and utilize lead safe work practices. In addition, all work must be completed, as a minimum, utilizing the lead safe work practices identified in the EPA guidance document titled "steps to lead safe renovation, repair and painting", pages 12 thru 23. This document is available electronically at the following link: HTTP://WWW.EPA.GOV/LEAD/PUBS/STEPS.PDF.

EPA Renovation, Repair and Painting Regulation Requirements

In general, all firms that disturb 6 square feet of painted surface in a room or 20 square feet on the exterior within a 30 day period in **this** facility must comply with the EPA's Renovation, Remodel and Repair (RR&P) regulation and must be registered with the federal EPA. Per the Regulation, the area of disturbance is calculated, by adding up the entire surface areas being removed/disturbed, which then determines the amount of painted surface area disturbed. Work that involves window replacement or demolition of a painted surface, the RR&P regulation applies regardless of size. This regulation also requires that the contractor must assign a RR&P trained supervisor that is responsible for ensuring and documenting all work is conducted in compliance with the RR&P regulation and there are extensive record keeping and notification requirements that the Contractor must perform. In addition, This is a general overview of the regulation and the contractor must refer to regulation for additional requirements and information. Fines are expensive and the compliance with this regulation rests solely on the Contractor so it is very important that Bidders/Contractors are well versed in this regulation.

LEAD CATEGORY #N/A	PAINTS, COATINGS & CERAMIC TILE IN BUILDINGS CONSTRUCTED BEFORE 1978
CONTAINS LEAD?: **SEE FACS REPORT**	**Buildings:** ALL

– CONTINUED FROM PAGE #10

WCSD Requirements

In addition to regulatory requirements, the WCSD has requirements that must be met by the Contractor/Bidder. The contractor is responsible for submitting to the ES&A department lead disturbance procedures that outline the lead safe work practices to be utilized and that procedure must comply with the Districts minimum lead disturbance requirements. The current minimum lead disturbance requirements, which will apply to this project, follow these tables.

OSHA action level training and RR&P training certification and RR&P firm certification must be submitted to the project manager and they are to submit a copy to the ES&A department. The ES&A department must review, verify, and approve all required documentation **prior** to the contractor being able to perform any disturbance, so time for review must be taken into account when developing schedules. Once the ES&A department has approved the procedures and training and firm certification, the contractor may proceed but they must notify the ES&A department at 325-8490 of **any** paint/coating disturbance immediately disturbance prior to the disturbance**.** ES&A department personnel, project managers and assistant project managers and other district personnel will spot check in the field, to ensure compliance with the contractors submitted and approved procedures.

Refer to section listed below regarding lead sampling that may be available.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE

A NOTE ABOUT SAMPLING AND SAMPLING REQUEST PROCEDURES

Only approximately 20% of the paints and coatings in the District have been found to contain lead. The majority of white and off-white paints on sheetrock and block walls does not contain lead in facilities constructed after approx. 1990. Brighter or more colorful paints/coatings on any surface, or all paints and coatings on metals, are much more likely to be found to contain lead in all facilities. In addition, ceramic tile in any age facility is very likely to contain lead. It is highly recommended that sampling be done to confirm lead content unless time does not allow a delay for processing samples through the WCSD ES&A department. If paints and coatings are not sampled, all paints and coatings must be assumed to be lead containing, above 5000 parts per million (lead based), and treated in accordance with all lead regulations, lead specifications, and requirements identified in this permit.

The process to request lead sampling is for anyone requiring sampling to submit through their project's Project Manager. The designated WCSD Project Manager will submit the required sampling forms, and sampling will be coordinated by the ES&A department. A minimum of 10 days will be allowed before sampling results are provided to the Project Manager for them to be distributed to all interested parties. All lead sampling must be processed through the ES&A department, and sampled by ES&A approved and trained lead professionals.

Any paints or coatings that are not specifically addressed on this permit, or on the project drawings, has to be assumed to be lead containing, and above 5000 parts per million (lead based) – no exceptions. Any disturbance to those paints and coatings not specifically addressed on this permit or on the project drawings must be done by properly trained (Minimum of OSHA action level training) personnel, and those disturbances must be performed in accordance with all lead requirements listed in this permit, as well as any applicable regulations and local requirements. Many times scope modifications are required after the bid, and new areas of the facility may need to be disturbed. These areas would not have been addressed on this permit, since they were unknown at the time of issuance. Additional sampling could be conducted by requesting lead sampling through their project's Project Manager, but there will be a delay getting sampling requests and a new MDP would be required. The District reserves the right to direct the Contractor to assume new paints and coatings, due to scope changes, are lead containing and the contractor would then be required to treat all paints and coatings as lead containing in compliance with all requirements of this permit.

REPLACEMENT PAINTS, COATINGS, CERAMIC TILE, AND OTHER LEAD CONTAINING MATERIALS

Unless otherwise specifically allowed by this projects specifications, the Contractor shall not reinstall any lead containing paints/coatings in any detectable levels during the process of completing this project. "lead containing" is defined as any paint or coating that has ANY detectable lead level when paint chip sampling is conducted and chip is analyzed by the ICP method. The District may perform sampling of replacement materials and if analysis finds any detectable levels of lead, the Contractor will be liable for all costs to properly remove that material and re-apply paints and coatings with no detectable levels of lead. Contractors are encouraged to pre-sample paints they may be using to determine the actual amount in paint/coatings used.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE

MINIMUM REQUIREMENTS TO PERFORM ATTACHMENTS AND PENETRATIONS IN WCSD FACILITIES

Below are the minimum requirements to perform any Attachment and Penetration activity to a known or assumed asbestos and/or lead containing material in Washoe County School District (WCSD) facilities. This document is not provided to address demolition, stabilization, abatement, or removal activities. If any work to known or assumed asbestos or lead materials need to be done on this project, and it is anything other than the installation of screws, the removal of screws, or the drilling of holes, the successful bidder must comply with, in addition to these minimum requirements, all applicable District asbestos and lead specifications and requirements. Regarding these procedures, the District has done its best to provide a complete and regulatory compliant attachment and penetration procedure, but by signing this MDP, the Contractor acknowledges that it is the successful bidder's sole responsibly for compliance with this MDP, as well as any other applicable regulatory requirements.

ASBESTOS/LEAD PROCEDURE SUBMISSION PROCESS

Prior to starting this project, each contractor working on this project is required to submit to the WCSD ES&A department an asbestos/lead procedure that includes all District requirements listed below. To simplify the procedure submittal process, an electronic PDF fillable template of these requirements will be provided to the successful bidder of this project. This document is available by contacting the assigned WCSD Capital Projects Project Manager for this project. Contractors must utilize the most current above-mentioned electronic template and fill out all required information, add company letterhead, sign, and date the document. The completed procedures will be e-mailed to the Project Manager by all contractors working on this project that will performing any applicable disturbances. Once submitted, the WCSD Project Manager will pass the document onto the ES&A department for approval. Successful bidders are required to add time to their project schedule for this procedure submittal and approval process.

The Contractor has the option to submit a site-specific or blanket district-wide applicable procedure. A district-wide blanket procedure applies to a scheduled project, as well as all future sites where a contractor will be performing disturbances. The site specific procedure will apply to just one site or project. District-wide procedures are valid for one year from the date the procedure is signed by the ES&A department. Site specific procedures will be valid for the term of the project. Each Contractor must receive a signed and approved procedure prior to performing any disturbances to all asbestos/lead paint or assumed asbestos/lead paint materials. The procedure is a combined procedure and it addresses both asbestos and lead disturbances. A minimum of one work day will be required by the ES&A department for the review and approval process.

In addition to the Material Disturbance Permit (MDP), the Contractors must also have a copy of the approved procedures on site at all times. The purpose of this procedure is to document the agreement between the Contractor and the District that all lead and asbestos disturbances performed by staff of the Contractor will be done per all noted District requirements, District Specifications, and project specifications. Again, Contractors must ensure that their procedure has been approved, and the approved signed procedure is on site prior to any disturbance.

MINIMUM REQUIREMENTS

1. Receive approved Lead/Asbestos procedures as identified above.

2. Technicians performing disturbances will be required to have a minimum of AHERA 16 Hour O&M training and OSHA action level training per 29 CFR 1926.62 (i) (2) lead training. In addition, as applicable, contractors must comply with the EPA RR&P training and certifications requirements listed in the RR&P section of this appendix. Copies of training certifications, including a refresher within the last 12 months, will be provided to the ES&A Department **prior** to the start of any project. Only personnel with the proper minimum training will be authorized to perform any disturbance to asbestos/lead paint or assumed asbestos/lead paint containing materials, or be in the adjacent area of a disturbance.

3. Notify the ES&A Department at **325-8490** and leave a message with the time, name of the technician doing the work, date and exact locations in the school where they will be performing any disturbance. This call should take place immediately prior to disturbance, this phone number (**325-8490**) will go to voice mail, and the contractors are to provide notifications with above identified information, 24 hours a day. The Contractor is also required to notify their assigned WCSD Construction Department Project Managers and Assistant Project Managers of scheduled disturbances so they can also verify compliance with the contractors approved disturbance procedures.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE

4. Contractors must refer to this Material Disturbance Permit to determine what materials contain asbestos or lead and utilize the applicable lead/asbestos procedures. Some materials cannot be disturbed, and each specific material disturbance permit will identify what can be disturbed and provided material disturbance instructions. The minimum disturbance permits in this section of the material permit are in addition to any requirements listed in the material disturbance instructions. Any instance where 100% of the minimum asbestos/lead requirements are not followed, the District will immediately hire an environmental remediation contractor as well as an environmental consultant to properly clean up the contamination and perform air sampling. The contractor will be responsible for reimbursing the District for all costs due to any improper or unauthorized disturbances.

5. Contractors or technicians who are new to performing asbestos/lead paint or assumed asbestos/lead paint disturbances for the District must contact the Capital Projects PM/PCI Department and schedule a disturbance. A Capital Projects PM/PCI employee will be scheduled to review the technician's compliance with the disturbance procedures in the field. Once a technician has demonstrated on a minimum of two (2) occasions to the Capital Projects Department that he has an understanding of the District disturbance requirements and has proper equipment, the ES&A Department will then authorize that technician to perform disturbances without prior approval of the Capital Projects Department. Notifications prior to starting all disturbances as listed above will still be required and technicians should expect unannounced random compliance inspections, from the ES&A Department. A list of approved technicians is available upon request form the ES&A department.

6. Post the appropriate "Danger Lead - Keep Out" or "Danger Asbestos Keep Out" signs on the entry side of all doors leading into classrooms, hallways, bathrooms, offices or mechanical rooms where drilling is to occur. Doors will be closed. It is the contractor /technician's responsibility to take adequate means to keep the public or school staff out of the disturbance area.

7. Large rooms, such as multipurpose rooms, will have yellow caution tape placed across all entries to the room in addition to signage but access to these areas must be restricted to ensure no unprotected person can enter the areas where disturbances are taking place. If unprotected personnel can see the activity, this is not a large enough area of demarcation.

8. A 6 ml plastic drop will be placed under the disturbance in a manner that extends 6' out in all directions from the disturbance area. This poly drop can be reused if properly wet-wiped or HEPA-vacuumed off after use.

9. Worker will don the respiratory protection and a protective suit, (protective suits are optional for lead disturbance, "attachments and penetration" disturbances if the Contractor will not exceed the lead action level) and initiate personal air monitoring procedures per item #10 below. Respiratory protection is required throughout all asbestos/lead paint or assumed asbestos/lead paint disturbances in WCSD regardless of air sampling results.

10. If a Contractor is performing a **lead** attachments and penetrations (see the definition in #20 below), air sampling will be conducted at the start of the project. If air sampling results show the technicians performing the work is below the OSHA Lead Action Level, air sampling can be suspended unless the work being performed is changed. Air sampling will be performed for each type of lead attachment and penetration activity to develop a representative sample for each lead activity. Air sampling will be performed during **all** asbestos disturbances, no exceptions.

11. Drill the hole or holes as required using an HEPA VAC and a shrouded or dust collecting apparatus (i.e. Bit Buddy. A HEPA VAC is to remain running during this whole process to ensure all debris is cleared from hole. All clean-up must be conducted the HEPA Vacuum. If a contractor fails to properly control the asbestos/lead containing dust, the District will then hire an environmental remediation contractor as well as an environmental consultant to properly clean up the contamination. The contractor will be responsible for reimbursing the District for all costs due to improper disturbances that result in debris exiting the area of disturbance.

12. All HEPA vacuums used will have been DOP challenge tested prior to first use and annually thereafter. If this project involves 30 or more disturbances over the span of this project, the HEPA vacuum will be DOP tested on-site prior to the start of the project.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE

13. If required, to be determined by the technician, an encapsulant material may be sprayed or brushed on to the area of the holes.

14. A device, backing, box or raceway, or any other equipment will then be mounted using anchors installed per #11 above, with the HEPA VAC running and properly directed at the area of the disturbance.

15. A HEPA VAC or wet methods will be used to clean up any debris on 6ml poly drop, around device box, technician's suit, and any surfaces below holes, such as tops of chalkboards and base boards.

16. The poly drop, if utilized, will be folded into itself in such a manner as to not spread any debris, the HEPA vacuum hose sealed, and personal air monitoring time logged appropriately. This poly drop can be reused if it is properly wet-wiped or HEPA-vacuumed off after use.

17. All signs and equipment are to be removed, and the technician is to move to the next location. The contaminated suit should be removed and a new suit utilized at the new disturbance location, unless the suit can be properly decontaminated.

18. Upon completion of a shift, air samples will be dated and sent in to a properly accredited lab to be analyzed. Results will be forwarded to WCSD. Lab results will be e-mailed directly from the lab to the ES&A Department within 48 hours of the disturbance. All lab results will reference the Material Disturbance Permit (MDP) # located on the top of the first page of this permit. Results without the MDP number prefix will be returned to the lab for clarification and the addition of the MDP tracking number

19. All debris, waste, poly drop, suits, etc. will be placed in 6 mil poly waste bags (double bagged) and disposed of properly.

20. The definition of "Attachment and Penetrations" in this document is **only** the drilling of holes through a HEPA shrouded device, the installation of screws through a HEPA shrouded device, or the removal of screws through a HEPA shrouded device. **Any other activity** that is not attachments and penetrations as listed in item #20 must be designed by an asbestos or lead project designer, done per a lead specification, and supervised by the District or District hired outside asbestos/lead consultant. Contractors cannot perform any work, other than "Attachments and Penetrations" without an onsite District or District hired asbestos or Lead Consultant being present.

21. All asbestos abatement or lead disturbances, other than "Attachment and Penetrations", must be completed in full compliance with applicable regulations, the District's Asbestos Abatement Specifications, and District hired asbestos or lead consultants supplement specifications. If in error, an asbestos abatement bid or quote is put forth without the District Asbestos Abatement Specifications, Contractors are required to request a copy of the most current asbestos abatement specifications from the bid or quote entity through the formal bid inquiry process

THE UNDERSIGNED AGREES TO COMPLY WITH THE CONDITIONS OF THIS MATERIAL, WATER & LEAD DISTURBANCE PERMIT, APPENDIXES, & ALL APPLICABLE REGULATIONS. UNDERSIGNED ACKNOWLEDGES LIABILITY FOR ANY COSTS THE DISTRICT MAY INCUR TO INVESTIGATE & CLEAN UP ANY DISCOVERY OF IMPROPER AND/OR UNAUTHORIZED DISTURBANCES DONE BY UNDERSIGNED'S EMPLOYEE(S) OR SUB-CONTRACTOR(S) TO MATERIALS LISTED AS LEAD/ASBESTOS-CONTAINING BY THE DISTRICT. IN ADDITION, THE UNDERSIGNED AGREES TO ALL REQUIREMENTS OF THE WATER & LEAD APPENDIX.

Executive Summary

Forensic Analytical Consulting Services, Inc. (FACS) was retained by Washoe County School District to perform an asbestos and lead paint survey of the Loder Elementary School campus, located at 600 Apple Street in Reno, Nevada. The survey involved all areas of the campus and included identification of suspect asbestos-containing materials (ACM) and suspect lead-containing paints and coatings which will be disturbed during the upcoming demolition project at the site. Appendix A of this report includes a Functional Spaces Notes Report for all spaces, suspect materials and components identified, and their respective results from this survey. Appendix B of this report includes lead paint sample summary tables and XRF Survey Data Tables for all suspect paints and coatings sampled for lead as part of this survey. This survey was performed between November 12, 2024, and January 17, 2025.

Asbestos

Multiple materials at the site were found to contain asbestos by laboratory analysis.

Please refer to the Findings and Recommendations section of this report for a detailed listing of all asbestos-containing materials.

Please refer to the attached Functional Spaces Notes Report in Appendix A for identification of materials and asbestos-content on a space-by-space basis. Materials will be listed as being non-suspect for asbestos, sampled and found to be none-detect for asbestos, or will be identified as assumed, known, or quantified with a percentage of asbestos.

Any suspect materials not included in this inspection must be assumed to be asbestos-containing materials until tested and proven to be asbestos-free.

Lead

Multiple paints, coatings and components were found to be **lead-based** or **lead-containing** by either XRF or laboratory analysis. The spaces noted on tables are spaces of sampling and these lead-containing paints, coatings or materials may exist in additional spaces.

Please refer to the summary tables and XRF Report Forms in Appendix B for a complete listing of lead-based, lead-containing, and lead-free paints.

Any paints or coatings not included in testing must be handled as lead-containing unless sampled and proven otherwise.

Introduction

Forensic Analytical Consulting Services, Inc. (FACS) was retained by Washoe County School District to perform an asbestos and lead paint survey of the Loder Elementary School campus, located at 600 Apple Street in Reno, Nevada. The survey involved all areas of the campus and included identification of suspect asbestos-containing materials (ACM) and suspect lead-containing paints and coatings which will be disturbed during the upcoming demolition project at the site. This survey was performed between November 12, 2024, and January 17, 2025.

Scope of Work

The purpose of this survey was to identify asbestos-containing materials (ACMs) and lead-containing paints and coatings throughout the campus as part of the upcoming demolition project at the site. The visual inspection, bulk sampling, and survey documentation were performed by Daniel Prado, Zachary Ramos, Ryan Hettich, and Khong Lunaria. Mr. Prado, Mr. Ramos, and Mr. Hettich are licensed by the Division of Industrial Relations (DIR) as Asbestos Abatement Consultants (AAC). Mr. Lunaria is licensed by the DIR as an AAC Trainee. Mr. Prado, Mr. Ramos, Mr. Hettich, and Mr. Lunaria are US EPA-accredited Asbestos Hazard Emergency Response Act Building Inspectors. Mr. Prado and Mr. Ramos are also US EPA Certified Lead Inspector/Assessors. The scope of the survey and the services provided by FACS included:

- Performing a visual inspection of the entire site to identify accessible suspect asbestos-containing materials (ACMs) present;
- Collection of bulk material samples for asbestos analysis by polarized light microscopy (PLM);
- Performing a visual inspection of the buildings and structures for suspect lead-containing paints and coatings and analyzing these materials using a x-ray fluorescence spectrum analyzer;
- Collection of bulk paint chip samples for lead analysis by inductively coupled plasma (ICP) analysis;
- Ensuring the technical quality of all work by using Asbestos Hazard Emergency Response Act (AHERA) accredited Building Inspectors;
- Ensuring the technical quality of all work by using US EPA Certified Lead Inspectors / Assessors; and
- Consolidating data and findings into a report format.

Site Characterization

Loder Elementary School is comprised of four main building wings, one large semi-portable building, two typical portable buildings, and several small storage sheds. There is also a sports/activity field and parking lots which contain suspect materials.

The exteriors of the four building wings are comprised of concrete, CMU, wood paneling, rolled asphalt roofing, single-ply roofing, mastics, and sealants.

The exteriors of the portables and sheds are comprised of concrete, wood siding, sealants, rolled asphalt roofing, asphalt shingle roofing, sealants, and mastics.

Interior areas in all buildings are comprised of common building materials including, but not limited to, concrete, fiberglass pipe wrap, duct tape and insulation, epoxy, CMU, vinyl floor tile, drywall, carpet, baseboards, mastics, and false ceiling tile and acoustic ceiling tile systems.

Exterior areas, including the field and parking lots, include suspect materials, namely concrete.

Survey Methods

Document Review

Original site plans, project plans, and other documents provided by the Washoe County School District's planning department contact, Nick Vraney, were reviewed prior to conducting the survey.

Documents available from the Washoe County School District's Environmental Safety and Assessment Department were reviewed for past sampling results. The results from past inspections conducted were used as available and applicable still to the site based on the results of FACS' visual survey and identification of materials on District records.

Visual Inspection

Accessible building materials were visually inspected using the methods presented in the Federal AHERA regulations (40 CFR, Part 763). AHERA inspection methodology is required to be used for inspections of K-12 schools and is generally accepted as the industry standard for all ACM inspections regardless of structure or facility type. Suspect ACMs were also physically assessed for friability, condition and possible disturbance factors. In addition, FACS followed ASTM standards for inspections as required by Northern Nevada Public Health.

All areas were accessible during this inspection except for the field shed interior on the east side of the sports/activity field. Destructive methods used to investigate behind materials or above ceilings were performed as available, but not completed for areas with non-destructive materials, such as concrete or CMU walls. Review of provided plans were used to make determinations of potentially hidden materials within these areas as necessary.

Asbestos Inspection

<u>Bulk Sample Collection</u>

Bulk samples of identified homogeneous materials were collected from materials that may be impacted by the planned renovation activities. Samples were collected of each separate homogeneous area. A homogeneous area is defined as a surfacing material, thermal system insulation, or miscellaneous material that is uniform in use, color and texture. Examples of homogeneous areas could include:

Vinyl floor tiles
False ceiling panels
Drywall with joint compound

The specific number of samples collected was determined by using the methods required by the Federal AHERA regulations (40 CFR, Part 763.86) and ASTM standards as noted below:

1) For Surfacing Material:
   1,000 ft^2 or less – collect 3 samples
   1,001 to 5,000 ft^2 – collect 5 samples
   5,001 ft^2 or greater – collect 7 samples

2) For Thermal System Insulation:
   "In a randomly distributed manner" – collect 3 samples
   6 linear feet of patching or less – collect 1 sample
   cementitious pipe fittings – "In a manner sufficient to determine"

3) For all Miscellaneous Material:
   Collect samples "In a manner sufficient to determine whether material is ACM (asbestos-containing material) or not ACM"…" – AHERA

   Collect "A minimum of three bulk samples shall be collected of each homogeneous miscellaneous material, except that a single sample may suffice for small manufactured items such as HVAC vibration dampeners, gaskets and friction products. This exception applies to individual components of less than 6 ft^2 (0.557 m^2) in size and not to multiple installations of similar components." – ASTM E2356 – 18 Standard

The suspect ACMs were sampled using a knife, chisel, scraper, drill or other similar coring device suitable to the type of material sampled to cut through its entire thickness and to ensure that a cross-section of the material was obtained. The material was then placed in an appropriately labeled container that was sealed and submitted to SGS-Forensic Laboratories for analysis. A unique sample number (e.g. PJ83676-01A) was assigned to each sample.

Bulk samples will be retained by the laboratory for one month unless otherwise instructed. After this period, the samples will be disposed of appropriately.

<u>Bulk Sample Analysis</u>

A total of 465 bulk samples were collected from a total of 124 suspect materials.

All bulk samples collected were analyzed by SGS – Forensic Laboratories (SGS-FL) in their Hayward and Carson, California laboratories.

SGS-FL is accredited by the National Institute of Science and Technology's (NIST) National Voluntary Laboratory Accreditation Program (NVLAP). SGS-FL participates in the National Institute for Occupational Safety and Health (NIOSH) Proficiency Analytical Testing Program and has substantial experience in the analysis of asbestos.

Samples were analyzed using Polarized Light Microscopy with Dispersion Staining (PLM/DS) techniques in accordance with the methodology approved by the U.S. Environmental Protection Agency (EPA). The percentage of asbestos present in the samples was determined on the basis of a visual area estimation. The EPA defines asbestos-containing materials (ACM) as any material containing more than one percent (1%) asbestos as determined using the method specified in Appendix A, Subpart F, 40 CFR Part 763, Section 1, Polarized Light Microscopy (PLM). 40 CFR Part 763 identifies the lower limit of reliable quantification for asbestos using the PLM method as approximately one percent (1%) by volume. In addition to the percentages, the types of asbestos minerals are also reported. The PLM method is the standard method used to analyze asbestos bulk samples.

When "None Detected" (ND) appears in the laboratory results, it should be interpreted as meaning asbestos was not observed in the sample material.

Lead Inspection

The client-defined lead inspection was modeled upon the sampling protocol described in "Chapter 7: Lead Based Paint Inspection" of the HUD Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (1997 Revision).

OSHA, in Title 29 Code of Federal Regulations (CFR) Part Number 1926, Standard Number 1926.62, regulates all construction work where an employee may be occupationally exposed to lead. Paints, coatings, or materials with any detectable level of lead is considered lead-containing by OSHA. Paints or coatings containing lead above 1.0 mg/cm^2, 0.5% by weight, or 5,000 parts per million are considered lead-based by the US EPA.

For purposes of this report, materials containing lead shall be defined as materials that XRF testing has identified as containing a lead content at or above 0.01 mg/cm^2, or 0.00 mg/cm^2 readings which have not been confirmed with laboratory analysis of bulk samples. In addition, any laboratory analysis of bulk samples that find detectable concentrations of lead will be handled as lead-containing or lead-based as determined by the amount of lead present.

XRF Testing Methodology

Surfaces and components were surveyed for lead content utilizing a portable X-ray fluorescence (XRF) analyzer, Sci-Aps Model X-550PB, serial number 01149. The XRF analyzer contains an electrically powered x-ray cathode tube which bombards tested surfaces with X-rays and gamma rays. This external energy source excites any lead atoms within the tested paint or coating, causing their atoms to emit X-ray photons with a characteristic energy profile. The instrument analyzes the emitted energy to identify and quantify the amount of lead in the tested paint or coating, with lead content reported in milligrams per square centimeter.

Testing combinations of homogeneous components in one area are representative of similar components found in other areas with similar construction and painting histories. During this survey, the inspector visually identified the painted or coated component to test, an XRF reading was collected, and the reading was documented in the XRF data table contained in Appendix B. For each test reading, the data table identifies the room equivalent/space designation, the tested component name, the substrate material, the sample location, paint/coating color, condition assessment, and the XRF result expressed as lead content by weight in milligrams per square centimeter (mg/cm^2).

Bulk Sample Methodology

XRF testing performed during this survey was used to determine which paints or coatings at the site have detectable concentrations of lead, and to determine which paints or coatings at the site are lead-based paint. OSHA does not accept XRF test results for use in determining that a paint or coating does not contain lead. OSHA requires laboratory analysis of a bulk sample to classify a paint or coating as lead-free.

During this inspection, FACS personnel collected 133 bulk paint chip samples from 45 suspect paints for laboratory confirmation of lead-content. These samples were scraped from the substrate using a knife or chisel to obtain sufficient material for analysis. Each sample was given a unique marker number, (e.g. PJ83676-01PbA) identified on a chain-of-custody, packaged, and sent via FedEx to the appropriate laboratory.

All bulk samples collected were analyzed by SGS – Forensic Laboratories (SGS-FL) in Carson, California.

SGS-FL is accredited by the American Industrial Hygiene Association's Environmental Lead Laboratory Accreditation Program for the analysis of lead in bulk paint chips by inductively coupled plasma.

Findings and Recommendations

Forensic Analytical Consulting Services, Inc. (FACS) was retained by Washoe County School District to perform an asbestos and lead paint survey of the Loder Elementary School campus, located at 600 Apple Street in Reno, Nevada. This survey was performed between November 12, 2024, and January 17, 2025.

Asbestos

Please refer to the attached Functional Spaces Notes Report in Appendix A for identification of materials and asbestos-content on a space-by-space basis. Materials will be listed as being non-suspect for asbestos, sampled and found to be none-detect for asbestos, or will be identified as **Assumed** to contain asbestos, **Known** to contain asbestos, or quantified with a percentage of asbestos.

The following materials were either found to contain asbestos by laboratory analysis or are known to contain asbestos from past sampling by Washoe County School District's ES&A Department:

Building A

- Carpet & Mastic – Red Multi
- Carpet & Mastic – Red Walk-off
- Doorframe Sealant

Building B

- Carpet & Mastic – Red Multi
- Carpet & Mastic – Red Walk-off
- CMU & Grout – Textured (Exterior Chimney Only)
- Doorframe Sealant
- Fire Door – 60 Minute Rating
- Fire Door – 90 Minute Rating
- Silver Paint & Mastic (Roof)

Building C

- Carpet & Mastic – Red Multi
- Carpet & Mastic – Red Walk-off
- Doorframe Sealant
- Epoxy – Red/Grey (Room 44RB Only)

Building D

- Carpet & Mastic – Red Multi
- Carpet & Mastic – Red Walk-off
- Doorframe Sealant
- Hard Elbow TSI
- Insulated Door (Freezer)

Building E

- Penetration Mastic – Grey (Roof)

Portable 602

- Carpet & Mastic – Red Multi
- Penetration Mastic – Black (Roof)

The demolition of the structures at this site would fall under the regulatory requirements of the Northern Nevada Public Health Air Quality Management Division. A notification for the demolition of the structures will need to be filed at least 10 working days prior to any demolition of structural members. In addition, this 10-working day notification will need to be filed prior to the abatement of asbestos-containing materials if they are categorized as a regulated asbestos-containing material (RACM) or if they are non-friable materials that will be removed using mechanical means (e.g. removal of floor mastic with a buffer). Material disposal would be based on the friability of material, method of removal, and requirements of any other project-specific obligations.

To comply with the AHERA regulation and OSHA requirements, workers performing asbestos abatement will need to have AHERA Worker training with at least one worker trained to the AHERA Contractor-Supervisor level. Workers will need to use asbestos work practices required by OSHA for the appropriate abatement class of work being performed along with any project-specific work plans. A notification must be submitted to the local OSHA office for the abatement of asbestos-containing materials.

The contractor performing abatement of asbestos-containing materials will need to hold the A-23 license from the Nevada State Contractors Board and as required by the Nevada Administrative Code (NAC) 624.150(23).

Lead

Multiple paints, coatings and components were found to be **lead-based** or **lead-containing** by either XRF or laboratory analysis. The spaces noted on tables are spaces of sampling and these lead-containing paints, coatings or materials may exist in additional spaces.

Please refer to the summary tables and XRF Report Forms in Appendix B for a complete listing of lead-based, lead-containing, and lead-free paints.

OSHA regulates the handling of paints and coatings containing lead down to any detectable concentration. Therefore, workers that will handle paints or coatings on this project must have lead training. For work with Washoe County School District, this training must be OSHA Action Level training at minimum. Any contractor with workers disturbing any quantity of detectable lead must perform an initial determination regarding worker exposures to lead, which may be based on personal air monitoring at the start of the project, prior employee monitoring from the past 12 months under workplace conditions closely resembling the current project, or objective data demonstrating that exposures will not exceed the OSHA action level (30 micrograms per cubic meter of air). It is the employer's responsibility to conduct the initial determination and comply with any relevant OSHA requirements.

Workers must use lead-safe work practices when disturbing paints or coatings that contain lead. Disturbance of lead-containing paints or coatings must be performed within a contained area to prevent the spread and build-up of lead dust. HEPA vacuums, dustless tools or shrouds, and/or intact removal of components should be employed to minimize lead dust generation and work areas must be properly cleaned following disturbance to lead-containing materials during this project. Waste generated during disturbance to lead-containing materials must be profiled in a hazardous waste determination to ascertain proper disposal requirements.

FACS recommends that the results of this report be incorporated into any demolition plans provided for this project for informational purposes.

Limitations

This investigation is limited to the conditions and practices observed, and information made available to FACS. The methods, conclusions and recommendations provided are based on FACS' judgment, expertise, and the standard of practice for professional service. They are subject to the limitations and variability inherent in the methodology employed. As with all environmental investigations, this investigation is limited to the defined scope and does not purport to set forth all hazards, nor indicate that other hazards do not exist.

Please do not hesitate to contact our office at 775-993-7389 with any questions or concerns. Thank you for the opportunity to assist Washoe County School District with promoting worker safety and a healthy environment.

Respectfully,
FORENSIC ANALYTICAL

PJ83676-1A	12781723						
Layer: Multi-Color Carpet			**ND**				
Layer: Grey Foam Backing			**ND**				
Layer: Clear Mastic			**ND**				
Layer: Black Mastic		Chrysotile	**Trace**				
Layer: Grey Cementitious Material			**ND**				
Total Composite Values of Fibrous Components:		**Asbestos (Trace)**					
Cellulose (Trace) Synthetic (85 %)							
Comment: This comment applies to the Black Mastic; Insufficient material for additional analyses.							
PJ83676-1B	12781724						
Layer: Multi-Color Carpet			**ND**				
Layer: Clear Mastic			**ND**				
Total Composite Values of Fibrous Components:		**Asbestos (ND)**					
Cellulose (Trace) Synthetic (85 %)							
PJ83676-1C	12781725						
Layer: Multi-Color Carpet			**ND**				
Layer: Clear Mastic			**ND**				
Total Composite Values of Fibrous Components:		**Asbestos (ND)**					
Cellulose (Trace) Synthetic (85 %)							
PJ83676-1D	12781726						
Layer: Multi-Color Carpet			**ND**				
Layer: Clear Mastic			**ND**				
Total Composite Values of Fibrous Components:		**Asbestos (ND)**					
Cellulose (Trace) Synthetic (85 %)							
PJ83676-1E	12781727						
Layer: Multi-Color Carpet			**ND**				
Layer: Grey Foam Backing			**ND**				
Layer: Yellow Mastic			**ND**				
Layer: Black Mastic		Chrysotile	**2 %**				
Layer: Grey Cementitious Material			**ND**				
Total Composite Values of Fibrous Components:		**Asbestos (Trace)**					
Cellulose (Trace) Synthetic (85 %)							
Comment: This comment applies to the Black Mastic; Insufficient material for additional analyses.

Vincent To, Laboratory Supervisor, Carson Laboratory

Note: Limit of Quantification ('LOQ') = 1%. 'Trace' denotes the presence of asbestos below the LOQ. 'ND' = 'None Detected'.

Analytical results and reports are generated by SGS Forensic Laboratories (SGSFL) at the request of and for the exclusive use of the person or entity (client) named on such report. Results, reports or copies of same will not be released by SGSFL to any third party without prior written request from client. This report applies only to the sample(s) tested. Supporting laboratory documentation is available upon request. This report must not be reproduced except in full, unless approved by SGSFL. The client is solely responsible for the use and interpretation of test results and reports requested from SGSFL. This report must not be used by the client to claim product endorsement by NVLAP or any other agency of the U.S. Government. SGSFL is not able to assess the degree of hazard resulting from materials analyzed. SGS Forensic Laboratories reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified. All samples were received in acceptable condition unless otherwise noted.

Appendix B

Lead Paint Chip Summary, Sample Chains-of-Custody, Laboratory Results Reports and XRF Report Forms

Lead-Based Paints & Coatings

- White Paint on CMU Wall
- White Paint on Wood Cabinet
- White Paint on Wood Door
- Blue Paint on Concrete Walls
- Blue Paint on Metal Door Frames
- Yellow Paint on Concrete Sidewalk
- Beige Paint on Concrete Wall
- Cream Paint on CMU Wall

Lead-Containing Paints & Coatings

The following paints and coatings were found to be lead-containing by laboratory analysis:

- Blue Paint on Metal Coping Cap
- Blue Paint on Metal Trim
- Blue Paint on Wood Trim
- Brown Paint on Metal Coping Cap
- Brown Paint on Wood Siding
- Cream Paint on Wood Wall/Siding
- Grey Paint on Metal Beam
- Grey Paint on Metal Roof Hatch
- Light Grey Paint on Metal Enclosure
- Red Paint on Metal Beam
- Silver Paint on Metal Vent/Trim
- White Paint on Acoustic Ceiling Tile
- White Paint on False Ceiling Panel
- White Paint on Metal Enclosure
- White Paint on Metal Panel
- White Paint on Metal T-Grid
- White/Red Paint on Metal Pipe
- White Paint on Tackboard Wall
- White Paint on Wood Panel
- White Paint on Wood Trim
- Yellow Paint on Concrete/Asphalt Lot

Lead-Free Paints & Coatings

- Blue Paint on Concrete/Asphalt Lot
- Blue Paint on Metal Door/Door Frame
- Blue Paint on Metal Handrail
- Blue Paint on Wood Trim
- Brown Paint on Metal Door Frame
- Clear Varnish on Wood Door
- Cream Paint on Drywall Wall Panel
- Grey Coating on Concrete Parking Curb
- Grey Paint on Wood Trim/Siding
- Off-White Paint on Drywall Wall/Ceiling
- White Paint on Concrete/Asphalt Lot
- White Paint on Drywall Wall/Ceiling
- White Paint on Wood Siding

All other paints and coatings were found to be lead-containing by XRF analysis.

Lead Paint Chip Summary (Lab Report M265032)					
Sample Number	**Component Location**	**Component**	**Color**	**Substrate**	**Analytical Results (mg/kg)**
01APb	Parking Lot – W Side N End	Curb	White	Concrete	< 3

* The Reporting Limit represents the lowest amount of analyte that the laboratory can confidently detect in the sample, and is not a regulatory level. The Units for the Reporting Limit are the same as the Units for the Final Results.

Vincent To, Laboratory Supervisor, Carson Laboratory

Analytical results and reports are generated by SGS at the request of and for the exclusive use of the person or entity (client) named on such report. Results, reports or copies of same will not be released by SGS to any third party without prior written request from client. This report applies only to the sample(s) tested. Supporting laboratory documentation is available upon request. This report must not be reproduced except in full, unless approved by SGS. The client is solely responsible for the use and interpretation of test results and reports requested from SGS. SGS is not able to assess the degree of hazard resulting from materials analyzed. SGS reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified. Any modifications that have been made to referenced test methods are documented in SGS Standard Operating Procedures Manual. Sample results have not been blank corrected. Quality control and sample receipt condition were acceptable unless otherwise noted.
Note* Sampling data used in this report was provided by the client as noted on the associated chain of custody form.

Lead Paint Chip Summary (Lab Report M265033)					
Sample Number	**Component Location**	**Component**	**Color**	**Substrate**	**Analytical Results (mg/kg)**
18A	Roof Section C – Center	Pipe	White/Red	Metal	74
18B	Roof Section A – S Side E End	Pipe	White/Red	Metal	28
18C	Roof Section B – N Side E End at D	Pipe	White/Red	Metal	< 5
19A	Roof Section A – South of Center	Enclosure	White	Metal	< 7
19B	Roof Section C – Center	Enclosure	White	Metal	11
19C	Roof Section B – N Side Center	Enclosure	White	Metal	170
20A	Roof Section B – N Side W End	Panel	White	Metal	780
20B	Roof Section B – N Side Center	Panel	White	Metal	680
20C	Roof Section B – N Side E End	Panel	White	Metal	1300
21A	Roof Section C – S Side Center	Beam	Red	Metal	64
21B	Roof Section B – W Side Center	Beam	Red	Metal	1200
21C	Roof Section A – South of Center	Beam	Red	Metal	430
22A	Roof Section D – S Side Center	Trim	Blue	Metal	< 20
22B	Roof Section B – N Side Center at D	Trim	Blue	Metal	< 20
22C	Roof Section D – S Side W End	Trim	Blue	Metal	22
23A	Roof Section B – W Side N End	Vent	Silver	Metal	23
23B	Roof Section B – W Side N End	Trim	Silver	Metal	4
23C	Roof Section B – N Side Center	Trim	Silver	Metal	3
24A	Roof Section B – W Side Center at D	Trim	White	Wood	270
24B	Roof Section B – NW Corner at D	Trim	White	Wood	20
24C	Roof Section B – N Side E End at D	Trim	White	Wood	130
25A	Roof Section B – S Side E End of N Enclosure	Enclosure Beam	Light Grey	Metal	6
25B	Roof Section B – S Side W End of N Enclosure	Enclosure Beam	Light Grey	Metal	9
25C	Roof Section B – S of Center of N Enclosure	Enclosure Beam	Light Grey	Metal	< 6
26A	**Roof Section B – N Side W End at D**	**Wall**	**White**	**CMU**	**6200**
26B	**Roof Section B – N Side W End at Chimney**	**Wall**	**White**	**CMU**	**10000**

Lead Paint Chip Summary (Lab Report M265033)					
Sample Number	**Component Location**	**Component**	**Color**	**Substrate**	**Analytical Results (mg/kg)**
26C	Roof Section B – N Side E End at D	Wall	White	CMU	330
27A	Roof Section E – S Side Center	Panel	White	Wood	8

Analytical results and reports are generated by SGS at the request of and for the exclusive use of the person or entity (client) named on such report. Results, reports or copies of same will not be released by SGS to any third party without prior written request from client. This report applies only to the sample(s) tested. Supporting laboratory documentation is available upon request. This report must not be reproduced except in full, unless approved by SGS. The client is solely responsible for the use and interpretation of test results and reports requested from SGS. SGS is not able to assess the degree of hazard resulting from materials analyzed. SGS reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified. Any modifications that have been made to referenced test methods are documented in SGS Standard Operating Procedures Manual. Sample results have not been blank corrected. Quality control and sample receipt condition were acceptable unless otherwise noted.
Note* Sampling data used in this report was provided by the client as noted on the associated chain of custody form.

Lead Paint Chip Summary (Lab Report M265830)					
Sample Number	**Component Location**	**Component**	**Color**	**Substrate**	**Analytical Results (mg/kg)**
18APb	HS Portable Exterior – NE Corner	Handrail	Blue	Metal	< 20

Site Address

Loder Elementary School
600 Apple Street
Reno, NV 89502

Background

Washoe County School District (WCSD) will be performing an upcoming demolition project at their existing Loder Elementary School site. This project will include the demolition of the main school buildings and portable structures along with the demolition of parking lots and other site areas. The work onsite will involve the handling of various hazardous materials including asbestos-containing materials, lead-containing paints, coatings, and materials, and other hazardous materials that potentially may be discovered during the demolition process.

This set of specifications is to account for known and potential work to take place during all phases of the project.

Scope of Work

This project partly consists of the demolition of the four main building wings, a large semi-portable building, two typical portable buildings, and several small storage sheds after the abatement of all asbestos-containing materials is performed in compliance with the US EPA NESHAP requirement for the demolition of a regulated structure. There is the potential for buried hazardous materials, such as asbestos-cement water pipe, to become exposed and required to be removed for construction activities as well. Construction of a new campus on east side of the existing property will occur as part of this project.

This narrative is not a definitive scope of all work to be completed, including hazardous materials work, and is primarily intended to provide a general overview of the project. Project drawings and other construction documents developed shall be consulted to determine exact scope of work.

Forensic Analytical Consulting Services, Inc. (FACS) conducted a comprehensive site survey in the winter of 2024/2025 to identify the hazardous materials within the planned project areas. This survey also incorporated previous sampling results from the Washoe County School District's Environmental Safety and Assessments (ES&A) Department.

Asbestos-Containing Materials

The materials listed on the following page were found to contain asbestos at interior and exterior locations of the site buildings slated for demolition.

Main Building (Wings A-D)

- Carpet & Mastic – Red Multi
- Carpet & Mastic – Red Walk-off
- CMU & Grout – Textured (Wing B Exterior Chimney Only)
- Doorframe Sealant
- Epoxy – Red/Grey (Room 44B Only)
- Fire Door – 60 Minute Rating
- Fire Door – 90 Minute Rating
- Hard Elbow TSI (Wing D)
- Insulated Door (Wing D)
- Silver Paint & Mastic (Wing B Roof)

Semi-Portable Building (Wing E)

- Penetration Mastic – Grey (Roof)

Portable 602

- Carpet & Mastic – Red Multi
- Penetration Mastic – Black (Roof)

These materials shall be abated by a contractor currently registered with the Nevada Division of Industrial Relations as an Asbestos Abatement Contractor. This contractor shall also be currently licensed by the Nevada State Contractors Board and hold the A-23 classification for the Removal of Asbestos.

Lead-Based/Lead-Containing Paints & Coatings

All paints and coatings within the project area of this phase were found to be lead-based or lead-containing except for the following:

- Blue Paint on Concrete/Asphalt Lot
- Blue Paint on Metal Door/Door Frame
- Blue Paint on Metal Handrail
- Blue Paint on Wood Trim
- Brown Paint on Metal Door Frame
- Clear Varnish on Wood Door
- Cream Paint on Drywall Wall Panel
- Grey Coating on Concrete Parking Curb
- Grey Paint on Wood Trim/Siding
- Off-White Paint on Drywall Wall/Ceiling
- White Paint on Concrete/Asphalt Lot
- White Paint on Drywall Wall/Ceiling
- White Paint on Wood Siding

Any work disturbing lead paints or coatings must be performed using lead-safe work practices by personnel with OSHA Action Level training.

These specifications identify only a general narrative for the scope of work for this project. The contractor is responsible for reviewing project drawings and construction plans, along with completion of own measurements, inspection of site conditions, and any other items required to submit their bids and complete the project.

Within these specifications are means and methods for the removal of materials that will be followed on the project for all known work to be completed and additional work that may potentially be required, such as buried transite pipe removal. As not all potential circumstances or conditions can be anticipated, minimal field adjustment of the means and methods listed within this document may be required. Included within project drawings are documents and/or drawings identifying areas and materials that will require abatement of asbestos.

The general contractor and any sub-contractors working onsite will need to consult the WCSD ES&A Department's Material Disturbance Permit (MDP) to verify asbestos and lead content of materials prior to impacting any materials. In addition, FACS has provided a site survey report for the areas inspected as reference, but this document does not take precedence over MDP or project drawings and other construction directives.

Testing of materials not previously sampled or testing to verify asbestos and lead content of materials will only be performed by WCSD ES&A Staff or District's independent third-party consultant. Testing by another third-party consultant will not be accepted as proof of the asbestos-content of building materials or lead-content of paints or coatings.

The lead paint inspection conducted by FACS identified lead-based paints or coatings within the project area. Although lead-based paints are present, a demolition does not fall under the requirements of the US EPA Renovation, Repair and Painting (RRP). The contractor must still meet requirements set forth in these specifications, and applicable Federal, State, and local requirements, namely the OSHA Lead in Construction Standard, when handling paints or coatings that do contain lead.

As noted above, nearly all paints and coatings of the site contain lead. Thus, the contractor shall be cognizant that not all work disturbing lead may be reflected in the drawings. For example, work involving the removal of baseboard materials from painted surfaces or removal of equipment from painted surfaces may require lead work activities to be performed but may not be explicitly listed on project drawings as lead work activity.

Many of the materials that may be disturbed as part of the project contain silica. The contractor is responsible for complying with the requirements of 29 CFR 1926.1153 – OSHA's Crystalline Silica Standard for Construction. Proof of compliance with the Standard shall be provided by contractors at the District or independent third-party request.

Project Requirements

All asbestos-containing materials must be abated from the buildings prior to the actual demolition of the structures occurring. This includes materials that may be non-friable or less than 1% asbestos.

Prior to demolition of any of the planned buildings, the contractor shall ensure that loose and peeling paints have been stabilized at interior and exterior areas. The requirement to stabilize paints is to ensure that more paint chip debris is not created by demolition activities than necessary. Conditions may change between the issuance of these specifications and submittal of bids (lead-containing paints may deteriorate further) and the contractor is

responsible for assessing the amount of paint to be stabilized for inclusion into their bid. The stabilization of paints may be handled by either a lead remediation contractor acting as a sub-contractor, or by any other trade that may meet the requirements of these specifications and WCSD requirements for lead work activities.

Removal of components containing lead in their entirety is not required prior to demolition but a contractor may opt to remove them as part of their waste disposal strategy to limit the potential for waste characterization to deem the entire waste stream as hazardous for lead. If the contractor chooses to remove these components, removal shall conform to the lead requirements set out by the District's ES&A Department or District's Consultant.

Contractor shall be approved by the WCSD ES&A Department to perform asbestos and lead activities within the District. **Firms which have not previously performed activities impacting asbestos or lead for the District will need to submit for approval all necessary documentation outlined in the WCSD ES&A Technical Specifications for the project at least fifteen (15) business days prior to work commencing.** The approval of firms includes contractors that will be performing work impacting lead-containing paints, even if that firm is not primarily a lead remediation contractor.

All worker asbestos and lead training certifications shall be submitted for approval to the WCSD ES&A Department at least fifteen (15) working days prior to project commencement at minimum. Online training of employees is not sufficient to meet the requirements of District policy and all training must be provided in-person with each individual receiving a training certificate from the training provider.

Contractor is responsible for reviewing WCSD ES&A worker roster for the company to ensure that all workers to be used on the project have been approved prior to arrival onsite. Workers not identified on the approved WCSD ES&A worker list for the contractor will not be allowed to perform any activities onsite, even if documentation is provided onsite at time of the project commencement or work. This applies to any personnel impacting lead-containing surfaces, even if not primarily a lead remediation contractor.

The contractor performing work on this project will be responsible for following all plan requirements to complete the project. Neither WCSD personnel, nor any independent consultant providing project oversight, will be responsible for identifying materials or components as part of this contract. The contractor's onsite supervisor(s) shall have a copy of these Specifications on site at all times and shall be familiar with the project requirements prior to arrival on site for the project. Failure to follow requirements of these Specifications, or lack of knowledge of requirements to be followed during the project are grounds for replacement of contractor's onsite supervisor.

Although it is not anticipated that the site will be occupied during abatement, no work impacting hazardous materials shall be performed when staff and students are present within buildings or in adjacent exterior areas of the site.

Only the hazardous materials contractor will be allowed to occupy the designated work area once asbestos and lead activities are scheduled to start. This applies to all WCSD non-ES&A staff/personnel, general contractor, and other sub-contractors. The designated work area shall only be occupied by the hazardous materials contractor, WCSD ES&A staff, and District's independent third-party abatement consultant.

Work that is deemed “penetration and attachment” by the District’s ES&A Department or District’s onsite third-party hazardous materials consultant shall be performed in accordance with the District’s policy for this type of work. These specifications may have applicable requirements that may be included for overall project compliance, but do not identify all work practices or engineering controls that would need to be met for compliance with the District’s penetration and attachment policy.

Contractor shall adhere to the requirements of these Specifications, WCSD ES&A Technical Specifications, Material Disturbance Permit, Lead Appendix (found in Material Disturbance Permit), and Federal, State, and Local regulations.

Water, HVAC, and Electricity

Water and electricity are available onsite currently; however, long hoses and cords may be necessary. Contractor shall provide a GFCI at the primary plug-in of all electrical trains used for electrical equipment. Hose washers shall be provided at all connections to prevent leakage of water and potential damage to District facilities. Contractor is responsible for any damage caused by their usage to any District water or electrical systems.

Over the course of the demolition portion of the project, it may become necessary to provide an additional water and electrical source, such as a generator and water truck, to provide enough power for equipment and water control to prevent visible emissions.

Contractor shall coordinate with the WCSD Project Manager for the shut-down of all HVAC systems within the project area prior to commencing setup for asbestos abatement or lead remediation activities. Contractor is responsible for the lock-out / tag-out of all electrical circuits and HVAC systems that may be impacted by the project. Contractor shall follow requirements of WCSD for the lock-out / tag-out of equipment.

Lighting

If work will take place in the evenings or in non-lit areas, the Contractor shall provide temporary lighting as required for workers to clearly see materials to be abated, traverse through the work area, and move waste to the waste receptacle. Sufficient lighting shall be provided to allow visual inspection to be performed at the conclusion of each work shift by the District’s independent third-party consultant; additional lighting may be necessary for a final clearance visual inspection.

Lighting used shall meet requirements for safety as set forth by OSHA requirements. All lighting shall have a sturdy base and guards to protect bulbs from breakage in the event they are dropped or knocked over.

Pre-Cleaning

No pre-cleaning of asbestos or lead contamination at project areas is required to complete this project; however, small amounts of garbage and build-up of dust may be required to be cleaned to allow sufficient adherence of containment barriers.

For exterior stabilization of paints, contractor is responsible for cleanup of any paint debris on the soil and hardscape around the buildings as applicable. This debris shall be cleaned from the soil/ground and a visual inspection performed prior to installation of any drop sheets for stabilization of remaining paints.

Notifications

The selected contractor is responsible for filing notification to the Northern Nevada Public Health Air Quality Management Division (NNPHAQMD) for the abatement of asbestos-containing materials. This includes notifying for the removal of hard elbow TSI, CMU texture, etc. as regulated (friable) asbestos-containing materials as necessary to comply with regulations and including non-friable materials (mastics, sealants, etc.) as a courtesy on the notification. Contractor shall also notify Nevada OSHA for the abatement of asbestos-containing materials on this project. These notifications shall be made at least 10 working days prior to abatement commencing onsite, including any containment setup. Contractor is responsible for the payment of any fees associated with asbestos abatement notifications.

In addition to the asbestos abatement notifications, the planned demolition of multiple buildings will require a notification to be filed with NNPHAQMD. Prior to demolition activities commencing, the asbestos survey report for the structure shall be filed and an Acknowledgement of Asbestos Assessment (AAA) Form shall be received to be filed for any necessary permits from the City of Reno.

If the AAA Form cannot be obtained due to a conflict in the survey report, the contractor shall notify FACS. It is recommended the AAA Form be obtained as soon after Notice to Proceed is issued to limit any potential delays in project schedule. The requirement for the contractor to obtain the AAA Form may be modified by other construction documents.

At least 10 working days prior to any demolition commencing, the contractor shall ensure that they hold the necessary demolition permit from NNPHAQMD for compliance with the US EPA National Emissions Standard for Hazardous Air Pollutants (NESHAP) regulation. A copy of the permit and a copy of proof of receipt of fees paid for the permit shall be provided to the WCSD Project Manager and Consultant prior to any demolition activities commencing. A copy of the permit shall be kept onsite during any demolition activities.

Additional requirements for a dust permit, storm water, and other construction permitting may be required to complete this project. The contractor shall review all construction documents and be familiar with applicable local, State, and Federal regulations regarding demolitions to ensure compliance.

Contractor(s) shall provide a copy of all notifications to the District's independent third-party consultant and have a copy posted onsite.

Equipment

Contractor is responsible for providing all necessary equipment in sufficient quantities to complete the work in the schedule provided for the project. All equipment must arrive onsite clean and in proper functioning order. Any equipment that arrives onsite dirty or not in proper functioning order shall be removed from the project site for cleaning and/or repairs.

The requirement for clean equipment in proper working order extends to any rental equipment used on the project. If rental equipment is used, contractor shall provide notification in writing to the rental agency that equipment will be used within an asbestos or lead regulated work area. Proof of this notification being filed shall be provided to District's independent third-party consultant.

Operators of lifts or other similar powered equipment must be trained in the use of equipment to meet manufacturer and OSHA requirements. Proof of training shall be provided if requested to WCSD and District's third-party consultant.

Training

Workers disturbing asbestos-containing materials must have AHERA Worker training. One worker on the abatement work crew must be trained to the AHERA Contractor-Supervisor level. The primary crew supervisor may not leave the site anytime abatement activities are taking place during a work shift.

Workers performing tasks impacting lead paints or coatings, regardless of level of lead present, must have OSHA Lead Action Level training. This requirement extends to any contractor and their personnel performing penetration and attachment activities as well as personnel performing the demolition of structures with lead-containing or lead-based paints or coatings.

As noted previously, all workers certifications must be approved by the WCSD ES&A prior to arrival onsite to start work. Certifications shall clearly identify the name/level of the training and provide the complete name of the worker. Failure to meet these requirements may cause a delay in approval or a complete rejection of certifications until corrections can be made and new copies obtained by the contractor.

Copies of the worker certs will also be requested to be provided to the District's onsite third-party consultant as well. Web-based or virtual training is prohibited by District policy.

As this project may take place over multiple phases, contractors are responsible for continuing to ensure worker roster is up to date with staff certifications. Certifications cannot be approved onsite by the District's independent third-party consultant.

Personal Protection Equipment

All personnel entering a regulated area (both asbestos and lead), regardless of level of work to be performed, shall wear disposable coveralls, tight-fitting half-face, negative-pressure air purifying respirators fitted with HEPA (P-100) filters, hard hats and safety glasses at minimum. Additional PPE requirements, based on materials and locations of work, are provided below.

Street clothes may not be worn beneath disposable coveralls at interior asbestos abatement regulated work areas. Street clothes may be worn beneath disposable coveralls for exterior asbestos abatement and lead activities, but street clothes will be HEPA-vacuumed clean if coveralls are torn or ripped. Requirements of PPE extend to any contractors disturbing hazardous materials, even if they are not primarily a remediation contractor.

All employees shall have a valid medical clearance and fit test for the respirators to be worn. Copies of the medical clearance and fit test must be provided to the District's onsite independent third-party consultant.

TSI Abatement – Workers shall start the project wearing full-facepiece powered air purifying respirators (PAPR) fitted with HEPA (P-100) filters. At least two batteries shall be provided for each PAPR onsite to allow one battery to charge while the respirator is being worn. The contractor's supervisor shall record the measured flow rate of PAPRs as they are donned to ensure sufficient pressure exists in accordance with manufacturer guidelines.

Contractor may reduce respiratory protection down to tight-fitting negative-pressure air purifying half-mask respirators fitted with HEPA (P-100) filters if personal air monitoring results shows exposures are below 0.01 fibers/cc as an 8-hour time weighted average for three consecutive shifts.

Mastic Abatement – Workers shall wear rubber boots and stacked filters with organic vapor and HEPA cartridges shall be fitted to respirators.

Exterior & Roofing Abatement – Contractor is responsible for providing sufficient fall-protection safety equipment in locations and amounts required by OSHA for employees. This includes any necessary tie-offs, lanyards, harnesses, etc. Contractor is also responsible for ensuring there is sufficient equipment for use by consultant or other regulatory inspectors that may be required to use to access areas.

For personnel operating heavy equipment to demolish structures, workers are approved to wear standard construction garb and do not require respiratory protection if all aspects of this specification are met and if the contractor provides an initial exposure assessment stating work is not anticipated to expose workers above the OSHA Lead Action Level or PEL. If personnel performing demolition must enter a regulated area, or an initial exposure assessment is not provided, they shall wear all required PPE for a regulated area as referenced above.

The contractor may opt to include additional PPE items based on their own job hazard assessment for the project, but they may not reduce level/type of PPE below what is required in this Specification.

Personal Air Monitoring

The contractor is responsible for the collection of personal air samples on 50% of workers entering a regulated work area during asbestos abatement and lead disturbance activities as applicable. If an odd number of workers are entering the regulated work area, the contractor shall round up for the number of workers to be monitored (i.e., five workers entering a work area would require collection of three samples). These samples shall be collected in accordance with OSHA sampling protocols and analyzed by a laboratory with the proper accreditation and approval from the WCSD ES&A Department.

The contractor shall have their laboratory submit or fax, within **48 hours** of the date the sample was collected, the final laboratory result documents (including legible chain-of-custody) for air monitoring to the WCSD ES&A Department. No hand-written results reports will be allowed. The laboratory reports will reference the air monitoring cassette's factory assigned number and the personal air monitoring results must be properly applied to an 8-hour time weighted average. Failure to submit results within the required 72-hour period (48-hour turnaround with 24-hour grace period) may result in the District temporarily stopping the applicable remediation project until results are received. Continued failure may also result in the termination of the contract.

The District's independent third-party consultant reserves the right to halt work or increase respiratory protection in the event that personal air sample results are not received in the manner as specified above, or if area air sampling shows current respiratory protection does not sufficiently protect employees.

Security and Safety

The Contractor is responsible for security of all equipment and safety of all employees. Contractor shall provide any storage containers or security needed for tools and equipment if they are to be left onsite. Contractor shall coordinate with WCSD Site Facilities Coordinator or WCSD Project Manager for placement of any storage container brought onsite.

Contractor is responsible for security of the building at locations that have components removed before replacement (for example, after removal of wall-mounted louvers, doors, windows, etc.) or components removed to create openings for the exhaust of negative air machines. In addition, contractor is responsible for enclosing any decontamination chambers sited at exterior areas of a structure in plywood. Security measurements must meet the approval of general contractor and WCSD.

Contractor is responsible for all worker safety and following all applicable regulations, namely Nevada and Federal OSHA. Contractor or their designated supervised shall hold a safety meeting on the first day of the project that addresses all safety hazards workers may encounter.

Safety meetings shall be held at least weekly thereafter, or in the event that job hazards change or an accident occurs. The safety meeting topics shall be documented and all attendees sign the document for recordkeeping. A copy of the safety meeting shall be provided to the District's independent third-party consultant.

Work Hours and Dates

A specific schedule of calendar dates for the project will be provided in other contract documents. However, it is anticipated that workdays and hours will be Monday through Friday, 07:00 am to 03:30 pm. WCSD holidays are excluded dates of work and no work shall be scheduled for these dates. As noted above, a detailed schedule of project events, including shift hours, shall be provided for approval by WCSD.

The contractor may request alternate days or hours in writing to the WCSD Project Manager for approval, but it does not guarantee acceptance. The request must be filed at least 48 hours prior to the first alternate shift commencing.

Adverse Weather Conditions

Exterior work shall be planned and scheduled when there are favorable weather conditions, such as, performing the abatement work when the forecast is for "clear skies" and no rain for three or more consecutive days.

Polyethylene critical barriers and drop sheets require sufficient attachment and/or anchoring to prevent windy conditions from rendering them ineffective.

Windy conditions that cause dust and/or debris to be blown beyond the removal work area or the poly drop sheets will require stoppage of removal work, correction of any containment deficiencies, and clean-up and disposal of all waste material generated before abatement or remediation work may continue.

The District or District's independent third-party consultant has the authority to halt abatement or remediation work due to adverse weather conditions. Neither the District, nor the District's consultant, will be responsible for lost work shifts or hours due to Contractor failing to monitor weather and attempting to proceed when inclement weather is forecasted.

Occupancy

As noted previously, the immediate project area will be limited to the hazardous materials contractors, WCSD ES&A staff, and District's independent third-party consultant once abatement and remediation activities are ready to commence. Once the area has been cleared, other parties may occupy.

For exterior asbestos abatement, no unauthorized personnel shall be within 50 feet of the work area. For exterior lead remediation activities, no unauthorized personnel shall be within 30 feet of the work area.

Emergency services may also occupy areas in the event of an emergency during the project.

Challenge Testing

All HEPA-filtered equipment to be used on this project shall be challenge tested (DOP or equivalent) at the project site prior to use. If the abatement on this project extends over multiple mobilizations, the HEPA-filtered equipment shall be tested prior to use for each mobilization. Copies of the challenge testing results shall be provided to the WCSD ES&A and/or District's independent third-party consultant.

No HEPA-filtered equipment will be allowed to remain onsite after a contractor demobilizes from the site or stored onsite when the contractor cannot guarantee security of the equipment.

Air Pressure Differential Requirements

All interior containment areas shall be placed under negative air pressure. An air pressure differential of -0.050" WC must be established and maintained through all abatement or remediation activities until clearance sample results are received. The air pressure differential shall be displayed and recorded by a properly functioning manometer at each negative pressure enclosure location. Failure to have a properly recording manometer will require the Contractor-Supervisor to record the air pressure differential by hand at 10-minute intervals, including recording of any pressure differential loss and re-establishment of sufficient air pressure differential.

The manometer display shall have the correct date and time for the data being recorded and this requirement extends to any handwritten data. Copies of the air pressure differential readings shall be provided to the ES&A Department and District's independent third-party consultant.

Asbestos Abatement Containment & Handling Requirements

The following specification sections have been developed to best capture all containment requirements to allow the contractor to submit a reasonable bid. However, it can be expected that some modifications to the requirements below will need to be made to fit specific space conditions, allow a safer or more-efficient abatement to be completed and as required to meet changing project schedule as work progresses onsite.

All poly used on this project shall be 6-mil in thickness and fire-retardant, unless exempted below. All containment areas must have a fire extinguisher within the containment, at the entry / exit to containment area, and within the containment area as required by OSHA. No work shall take place until these extinguishers are in place.

Anticipated interior abatement at the site includes, but is not limited to, removal of fire/insulated doors, carpet with associated mastics, epoxy, hard elbow TSI, and doorframe sealants.

The following specifications are designed for interior work to proceed with miscellaneous materials abatement and remediation occurring prior to that of flooring materials. The remediation contractor may request to make modifications to containment areas in writing, but any modification must be approved by the District's AHERA Project Designer in writing before implementation.

Anticipated abatement at the exterior of buildings scheduled for demolition includes removal of CMU texture from the chimney, doorframe sealants, and various roofing mastics.

No exterior containment area may remain in place past the work shift that the asbestos abatement work is performed in.

Interior Containment Requirements

The following requirements apply to any asbestos abatement exceeding the OSHA definition of "small-scale, short-duration" Class III work. Separate requirements will be included later in the specifications for Class III work.

1. Any loose equipment, furnishings, or supplies shall be removed by District and general contractor (or other sub-contractor) prior to any containment construction activities commencing. Other construction contract documents may modify or identify the exact party responsible for movement and salvage of items that will not disturb hazardous materials.
2. Critical barriers shall be erected at all openings within the work area and shall be sealed with two layers of 6-mil poly. This includes doors, vents, operable windows, etc.
3. Any poly walls installed at areas to act as walls of a containment must be two layers of 6-mil poly and sufficiently secured to prevent a breach in containment during the abatement process.
4. One layer of 6-mil poly shall cover the work area floor if flooring is asbestos-containing. If flooring is not asbestos, two layers of 6-mil poly shall be installed to prevent contamination of flooring materials.
5. Poly drop sheets shall be secured to prevent billowing and creation of a trip hazard or movement of drop sheets.
6. Poly seams shall be staggered at least 4" to prevent debris from falling below the poly drop sheet or wall poly seams.
7. Wall surfaces and other immovable objects that may not be required to be removed within containment areas shall be covered with one layer of 6-mil poly.
8. All interior work exceeding the "small-scale, short-duration" definition shall be completed within a negative pressure enclosure. The contractor shall provide sufficient negative air machines to generate an air pressure differential of at least -0.050" WC within the work area when compared to adjacent areas.
9. All negative air machines shall be exhausted to the exterior of the structure using wire-reinforced flex ducting. All negative air machines shall be installed within the containment; installation of the face of the machine into poly walls or barriers is not allowed.
10. Work cannot start until air pressure differential of -0.05" WC or greater has been established and must be maintained through all phases of the abatement project. As noted above, air pressure differential shall be displayed on a fully-functioning recording manometer.
11. A viewport shall be placed on the poly walls or at site windows, as allowable, to allow viewing of work area for inspectors. Placement of view ports must be approved, and may be directed by, District's ES&A Department or District's independent third-party consultant.
12. A three-stage decontamination chamber system shall be attached to each negative pressure enclosure. The requirements for this system are detailed below.
13. All poly barriers that may allow access into a regulated area shall have signs installed at clearly visible locations to prevent tampering or breaching of containment areas. These barriers may be at doorways, free-standing poly walls, or similar locations. In addition, signs shall be posted on the flap leading from the "clean" chamber into the shower of the decontamination system.

14. Signs shall meet requirements set forth in 1926.1101(k)(7) for an asbestos regulated area, and 1926.62(m) for a lead regulated area, including the use of protective clothing and respiratory protection. Signs shall be posted once the containment area has been approved, but before any abatement begins.

Interior Abatement Requirements

1. All materials shall be removed as intact as possible using hand tools to the greatest extent possible.
2. Materials to be disturbed shall be wetted prior to, and during, disturbance with amended water to limit the creation of visible emissions.
3. A build-up of waste or debris within the work area is prohibited. Contractor workers shall ensure the area is kept free of a build-up of unpackaged waste, waste bags, consumed supplies or packaging, or other debris as work progresses to prevent the crushing of debris into a finer dust, generation of visible emissions from dried out material, and accidents within the work area.
4. Door sealants, fire/insulated doors, and other miscellaneous asbestos-containing materials shall be removed before flooring by hand or with hand tools as intact as possible when inside a larger containment or will be conducted using the small-scale short-duration methods in the following section of these specifications.
5. For the removal of the asbestos-containing carpet and mastic and epoxy flooring, all abatement must be conducted using hand tools only.
6. Contractor may opt to use a standard buffer and mastic solvent or hydro-blasting of floor surfaces to remove floor mastic.
7. Contractor that opts to use a hydro-blasting unit to “power wash” the floors clear of mastic, shall include any cracks or seams in the concrete slab. This system shall have a man-operated unit that will capture the water with vacuum pressure at the front of the machine as it is operating to prevent the build-up of water in the containment.
8. The abatement contractor shall anticipate the unit not being able to hydro-blast all areas of the containment (corners, along walls) and shall plan to use alternate methods to remove mastic in such areas. Any mechanical means to remove the mastic will need to have HEPA-filtered local exhaust.
9. If a buffer shall be used for the abatement of mastic from the floor surface, workers shall assure that an overabundance of mastic solvent is not used that may escape the containment area or run below fixed cabinetry. Solvent shall be low-odor and contractor shall ensure respiratory protection filters for fumes is provided in addition to HEPA-filters provided for asbestos abatement.
10. Flooring mastic must be abated to the point of no three-dimensional material on the substrate. Contractor will be required to chase mastic into cracks or divots of the substrate.

Interior General Waste Packaging Requirements

1. No “loose” water shall be present in waste bags at the conclusion of packaging. Water shall be soaked up with either kitty litter or diatomaceous earth as necessary to meet this requirement.
2. A HEPA-vacuum shall be used to evacuate air from waste bags when sealing. Workers using hands or knees to collapse air out of waste bags is prohibited.
3. Waste shall be placed into 6-mil poly waste bags. All waste bags shall be sealed in a “gooseneck” fashion to create a leak-tight container.
4. Waste shall be properly labeled for disposal as either a non-hazardous asbestos containing waste (OSHA labeling) or regulated asbestos-containing material (EPA and OSHA labeling) prior to removal from the containment area.
5. Contractor may opt to construct load-out chambers for waste. These chambers shall be no less than two-chambers based on materials being removed and work activities taking place within the containment

area. Additional requirements for load-out chambers are located in the decontamination chamber section below.
6. Waste transport containers, such as rolling carts, shall be lined with one layer of 6-mil poly prior to use for waste transportation.
7. Additional waste requirements are identified in the waste disposable section below.

Interior Containment Cleaning Requirements

1. At the conclusion of asbestos and lead abatement, the remaining surfaces of the work area shall be wet-wiped and HEPA-vacuumed clean of all debris and dust. Cleaning shall take place from ceiling down to the floor area.
2. As part of the detail cleaning, the top layer of poly, such as at floor areas not removed as part of abatement activities, may be removed.
3. During final cleaning, contractor workers shall start from the area furthest from entry/exit point and work their way back to the entry/exit to the containment area.
4. Containment poly is included in description of asbestos waste and must be packaged as noted above.
5. A final visual inspection can only be requested after all cleaning has been completed, all waste has been packaged and removed from the containment area, and the remediation contractor's onsite supervisor has performed their own visual inspection.

Interior Abatement Requirements – Small-Scale Short-Duration

The following requirements are intended to apply to the abatement of fire doors and door sealants only.

These requirements apply only to the removal of one (1) door or less than 3 square feet of doorframe sealant per location. Any planned work exceeding small-scale, short-duration work would require the abatement contractor to follow all requirements in the sections listed above.

All training, PPE, and engineering controls listed in these specifications will still apply to work conducted in this manner.

1. Critical barriers shall be erected at all openings within the mini-containment work area and shall be sealed with two layers of 6-mil poly.
2. For intact removal of a fire door where no disturbance to insulation materials will occur, two layers of 6-mil poly shall be placed under the work area. No mini-containment will be required for intact fire door removal.
3. A one-stage mini-containment shall be established around the entire doorframe sealant removal area consisting of two layers of 6-mil poly walls and two layers of 6-mil poly floors.
4. Entrance to the mini-containment will be through double-flap poly curtains on the exterior and interior of the mini-containment.
5. The size of the mini-containment shall be sufficient to surround the planned area of work and allow up to two workers (max) to work efficiently and comfortably.
6. A HEPA-vacuum and Hudson sprayer shall be present inside the regulated area prior to abatement activities commencing.
7. Signs and/or barrier tape to establish the regulated area shall meet requirements set forth in 1926.1101(k)(7) for an asbestos regulated area, including the use of protective clothing and respiratory protection. Signs shall be posted once the containment area has been approved, but before any abatement begins. Personal Protection Equipment must be worn within this regulated area.

8. The doorframe sealant be removed by hand in a manner intended to cause as minor a disturbance as possible.
9. Debris generated by the removal process shall be cleaned using the HEPA-vacuum and wet-wiping procedures.
10. A final visual inspection can only be requested after all cleaning has been completed, all waste has been packaged in the containment area, and the remediation contractor's onsite supervisor has performed their own visual inspection.

Exterior Abatement Requirements – Roofing Mastics & CMU Texture

1. All openings leading into interior spaces shall be sealed with one layer of 6-mil poly as critical barriers. This includes doorways, windows, HVAC registers, etc. Intact critical barriers from other hazardous material work activities that may be remaining in place can be used as critical barriers for this work.
2. Poly sheeting shall be placed at ground surfaces if abatement is to take place within 10 feet of the roof edge.
3. Ground poly shall be secured or weighed down to prevent billowing and movement of poly drop sheet or creation of a trip hazard.
4. A HEPA-vacuum shall be present inside the regulated area prior to abatement activities commencing.
5. Signs and/or barrier tape to establish the regulated area shall meet requirements set forth in 1926.1101(k)(7) for an asbestos regulated area, including the use of protective clothing and respiratory protection. Signs shall be posted once the containment area has been approved, but before any abatement begins. Personal Protection Equipment must be worn within this regulated area.
6. A 6-mil poly drop sheet shall be attached to the regulated area to act as a decontamination area for abatement. This area shall include soap, towels, and water for workers to decontaminate themselves and equipment as removed from the regulated area. A waste bag for disposal of PPE and decontamination waste materials shall be in the decontamination area as well.
7. Materials shall be removed as intact as possible using non-mechanical means.
8. Contractor shall not remove more material than they are prepared to package and move off the roof for disposal in their work shift. No unpackaged waste may remain on the roof at work stoppages, including breaks or lunch period.
9. Materials shall be wetted using an airless sprayer applying amended water to the materials.
10. CMU texture on the exterior portion of the chimney shall be removed down to the bare substrate.
11. Mastics and sealants shall be removed down to the substrate and no three-dimensional material may remain at conclusion of abatement.
12. All waste shall be double-bagged in 6-mil poly bags prior to being removed from the roof's work area.
13. No "loose" water shall be present in the packaged waste when it is removed from the containment area. Water shall be soaked up with either kitty litter, diatomaceous earth or similar as necessary to meet this requirement.
14. Contractor is responsible for providing any lights required to sufficiently illuminate the work area if work is to be performed at night.
15. As noted above, contractor is responsible for providing all safety equipment and following all OSHA requirements for fall protection when working onsite.
16. Contractor will be responsible for the cleanup of any debris that intrudes into interior spaces of the school.
17. A final visual inspection will be performed at the conclusion of each day's shift by the District's third party consultant. The work area will need to be clean of all dust and debris with all materials abated down to the roof substrate to pass clearance.

Exterior Abatement Requirements – Transite Pipe

Although no transite pipe was discovered during the site survey, these requirements are included in the event they are discovered during the project.

1. The transite pipe material may be excavated to allow access by non-asbestos trained personnel; however, if transite pipe debris is discovered, excavation shall be halted to allow cleanup of material.
2. Contractor shall ensure the excavated area is shored as required to meet OSHA standards.
3. Excavated area shall be large enough to allow two workers to be in the trench area at the same time during abatement.
4. Once the pipe has been excavated, asbestos workers and supervisor shall conduct the setup of containment area.
5. One layer of 6-mil poly shall be placed over soil surfaces below and adjacent to the pipe to capture any debris generated.
6. Contractor will be required to provide pylon or similar component to allow barrier tape to be installed around the work area. This barrier tape shall be caution tape extending out 50 feet from the work area and the regulated work area shall extend out 15 feet in each direction from work.
7. Signs and/or barrier tape to establish the regulated area shall meet requirements set forth in 1926.1101(k)(7) for an asbestos regulated area, including the use of protective clothing and respiratory protection. Signs shall be posted once the containment area has been approved, but before any abatement begins.
8. A HEPA-vacuum and Hudson-type sprayer filled with amended water shall be in the work area for use.
9. The transite pipe shall be snap-cut for removal. Workers using the snap-cut tool shall be trained in the proper use of the tool to ensure the pipe is not crushed.
10. The area of cut shall be wetted with amended water prior to, and as work is conducted, to limit the release of asbestos fibers.
11. Transite pipe waste shall be cut in manageable sections. Transite pipe waste shall be wrapped in two separate layers of 6-mil poly and sealed in a leak-tight fashion.
12. If transite pipe is structurally sound and can be supported, it may be lifted out of the trench area by use of a backhoe. Pipe must be wrapped in poly prior to lifting out of the trench.
13. Work area shall be cleaned of all debris from pipe materials. This may require cleaning of poly drop sheets or bagging of contaminated soil. Any bagged waste shall be placed in two 6-mil poly waste bags.
14. All waste, non-essential supplies, and equipment shall be removed from the work area prior to a final visual inspection. To pass a final visual inspection, all transite pipe shall be removed as directed and the work area must be clean of all dust and debris.

Exterior Lead Paint Stabilization Requirements

1. Critical barriers shall be erected at openings within the work area and extending out at least 20 feet from work area. Critical barriers from other hazardous materials work activities that may be remaining in place can be used as critical barriers for this work. The openings to be sealed as critical barriers shall be sealed with one layer of 6-mil poly. This includes doors, vents, windows, etc.
2. One layer of 6-mil poly shall cover the ground at exterior work areas, extending at least 10 feet in each direction from the site of lead disturbance. This containment area may be increased if debris cannot be contained to the poly drop sheets. Fixed objects within this containment area shall be covered as well.
3. Poly drop sheets shall be secured to prevent billowing and creation of a trip hazard, and to prevent movement of drop sheets.

4. A wash station / decontamination area shall be attached to the containment area to allow workers to decontaminate themselves and equipment when exiting area. This wash station shall include water, soap, and towels for use with a waste bag for disposal of PPE and decontamination waste materials.
5. Lead hazard tape or caution tape with lead hazard signage shall be placed at the perimeter of the work area to create a regulated work area. Personal Protection Equipment must be worn within this regulated area.
6. Disturbance to painted or coated components or materials shall be performed using hand tools.
7. Painted or coated components or materials to be disturbed shall be wetted prior to and during removal to limit the creation of dust.
8. Painted surfaces shall be stabilized back to the point of being tight to the substrate.
9. A build-up of waste or debris within the work area is prohibited. Contractor workers shall ensure that the area is kept free of waste bags, paint chips, or other debris as work progresses to prevent the crushing of lead debris into finer lead dust.
10. Waste shall be placed into 6-mil poly waste bags. All waste must be double-bagged with both waste bags sealed in a "gooseneck" fashion to create a double-layered leak-tight container.
11. No "loose" water shall be present in the waste bags at the conclusion of lead disturbance. Water shall be soaked up with either kitty litter or diatomaceous earth as necessary to meet this requirement.
12. A HEPA-vacuum shall be used to evacuate air from waste bags when sealing. Workers using hands or knees to collapse air out of waste bags is prohibited.
13. At the conclusion of lead disturbance, the poly drop sheets shall be wet-wiped and HEPA-vacuumed clean of all debris and dust.

Building/Structure Demolition Note

Removal of lead-containing components in their entirety is not required to be completed for this project. If the contractor elects to remove such items prior to demolition of the planned structures to simplify waste profiling and disposal, the contractor should expect that containment and removal requirements will be similar to the requirements noted above.

If any components with lead-containing paint are left in place for demolition, the contractor performing the structure demolition will need to provide workers with OSHA lead training in compliance with these specifications. At the conclusion of demolition and loading of debris into waste bins for movement off-site, the contractor is responsible for leaving a clean work site behind. One of the keys to this clean work site criteria will be the HEPA-vacuum cleanup of all visible paint chip debris generated during the demolition of the building or structure.

To comply with NESHAP regulation, no visible emissions can be generated during remediation or demolition and materials cannot be tracked out of work area. Track out includes soil or debris on tires, failure of waste bins allowing debris to escape, and water running out of the work area.

Lead Hazard signs are not required for the demolition of the structure, but the contractor shall provide caution tape, or similar, to isolate work area from other portions of the site if requested by the WCSD Project Manager or Consultant.

Regulated Area Signage

Asbestos Danger and Lead Hazard signs shall be posted at all entrances to a containment area as appropriate for work being performed. Signage will be posted after a pre-start visual is passed and work may begin in the containment, but no work shall start until all signs are posted.

Signage shall meet the revised requirements for lead set forth in 29 CFR 1926.62(m) and for asbestos set forth in 29 CFR 1926.1101 (k)(7).

Decontamination Requirements

No consumption of food or fluids shall take place in the decontamination or load-out systems. Workers that wish to consume food or fluid shall fully exit the containment and decontamination system, including the doffing of all contaminated PPE.

Workers that fail to meet this requirement and remove PPE within a regulated area will be immediately removed from the project.

A three-stage decontamination chamber for worker ingress/egress shall be attached to all negative pressure enclosures. One system shall be required for every 10 workers that may be working within a containment area (i.e, 10 workers = 1 system, 11 workers = 2 systems). This chamber system shall consist of a dirty chamber, a shower, and a clean chamber. The decon chambers shall be constructed of 6-mil poly and each chamber shall be at least 3'L x 3'W x 7'H. A curb of at least 4" shall exist between each chamber to prevent the movement of debris or material from chamber to chamber. Each chamber shall be separated with a Z-flap that will seal closed in the event of a power outage.

The water in the shower shall be supplied by a properly functioning shower head. Both hot and cold water must be available and water temperature shall be controllable by workers using the shower. A splash pan may be required if workers cannot keep water contained into the shower system. The shower system shall have a filtration system that filters water down to 5 microns prior to discharge into a storm drain system. Soap, shampoo, towels and a waste bag for disposal of contaminated disposable PPE is required to be in the decontamination chamber system.

The floor of the dirty chamber shall have two layers of 6-mil poly. The top layer of the poly shall be replaced daily or more often if needed to maintain an acceptably clean decontamination system at the third-party consultant's discretion. Failure to keep any chamber of decon system in acceptable condition will be grounds for a work stoppage until cleaning has occurred and procedures have been corrected.

The contractor may opt to construct waste load-out chambers at containment areas. These chambers can be larger than worker decontamination systems, but the required air pressure differential must be maintained at all times and system shall be of reasonable size for the contractor to manage. Load-out chambers must be constructed of 6-mil poly and framing shall be sufficient to provide a sturdy construction. There must be self-sealing flaps between chambers of the load-out chamber. Load-out chambers can be reduced to no less than two chambers and only upon approval by the AHERA Project Designer or their onsite representative. Asbestos and/or lead signage shall be posted as appropriate at the load-out chamber and required PPE shall be worn in the load-out chambers as needed to comply with posted signage.

At no time will any ride-on equipment be used to access the load-out chambers to move waste. At no time will flaps of the waste load-out chambers or the worker decontamination system be pinned back to create a "tunnel" that does not provide an airlock between air chambers. At no time will a waste bin be directly attached to a containment or load-out chamber. At no time will waste be loaded into the load-out or decontamination system which prevent egress/ingress in the event of an emergency.

Failure by the contractor's onsite supervisor to monitor work crew and prevent this from occurring is grounds for dismissal of the supervisor and potentially crew members that fail to correct actions.

Disposal Requirements

Asbestos

As noted previously, all waste must be either double-bagged in 6-mil poly waste bags or sealed in two separate layers of 6-mil poly. Waste bags shall be sealed in a "gooseneck" fashion; "burrito-wrapped" materials shall have staggered seams to create a leak-tight container.

All asbestos-containing waste must be identified with OSHA labeling and EPA labeling is required for those materials determined to be friable or made friable during removal. The asbestos-containing materials identified as a non-friable asbestos-containing material may be disposed of as a non-hazardous asbestos-containing material waste unless made friable during removal or removed using mechanical means. For non-friable materials that are made friable or removed using mechanical means, and materials that are considered friable by the NESHAP regulation, the materials must be disposed of as a regulated asbestos-containing material (RACM) waste.

The contractor will need to provide fully enclosed, lockable waste bins for all waste created on this project. Waste bin will need to be labeled with asbestos signage once the waste is loaded into the bin. Waste bins shall be lined with one layer of 6-mil poly prior to waste being loaded. Hazardous and non-hazardous asbestos wastes may not be mixed within the same waste bin.

Asbestos waste shall be hauled from the site by a properly licensed waste hauler and disposed of at a waste facility that will accept the waste. Asbestos waste and lead waste cannot be mixed.

Lead

Contractor is responsible for the waste characterization profiling of all lead waste to be disposed of. This includes the contractor responsible for impacting and disposing of lead painted components during the demolition process. Copies of the laboratory results, including chain-of-custody, must be provided to WCSD ES&A or independent third-party consultant prior to disposal.

Lead-containing materials may be recycled, but a letter signed by the recycling facility acknowledging the lead-content of materials must be provided by the contractor prior to removal of such materials from the site. Materials that contain asbestos may never be recycled.

The contractor will need to provide a fully enclosed, lockable waste bin for all waste created on this project. Waste bin will need to be labeled with lead signage once the waste is loaded into the bin. Waste bins shall be lined with one layer of 6-mil poly prior to waste being loaded. Lead waste cannot be mixed with asbestos waste.

General Waste Bin Requirements

Waste bins will need to arrive onsite clean of debris or any other waste and in proper functioning order. Waste bins may be rejected by WCSD ES&A staff or District's independent third-party consultant if these conditions are not met, with no extra charge to the District. Plywood or similar material shall be placed below the casters or feet of the bin to prevent damage to site grounds. The contractor will be responsible for any damage to the site grounds by waste bin delivery, storage, or haul-off.

Lead Wipe Sampling Criteria

The District will hire the independent third-party consultant to perform lead wipe sampling prior to commencement of work. The consultant will collect wipe samples from floor and/or adjacent horizontal surfaces within the work areas to verify lead dust levels prior to work commencing. If cleaning of a surface to remove a detected lead hazard is required, the contractor shall be notified, and the hazardous materials contractor will be required to pre-clean to remove the hazard.

At the conclusion of lead disturbances, a post wipe sample will be collected from the interior work area, following removal of the containment poly. If post project wipe samples indicate that an EPA lead hazard exists, or if samples indicate a higher level of lead on surfaces than pre-project wipe samples showed, then recleaning of the work area will be necessary. Recleaning process will be required to be repeated until wipe samples indicate lead levels are below both current EPA hazard levels and below pre-wipe sample levels.

Clearance

Once an area passes visual clearance for the material abated, clearance air or wipe sampling will be performed by the ES&A Department or District's independent third-party consultant. Following are the requirements that must be met for clearance to be met and allow containment removal so that non-remediation personnel may re-occupy the space:

Asbestos

In containment areas where asbestos-containing materials are abated, clearance air samples will be collected in accordance with the US EPA AHERA regulation after passage of the final visual inspection. Samples will be collected in an aggressive fashion and analyzed by either phase contrast microscopy or transmission electron microscopy as required by AHERA, based on the amount of material abated within the containment area. Each sample set must meet clearance criteria set forth by the AHERA regulation for the analysis performed.

For exterior areas, passage of the final visual inspection will constitute clearance for asbestos abatement activities.

Lead

In the event that a lead hazard has been created by a contractor, such as improper disturbance of painted surfaces outside of a contained area, the District's ES&A staff or independent third-party consultant will collect clearance dust wipe or soil samples in the affected area. If a lead hazard has been created, the contractor performing the improper disturbance will be responsible for all cleaning costs required for the lead remediation contractor to abate the hazard and for collection of clearance dust wipe or soil samples to document that the lead hazard has been remediated.

As noted previously, pre-job and post-job lead wipe samples will be collected in spaces to verify the contractor has not created a lead hazard by removal of their containment area and to verify that the spaces can be re-occupied by non-lead trained personnel.

For exterior areas, passage of the final visual inspection will constitute clearance for lead remediation activities.

The contractor is responsible for all costs of labor and laboratory analysis for the collection of clearance air or wipe samples past the initial sample set collected within a containment area. This includes collection of samples due to failure to meet clearance requirements on the initial set of samples, contractor setting up more containment areas that reasonably expected, and contractor improper disturbance to surfaces after samples are collected but before analysis is completed.
