G. Install split sleeves (not shown on the drawings) to accommodate routing of horizontal cabling through non-rated full height gypboard walls. Sleeves shall be sized so as not to exceed a 20% fill rate.

H. Provide separate sleeves for routing of CAT 6 and CAT 6A cabling.

I. Install firestopping between the sleeve and structure, and between the telecom cables and the sleeve to maintain the wall rating.

J. Where sleeve penetrations are exposed in an architectural finished area, install chrome plated steel split ring escutcheon plates.

2.4 PULL BOXES

A. See the Electrical Specifications for additional pull box requirements and acceptable manufacturers.

B. Provide pull boxes where shown on the drawings to accommodate copper backbone cable splices.

C. Provide pull boxes in backbone cabling conduit every 100 feet and every 180 degrees of bend (whichever is the more strict provision) to facilitate pulling of backbone cabling.

D. Pull boxes shall be sized so as not to exceed the minimum bend radius of the backbone fiber and copper cabling.

E. Coordinate location of pull boxes with other trades. Provide access doors where required to access pull boxes in inaccessible wall or ceiling spaces.

2.5 CABLE HANGERS (J-HOOKS) AND SUPPORTS

A. Provide cable hangers (J-hooks) spaced at 5’-0” centers to support horizontal cable from the workstation outlet to the cable tray.

B. Hangers shall be prefabricated, zinc coated, carbon steel hangers designed specifically for 4-pair UTP communications cabling installations.

C. Hangers shall have an open top and rolled edges. Hangers shall have a minimum 2” and maximum 4” diameter loop.

D. Hangers shall be supported directly from the building structure. The Contractor shall provide anchors, beam clamps, threaded rod, rod fasteners, flange clips and brackets as needed to support the cable hangers from the building structure. Do not attach hangers to ceiling support wires or other support systems installed by other building trades.

E. J-hooks shall not support more cables than recommended by the manufacturer. J-hooks shall be sized to provide a minimum 20 percent spare capacity.

F. Cable bundles shall not exceed (24) cables and shall be loosely bound with Velcro cable straps.

G. Acceptable Products

1. Erico Caddy CableCat Clips.
2. B-Line Cable Hook System.
3. Panduit J-Pro Cable Support System.
4. Or approved equal.

2.6 VELCRO CABLE STRAPS

A. Install Velcro cable ties cut to length from a continuous roll to loosely bundle horizontal cabling routed down J-hook lines, on the cable tray and ladder rack.

B. Install Velcro cable ties at 2’-0” intervals outside of the telecom room and 1’-0” intervals inside the telecom room.

C. Do not exceed qty (24) cables per bundle.

D. Provide plenum rated Velcro tie wraps where cable is routed in plenum spaces.

E. The use of plastic tie-wraps to bundle cabling is not permitted.

A. Acceptable Products
1. Panduit HLS-15R6 or HLSP (plenum rated).
2. Leviton 43115-075.
3. Or approved equal.

2.7 MEASURING TAPE AND PULL STRING

A. Install pull string in all telecom conduit and innerduct. Pull string shall be ½” pre-lubricated high strength woven polyester with sequential foot markings. The tensile strength of the pull string shall be greater than or equal to 1,250 lbs.

B. Pull string shall meet or exceed the requirements of Bellcore GR-356-CORE “Generic Requirements for Optical Cable Innerduct and Accessories”.

C. Acceptable Products

1. Carlon TL145xx.
2. A-D Technologies Bull-Line WP12xx.
3. Or approved equal.

2.8 INNERDUCT

A. Provide multi-cell fabric innerduct where shown on the drawings and for installation of backbone fiber and copper cabling.

B. Innerduct should be terminated at the conduit entrance in the telecom rooms and secured to the plywood backboard.

C. Provide fabric innerduct size and cell count as shown on the drawings.

D. Acceptable Products

1. Maxcell Fabric Innerduct
2. No Known Equal.

2.9 FIRE STOPPING

A. Provide fire stopping and backing material between sleeves/conduit penetrations through rated partitions or floors. Provide fire stopping in sleeves/conduits after all cables have been installed.

B. The minimum required fire resistance ratings of the wall of floor assembly shall be maintained by the fire stop system. The installation shall provide an air and watertight seal.

C. Fire stopping shall be listed or classified by an approved independent testing laboratory. The system shall meet the requirements of “Fire Tests of Through-Penetration Fire Stops” designated ASTM E814.

D. Manufacturer’s recommended installation standards shall be closely followed (i.e. minimum depth of material, use of ceramic fiber and installation procedures).

E. For each firestopping system on the project, submit the page from the UL fire resistance directory showing the firestopping system.

F. Acceptable Manufacturers:

1. 3M.
2. Hilti.
3. Nelson.
4. Specified Technology.
5. Or approved equal.

PART 3 – EXECUTION

3.1 COMMUNICATION PATHWAY SUPPORTS

A. All hangers for communication items (conduit, boxes, wire basket tray, j-hooks and all other related equipment) where an “Epic Deck” system occurs shall be compatible for use with this system, “Epic Deck” is by Epic Metals Corporation. See Architectural and Structural drawings for locations.

3.2 CONCEALMENT

A. Telecom cabling pathways including conduit, sleeves and cable tray shall be concealed above ceilings, in walls, below slabs, and elsewhere throughout building. If concealment is impossible or impractical, or in areas without ceilings, Contractor shall submit proposed routing of the raceway for review and approval prior to starting that portion of the work.

B. All telecom cabling must be routed concealed above accessible ceilings or in conduit. No exposed telecom cabling is permitted with the exception of telecom cabling routed within the telecom rooms.

3.3 COORDINATION DRAWINGS

A. The telecom drawings are diagrammatic in depicting the routing of telecom cabling pathways.

B. The contractor shall coordinate the installation of all telecom pathways with the work of other trades including Mechanical, Electrical, Plumbing, Sprinkler, Structural and Architectural.

C. The contractor shall participate in coordination meetings with other trades prior to the installation of telecom cabling pathways. For a specific space/area, the telecom contractor shall coordinate the routing of telecom pathways with all other trades that have work in that specific space/area.

D. Prior to the installation of telecom cabling pathway including conduit, basket tray, cable tray, ladder rack, sleeves, etc., the contractor shall coordinate the routing of this pathway to avoid conflicts with and provide necessary clearances from the work of other trades. The contractor shall provide all horizontal offsets, vertical offsets and radius bends as necessary to coordinate the routing of the telecom pathway with the work of other trades and building structure.

3.4 COMMUNICATION PATHWAYS

A. Prior to cable installation, the Contractor shall verify that the telecommunications pathways are installed as specified in the Drawings and Specifications. Any variations or violations from these documents shall be immediately reported to the Owner’s Representative. No portion of the Structured Cabling System shall be installed in any component of the Telecommunications Pathways and Spaces which deviates from these documents. All cabling designated on the Blueprints as terminating within a specific Telecom Room shall be installed as such unless otherwise specified in writing by the Owner’s Representative.

B. Cabling for other trades shall not occupy any pathway utilized for telecommunications cabling.

C. The cable tray shall be installed so that a minimum of 6” clear space is maintained above the top of the tray to facilitate cable installation. The contractor shall coordinate the routing of the cable tray with other trades so that plumbing piping, fire sprinkler piping, ductwork, conduits, etc are not routed within the 6” clear space above the tray.

D. Where the routing of telecom pathways conflicts with the work of other trades, the telecom contractor shall reroute the telecom pathway (cable tray, conduit, sleeves, etc.) as required to eliminate the conflict.

E. The drawings are diagrammatic and provide a general routing for conduit, J-hooks and cable tray. The Contractor shall coordinate the exact routing of the communication raceway systems with other trades and the building structure. Access doors shall be installed as necessary to provide access for cable installation, inspection and maintenance.

F. Install conduit where shown on the drawings or as required to route telecom cabling in inaccessible ceiling or wall spaces. Install conduit to protect cable where routed through areas subject to damage including mechanical and electrical rooms.

G. Cable pathways including conduit, cable tray, sleeves, and J-hooks shall be sized for 20% fill capacity.

H. When installing conduit, J-hooks and cable tray, the Contractor shall maintain the following minimum clearance from sources of electro-magnetic interference (EMI).

1. 6” clear from power conductors.
2. 12” clear from fluorescent lighting fixtures and ballasts.
3. 36” clear from transformers and motors.

I. Provide all items necessary for the support and seismic bracing of conduit and cable tray including concrete anchors, clamps, brackets, hanger rods, rod stiffeners, unistrut, splice plates, couplers, expansion joint assemblies, etc.

J. The conduit and cable tray system shall provide a continuous ground path per the National Electrical Code. Conduit and tray shall be bonded to ground at the telecom rooms. All sections of the backbone conduit and tray shall be mechanically fastened and bonding jumpers shall be installed as necessary to provide continuous ground path.

K. In order to maximize floor and wall space in the telecom rooms, all conduit must be stubbed into the room above the ladder rack UON. Conduits shall not be stubbed up through the floor slab unless specifically shown on the drawings.

3.5 SLEEVES

A. Install sleeves through walls and floors as required to route horizontal and backbone telecom cabling.

B. Provide sleeves for penetration of all gypboard walls. Layout wall penetrations as directed by the General Contractor and provide split sleeves to the framing contractor for installation.

C. Where wire cable trays penetrate non-rated walls, stop cable tray short of wall and provide smoke and acoustical pathways.

D. Where wire cable trays penetrate fire rated walls, stop cable tray short of wall and provide 4” conduit sleeves with a UL listed firestop assembly.

E. Firestop all penetrations through rated walls. Firestop assemblies shall meet or exceed the rating of the walls or floors being penetrated.

F. Coordinate layout and installation of concrete wall and floor sleeves prior to concrete pours. Contractor is responsible for providing, installing, securing and covering sleeves. The contractor shall have field personnel on site during concrete pours to ensure that sleeves are not dislodged or moved during concrete pours. Contractor will be responsible for core drilling costs related to missed or improperly located sleeves.

G. Where sleeves are installed more than 24” above the overhead ladder rack in the telecom rooms, install wall mounted vertical ladder rack below the sleeves to support cabling.

H. Provide separate sleeves for routing of CAT 6 and CAT 6A cabling.

3.6 CUTTING, CORING AND PATCHING

A. The Contractor shall be responsible for all cutting, patching, coring and associated work to complete the telecommunications cabling pathway system.

B. Protect existing finishes from water damage during core/cutting work and cleanup all related water and debris. Patch adjacent work disturbed by installation of new work including insulation, walls and wall covering, ceiling and floor covering or other finished surfaces.

C. Contractor to submit all proposed concrete wall or floor penetrations to the Structural Engineer for approval prior to performing the work. Contractor shall locate and avoid cutting concrete reinforcing steel using current x-ray or pachometer equipment.

3.7 CABLE HANGERS

A. Secure cable tray and J-hook hanger supports directly to the building structure. Hangers shall not be supported from the work of other trades including ceiling supports, electrical conduits, plumbing pipes, sprinkler piping, ductwork, ceiling mounted equipment or their supports unless it is part of an engineered system.

B. Install J-hooks on a maximum of 5’-0” centers. Install J-hooks a minimum of 6” above ceiling tiles to facilitate ceiling tile removal.

END OF SECTION 270528

SECTION 270800 – COMMISSIONING OF COMMUNICATIONS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Drawings and general provisions of the Contract, Including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. The Contractor shall provide all equipment, materials, labor, and services necessary to complete the testing, labeling and documentation of the telecom cabling system in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

C. This section includes the minimum requirements for the testing, identification and administration for the telecommunications cabling system, including the following:

1. Testing

    a. Category 6 Cable Test Equipment and Test Procedures.
    b. Category 6A Cable Test Equipment and Test Procedures.
    c. Cable test reports.

2. Identification

    a. Labeling of work area outlet faceplates and jacks.
    b. Labeling of horizontal data, voice and video cabling.
    c. Labeling of Copper Patch Panels.

3. Administration

    a. As-built drawings.
    b. Materials listing.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 11 00: Communications Equipment Room Fittings
3. 27 15 00: Communications Horizontal Cabling
4. 27 51 13: Paging Systems
5. 27 53 13: Wireless Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of Specification Section 27 05 00 1.4 and in particular the following requirements

1. ANSI/TIA-568.2-D: Balanced Twisted-Pair Telecommunications Cabling And Components Standards (Revision D, September 2018).
2. ANSI/TIA-568.3-D: Optical Fiber Cabling and Component Standard (Revision D, October 2016).
3. ANSI/TIA-598-D: Optical Fiber Cable Color Coding (Revision D, July 2014).
4. ANSI/TIA-606-D: Administration Standard for Telecommunications Infrastructure (Revision D, October 2021).
5. ANSI TIA-526-7-A: Measurement of Optical Power Loss of Installed Single-Mode Fiber Cable Plant (Revision A, July 2015).
6. ANSI/TIA-526-14-C: Optical Power Loss Measurement of Installed Multimode Fiber Cable Plant (Revision C, 2015).
7. ANSI/TIA-1152-A: Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling (Revision A, November 2016).
8. ANSI/NFPA-70, 2023 -- National Electrical Code (NEC).
9. Underwriter's Laboratories, Inc. (UL).

1.4 SUBMITTALS

A. Test Equipment: Submit manufacturers' catalog sheets and specifications for the following cable testers

1. Category 6 cable tester.
2. Category 6A cable tester.

B. Calibration Reports: Provide calibration reports for all test equipment to be used on the Project. The calibration must have been performed by a manufacturer certified calibration facility and be dated no more than 60 days prior to the start of testing.

C. Cable Test Reports: Provide bound test reports for all cables signed by the technician performing the cable testing. Include Manufacturers data sheets for the cabling being tested.

D. Labels: Submit manufacturer's data sheets on the type of labels to be used for each labeling application.

PART 2 – PRODUCTS

2.1 HORIZONTAL CATEGORY 6 UNSHIELDED TWISTED-PAIR CABLE TESTER

A. Shall perform all tests necessary to certify the horizontal Category 6 UTP cabling in accordance with ANSI/TIA/EIA 568 B.2-1.

B. Shall be a UL certified Level III test set calibrated by a manufacturer certified calibration facility. The calibration shall be dated no more than 60 days prior to the start of testing.

C. Acceptable Manufacturers

1. Fluke Networks
2. Ideal Industries
3. Agilent Technologies
4. Or equal.

2.2 CATEGORY 6A (AUGMENTED) UNSHIELDED TWISTED-PAIR CABLE TESTER

A. Shall perform all tests necessary to certify the horizontal Category 6A UTP cabling in accordance with ANSI/TIA/EIA 568 B.2-1 and Category 6A standard ANSI/TIA/EIA–568-B.2-10 -- Augmented Category 6 Cable.

B. Shall be a UL certified Level IV test set calibrated by a manufacturer certified calibration facility. The calibration shall be dated no more than 60 days prior to the start of testing.

C. Acceptable Manufacturers

1. Fluke Networks
2. Ideal Industries
3. Agilent Technologies
4. Or equal.

2.3 LABELS

A. Labels shall be laser printed and shall meet the legibility, defacement, exposure and adhesion requirements of UL 969.

B. Acceptable manufacturers

1. Belden
2. Brady
3. Brother
4. HellermannTyton.
5. Or approved equal

2.4 WORK AREA OUTLET FACEPLATE LABELS

A. Label each port in each faceplate in accordance with Labeling Scheme identified on the Drawings. Label must be machine printed and inserted in the faceplate label window. Labels shall be provided by the faceplate manufacturer of the faceplate.

B. Acceptable manufacturers

1. Belden
2. Brother
3. HellermannTyton.
4. No Substitution

2.5 HORIZONTAL CABLE SHEATH LABELS

A. Label horizontal cable sheaths at work area outlets and at patch panels with laser printed self-laminating wrap around vinyl labels. Labels shall be in accordance with the Labeling Scheme identified in WCSD SCS-015.

B. Labels shall be white with black type. Label size shall be 1.0” wide by 1.5” high.

C. At the Telecom Room, cable labels will be affixed to cable a minimum of 1 inch from the termination on the patch panel, and placed in such a way as to be clearly visible.

D. At the work area outlet, cable labels shall be affixed to the cable 2 inches from the termination on the jack.

1. Acceptable Manufacturers:

    a. Belden
    b. Brady
    c. Brother
    d. HellermannTyton.
    e. Or approved equal

2.6 COPPER PATCH PANEL LABELS.

A. Label each patch panel with a single panel ID label in accordance with the labeling scheme identified WCSD SCS-015.

B. Labels shall be compatible with the patch panels provided for the Project.

C. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.5” wide by 0.5” high.

1. Acceptable Manufacturers:

    a. Belden
    b. Brady
    c. Brother
    d. HellermannTyton.
    e. Or approved equal

D. Label each patch panel port with a laser printed label. Label each port with the room number of the room housing the work area outlet.

E. Labels shall be compatible with the patch panels provided for the Project.

F. Label material shall be permanent polyester. Labels shall be white with black type. Label size shall be 0.375” high.

1. Acceptable Manufacturers:

    a. Belden
    b. Brady
    c. Brother
    d. HellermannTyton.
    e. Or approved equal

    f.

PART 3 – EXECUTION

3.1 CABLE TESTING – GENERAL

A. Visually inspect all cables, cable reels, and shipping cartons to detect cable damage incurred during shipping and transport. Return visibly damaged items to the manufacturer.

B. Where post-manufacture test data has been provided by the manufacturer on the reel or shipping carton, submit copies to the Owner's Representative as part of the cable test results.

C. The Owner's Representative reserves the right to observe any or all portions of the cable testing process.

D. The Owner's Representative further reserves the right to conduct, using contractors equipment and labor, a random re-test of up to ten percent (10%) of the cable plant to confirm documented test results.

E. Test results and corrective procedures are to be documented and submitted to the Owner's Representative within five (5) working days of test completion.

3.2 CATEGORY 6 UTP CABLE TESTING

A. A representative of the end-user shall be invited to witness field testing. The representative shall be notified of the start date of the testing phase 5 business days before testing commences.

B. Field test measurements shall be made in accordance with Annex I of ANSI/TIA/EIA-568-B.2 unless otherwise noted.

C. Field test measurements shall be conducted from 1 MHz to 250 MHz.

D. Field testing shall be conducted using a level III tester. The accuracy of the level III tester shall meet or exceed the requirements of Annex B of ANSI/TIA/EIA-568-B.2-1. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.

E. Every cabling link shall be tested in accordance with the ANSI/TIA/EIA-568-B.1 Section 11.2: “100-Ohm twisted-pair transmission performance and field test requirements”.

F. The installed twisted-pair horizontal links shall be tested from the patch panel in the telecommunications room to the work area outlet. The cable must pass the “Permanent Link” performance limits specification as defined in ANSI/TIA/EIA-568-B.1.

G. 100% of the installed cabling links must be tested and must pass the requirements of the standards mentioned above. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation.

H. Trained technicians who have successfully attended an appropriate training program shall execute the tests. Appropriate training programs include but are not limited to installation certification programs provided by BICSI or the ACP (Association of Cabling Professionals).

I. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field tester manufacturer must provide documentation as an aid to interpret results marked with asterisks. (Reference TIA-568-B; Annex I: Section I.2.2).

J. The Contractor shall provide Category 6, 250 MHz channel test results on all pairs of cable. The following minimum field test parameters are required:

1. Wire map (including cable shield if present).
2. Length.
3. Insertion loss.
4. Near-end crosstalk (NEXT) loss.
5. Power sum near-end crosstalk (PSNEXT) loss.
6. Equal-level far-end crosstalk (ELFEXT).
7. Power-sum equal-level far-end crosstalk (PSELFEXT).
8. Return loss.
9. Propagation delay.
10. Delay skew.

K. Test results shall be provided in electronic format and printed 8.5” x 11” format signed by the technician performing the testing. The electronic format should be a Microsoft Word .doc file. Along with the above test parameters, the following information must be included for each cable tested:

1. Name of Owner and name of project (building name).
2. Date and time of test.
3. Name of technician performing the field testing.
4. Manufacturer, model number, serial number and software revision of field tester.
5. Cable ID (Telecom Room # - Patch Panel # - Port # / Work Area Room # - Telecom Outlet – Jack #).
6. Overall Pass/Fail result.
7. Manufacturer, category and model number of cable.
8. NVP used to determine cable length.

3.3 CATEGORY 6A (AUGMENTED) UTP CABLE TESTING

A. A representative of the end-user shall be invited to witness field testing. The representative shall be notified of the start date of the testing phase 5 business days before testing commences.

B. Field test measurements shall be made in accordance with Annex I of ANSI/TIA/EIA-568-B.2 1 and the Category 6A standard ANSI/TIA/EIA–568-B.2-10.

C. Field test measurements shall be conducted from 1 MHz to 500 MHz.

D. Field testing shall be conducted using a level IV tester. The accuracy of the level IV tester shall meet or exceed the requirements of Annex B of ANSI/TIA/EIA-568-B.2-1 and the Category 6A standard ANSI/TIA/EIA–568-B.2-10. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.

E. Every cabling link shall be tested in accordance with the ANSI/TIA/EIA-568-B.1 Section 11.2: “100-Ohm twisted-pair transmission performance and field test requirements”.

F. The installed twisted-pair horizontal links shall be tested from the patch panel in the telecommunications room to the work area outlet. The cable must pass the “Channel” performance limits specification as defined in ANSI/TIA/EIA-568-B.1.

G. 100% of the installed cabling links must be tested and must pass the requirements of the standards mentioned above. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for all links shall be provided in the test results documentation.

H. Trained technicians who have successfully attended an appropriate training program shall execute the tests. Appropriate training programs include but are not limited to installation certification programs provided by BICSI or the ACP (Association of Cabling Professionals).

I. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field tester manufacturer must provide documentation as an aid to interpret results marked with asterisks. (Reference TIA-568-B; Annex I: Section I.2.2).

J. The Contractor shall provide Category 6A, 500 MHz channel test results on all pairs of cable. The following minimum field test parameters are required:

1. Wire map (including cable shield if present).
2. Length.
3. Insertion loss.
4. Near-end crosstalk (NEXT) loss.
5. Power sum near-end crosstalk (PSNEXT) loss.
6. Equal-level far-end crosstalk (ELFEXT).
7. Power-sum equal-level far-end crosstalk (PSELFEXT).
8. Return loss.
9. Propagation delay.
10. Delay skew.

K. Testing and certification of the Category 6A cabling system for Alien Crosstalk IS REQUIRED as follows:

The Contractor shall perform Alien Crosstalk testing on 1% of the installed CAT 6A links. Testing shall be performed in accordance with Fluke Electronic's or Agilent Technologies' current White Paper specifying field Alien Crosstalk testing procedures. "Worst case" CAT 6A links shall be selected for the testing based on overall cable length and where the cable is routed adjacent to the largest number of cables.

L. Test results shall be provided in a CD-ROM format within 5 days after the completion of the project. Test documentation shall be saved in Fluke LinkWare file format version 2.2 or later and must include (along with the above test parameters), the following information:

1. Test results as downloaded from the tester. The following information shall be included in the test results:

   a. Record of test frequencies.
   b. Cable type.
   c. Conductor pair and cable I.D.
   d. Measurement direction.
   e. Reference setup.
   f. Crew member name(s).

2. Additional documentation required to provide the following (if not included in test results):

   a. Test equipment name, manufacturer, model number, serial number, software version and last calibration date.

b. The test method used and the specific settings of the equipment during the test as well as the software version being used in the field test equipment.
c. Any required information not listed in test results (crew member, etc.).

3. The CD shall be clearly marked on the outside front cover with the words "Project Test Documentation", the project name, and the date of completion (month and year).

4. Unless the manufacturer specifies a more frequent calibration cycle, an annual calibration cycle is anticipated on all test equipment used for this installation. The Contractor must provide a copy of the last calibration certification with submitted test results.

5. When repairs and re-tests are performed, the problem found and corrective action taken shall be noted, and both the failed and passed test data shall be documented.

3.4 CABLE TESTING VALIDATION

A. If requested by the Owner’s Representative, the Contractor shall participate in cable testing validation.

B. After the Contractor has completed all cable testing and submitted test results, the Contractor shall, in the presence of the Owner's Representative, test up to 5% of the installed and tested cables (random sample to be selected by the Owner's Representative).

3.5 IDENTIFICATION AND LABELING

A. The Contractor shall confirm the telecom room and work area room numbers with the Owner or Owner's Representative prior to labeling.

B. Labeling scheme shall follow the requirements of Washoe County School District Structured Cabling Specification WCSD-SCS-015 dated March 13, 2023.

C. Work Area Outlet Face Plates: See WCSD-SCS-015 for requirements.

D. Work Area Data and Voice Jacks: See WCSD-SCS-015 for requirements.

E. Work Area Horizontal Data, Voice and Video Cable: See WCSD-SCS-015 for requirements.

F. Telecom Room Horizontal Data, Voice and Video Cable: See WCSD-SCS-015 for requirements.

G. Patch Panels: See WCSD-SCS-015 for requirements.

H. Patch Panel Ports: See WCSD-SCS-015 for requirements.

I. Fiber Termination Cabinets: See WCSD-SCS-015 for requirements.

J. 110 Blocks: See WCSD-SCS-015 for requirements.

K. Backbone Cables: See WCSD-SCS-015 for requirements.

L. Equipment Racks and Cabinets: See WCSD-SCS-015 for requirements.

3.6 ADMINISTRATION

A. As-Built Drawings.

1. The Contractor shall provide As-Built drawings at the end of the project. One (1) reproducible and (1) blue line shall be provided. Electronic versions of the drawings in AutoCAD version 2000/2002 and PDF shall also be provided. The following information shall be provided on the As-Built Drawings:

a. Plan location of all telecom outlets.
b. Quantity and type of drops at each telecom outlet.
c. Telecom room where the drops are terminated.
d. Cable tray layout. Provide dimensions from building grid lines to locate cable tray.
e. J-hook layout. Provide dimensions from building grid lines to locate J-hook runs.
f. Conduits and pull box layout. Provide dimensions from building grid lines to locate conduits and pull boxes.
g. Backbone cable runs and pair/strand counts.
h. Horizontal and vertical sleeve layout.
i. Outside plant vaults and pull boxes. Provide dimensions from curbs to locate vaults and pull boxes.
j. Outside plant conduits. Provide dimensions from curbs to locate conduit.

B. Materials Listing

1. The contractor shall provide a spreadsheet indicating the materials and quantities used on the project. At a minimum, the spreadsheet will contain the following information: Item description, manufacturer, part number, quantity and color (where applicable).

END OF SECTION 270800

SECTION 271100 – COMMUNICATION EQUIPMENT ROOM FITTINGS

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Drawings and general provisions of the Contract, Including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. The Contractor shall provide all equipment, materials, labor, and services necessary to complete communication equipment rooms and spaces, and to ensure that they are in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

C. Minimum requirements and installation methods are included for the following:

1. Horizontal Cable Managers
2. Category 5E Copper Patch Panels
3. Category 6 Copper Patch Panels
4. Category 6 Copper Patch Cords
5. Category 6A Copper Patch Panels
6. Category 6A (Augmented) Copper Patch Cords
7. Velcro Cable Ties

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications
4. 27 15 00: Communications Horizontal Cabling
5. 27 51 13: Paging Systems
6. 27 53 13: Wireless Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with the requirements of Specification Section 27 05 00 1.4 and in particular the following standards and code requirements.

1. ANSI/TIA-568.0-E: Generic Telecommunications Cabling for Customer Premises (Revision E, March 2020).
2. ANSI/TIA-568.1-E: Commercial Building Telecommunications Infrastructure Standard (Revision E, March 2020).
3. ANSI/TIA-568.2-D: Balanced Twisted-Pair Telecommunications Cabling And Components Standards (Revision D, September 2018).
4. ANSI/TIA-568.3-D: Optical Fiber Cabling and Component Standard (Revision D, October 2016).

5. ANSI/TIA-569-E: Telecommunications Pathways and Spaces (Revision E, May 2019)
6. ANSI/TIA-598-D: Optical Fiber Cable Color Coding (Revision D, July 2014).
7. ANSI/TIA-606-D: Administration Standard for Telecommunications Infrastructure (Revision D, October 2021).
8. ANSI/TIA-607-D: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises (Revision D, July 2019).
9. ANSI/NFPA-70, 2023 - National Electrical Code (NEC).
10. Underwriter's Laboratories, Inc. (UL).

1.4 QUALITY ASSURANCE

A. All cable, raceways and equipment in the telecom rooms shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the Specifications shall be subject to the control and approval of the Owner's Representative.

1.5 SUBMITTALS

A. Manufacturer's Data Sheets: Submit manufacturer's data sheets in electronic PDF format for the following items:

1. Horizontal Cable Managers
2. Category 5E Copper Patch Panels
3. Category 6 Copper Patch Panels
4. Category 6 Copper Patch Cords
5. Category 6A Copper Patch Panels
6. Category 6A (Augmented) Copper Patch Cords
7. Category 6 Entrance Terminals with Primary Protector Modules
8. Velcro Cable Ties

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

C. Shop Drawings: Submit shop drawings indicating the proposed layout of all telecom cabling pathways and equipment located in the telecommunication rooms, including coordinated rack elevations for existing and new rack-mounted equipment shown on the Contract Drawings. Shop drawings shall be coordinated with all trades having work in the telecom rooms. Shop drawings shall include the following items:

1. Plan view showing the layout of all floor mounted telecom and electrical equipment including cabinets, racks, UPS's and vertical cable management devices. Dimensions shall be provided showing required maintenance clearances in the front, rear and side of all equipment.
2. Plan view of all vertical floor sleeves and floor openings.
3. Plan view showing the layout of all cable pathway including horizontal ladder rack, horizontal basket tray, cable radius drop outs, vertical ladder rack and sleeves.
4. Plan view showing the location of all lighting fixtures, HVAC ductwork, fan coil units and/or split units serving the room. The contractor shall coordinate this work so that it does not conflict with the overhead cabling pathways or other telecom equipment.
5. Plan view showing the layout of all wall mounted equipment including ground bars, wall mounted racks, building entrance terminals, wall mounted termination fields, security panels, electrical panels, etc.
6. Wall elevations showing the layout and elevation of all wall mounted equipment.

1.6 DELIVERY, STORAGE & HANDLING

A. Protect all wiring blocks, patch panels, jacks and patch cords from moisture, dust and debris prior to installation.

B. Install equipment in the telecom rooms only after the room construction is complete and the room clean. This includes all gypboard walls, gypboard ceilings, floor finishes, t-bar grid, plywood backboards, door frames, doors and paint. Notify the Owner's Representative of any incomplete items prior to installing equipment.

1.7 GUARANTEE

A. See Specification Section 270500 1.10 for warranty requirements which apply to the patch panels and cabling specified in this section.

PART 2 – PRODUCTS

2.1 HORIZONTAL CABLE MANAGEMENT

A. Horizontal and vertical cable managers shall be provided from the same manufacturer and shall be compatible with the specified racks.

B. Horizontal cable managers shall be 2 rack units in height and have. See rack elevations for quantity.

C. All components shall be color black.

1. Acceptable Products:

a. Chatsworth P/N 11564-719 with slip on cover P/N 11764-719.
b. No Substitutions.

D.

2.2 CATEGORY 5E COPPER PATCH PANELS

A. Provide 19" rack mounted 48-port or 24-port Category 5E data patch panels as shown on the drawings.

B. Patch panels shall be constructed of black anodized aluminum or black powder coated steel.

C. Patch panels shall have fixed outlet jacks with 110 IDC connectors on the rear of the panel.

D. Patch panels shall be wired in accordance with the T568B standard.

E. The same manufacturer will be used for both the patch panels and workstation outlets throughout the Project.

F. Provide rear cable termination bracket with each patch panel.

G. Patch panels shall conform to ANSI/TIA/EIA–568-A Addendum 5 as shown below.

Parameter	Worst Case Channel Performance at 100MHz
Specified Frequency Range	1-100 MHz
Attenuation	0.4 dB
NEXT	43.0 dB
Return Loss	20.0 dB

H. Acceptable Products:

1. Belden/CDT P/N AX103258 (24-port), AX103259 (48-port). Provide cable tie-bar for each patch panel AX101173.
2. No Substitutions.

2.3 CATEGORY 5E COPPER PATCH CORDS FOR BACKBONE VOICE CABLING.

A. For every installed 25-pair CAT 5E backbone cable, provide qty (4) 7'-0" Category 5E patch cords with blue jackets

B. Acceptable Products:

1. Belden/CDT P/N C501106007.
2. No Substitutions.

2.4 CATEGORY 6A (AUGMENTED) COPPER DATA PATCH PANELS

A. Patch Panels shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

1. Provide 19” rack mounted 48-port Category 6A data patch panels as shown on the drawings. Category 6 field device cabling for surveillance, audio enhancement, and paging systems shall terminate on Category 6A RevConnect patch panels where indicated in the cable and termination schedule.

B. Patch Panels shall be 100% pre-loaded with CAT 6A modules.

C. Each patch panel CAT 6A module shall be provided with a color coded icon insert to designate its relationship to the following systems:

1. Data Port: Icon Insert – No icon insert required.
2. Wireless Access Point Port: Icon Insert color “White”.
3. CCTV System: Icon insert color “Black”.
4. Audio Enhancement System: Icon insert color “Gray”.
5. Paging System: Icon insert color “Green”.

D. Patch panels shall conform to the performance requirements of ANSI/TIA/EIA–568-B.2-10 for Augmented Category 6 Cable as outlined below.

Frequency (MHz)	NEXT (dB) (min.)	PSANEXT (dB) (min.)	RETURN LOSS (dB) (min.)
0.772	96.2	112.2	70.2
1	94.0	110.0	68
4	82.0	98.0	56
8	75.9	91.9	49.9

10	74.0	90.0	48.0
16	69.9	85.9	43.9
20	68.0	84.0	42.0
25	66.0	82.0	40.0
31.25	64.1	80.1	38.1
62.5	58.1	74.1	32.1
100	54.0	70.0	28.0
200	48.0	64.0	22.0
250	46.0	62.0	20.0
300	44.5	60.5	18.5
350	43.1	59.1	17.1
400	42.0	58.0	16.0
450	40.9	56.9	114.9
500	40.0	56.0	14.0
550	39.2	55.2	13.2
600	38.4	54.4	12.4
625	38.1	54.1	12.1

E. Acceptable Products:

1. 48-Port Cat 6A Patch Panels:

   a. Belden/CDT RevConnect P/N RVAPPF2U48BK.
   b. No Substitutions.

2. Colored Icon Inserts:

   a. Belden/CDT RevConnect P/N RVUICxx-B24 (provide icon insert colors for different systems as indicated above).
   b. No Substitutions.

2.5 CATEGORY 6 COPPER PATCH CORDS

A. Patch cords shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Provide Category 6 UTP patch cords for interconnection of owner furnished switches and patch panels in all IDF’s and the MDF.

1. Provide one (1) 4’-0” CAT 6 patch cord for each data drop or device connection related to the following systems, coordinated with the cable and termination schedule and system diagrams:
2.
3. CCTV System: Patch Cord Color “Black”.
4. Audio Enhancement System: Patch Cord Color “Gray”.
5. Paging System: Patch Cord Color “Green”.

C. Cabling used for patch cords shall be manufactured by the same manufacturer as the horizontal cabling and shall be of the same product line. Cable shall conform to the requirements of ANSI/TIA/EIA–568-B.2 Addendum 1. Electrical characteristics and performance of the patch cables shall be nearly identical to the horizontal cable with

exceptions given due to differences between solid and stranded conductors as indicated in the following table.

Frequency (MHz)	Stranded Conductor Cable Insertion Loss (dB)
1	2.4
4	4.5
8	6.4
10	7.1
16	9.1
20	10.2
25	11.4
31.25	12.8
62.5	18.5
100	23.8
200	34.8
250	39.4

D. Patch cords shall be rated for use as communications cable and shall have the designation “CM” or “CMR” printed on the jacket.

E. Acceptable Products:

1. Belden/CDT GigaFlex PS6+ Modular Cord P/N C60110xxxx (provide patch cord jacket colors for different systems as indicated above).
2. No Substitutions.

2.6 CATEGORY 6A (AUGMENTED) PATCH CORDS

A. Patch cords shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Provide Category 6A patch cords for interconnection of owner furnished switches and patch panels in all IDF’s and the MDF. Provide one (1) 4’-0” CAT 6A patch cord for each data drop related to the following systems:

1. Telecom Outlet: Patch Cord Color “Yellow”.
2. Wireless Access Point: Patch Cord Color “White”.

C. Provide Category 6A “work-area” patch cords for interconnection of owner furnished workstations and phones at the work-area outlets. Provide one (1) 15’-0” CAT 6A patch cord for each data drop related to the following systems:

3. Telecom Outlet: Work-Area” Patch Cord Color “Yellow”.

D. Patch cords shall be 4-pair, Category 6A unshielded twisted pair with solid conductors. Patch cords shall be manufactured by the same manufacturer of the horizontal cabling.

E. Physical Characteristics:

1. Category 6A cable shall meet or exceed the requirements of ANSI/TIA/EIA–568-B.2-10 -- for Augmented Category 6 Cable.

2. Cable shall have a listed riser rated jacket (CMR).

3. Cables shall be constructed of 4-pair, 23 AWG solid copper conductors.

4. The cable jacket must have the following legible markings

   a. Manufacturer's name.
   b. Copper conductor gauge.
   c. Pair count.
   d. UL and CSA listing.
   e. Manufacturer's trademark.
   f. Category rating.
   g. Jacket rating (CMR).

F. Acceptable Products:

1. Belden/CDT CA21104004 (4'-0" data drop patch cord - color yellow), CA21109004 (4'-0" WAP drop patch cord - color white), CA21104015 (15'-0" data drop "work-area" patch cord – color yellow).
2. No substitutions.

   a.

2.2 VELCRO CABLE TIES

A. Provide Velcro cable ties cut to length from a continuous roll to loosely bundle horizontal cabling in the telecom rooms routed on the ladder rack to the patch panels. Install Velcro cable ties at 1'-0" intervals.

B. Do not exceed qty (24) cables per bundle.

C. Do not attach cable bundles to the runway with the Velcro cable ties. Do not use plastic tie-wraps.

D. Acceptable Products

1. Panduit HLS-15R6.
2. Leviton 43115-075.
3. Or approved equal.

PART 3 – EXECUTION

3.1 TELECOM EQUIPMENT ROOM COORDINATION

A. The electrical and telecom contractors are responsible for coordinating the installation of all equipment and cabling pathways located within the telecom rooms.

B. The electrical and telecom contractors shall coordinate the work of all other trades that have work located within the telecom equipment rooms.

C. The electrical and telecom contractors shall create and submit for approval coordinated scaled shop drawings of the telecom room showing the proposed location of all work. Shop drawings shall be submitted and approved prior to installing any work in the telecom rooms.

3.2 HORIZONTAL CABLE PATHWAY

A. Should vertical or horizontal clearances not be possible due to physical constraints of the designated space, the Contractor shall immediately contact the Owner's Representative for alternative routing. Where the drawings indicate reuse of existing junction boxes, conduits, or pathway segments, verify existing pathway condition, capacity, continuity, and routing prior to use and maintain all specified bend radius, fill, pull-box, firestopping, grounding, and accessibility requirements.

B. Coordinate routing of cable pathway with lighting and HVAC serving the room. Secure cable pathway to walls, overhead structure and or equipment racks/cabinets as required.

C. Bond cable pathway sections together with #6 green insulated bonding jumpers. Bond pathway to telecom room ground bar with #6 green insulated conductor.

3.3 CABLE MANAGEMENT

A. Neatly bundle cabling with Velcro tie wraps on the horizontal ladder rack. Space Velcro tie wraps at 1'-0" on center.

B. Do not exceed qty (24) cables per bundle.

C. Neatly dress horizontal cable from the horizontal ladder rack, through the rear vertical cable managers to the rear of the patch panels. Use Velcro cable ties as necessary to maintain cable bundles. Do not exceed the manufacturer's cable bend radius.

D. Do not install cable ties to bundle patch cables.

3.4 PATCH PANELS

A. Terminate and dress cables on the rear of the patch panels in accordance with manufacturer instructions using the provided rear cable management bar or bracket.

B. Maintain cable twists within ½" of the patch panel IDC blocks.

END OF SECTION 271100

SECTION 271500 – COMMUNICATIONS HORIZONTAL CABLING

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. The Contractor shall provide all equipment, materials, labor, and services necessary to complete the horizontal cabling system, and to ensure that it is in compliance with requirements stated or reasonably inferred by the Specifications and the Contract Drawings.

B. The horizontal cabling is that portion of the communication cabling system that extends from the work area communications outlets to the patch panels in the communications rooms.

C. This section includes minimum requirements for the following

1. Horizontal Category 6 Cabling.
2. Horizontal Category 6A (Augmented) Cabling.
3. CAT 6A Patch Cords.
4. Category 6A 8-Position Jacks.
5. Category 6A Field Mount Plugs
6. Work Area 4-Port Plastic Faceplates
7. Work Area 4-Port Stainless Steel Faceplates
8. Velcro Cable Straps

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications
4. 27 11 00: Communications Equipment Room Fittings
5. 27 51 13: Paging Systems
6. 27 53 13: Wireless Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Materials and work specified herein shall comply with Specification Section 27 05 00, the Contract Drawings, Washoe County School District Structured Cabling System Standard WCSD-SCS-015 dated March 13, 2023, and the following code and industry requirements.

1. ANSI/TIA-568.0-E: Generic Telecommunications Cabling for Customer Premises (Revision E, March 2020).
2. ANSI/TIA-568.1-E: Commercial Building Telecommunications Infrastructure Standard (Revision E, March 2020).

3. ANSI/TIA-568.2-D: Balanced Twisted-Pair Telecommunications Cabling And Components Standards (Revision D, September 2018).
4. ANSI/TIA-569-E: Telecommunications Pathways and Spaces (Revision E, May 2019)
5. ANSI/TIA-1152-A: Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling (Revision A, November 2016).
6. Underwriter's Laboratories, Inc. (UL).

1.4 QUALITY ASSURANCE

A. All materials shall be installed in a neat and workmanlike manner. All methods of construction that are not specifically described or indicated in the Specification shall be subject to the control and approval of the Owner's Representative. Equipment and materials shall be of the quality and the manufacturer indicated. The equipment specified is based upon the acceptable manufacturers listed.

B. The Contractor shall strictly adhere to all Category 6 and Category 6A installation practices when installing unshielded twisted-pair cabling.

1.5 SUBMITTALS

A. Manufacturer's Data Sheets: Submit manufacturers data sheets for the following items

1. Horizontal Category 6 Cabling.
2. Horizontal Category 6A (Augmented) Cabling.
3. Category 6A 8-Position Jacks.
4. Category 6A Field Mount Plugs
5. Work Area 4-Port Plastic Faceplates
6. Work Area 4-Port Stainless Steel Faceplates
7. Velcro Cable Straps

B. Bill of Materials: Submit a detailed bill-of-materials listing all manufacturers, part numbers, and quantities proposed for use on this project.

1.6 DELIVERY, STORAGE & HANDLING

A. Visually inspect all cables, cable reels, and shipping cartons to detect possible cable damage incurred during shipping and transport. Visibly damaged goods are to be returned to the supplier and replaced at no additional cost to the Owner.

1.7 GUARANTEE

A. The Category 6 and 6A horizontal cabling system including work area jacks, horizontal cabling, patch panels and patch cords shall be covered by a minimum 25-year system warranty from Belden/CDT (see section 270500 1.10 for warranty requirements).

PART 2 – PRODUCTS

2.1 HORIZONTAL CATEGORY 6 CABLE

A. Horizontal cabling shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Horizontal cabling shall be 4-pair, Category 6 unshielded twisted pair.

1. Physical Characteristics

   a. Category 6 cable shall meet or exceed the requirements of ANSI/TIA-568.2-D for balanced twisted-pair telecommunications cabling and components.

2. Cable shall have a listed plenum rated jacket (CMP).

3. The cable jacket must have the following legible markings

   a. Manufacturer's name.
   b. Copper conductor gauge.
   c. Pair count.
   d. UL and CSA listing.
   e. Manufacturer's trademark.
   f. Category rating.
   g. Sequential foot markings, in one foot increments.
   h. Jacket rating (CMP).

4. Horizontal data cable shall have a GRAY jacket with black lettering.

C. Transmission Characteristics

1. Cable shall conform to ANSI/TIA-568.2-D and shall be certified as Category 6 Permanent Link or Channel as applicable to the installed configuration.

Frequency (MHz)	Solid Conductor Cable Insertion Loss (dB)	NEXT Loss (dB)	PSNEXT Loss (dB)	ELFEXT Loss (dB)	Power Sum ELFEXT (dB)	Return Loss (dB)
1	2.0	74.3	72.3	67.8	64.8	20.0
4	3.8	65.3	63.3	55.8	52.8	23.0
8	5.3	60.8	58.8	49.7	46.7	24.5
10	6.0	59.3	57.3	47.8	44.8	25.0
16	7.6	56.2	54.2	43.7	40.7	25.0
20	8.5	54.8	52.8	41.8	38.8	25.0
25	9.5	53.3	51.3	39.8	36.8	24.3
31.25	10.7	51.9	49.9	37.9	34.9	23.6
62.5	15.4	47.4	45.4	31.9	28.9	21.5
100	19.8	44.3	42.3	27.8	24.8	20.1
200	29.0	39.8	37.8	21.8	18.8	18.0
250	32.8	38.3	36.3	19.8	16.8	17.3

2. Propagation delay skew shall not exceed 45 ns per 100 meters for all frequencies from 1 MHz to 250 MHz.

D. Acceptable Products:

1. Belden/CDT Gigaflex 2400 P/N 2413 08U1000 (jacket color gray).
2. No Substitutions.

2.2 CATEGORY 6A (AUGMENTED) HORIZONTAL CABLE

A. CAT 6A Horizontal cabling shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Horizontal data cabling for standard telecom outlets and wireless access points shall be 4-pair, Category 6A unshielded twisted pair.

C. Physical Characteristics

1. Category 6A cable shall meet or exceed the requirements of ANSI/TIA-568.2-D for Category 6A balanced twisted-pair telecommunications cabling and components.

2. Cable shall have a listed plenum rated jacket (CMP).

3. Cables shall be constructed of 4-pair, 23 AWG solid copper conductors.

4. The cable jacket must have the following legible markings

a. Manufacturer’s name.
b. Copper conductor gauge.
c. Pair count.
d. UL and CSA listing.
e. Manufacturer’s trademark.
f. Category rating.
g. Sequential foot markings, in one foot increments.
h. Jacket rating (CMP).

5. Horizontal data cable shall have a YELLOW jacket with black lettering.

D. Transmission Characteristics

1. Cable shall conform to ANSI/TIA-568.2-D and shall be certified as Category 6A Permanent Link or Channel as applicable to the installed configuration.

Frequency (MHz)	NEXT (dB) (min.)	PSANEXT (dB) (min.)	RETURN LOSS (dB) (min.)
0.772	96.2	112.2	70.2
1	94.0	110.0	68.0
4	82.0	98.0	56.0
8	75.9	91.9	49.9
10	74.0	90.0	48.0
16	69.9	85.9	43.9
20	68.0	84.0	42.0
25	66.0	82.0	40.0
31.25	64.1	80.1	38.1
62.5	58.1	74.1	32.1
100	54.0	70.0	28.0
200	48.0	64.0	22.0
250	46.0	62.0	20.0
300	44.5	60.5	18.5

350	43.1	59.1	17.1
400	42.0	58.0	16.0
450	40.9	56.9	14.9
500	40.0	56.0	14.0
550	39.2	55.2	13.2
600	38.4	54.4	12.4
625	38.1	54.1	12.1

2. Propagation delay skew shall not exceed 35 ns per 100 meters for all frequencies from 1 MHz to 625 MHz.

E. Acceptable Products.

1. Belden 10GXS CAT 6A Cabling. Belden/CDT Part Number 10GXS13 0041000 (jacket color yellow).
2. No Substitutions.

2.3 CATEGORY 6A FIELD MOUNT PLUGS

A. Field mount plugs shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Terminate CAT 6 cabling at all device locations for the following systems on CAT 6A field mount plugs and connect directly to the device.

1. CCTV System.
2. Audio Enhancement System.
3. Paging System.
4. Access Control System rough-in only, where specifically indicated on the Contract Drawings. Active access control devices, panels, readers, software, programming, and final system commissioning are not included in this Section unless expressly shown otherwise.

C. Terminate CAT 6A cabling at all device locations for the following systems on CAT 6A field mount plugs and connect directly to the device.

1. Wireless Access Points.

D. Field mount plugs shall be 8-pin Category 6A and will conform to the requirements of ANSI/TIA/EIA–568-B.2-10.

E. Pin/Pair assignment shall be in accordance with T568B.

F. Acceptable Products:

1. Belden/CDT RevConnect P/N RVAFPUBK-S1.
2. No Substitutions.

2.4 CATEGORY 6A MODULAR JACKS

A. CAT 6A modular jacks shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Modular jacks shall be 8-pin Category 6A and will conform to the requirements of ANSI/TIA/EIA–568-B.2-10.

C. Pin/Pair assignment shall be in accordance with T568B.

D. Modular jacks shall be manufactured by the same manufacturer as the patch panels in the telecommunication rooms.

E. Modular data jacks shall be color YELLOW.

F. Modular jacks shall be compatible with plastic faceplates and stainless steel faceplates.

G. Modular jacks shall be “Keystone” style.

H. Transmission characteristics for a mated-connection (jack and cord) shall conform to ANSI/TIA/EIA–568-B.2-10 as shown below.

Frequency (MHz)	NEXT (dB) (min.)	PSANEXT (dB) (min.)	RETURN LOSS (dB) (min.)
0.772	96.2	112.2	70.2
1	94.0	110.0	68.0
4	82.0	98.0	56.0
8	75.9	91.9	49.9
10	74.0	90.0	48.0
16	69.9	85.9	43.9
20	68.0	84.0	42.0
25	66.0	82.0	40.0
31.25	64.1	80.1	38.1
62.5	58.1	74.1	32.1
100	54.0	70.0	28.0
200	48.0	64.0	22.0
250	46.0	62.0	20.0
300	44.5	60.5	18.5
350	43.1	59.1	17.1
400	42.0	58.0	16.0
450	40.9	56.9	14.9
500	40.0	56.0	14.0
550	39.2	55.2	13.2
600	38.4	54.4	12.4
625	38.1	54.1	12.1

I. Acceptable Products:

1. Belden/CDT 10GX RevConnect Jacks P/N RVAMJKUYL-S1.
2. No Substitutions.

2.5 WORK AREA 4-PORT PLASTIC FACEPLATES

A. Faceplates shall meet the specific manufacturer system warranty requirements listed in Specification Section 270500 1.10.

B. Provide UL listed faceplates. Faceplates should be white (verify with Architect), flush mounted and manufactured of high impact thermoplastic.

C. Faceplates shall have top and bottom label holders with plastic inserts.

D. Provide faceplates with a minimum of 4 and a maximum of 6 modules. Provide blank inserts in unused openings.

E. Faceplates shall accept “Keystone” style modular jacks.

F. Faceplates shall be manufactured by the same manufacturer as the outlet jacks and shall be compatible with the submitted outlet jacks.

G. Acceptable Products:

1. Belden/CDT 4-Port Faceplate P/N AX102249 (color white) – verify color w/Architect.
2. No Substitutions.

2.6 WORK AREA 4-PORT STAINLESS STEEL FACEPLATES

A. Provide UL listed stainless steel faceplates at workstation outlets in the multipurpose room and where shown on the drawings.

B. Provide 4-port faceplates. Provide blank inserts in unused openings.

C. Faceplates shall accept “Keystone” style modular jacks.

D. Faceplates shall be manufactured by the same manufacturer as the outlet jacks and shall be compatible with the submitted outlet jacks. Provide “keystone” jacks as necessary.

E. Acceptable Products:

1. Stainless SG Faceplate. Belden/CDT AX102009.
2. No Substitutions.

2.7 VELCRO CABLE STRAPS

A. Loosely bundle horizontal cabling with Velcro tie wraps.

B. Velcro tie wraps shall ¾” in width and cut from a continuous roll.

C. Install Velcro cable ties at 2’-0” intervals outside of the telecom rooms and 1’-0” intervals inside the telecom rooms.

D. Do not exceed qty (24) cables per bundle.

E. Acceptable Products

1. Panduit TAK-TY HLSP (plenum).
2. Leviton 43115-075.
3. Or equal.

PART 3 – EXECUTION

3.1 HORIZONTAL CABLE ROUTING AND TERMINATION

A. Horizontal CAT 6 and CAT 6A cable routed in underground, under-slab, exterior, wet, or damp conduit shall be indoor/outdoor rated and suitable for wet locations while maintaining the required plenum or riser listing for the installed pathway.

B. Ten feet of cable slack shall be stored at the telecom room and three feet of cable slack shall be provided in the ceiling space above the telecom outlet for every installed horizontal cable.

C. All horizontal cables shall be installed in cable bundles. Cable bundles shall not exceed qty (24) cables per bundle and will be loosely bound with velcro straps. Cables in a bundle should be uncombed until entry into each rack's vertical cable management, where the cables are to be combed and dressed together until terminated on each patch panel.

D. Category 6 and Category 6A cables shall be bundled separately.

E. Cables shall be installed in continuous lengths from origin to destination with no splices unless explicitly shown on the Contract Drawings. Transition points, consolidation points or couplers shall not be used unless specifically detailed and approved by the Owner's Representative.

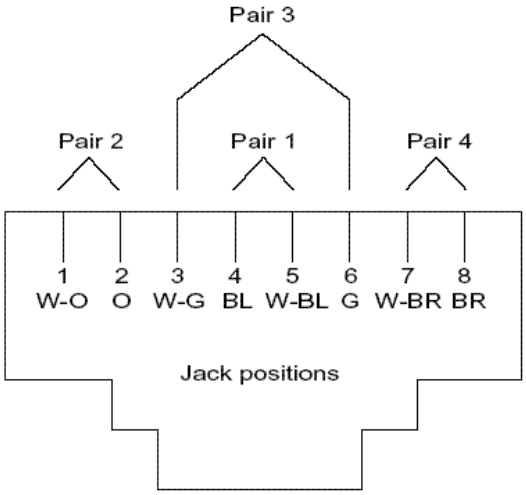
F. The cable's minimum bend radius and maximum pulling tension shall not be exceeded. Refer to manufacturers requirements and reference documents.

G. All telecom cables shall be supported by approved telecom pathways having dedicated support systems directly attached to structure (i.e. conduit, j-hooks, cable tray, etc.). Cables shall not be attached to or supported by ceiling grid, ceiling grid support wires, lighting fixture support wires or the work of other mechanical, electrical, plumbing or sprinkler trades.

H. All telecom cables shall be stored in accordance with the manufacturer’s requirements.

I. Any cable damaged or exceeding the manufacturer’s recommended installation parameters during installation shall be replaced by the Contractor prior to final acceptance at no cost to the Owner.

J. All telecom cables shall be labeled with self-adhesive labels. At the work area outlet, the cable label shall be applied to the cable behind the faceplate on a section of cable that can be accessed by removing the cover plate. At the Telecom Room, each cable shall be clearly labeled on the cable jacket behind the patch panel at a location that can be viewed without removing the bundle support ties. Cable labels located within the bundle or where obscured from view shall not be acceptable.



K. Cables shall be installed in accordance with the recommendations made in the ANSI/TIA/EIA-568-B standard document, manufacturer’s recommendations and installation guides, and best industry practices.

L. Cables shall be installed in accordance with ANSI/TIA-568.0-E, ANSI/TIA-568.1-E, ANSI/TIA-568.2-D, manufacturer recommendations and installation guides, WCSD-SCS-015, and best industry practices.Plastic “zip-ties” shall not be permitted within the Structured Cabling System. “Velcro” type (hook and loop) tie wraps shall be used for the purpose of bundling / managing horizontal and backbone cabling (must be plenum rated if installed within a plenum space).

M. Horizontal UTP pair untwist at the termination shall not exceed 0.5”.

N. Jack pin/pair assignments shall be T568B for all installed horizontal cabling unless otherwise specified within the Project Documents.

1. T568B Jack pin/pair assignments are as follows:

O. For horizontal cabling, if a J-hook System is used to support cable bundles, all horizontal cables shall be supported at a maximum of 60” intervals. J-hooks must be secured to the permanent building structure. J-Hooks shall not be attached to ceiling tiles, ceiling grid, ceiling support wires or to the work of other mechanical, electrical, plumbing and sprinkler trades.

P. The horizontal telecom pathway and pathway support system shall not permit significant lateral or vertical motion. Cable quantities shall not exceed J-Hook System manufacturer recommendations or qty (24) cables, whichever is fewer.

Q. Telecom cables may not rest on acoustic ceiling grids or panels, or be attached to any portion of the building except for dedicated telecom pathway including conduit, innerduct, ladder rack, cable tray and/or J-hooks.

R. The cable length between the work area outlet and the termination in the telecommunications closet shall not exceed 295 feet. Any horizontal cable runs longer than 295 feet should be brought to the immediate attention of the Owner's Representative prior to installation.

S. When placing cable, the Contractor shall maintain the following minimum clearance from sources of electro-magnetic interference (EMI).

1. 6” clear from power conductors.
2. 12” clear from fluorescent lighting fixtures and ballasts.
3. 36” clear from transformers and motors.

3.2 WORK AREA OUTLETS

A. Work Area outlets and connectors shall be installed in accordance with manufacturer’s recommendations and installation guides, and best industry practices.

B. Cables shall be dressed and terminated in accordance with the recommendations made in the ANSI/TIA/EIA-568-B standard document, manufacturer's recommendations and best industry practices.

C. Pair untwist at the termination shall not exceed 0.5".

D. Bend radius of the cable in the termination area shall not be less than 4 times the outside diameter of the cable.

END OF SECTION 271500

SECTION 275113 – PAGING SYSTEM

PART 1 – GENERAL

1.1 SUMMARY OF WORK

A. This section includes a fully operational IP platform for a district-wide internal and school Critical Communications Solution, incorporating school safety notifications and general communications including but not limited to the following:

1. The platform shall provide complete internal communications and employ state of the art IP Technology including the minimum functions listed.

   a. Two-way internal intercommunications between staff locations and classrooms.
   b. Scheduled bell events.
   c. Emergency announcements that will override any pre-programmed audio, assuring that all Emergency/Lockdown etc., are heard at each and every speaker location.
   d. Capability of prerecording emergency announcements that can be activated by a Soft Key on an administrative console, panic button, dial string, or web browser.
   e. Atomic Time Synchronization with Class Change Tones utilizing multiple, programmable schedules for each zone.
   f. District-wide, Emergency, Group, All School and Zone live voice paging.
   g. District-wide, Emergency, Group, All School and Zone paging for pre-recorded audio – tones, music and voice.
   h. Web-based user interface.
   i. “Code Red” push button to initiate pre-recorded lock down announcement.
   j. Status indicator lights adjacent to all clocks (flush j-box, blank cover plate and conduit roughin only – status lights and cabling are future).

2. The system shall support a minimum of 1000 level priorities which shall be user-definable, allowing each end point to place a minimum of 5 different priority calls at the same time.
3. Any authorized administrator shall be able to call from outside the school into any classroom, zone, or entire school directly via the School District supplied SIP enabled Telephone Network. This shall allow remote monitoring, call-in annunciation, and two-way conversation from outside the facility as well as paging into the system. (Compliance with NEMA Standard SB-40 for emergency communications in K-12 Schools).
4. Authorized system users shall be able to create a minimum of 100 automated sequences with voice instructions, tones, emails, program distribution, and relay activations and replay them.

5. Automated message strings shall be manually initiated from a single-button access on the console, on a SIP connected telephone, a panic button, from the web-based user interface or via interface with third party systems.
6. Paging and two-way intercom features shall be accessible from any system console or SIP connected telephone for each campus.
7. The platform shall synchronize its system time to the network timeserver or a web-based time server.
8. Each single campus installation shall be locally survivable for intercom, paging, bells, and emergencies such as lockdown, even when the district connection is unavailable.
9. This specification establishes a minimum level of quality, features, and performance for individual components as well as the integrated system.
10. Systems that do not comply with the feature-sets highlighted in this Specification will not be considered.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications
4. 27 11 00: Communications Equipment Room Fittings
5. 27 15 00: Communications Horizontal Cabling
6. 27 41 16: AV and Safety Alert Systems
7. 27 53 13: Synchronized Clock Systems

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 DEFINITION OF TERMS

A. Installer(s): Shall refer to the person, persons, or company who or which actually contracts to perform the work specified herein.

1.4 SUBMITTALS

A. Product data for each component.

B. Shop Drawings: Prior to proceeding with the work: Provide detailed equipment assemblies and indicate dimensions, weights, required clearances, method of field assembly, components, location of each field connection, and a complete schedule of all equipment and materials with associated manufacturer’s product data sheets which are to be used.

1. Wiring Diagrams: Detail wiring for power, signal, and control systems and differentiate between manufacturer-installed and field-installed wiring. Identify terminals to facilitate installation, operation, and maintenance. Include a single-line diagram showing cabling interconnection of components and levels throughout system and impedances.
2. Drawings and lists indicating proposed nameplate nomenclature and arrangements for control panels and plug panels prior to fabrication reflecting equipment used.
3. Each drawing shall have a descriptive title and all sub-parts of each drawing shall be labeled. All drawings shall have the name and locations of the project, Systems Contractor's name in the title block.
4. Details and descriptions of any other aspect of the system, which must differ from the contract documents due to field conditions or equipment, furnished.

C. FCC Approval: The system shall be approved for direct interconnection to the telephone utility under Part 68 of FCC rules and regulations. Systems, which are not FCC approved or utilize an intermediary device for connection, will not be considered. Provide the FCC registration number of the system being proposed as part of the submittal process.

D. Product Certificates: Signed by manufacturers certifying that products furnished comply with specified requirements.

E. Installer Certificates: Signed by manufacturers certifying that Installers comply with specified requirements.

F. Manufacturer Certificates: Signed by manufacturers certifying that they comply with specified requirements.

G. Field Test Reports: Indicate and interpret test results for compliance with performance requirements. Include record of final matching transformer-tap settings, and signal ground-resistance measurement certified by Installer.

H. Maintenance Data: For equipment to be included in maintenance manuals specified in Division 1.

1. Record of Owners equipment-programming option decisions.
2. All instructions necessary for proper operation and manufacturer's instructions.
3. "Proof of Performance" information.
4. Manufacturer's maintenance information.
5. Copies of non-proprietary computer programs and system set up disks documenting all programmable features of the installed system.

I. As-Built Drawings: Prior to final acceptance, provide as-built drawings in PDF format indicating all cable numbers and construction details in accordance with the actual system installation. Revise all shop drawings to represent actual installation conditions. These Record Drawings will be used during "Final Acceptance Testing".

J. System Training: Submit the following information describing the training programs and system trainers as outlined in paragraph 1.6 of this specification and in accordance with Division 1 specifications.

1. Include with the submittal a preliminary staff development training program in outline form for review and approval by the owner's representative.
2. Include with the submittal a current copy of the trainer's certification from the manufacturer that certifies and identifies the trainer(s) who are eligible to provide training and support for the project.
3. Include with the submittal a current copy of trainer's needs assessment form which will be reviewed with the owner's designated representative for the system's preliminary system programming and configuration.
4. Include with the submittal copies of all documentation used to identify for the owner those participants attending and completing the training programs.

K. A copy of the manufacturer's standard statement of warranty proving all equipment provided for the school communications network is covered with the required five-year warranty shall be included with the project submittal. This statement of warranty shall be provided on the manufacturer's stationary.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced Installer who is an authorized representative of equipment manufacturer for both installation and maintenance of equipment required for this Section. Provide the following within thirty (30) days after notification to proceed:

1. Provide a list of installations that the Installer has specifically installed for verification by the Owner. Random installations from other vendors and/or Installers shall not be accepted. The Installer, not its employees, must meet these qualifications.
2. The Installer shall be bondable.
3. The Installer shall demonstrate to the satisfaction of the Owner or his representative that he has:

    a. Adequate plant and equipment to pursue the work properly and expeditiously.
    b. Adequate staff and technical experience to implement the work.
    c. Suitable financial status to meet the obligations of the work.
    d. Technically capable and factory trained service personnel at a local service facility to provide routine and emergency service for all products used in this project.

B. Any Contractor, who intends to bid on this work and does not meet the requirements of the "Quality Assurance" paragraph(s), shall employ the services of an "Installer" who does meet the requirements and who shall provide the equipment, make all connections and continuously supervise the installation. A subcontractor so employed as the "Installer" must be acceptable to the

Architect/Engineer. The "Installer" shall be identified within thirty (30) days of notification to proceed for acceptance by the Architect/Engineer.

C. Because the life expectancy of this type of communications structure normally exceeds 10 years, the owner expects continuity from the service provider. If the installing/servicing company has not been an authorized provider of the manufacturers product for at least three (3) years, the following is required:

1. A list of (2) systems manufacturers of which they currently are authorized service providers where the relationship exceeds three (3) years.
2. A letter from the manufacturer outlining the details of changes in service providers over the last three (3) years and what actions they will take to ensure continuity of service to the customer.

D. Each major component of equipment shall have the manufacturers name, address and model number on a plate securely affixed in a conspicuous place. NEMA code ratings, UL Label, or other data that is die-stamped into the surface of the equipment shall be easily visible.

E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction.

F. Comply with NFPA 70

G. Comply with NEMA Standard SB-40 for Emergency Communications in K-12 schools.

H. Comply with UL 60950.

1.6 IN-SERVICE TRAINING

A. The contractor shall provide and implement a complete and comprehensive staff training program for all administrators, facility staff members, and teachers. This mandatory training program will provide school staff a complete understanding of how to utilize and properly operate all functions.

B. The training program shall be implemented by a staff member/trainer employed by the contractor. The trainer must be factory certified to provide training on their product.

C. All staff development training is to be coordinated through the owner's designated representative. As training sessions are completed, the trainer will provide the school's administrative staff and school district's staff a document listing all of the staff and faculty members who attended, received, and completed the training program.

1.7 WARRANTY

A. Provide a manufacturer's five-year warranty of the school communications network equipment against defects in material and workmanship. This warranty will cover all electronic system components. Additional warranties cover clocks, speakers, and call in switches. If any defects are found within the warranty period, the defective equipment shall be replaced at no cost (equipment only); a one year warranty shall be provided for labor.

B. A copy of the manufacturer's standard statement of warranty proving all equipment provided for the school communications network is covered with the required five-year warranty shall be included with the project submittal. This statement of warranty shall be provided on the manufacturer's stationary. The standard five-year warranty is an important element in establishing a standard in quality. Manufacturers who circumvent the five-year warranty by offering special "extended warranties" that are not part of their normal published warranty will not be accepted.

C. Contractor shall respond, excluding weekends and holidays, within 24 hours to any warranty service calls. If equipment cannot be repaired within 24 hours of service visit, the contractor shall provide "loaner" equipment to the facility at no charge.

D. Make available a service contract offering continuing factory authorized service of the system after the initial warranty period.

1.8 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide the following system:

1. Telecenter manufactured by Rauland

a. Authorized Rauland Distributor contact:

(1) Jeff Bowers
Innovative Communications Systems, Inc.
775-825-2011
jbowers@innovativecomsys.com

PART 2 – PRODUCTS

2.1 SYSTEM REQUIREMENTS

A. The platform shall utilize state of the art IP Technology for Call-in Notification, School Safety Paging and Evacuation tones, Atomic Time Synchronization, Class Change Tones utilizing multiple, programmable schedules for each zone, Two-way hands-free Internal Communications and Paging, and Program Distribution. The system shall be easy to learn and operate. All standard programming shall be web-based and user friendly to allow the system administrator the ability to easily program system features.

B. Provide complete and satisfactorily operating district/school communications and district/school safety as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated. Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information. Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.

C. The platform shall be a single electronic system consisting of a minimum of 10 audio channels for each campus, (classroom) IP Speaker Modules and call switches, IP Zone Modules connecting corridor speakers, inside and outside horns, IP Administrative Consoles, SIP enabled PBX integration and district-wide integration for paging, emergency notifications, calendar scheduling and configuration.

D. Each Classroom shall be provided with a Speaker Module interface and a minimum of 5 different call switches, each with their own annunciation path and priority.

E. Call-ins may automatically annunciate (display of priority and location) to administrative consoles, SIP enabled phones, and outside phones.

F. Call-ins shall be programmed to automatically change priority and annunciation route based on age of call-in and original priority.

G. Call-ins may have priority (and annunciation route) changed by user action from a console or SIP enabled phone.

H. Call-in annunciation route shall include playing pre-recorded audio over speakers, sending a pre-configured email, and activating relays.

I. The platform shall lend itself to expansion by simple addition of hardware modules.

J. The platform shall connect directly to an existing, standard protocol WAN/LAN network, without the need for a separate server at each school location. Configuration, including bell schedules, calendars, and emergency sequences can be remotely created, changed, stored and downloaded to the system by an authorized user from a web-based user interface.

K. The platform shall provide the ability to initiate school safety paging announcements, evacuation tones and take cover tones from any telephone or connected web browser within the facility or outside the facility to any other location within the facility or district.

L. The platform shall provide the ability to selectively communicate or monitor individual classrooms in emergency situations from any telephone within the facility or outside the facility to any other location within the facility; all communication within the classroom shall be hands-free and will not require any interaction by the classroom user.

M. The platform shall provide classroom users the ability to confirm that they have safely secured their classrooms during an emergency with a single button press. The front office administrator will receive confirmation that the classroom is safely secured via an administrative console and web-based user interface. The front office administrator can view classrooms that are not safely secured via the administrative console. The front office administrator can view classrooms that are not safely secured via the web-based user interface. The front office administrator shall be able to initiate two-way communication, without a pre-announcement tone, to the classroom during an emergency via the administrative console. Web-based user interface will still identify that a school is in an emergency, even if all classrooms are safely secured. Individual classroom check-in and school emergency status shall be viewed from the web-based user interface, both on-site and remotely.

N. IP Addressable and POE powered Speaker Modules for individual rooms shall be system programmable and may be assigned any two, three, four, five or six digit number as well as name and description. Any extension may be reassigned at any time.

O. IP-enabled two-way voice communication shall be available from any provided telephone or administrative console through any speaker in a campus. This shall allow hands-free communication to any classroom or any individual loudspeaker unit. A programmable pre-announce tone shall sound immediately before the intercom path is opened and a supervisory tone shall continue to sound at regular intervals when speaker monitoring is active, complying fully with all privacy legislation. Pre announce tone and supervisory tones shall be disabled during designated emergencies automatically.

P. The platform shall allow users to configure multiple schedules per school, with a minimum of 500 unique events per schedule, and automatic Daylight Savings time correction. Schedules can be programmed to occur once, daily, weekly, monthly, or in any combination of the preceding recurrences. Each school may have a minimum of 20 unique bell schedules, with a minimum of 5 active schedules on any given day for each campus. User shall be able to select from 25 standard included tones as well additional user created and uploaded audio files for class change signaling and messaging. In addition, scheduled events shall include relay actions, email notifications, and paging exclusions as system configuration changes. The platform shall allow control of the bell schedules via the district WAN/LAN without the need for a separate server at each school location. Bell schedules can be remotely created, changed, stored and assigned to calendar days for the local school by an authorized user from a web-based user interface.

Q. The platform shall be able to integrate with an existing PA system or operate as a fully independent IP solution. The platform shall be able to function in combination of said configurations, and allow for seamless communication within a school or district-wide, regardless of the type of configuration used. The platform shall be scalable, with the ability to easily add, install, and configure additional equipment to a system.

R. The platform allows for customization of preprogrammed sequences, used for emergencies, events, and everyday communications. Preprogrammed sequences can be activated from the push of a relay button, soft key of an administrative console, a dial string of a SIP phone, or a web browser configured to the district network. Sequences can be initiated automatically as part of a schedule or on the fly. Preprogrammed sequences can be customized to utilize any combination of audio tones, emails, relays, tone exclusions, swings, delays, duples, SIP phone notifications, and program distribution. Audio tones can include customized audio files and voice messages, recorded in any language. Uploaded audio tones and messages can be preprogrammed to annunciate repeatedly or individually, as part of a scheduled sequence or on the fly. Each school in a district can have its own customized sequences, and can be activated individually, in groups, or district-wide.

2.2 EQUIPMENT AND MATERIAL

A. Server Software

1. Provides district-wide paging, bell event scheduling, emergency notification and configuration for entire district.
2. Ability to configure system and initiate system features, per school and district-wide via web-based user interface.
3. The software has the ability to sync system time to the Atomic Clock Signal or to the school's or district's network time server.
4. The software will provide a web browser to deliver district-wide emergency paging, pre-recorded messages and tones from any authorized computer in the facility or the district. The software must be capable of automatically notifying district personnel via the WAN/LAN of an alarm condition.
5. The software can automatically broadcast emergency instructions via associated system hardware throughout an entire district when an alarm (e.g. lockdown, lockout, security, fire) is initiated via the web-based user interface. The emergency instructions are preprogrammed and require no user intervention. Bell tones are able to be halted during an emergency. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.
6. The software allows for user-uploaded pre-recorded messages and tones. Software supports the upload of MP3 and WAV file types. User-uploaded pre-recorded messages and tones can be part of emergencies, sequences, and bell schedules.
7. The software can be installed in cloud, virtual or physical server environments.
8. The web-based user interface supports secure HTTP browsing.
9. The software supports encryption to ensure secure access.
10. The system shall monitor itself if devices go offline and system actions are not received. Specified users shall receive email notifications when devices go offline. The software shall be able to keep a log and report on system activity within a school or all schools district-wide for a minimum of one year. These reports can be exported to excel spreadsheets.

11. The software will support a minimum of 20 bell schedules per school, with 5 schedules assignable to a specific school day. Bell schedules can be programmed to annunciate tones, activate relays, send emails, activate program distribution, and notify SIP phones.
12. The system allows programmable end points to be automatically included or excluded for live paging, bell tones, or prerecorded audio, depending on the time or day or day of the week. These inclusions/exclusions can be applied manually or automatically depending on their schedule.
13. The software can automatically send an email, as part of a programmed sequence of events, to district administrators alerting them of an emergency within the district.
14. The software provides the ability to view schools that are in an emergency status, using any web browser on the district's network. The software shall identify the name of the school in an emergency as well the type of emergency that school is in.
15. The software provides the ability to view individual classrooms that are not checked-in during an emergency, using any web browser on the district's network. The software shall identify the name, extension, and description of the classroom that is not checked-in during the emergency.
16. The system has a minimum of 5 customizable emergencies, one of them being an All-Clear – with the ability to return the system from an emergency to normal status. Each emergency shall have a minimum of 500 unique events.
17. As a district-wide communications solution, the system shall be able to provide simultaneous communications to all schools or groups of schools within a district. The system shall allow a user to initiate district-wide communications to individual schools, all schools or groups of schools, from a web-based user interface. The system shall allow a user to initiate prerecorded audio, live paging, or programmed sequences to individual schools, all schools or groups of schools, from the web-based user interface. Programmed sequences shall be customizable per school, and the system shall be able to activate them simultaneously to individual schools, all schools or groups of schools, from the web-based user interface.
18. The communications software must allow upgrade from an individual school system to multiple schools, or an entire school district, using the same web-based user interface. The communications software from an individual school system must be identical in typical user operation to the multiple schools or entire school district communications system software.

B. Campus Controller

1. Provides call routing for paging and intercom for a single facility.
2. System shall connect to the district provided Telephone Network via a SIP connection.
3. Support a flexible numbering plan allowing two, three, four, five, or six digit extensions.
4. SIP interface to a district provided Telephone Network shall be capable of allowing connected phones to display classroom call-ins, answer

internal intercom call-ins, make pages and change priorities of call-ins in progress.

5. Direct dialing, two-way amplified voice intercom between any provided telephone or admin console and speaker without the use of a press-to-talk or talk-listen switch.
6. Ability to upgrade priority level from individual call switch.
7. The ability to answer intercom call-ins registered at administrative consoles and pre-selected telephones.
8. The ability to automatically escalate incoming call-ins to an alternate telephone or group of telephones if they remain unanswered for a predetermined amount of time.
9. The ability to manually upgrade an intercom call-in to an alternate telephone or group of telephones.
10. The ability for classrooms to “check-in” via push button when they have successfully secured their location during emergency.
11. Administrative console shall display locations that have not checked in to confirm their secured location and provide hands-free audio monitoring and communication to unsecured locations.
12. The controller shall not need direct connection to any classroom via home run or distributed wiring. It shall communicate solely through the IP network.
13. Single button access from any console on the system to distribute emergency announcements within the facility to all or select locations equipped with speakers. Emergency announcements originating from any assigned administrative console shall have priority over all regular system functions.
14. Ability for administrative consoles and connected phones to selectively monitor audio at any two way speaker during an emergency.
15. Stores a minimum of 48 hours’ worth of Bell Event Schedules, all emergency notification sequences as well as facility wide configuration.
16. System has the ability to sync system time to the Atomic Clock Signal or to the school’s or districts network time server.
17. System’s SIP Interface shall provide:

    a. Audio paging access from any telephone to any single intercom speaker, zone (group) of intercom/paging speakers, or all speakers/paging horns throughout the entire facility.
    b. Ability to answer a call-in directed to that SIP extension.
    c. Ability to upgrade a call-in directed to that SIP extension.
    d. Single button access from any telephone on the system to initiate alarm signals within the facility to all or select locations equipped with speakers. A minimum of 25 separate distinct alarm signals shall be provided. Alarm signals originating from any assigned administrative telephone shall have priority over all regular system functions.
    e. Ability to initiate a school-wide emergency including lockdown and evacuate sequences.
    f. SIP device shall display call-in information from call in switch. Information will include a minimum of Classroom Name, Number, and Priority Level.

18. The system will have the ability to utilize a web browser and a USB microphone connected to the PC to deliver district-wide live emergency paging, pre-recorded messages and tones from any authorized computer in the facility or the district. The system must be capable of automatically notifying district personnel via the WAN of an alarm condition.
19. The system can automatically broadcast emergency instructions throughout an entire campus when an alarm (e.g. lockdown, lockout, security, fire) is tripped or manually activated. The emergency instructions are preprogrammed and require no user intervention. Bell tones are able to be halted during an emergency. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.

C. IP Addressable Modules:

1. System shall provide multiple IP Addressable Modules for intercom, paging and relay activation.

    a. All Modules are POE 802.3af compliant
    b. All Modules support DHCP.
    c. All Modules connect to network with a single RJ45 connector

2. IP Addressable Speaker Module

    a. Shall interface to school's data network, a classroom speaker, and multiple call switches.
    b. A minimum of 5 levels of call-in can be placed from an IP Speaker Module. The call-ins are routed to administrative consoles and select SIP connected telephones and can only be cleared from the system once answered. If a call-in is not answered within a preprogrammed time the call-in may reroute to other telephones, consoles, and speakers.
    c. An option for Privacy call in switches is supported. When the Privacy switch is activated it prevents administrative or classroom telephones from monitoring the specific classroom/location intercom speaker.
    d. The ability to belong to one or more of a minimum of 100 independent zones for zone paging, program/music distribution zones and class change tone zones; this assignment is a programmable function, changeable by time of day. Each IP Speaker Module's location shall be programmed in software to belong to any combination of software zones. IP Speaker Modules shall be designed to mount near ceiling and wall speakers and in the plenum space.
    e. Intercom and paging volume adjustable from Software interface.

3. IP Addressable Zone Paging Module

a. Zone Paging Module shall connect multiple speakers for district all page, all page, zone paging, bells, audio events and, emergency notification.
b. Zone Paging Modules shall be rack and wall mountable.
c. Zone Paging Modules shall be able to belong to one or more of 100 independent zones for live paging, bells, pre-recorded audio and emergency notification.

4. IP Addressable Aux I/O Module

a. Aux I/O Module shall have two input contacts and two output contacts.
b. Input and output contacts are individually addressable.
c. Aux I/O Module shall be wall and rack mountable.
d. User can program relays to be activated manually, through an event/bell schedule, or during emergency notification.
e. Aux I/O Module can perform school lockdown from a single press of a panic button.

5. IP Addressable Program Line Input Module

a. Program Line Input Module shall provide line level audio program distribution into system.
b. Program Line Input Module shall have a 3.5mm cable jack.
c. Program Line Input Module shall be configured via web-based user interface.
d. User can configure program distribution to be activated manually or automatically through an event/bell schedule.
e. Program Line Input Module will have a system priority level such that emergency communications override program distribution.

D. IP Addressable Analog Gateway

1. IP Addressable Gateway provides integration with existing analog wiring infrastructure – consisting of shielded two-pair classroom field wiring. The Gateway provides the ability to reuse speaker wiring, speakers, and punch blocks to integrate analog infrastructure with IP platform.
2. Each Gateway will have 5 watts of power per port and 25 watts total per device.
3. Supports 24 classrooms that utilize 25 Volt speakers and all current Telecenter call switches for front office notification.
4. Supports minimum of 5 call switch priorities per classroom, capable of lockdown check-in functionality, while reusing existing shielded two-pair classroom field wiring.
5. Classroom intercom volume adjustable from Software interface.
6. Classroom paging volume adjustable from Software interface.
7. Configured to the school network and can be used in conjunction with IP Addressable Modules.

E. IP Addressable Administrative Console

1. A full color screen with 64 soft keys, 3 line select, volume control, push to talk, speakerphone mode and left/right and up/down scrolling.
2. Audio paging access from any Console to any single intercom speaker, zone (group) of intercom/paging speakers, or all speakers/paging horns throughout the entire school.
3. Programmable soft key access from any console on the system to initiate alarm signals within the school to all or select locations equipped with speakers. A minimum of 25 separate distinct alarm signals shall be provided. Alarm signals originating from any assigned administrative console shall have priority over all regular system functions.
4. Programmable soft key access from any console to automatically broadcast page emergency instructions throughout an entire school when an alarm (e.g. lockdown, lockout, security, fire) is tripped or manually activated. The emergency instructions are preprogrammed and require no user intervention. The system provides redundant alarm annunciation over intercom/paging speakers and is not meant to replace primary fire alarm or security systems.
5. Ability to perform intercom to any single IP Addressable Speaker Module.
6. Ability to display 3 call-ins at a time on the screen while other call-ins are annunciating and the ability to scroll to view all call-ins.
7. Ability to upgrade a call-in via soft key.
8. Programmable soft key access from any console for activating relays, campus wide.
9. Ability to maintain, along with controller and other IP Modules system functions, including intercom, bells and paging for the local campus in the event of district-wide connection loss.
10. Classrooms that have not 'checked-in' during an emergency are listed on the Administrative Console's screen.
11. The time duration of an emergency is shown on the screen of the administrative console. The check-in timer is shown on the screen of the administrative console.

F. Audio Paging/Program Amplifiers

1. Power amplifier(s) shall be provided to provide a minimum of 2 watts of power to all paging speakers, and 15 watts of power to all paging horns.
2. The maximum load on the paging/program amplifiers shall be 80% of the rated maximum output of the amplifiers.

G. Normal/Emergency Call Switch – Rauland Dual Level Call In Switch

1. Normal/Emergency Call Switches indicated on the drawings shall provide the following functions and features:

    a. One (1) "Normal" call switch that shall activate a distinctive "NORMAL" level call from single button activation. The button shall be clearly marked "NORMAL" and will route the call-in to any one or more Administrative Consoles and/or Marquee

Displays for quick and easy response from an Administrative Console.

b. One (1) “Emergency” call switch that shall activate a distinctive “EMERGENCY” level call from single button activation. The button shall be red in color and shall be clearly marked “EMERGENCY” and will route the call-in to any one or more Administrative Consoles and/or Displays for quick and easy response from an Administrative Consoles.

H. Emergency/Check-In Call Switch – Rauland Check-In Call In Switch

1. Emergency/Check-In Call Switched indicated on the drawings shall provide the following functions and features:

a. One (1) “Emergency” call switch that shall activate a distinctive “EMERGENCY” level call from single button activation. The button shall be red in color and shall be clearly marked “EMERGENCY” and will route the call-in to any one or more Administrative Consoles and/or Displays for quick and easy response from an Administrative Consoles.

b. One (1) “CHECK-IN” call switch that shall activate a distinctive “CHECK-IN” level call from single button activation. The button shall be blue in color and shall be clearly marked “CHECK-IN” and will route the call-in to any one or more Administrative Consoles. This button will be used for emergency check-ins during school emergencies, notifying the front office of the classroom occupants’ safety during an emergency.

I. Equipment Racks

1. All equipment racks shall provide 44 spaces (77”) minimum for mounted system equipment.
2. All equipment racks shall be multi-rack format (“gangable”) style, bolted together, and open cavity.
3. All equipment racks will be provided with lockable rear doors.
4. Equipment rack(s) shall be located in climate-controlled areas/rooms as shown on drawings.
5. All head-end, distribution, and source equipment, including data and power, shall be located in racks configured as approved by the Engineer.
6. Rack mounted equipment shall be accessible from front and rear.
7. All unused rack spaces will be covered with appropriate blank/vent panels.

J. Synchronized Clock System

1. Provide complete and satisfactorily operating NTP Synchronized Clock System with analog and/or digital secondary clocks as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated.
2. (NTP) Network Time Protocol is a network standard protocol that assures accurate synchronization to the millisecond of computer clock

times in a network of computers. Based on UTC, NTP synchronizes client workstation clocks to the U.S. Naval Observatory Master Clocks in Washington, DC and Colorado Springs, CO. Running as a continuous background client program on a computer, NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust computer clocks.

3. The system shall be easy to learn and operate. All standard system programming shall be user friendly to allow the system administrator the ability to easily program system features.
4. Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information.
5. Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.
6. The NTP Synchronized System consists of a wired NTP receiver connected to a time server. Wired analog and digital clocks are synchronized to the NTP time. System shall synchronize all clocks to each other. System shall utilize NTP technology to provide atomic time to components.
7. System shall not require hard wiring for its components except for AC Power.
8. Analog Clocks shall synchronize to +/- 1 second of the transmitter displayed time.
9. Clocks shall automatically adjust for Daylight Saving per settings on the transmitter
10. The system shall have an internal clock that is continually updated by the NTP receiver. If a NTP failure were to occur, the clocks would continue to be synchronized to the internal clock and would not deviate from each other. Once NTP time is restored, all clocks would once again be synchronized to the NTP time.
11. The system must have a failsafe design so that if a power interruption were to occur, the clocks will continue to operate. If a sync signal is not received by the analog clocks for 48 hours, the second hand will double pulse to indicate this condition. Upon restoration of power, the transmitter will once again communicate with the clocks and normal operation will resume.
12. System shall be 100% programmable from the front operational panel with lights that indicate power status and NTP reception. Panel programming will also include Time Zone, Frequency, 12 or 24 hour operation and DST on/off.
13. The system may be modified to use GPS instead of NTP as the time source without the need to replace the transmitter. A GPS receiver would need to be added with access to the outside of the building.

K. Interior Ceiling Speakers

1. Provide Ceiling Speaker Assembly consisting of 8 Ohm, 8" speaker mounted in a 2 foot by 2 foot, or 2 foot by 1 foot, lay-in baffle, with an integrated back box that covers the full area of the baffle.

2. The speaker shall be connected by inserting an 8-pin RJ45 terminated CAT 5e or Cat 6 cable.
3. The speaker shall include provisions to allow attachment of a safety cable if required.

L. Wall Mounted Horns

1. Provide double re-entrant type horn loudspeakers with integral driver. The horn loudspeaker shall be impervious to weather and vandalism. Horn shall be constructed of heavy-duty ABS plastic. Horn loudspeaker drivers shall be rated at 15 watts with a frequency response of 480 Hz to 14 KHz. Sensitivity shall be 106 dB 1 watt, 1 meter. Transformer assembly shall be dual voltage multi-tap type suitable for 25 or 70-volt installations. Dispersion pattern shall be 180 degrees conical. The horn loudspeaker shall be constructed of treated heavy gauge aluminum, with all exposed parts potted and a sealed driver. Wiring terminal shall be fully enclosed. The speaker flange and mounting surface shall have a cork-rubber gasket. The horn loudspeakers finish shall be gray baked on enamel.
2. The recessed back box shall be of heavy gauge cold-rolled steel, spot welded for stability with a rust-retardant gray primer finish. Acoustically treat the interior to eliminate mechanical resonance. The back box shall be 10-3/4”x10-3/4”x6” deep.
3. The baffle shall be vandal proof, the faceplate constructed of 14-gauge carbon steel with a minimum tensile strength of 55,000 PSI. A lattice grid sub-plate shall deny access to the horn but be acoustically transparent for sound projection. Provide tamper proof, stainless steel mounting hardware. The baffle shall a mar/scratch baked epoxy rust inhibitive finish.

M. Uninterruptible Power Supplies (UPS)

1. UPS equipment provided for this system will include Power Conditioning to smooth current and voltage fluctuations.
2. UPS equipment will be sized in accordance with the system manufacturer’s recommendations.
3. Provide an individual UPS for EACH SYSTEM CONTROLLER (Gateway) furnished with the system.
4. Provide additional UPS(s) for protection of all other equipment furnished with the system and housed in the equipment racks.
5. All UPS equipment shall be rack mounted.

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine conditions, with the Installer present, for compliance with requirements and other conditions affecting the performance of the School Communications and School Safety Network.

B. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install system in accordance with NFPA 70 and other applicable codes. Install equipment in accordance with manufacturer's written instructions.

B. Furnish and install all material, devices, components and equipment for a complete operational system.

C. Impedance and Level Matching: Carefully match input and output impedance's and signal levels at signal interfaces. Provide matching networks where required.

D. Control Circuit Wiring: Install control circuits in accordance with NFPA 70 and as indicated. Provide number of conductors as recommended by system manufacturer to provide control functions indicated or specified.

E. All housings are to be located as indicated.

F. The contractor shall provide necessary transient protection on the AC power feed, all copper station lines leaving or entering the building, and all central office trunks. All protection shall be as recommended by the equipment supplier and referenced to earth ground.

G. Wiring within Enclosures: Provide adequate length of conductors. Bundle, lace, and train the conductors to terminal points with no excess. Provide and use lacing bars.

H. Provide physical isolation from speaker-microphone, telephone, line-level wiring, and power wiring. Run in separate raceways, or where exposed or in same enclosure, provide 12 inch minimum separation between conductors to speaker-microphones, telephone wiring and adjacent parallel power. Provide physical separation as recommended by equipment manufacturer for other system conductors.

I. Identification of Conductors and Cables: Use color coding of conductors and apply wire and cable marking tape to designate wires and cables so all media are identified in coordination with system wiring diagrams.

J. Weatherproofing: Provide weatherproof enclosures for items to be mounted outdoors or exposed to weather.

3.3 GROUNDING

A. Provide equipment grounding connections for Integrated Electronic Communications Network systems as indicated. Tighten connections to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounds.

B. Ground equipment, conductor, and cable shields to eliminate shock hazard and to minimize to the greatest extent possible, ground loops, common mode returns,

noise pickup, cross talk, and other impairments. Provide 5-ohm ground at main equipment location. Measure, record, and report ground resistance.

C. Provide all necessary transient protection on the AC power feed and on all copper station lines leaving or entering the building. Note in system drawings, the type and location of these protection devices as well as all wiring information.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Inspection: Make observations to verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Provide a list of final tap settings of paging speaker line matching transformers.

C. Testing: Rectify deficiencies indicated by tests and completely re-test work affected by such deficiencies at Contractor's expense. Verify by the system test that the total system meets the Specifications and complies with applicable standards.

3.5 FINAL ACCEPTANCE TESTING

A. The Final Acceptance Testing shall be provided to the Owner or the Owners designated representative only. Final acceptance testing to any other trade or service provider for the project will not comply with the requirements of this section.

B. The contractor will provide a Final Acceptance Test record document signed by both the contractor and the Owner or designated Owner’s Representative establishing the “In Warranty” date. The warranty period will not commence until the Final Acceptance Test is completed.

C. Be prepared to verify the performance of any portion of the installation by demonstration, listening and viewing test, and instrumented measurements. Make additional adjustments within the scope of work and which are deemed necessary by the Owner because of the acceptance test.

3.6 COMMISSIONING

A. The contractor shall train the Owner's maintenance personnel in the procedures and schedules involved in operating, troubleshooting, servicing, and preventative maintenance of the system. This training will be in accordance with the training as outlined in Section 1.6 of these specifications. In addition to the Training Materials provided, the contractor will also furnish Operators Manuals and Users Guides at the time of this training.

B. Schedule training with Owner through the owners representative, with at least seven days advance notice.

3.7 OCCUPANCY ADJUSTMENTS

A. The contractor shall provide Occupancy Adjustments in accordance with Section 1.6 of these specifications. A response scenario amenable to both the owner and the contractor will be established and followed for the first year of service.

3.8 CLEANING AND PROTECTION

A. Prior to final acceptance, the contractor shall vacuum, wipe down and clean all system components and protect them from damage and deterioration. All blank spaces in equipment cabinets will be covered with blank panels. Top and side panels, and all cabinet doors will be installed. All general areas within and around all equipment rack/cabinets in the facility will be swept, vacuumed, and cleaned up. No cabinets will be left unlocked and all cabinet keys will be turned over to the owner or designated owner's representative.

END OF SECTION

SECTION 275313 - WIRELESS CLOCK SYSTEM

PART 1 – GENERAL

1.1 GENERAL REQUIREMENTS

A. All bids shall be based on the equipment as specified herein. The catalog numbers and model designations are that of the RAULAND-BORG CORPORATION. The specifying authority must approve any alternate system.

B. Bidders wishing to submit alternate equipment shall submit to the specifying authority, at least 10 days prior to bid opening, the equipment proposed to provide a precise functional equivalent system to meet specifications. Bidder shall provide adequate information prior to bid date such as specification sheets, working drawings, shop drawings, and a demonstration of the system.

C. Final approval of the alternate system shall be determined at the time of job completion. Failure to provide the "precise functional equivalent" shall result in the removal of the alternate system at the contractor's expense.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. 27 05 00: Common Work Results for Communications.
2. 27 05 28: Interior Communications Pathways.
3. 27 08 00: Commissioning of Communications.
4. 27 15 00: Communications Horizontal Cabling.
5. Applicable Division 26 requirements for power and raceway coordination.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 SUMMARY

A. This Section includes a NTP Synchronized Wireless Clock System. It includes requirements for a NTP Synchronization system components including, but not limited to, the following:

1. Transmitter
2. NTP Receiver module
3. Wireless Analog Clocks (Battery/AC Powered)
4. Wireless Digital Clocks (AC Powered)

1.4 RELATED SECTIONS:

A. The following Division 16 Section may contain requirements that relate to this Section:

1. "Electrical Boxes and Fittings," for boxes, cabinets and fittings used for installation of transmitter for system
2. Intercom/Public Address for interface to bell system

1.5 SYSTEM DESCRIPTION

A. Furnish and install all equipment, accessories, and materials in accordance with these specifications and drawings to provide a complete and operating NTP Synchronized Wireless Clock system.

1.6 SUBMITTALS

A. General: Submit the following in accordance with Conditions of Contract and Division 1 Specification Sections:

1. Submit equipment drawings with precise locations of transmitter, NTP receiver and all locations of clocks.
2. Submit product data sheets on each component, describing its operational and physical characteristics along with method of installation.
3. The system must operate in accordance with a “Radio Station Authorization” form FCC 601 granted by the Federal Communication Commission (FCC). Submit evidence of application for operating license prior to installing equipment. Furnish the license, or if the license has not been received, a copy of the application for the license, to the Owner prior to operating of the equipment. Upon receipt of license, deliver original license to owner.
4. Provide complete installation, set-up and maintenance instructions and submit a certificate of completion of installation and service training.

1.7 QUALITY ASSURANCE

A. All items of equipment including wire and cable shall be designed by the manufacturer to function as a complete system and shall be accompanied by the manufacturer's complete service notes and drawings detailing all interconnections.

B. The manufacturer must be a company specializing in the manufacturer of commercial timekeeping products with a minimum 30 continuous years of documented experience.

C. The contractor shall be an established electronics contractor that has had and currently maintains a locally run and operated business for at least 10 years. The contractor shall utilize a duly authorized distributor of the equipment supplied for this project location with full manufacturer's warranty privileges.

D. The contractor shall show satisfactory evidence, upon request, that the supplier maintains a fully equipped service organization capable of furnishing adequate inspection and service to the system. The supplier shall maintain at his facility the necessary spare parts in the proper proportion as recommended by the manufacturer to maintain and service the equipment being supplied.

E. Electrical Component Standard: Provide work complying with applicable requirements of NFPA 70 "National Electrical Code" including, but not limited to:

1. Article 250, Grounding.
2. Article 300, Part A. Wiring Method.
3. Article 310, Conductors for General Wiring.
4. Article 725, Remote Control, Signaling Circuits.

5. EIA Compliance: Comply with the following Electronics Industries Association Standards:

6. Racks, Panels, and Associated Equipment, EIA-310-A.

F. Installation and start up of all systems shall be under the direct supervision of a local agency regularly engaged in installation, repair, and maintenance of such systems. The supplier shall be accredited by the proposed equipment manufacturers and be prepared to offer a service contract for system maintenance.

G. Contractor providing equipment shall be responsible for providing all specified equipment and mentioned services for all equipment as specified herein. Contractor must be a local authorized distributor of all specified equipment for single source of responsibility and shall provide documents proving such. Contractor must provide written proof that they are adequately staffed with factory-trained technicians for all of the specified equipment. Contractor must have established business for and currently be providing all services for the equipment to be provided for a minimum of 5 years.

H. The contractor shall guarantee availability of local service by factory-trained personnel of all specified equipment from an authorized distributor of all equipment specified under this section. On-the-premise maintenance shall be provided at no cost to the purchaser for a period of one (1) year (parts and labor) from date of acceptance unless damage or failure is caused by misuse, abuse, neglect, or accident. Additionally, all manufacturer supplied products must be covered by a five (5) year (parts only) limited warranty from the date of acceptance. The warranty period shall begin on the date of acceptance by the owner/engineer.

I. The contractor shall, at the owner's request, make available a service contract offering continuing factory authorized service of the system after the initial warranty period.

J. The supplier shall visit the sites and familiarize himself with the existing conditions and field requirements prior to submitting a proposal.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver products in factory containers. Store products in a clean and dry space in original containers. Protect products from fumes and construction traffic. Handle carefully to avoid damage.

1.9 IN-SERVICE TRAINING

A. The contractor shall provide a minimum of 2 hours of in-service training with this system. Operators Manuals shall be provided at the time of this training.

1.10 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide a Rauland Telecenter U clock, bell, and paging system by Rauland, or an approved equivalent only where accepted by the Owner and Engineer prior to bid.

1. Telecenter manufactured by Rauland

a. Authorized Rauland Distributor contact:
(1) Jeff Bowers
Innovative Communications Systems, Inc.

775-825-2011

jbowers@innovativecomsys.com

PART 2- PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide one of the following systems:

1. Synchronized Wireless Clock System and secondary clocks manufactured by Rauland-Borg Corp.

B. The intent of this specification is to establish a standard of quality, function and features. It is the responsibility of the bidder to ensure that the proposed product meets or exceeds every standard set forth in these specifications.

C. The functions and features specified are vital to the operation of this facility, therefore, the acceptance of alternate manufacturers does not release contractor from strict compliance with the requirements of this specification.

D. Any proposed system that operates on an unlicensed frequency or has the FCC license in the name of someone other than the building owner will not be accepted.

E. The Contractor for this work shall be held to have read all the Bidding Requirements, the General Requirements of Division 1, and Contract Proposal Forms; and in the execution of this work, he will be bound by all of the conditions and requirements therein.

F. The contractor shall be responsible for providing a complete functional system including all necessary components whether included in this specification or not.

G. In preparing the bid, the bidder should consider the following:

1. No claim will be made against the owner for any costs incurred by the bidder for any equipment demonstrations which the owner requests.

H. Any prior approval of an alternate system does not automatically exempt the supplier from meeting the intent of these specifications. Failure to comply with the operational and functional intent of these specifications may result in the total removal of the alternate system at the expense of the contractor.

I. Alternate equipment shall be considered if submitted to the specifying authority at least ten (10) days prior to bid date. Submission of an alternate shall contain engineering drawings of the system with specification sheets covering all components of the system as well as all items of Section 1 "SUBMITTALS." The system and equipment drawings and specifications sheet shall meet all items of the specification.

J. The specifying authority must approve any alternate supplier.

2.2 SYSTEM REQUIREMENTS

A. GENERAL:

1. The system shall be easy to learn and operate. All standard system programming shall be user friendly to allow the system administrator the ability to easily program system features.

2. Provide complete and satisfactorily operating NTP Synchronized Wireless Clock System with analog and/or digital secondary clocks as described herein, using materials and equipment of types, sizes, ratings, and performances as indicated.
3. (NTP) Network Time Protocol is a network standard protocol that assures accurate synchronization to the millisecond of computer clock times in a network of computers. Based on UTC, NTP synchronizes client workstation clocks to the U.S. Naval Observatory Master Clocks in Washington, DC and Colorado Springs, CO. Running as a continuous background client program on a computer, NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust computer clocks.
4. Use materials and equipment that comply with referenced standards and manufacturers' standard design and construction, in accordance with published product information.
5. Coordinate the features of all materials and equipment so they form an integrated system, with components and interconnections matched for optimum performance of specified functions.

B. SYSTEM DESCRIPTION AND OPERATION

1. The NTP Synchronized Wireless System consists of a master transmitter located on the inside of the building, and a NTP receiver connected to a time server. An unlimited number of wireless analog and digital clocks are synchronized to the NTP time.
2. System shall synchronize all clocks to each other. System shall utilize NTP technology to provide atomic time to components.
3. System shall not require hard wiring for its components except for AC Power. Analog Clocks may be battery operated for full portability if required.
4. Analog Clocks shall synchronize to +/- 1 second of the transmitter displayed time.
5. Clocks shall automatically adjust for Daylight Saving per settings on the transmitter
6. The system shall have an internal clock that is continually updated by the NTP receiver. If a NTP failure were to occur, the clocks would continue to be synchronized to the internal clock and would not deviate from each other. Once NTP time is restored, all clocks would once again be synchronized to the NTP time.
7. The system must have a failsafe design so that if a power interruption were to occur, the clocks will continue to operate. If a synch signal is not received by the analog clocks for 48 hours, the second hand will double pulse to indicate this condition. Upon restoration of power, the transmitter will once again communicate with the clocks and normal operation will resume.
8. Battery Powered Analog Clocks shall require 2 "D" cell batteries.
9. System shall be 100% programmable from the front operational panel with lights that indicate power status and NTP reception. Panel programming will also include Time Zone, Frequency, 12 or 24 hour operation and DST on/off.
10. The wireless backbone must support expansion of the system to include wireless alphanumeric displays for emergency crisis communications.

C. The system may be modified to use GPS instead of NTP as the time source without the need to replace the transmitter. A GPS receiver would need to be added with access to the outside of the building.

D. The system shall lend itself to expansion by simple addition of wireless secondary clocks and their required power source.

2.3 EQUIPMENT AND MATERIALS

A. WIRELESS TRANSMITTER

1. Rauland Model # WCXATRAN

a. FCC Part 90 Approved, 467.2125-467.4375 MHz frequency range
b. Radio Technology (Narrowband FM, 12.5 KHz bandwidth)
c. 10 selectively available channels
d. 5 watt transmitter
e. Daylight Savings Time pre-programmed
f. Time Zone Pre-set
g. Non-Volatile Memory
h. LCD Display for time, date, year, power, time zone and signal reception
i. Operating Range (32 degrees F to 158 degrees F)
j. Rack or Shelf Mount
k. Power Supply Input: 120-volt AC, Output: 12-volt DC, 3 Amps
l. 7” Rear Mounted Antenna
m. Dimensions: 12”L x 6”W x 1.75”H Weight: 2 lbs
n. NTP Receiver Model # WCXRVRNTP
o. Optional External Antenna
p. For use in large campus applications. Up to 2 miles radius

B. SECONDARY 13” ANALOG CLOCK

1. Rauland Model # WCA1312B

a. 13” Analog Clock (Battery Powered using 2”D” Cell batteries).
b. Maintenance Free.
c. Five year manufacturer’s warranty.
d. Microprocessor based with built-in wireless receiver
e. Heavy Duty Construction
f. Durable ABS Casing
g. Clock numbering graphics shall be Standard Arabic Format (12HR-60 Minute)
h. Face of clock is white
i. Hour and Minute hands shall be black, second hand is red
j. The clock lens shall use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.
k. The clock shall have a low–profile, semi–flush design
l. Wire Guard Model #WCANA13WG in areas where protection is required as indicated on drawings or by owner.

C. SECONDARY 16” ANALOG CLOCK

1. Rauland Model # WCA1612B

a. 16” Analog Clock (Battery Powered using 2”D” Cell batteries).
b. Maintenance Free.
c. Five year manufacturer’s warranty.
d. Microprocessor based with built-in wireless receiver
e. Heavy Duty Construction
f. Durable ABS Casing
g. Clock numbering graphics shall be Standard Arabic Format (12HR-60 Minute)
h. Face of clock is white
i. Hour and Minute hands shall be black, second hand is red

j. The clock lens shall use a shatterproof polycarbonate material with no visible molding marks. Glass and/or visible molding marks are unacceptable.
k. Wire Guard Model #WANA16WG in areas where protection is required as indicated on drawings or by owner.
l. The clock shall have a low–profile, semi–flush design

PART 3 – EXECUTION

3.1 EXAMINATION

A. Examine conditions, with the Installer present, for compliance with requirements and other conditions affecting the performance of the NTP Synchronized Wireless Clock system.

B. Do not proceed until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:

1. Install system in accordance with NFPA 70 and other applicable codes. Install equipment in accordance with manufacturer's written instructions.

B. Wiring Methods:

1. Install cabling concealed in conduit or above accessible ceilings. No exposed cabling is permitted except within telecom rooms. Provide plenum-rated cabling. Install Cat 6 cabling for paging system IP devices in accordance with Division 27 requirements, and terminate, label, test, and certify cabling as indicated on the Drawings. Provide 18/2 plenum speaker cable, 18/2 plenum 24VAC power conductors, patch cords, and miscellaneous cabling required for a complete system.

C. Control Circuit Wiring:

1. Install control circuits in accordance with NFPA 70 and as indicated. Provide number of conductors as recommended by system manufacturer to provide control functions indicated or specified.
2. All housings are to be located as specified and shown on drawings.
3. Make installation in strict accordance with approved manufacturer's drawings and instructions.
4. The contractor shall provide necessary transient protection on the AC power feed. All protection shall be as recommended by the equipment supplier and referenced to earth ground.

D. Weatherproofing:

1. Provide weatherproof enclosures for items to be mounted outdoors or exposed to weather.

E. Repairs:

1. Wherever walls, ceilings, floors, or other building finishes are cut for installation, repair, restore, and refinish to original appearance.

3.3 GROUNDING

A. Provide equipment grounding connections for NTP Synchronized Wireless Clock systems as indicated. Tighten connections to comply with tightening torques specified in UL Standard 486A to assure permanent and effective grounds.

B. Ground equipment, conductor, and cable shields to eliminate shock hazard and to minimize to the greatest extent possible, ground loops, common mode returns, noise pickup, cross talk, and other impairments. Provide 5-ohm ground at main equipment location. Measure, record, and report ground resistance.

C. The contractor shall provide all necessary transient protection on the AC power feed leaving or entering the building.

D. The contractor shall note in his system drawings, the type and location of these protection devices as well as all wiring information.

E. The contractor shall furnish and install a dedicated, isolated earth ground from the central equipment rack and bond to the incoming electrical service ground buss bar.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Services:

1. Provide services of a duly factory authorized service representative for this project location to supervise the field assembly and connection of components and the pre-testing, testing, and adjustment of the system.

B. Inspection:

1. Make observations to verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Provide a list of final Atomic Clock Synchronized Master Clock system configuration.

C. Testing:

1. Test, commission, and demonstrate the complete clock, bell, and paging system at project completion. Testing and commissioning shall include verifying installation and support of all speakers and clocks, confirming speaker zones and tap settings, verifying rack-mounted equipment, confirming programming of paging zones, bell schedules, tones, and volume levels, verifying fire alarm mute interface operation, confirming integration with the existing Telecenter V system, and correcting deficiencies before acceptance.

3.5 COMMISSIONING

A. Train Owner's maintenance personnel in the procedures and schedules involved in operating, troubleshooting, servicing, programming, and preventative maintenance of the clock, bell, and paging system. Provide a minimum of 2 hours of training. Provide operator manuals, user guides, system documentation, and electronic operation and maintenance manuals at the time of training.

B. Schedule training with Owner through the Architect, with at least seven days advance notice.

3.6 OCCUPANCY ADJUSTMENTS:

A. When requested by the Architect within one year of date of Substantial Completion, provide on-site assistance in adjusting NTP Synchronized Wireless Clock system and adjusting controls to suit actual occupied conditions. Provide up to three visits to the site for this purpose.

3.7 CLEANING AND PROTECTION

A. Prior to final acceptance, clean system components and protect from damage and deterioration.

END OF SECTION 275313

SECTION 280000 – COMMON WORK RESULTS FOR ELECTRONIC SAFETY AND SECURITY

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Include all labor, materials, tools, transportation, storage costs, excavation, training, equipment, insurance, temporary protection, permits, inspections, taxes and all necessary and related items required to provide complete and operational electronic safety and security systems as shown on the Drawings and described in the Specifications.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 05 00: Conductors and Cables for Electronic Safety & Security.
2. Section 28 05 26: Grounding and Bonding for Electronic Safety & Security.
3. Section 28 05 28: Conduits and Backboxes for Electronic Safety and Security.
4. Section 28 05 53: Identification for Electronic Safety & Security.
5. Section 28 20 00: Video Surveillance.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 QUALITY ASSURANCE

A. The Contractor installing the Electronic Safety and Security systems shall have a minimum of (5) years experience installing commercial security systems of similar size and scope.

B. See individual Division 28 specifications for additional requirements.

1.4 REGULATIONS AND CODE COMPLIANCE

A. The Contractor will comply with all applicable governmental regulations including Federal, State, City, and Local applicable codes and ordinances.

B. References to codes and standards called for in the Specifications refer to the latest edition, amendments, and revisions to the codes and standards in effect on the date of these Specifications.

C. All work and materials shall conform to and be installed, inspected and tested in accordance with the governing rules and regulations as well as federal, state and local governmental agencies, including, but not limited to the following:

1. NFPA-70, 2023 - National Electrical Code (NEC).

2. Underwriters Laboratories (UL):

a. UL 50 - Enclosures for Electrical Equipment.
b. UL 294 – Access Control Systems
c. UL 365 – Police Station Connected Burglar Alarm Units and Systems
d. UL 609 – Local Burglar Alarm Units and Systems
e. UL 611 – Central Station Burglar-Alarm Units
f. UL 636 – Hold up alarms
g. UL 1076 – Proprietary Burglar Alarm Units and Systems
h. UL 1610 – Central Station Burglar-Alarm Units
i. UL 60950-1 - Information Technology Equipment - Safety.

3. Federal Communications Commission (FCC):

j. Code of Federal Regulations Title 47 - Part 15 – Radio Frequency Devices.
k. Code of Federal Regulations Title 47 - Part 68 – Connection of Terminal Equipment to the Telephone Network.

4. Americans with Disabilities Act (ADA).

1.5 DEFINITIONS

A.	Accessible Ceiling	Space above a ceiling constructed of removable tiles (clipped or unclipped). Acoustical ceiling grid with removal tiles would be considered an accessible ceiling. A gypboard ceiling would not be considered an accessible ceiling.
B.	Approved/Approval	Written permission to use a material or system.
D.	As Called For	Materials, equipment including the execution specified/shown in the Specifications.
D.	Code Requirements	Minimum requirements.
E.	Concealed	Work installed in pipe and duct shafts, chases or recesses, inside walls, above ceilings, in slabs or below grade.
F.	Exposed	Work not identified as concealed.
G.	Final Acceptance	Owner acceptance of the project from the Contractor upon certification by the Owner's Representative.
H	Furnish	Supply and deliver to installation location.
I.	Furnished by Others	Receive delivery at job site or where called for and install.
J.	Inspection	Visual observations by Owner or Owner's Representative.
K.	Install	Mount and connect equipment and associated materials ready for use.
L.	Listed	Refers to classification by a standards agency.

M.	Or Approved Equal	Approved equal or equivalent as determined by Owner or Owner's Representative.
N.	Owner's Representative	Design professional or Consultant representing the Owner.
O.	Provide	Furnish, install and connect ready for use.
P.	Relocate	Disassemble, disconnect, and transport equipment to new locations: then clean, test, and install ready for use.
Q.	Replace	Remove and provide new item.
R.	Review	A general contractual conformance check of specified products.
S.	Satisfactory	As specified in Specifications.

1.6 INTENT OF DRAWINGS

A. All drawings are diagrammatic unless otherwise noted as detailed dimensioned drawings. Drawings show approximate locations of equipment and devices. Exact locations are subject to the approval of the Owner or Owner's Representative. The Contractor shall verify dimensions and shall be responsible for their accuracy

B. Items mentioned in the Specifications and not shown in the Drawings or shown in the Drawings and not mentioned in the Specifications, shall be of like effect as if shown and mentioned in both. In the case of differences between the Drawings and the Specifications, the stricter provision as determined by the Owner or Owner's Representative shall govern.

C. Omissions from the Drawings or Specifications, or the incorrect description of details of Work which are necessary to carry out the intent of the Drawings and Specifications, or work which is customarily performed, shall not relieve the Contractor from performing such omitted or incorrectly described work.

D. No exclusion from, or limitations in, the language used in the Project Documents shall be interpreted as meaning that ancillary or accessory items necessary to complete any required system or item of equipment are to be omitted.

1.7 REVIEW OF SPECIFICATIONS

A. The Contractor shall carefully study and compare the Drawings and Specifications. Any error, inconsistency or omission discovered shall be immediately reported to the Owner or Owner's Representative. If the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission without such notice to the Owner or Owner's Representative, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the cost for any correction.

1.8 EXAMINATION OF THE PREMISES

A. The Contractor shall visit the Site to become familiar with the local conditions under which the work is to be performed and correlate the observations with the requirements of the Drawings and Specifications. No allowance will be made for claims of concealed

conditions which the Contractor learned or should have learned in exercising due diligence in its observations of the site and review of the local conditions.

B. Before ordering any materials or performing any work, the Contractor shall coordinate the installation with the work of other trades and shall verify all measurements. No extra charge or compensation will be allowed for duplicate work or material required because of an unverified difference between an actual dimension and the measurement indicated in the Drawings. Any discrepancies found shall be submitted in writing to the Owner or Owner's Representative for consideration before proceeding with the work.

1.9 COORDINATION OF CABLING PATHWAYS AND EQUIPMENT ROOMS

A. Drawings are diagrammatic in depicting the routing of security cabling pathways and the layout of security equipment.

B. The contractor shall coordinate the installation of all work with other trades including Mechanical, Electrical, Plumbing, Sprinkler, Structural and Architectural.

C. The contractor shall participate in coordination meetings with other trades prior to the installation of the work. For a specific space/area, the security contractor shall coordinate the routing and installation of all work with all other trades that have work in that specific space/area.

D. Prior to the installation of security cabling pathway including conduit, sleeves, etc., the contractor shall coordinate the routing of this pathway to avoid conflicts with and provide necessary clearances from the work of other trades. The contractor shall provide all horizontal offsets, vertical offsets and radius bends as necessary to coordinate the routing of the security pathways with the work of other trades and building structure.

E. Prior to the installation of equipment and/or cabling in the communication rooms, the contractor shall coordinate the layout of all equipment and cable pathways with the Telecom Contractor.

1.10 WARRANTY AND SERVICES

A. See individual Division 28 Specifications for warranty requirements.

PART 2 – PRODUCTS

2.1 EQUIPMENT AND MATERIALS MINIMUM REQUIREMENTS

A. Electrical equipment and systems shall meet UL Standards and requirements of the National Electric Code. This listing requirement applies to the entire assembly. Any modifications to equipment to suit the intent of the Specifications shall be performed in accordance with these requirements.

B. Equipment shall meet all applicable FCC Regulations.

C. All materials, unless otherwise specified, shall be new and be the standard products of the manufacturer. Used equipment or damaged material will be rejected.

D. The listing of a manufacturer as "acceptable" does not indicate acceptance of a standard or cataloged item of equipment. All equipment and systems must conform to the Specifications.

2.2 WORKMANSHIP, SUBSTITUTIONS, WARRANTY

A. Materials and workmanship shall meet or exceed industry standards and be fully guaranteed for a minimum of one (1) year from the date of final acceptance. Cable integrity and associated terminations shall be thoroughly inspected, fully tested and guaranteed free from defects, transpositions, open shorts, tight kinks, damaged jacket insulation, etc.

B. All labor must be thoroughly competent, skilled and trained, and all work shall be executed in strict accordance with the best practice of the trades.

C. The Contractor shall be responsible for and make good, without expense to the Owner, any and all defects arising during this warranty period that are due to imperfect materials, improper installation or poor workmanship.

D. After the Contract is awarded, requests to substitute for specified materials shall be submitted by the Contractor to the Owner or Owner's Representative within thirty (30) days, complete with reasons for the substitution and savings which accrue to the Owner if the substitutions are approved. Substitutions after Contract award will be considered only if the substitutions are equal or superior to the products specified.

E. No material substitutions will be allowed except by written acceptance from the Consultant. Specified catalog numbers are used for description of equipment and standard of quality only. Equivalent material will be given consideration only if adequate comparison data including samples are provided.

F. Approval of alternate or substitute equipment or material in no way voids the Specification requirements.

G. Under no circumstances shall the Owner be required to prove that an item proposed for substitution is not equal to the specified item. It shall be mandatory that the Contractor submit to the Owner or Owner's Representative all evidence to support the contention that the item proposed for substitution is equal to the specified item. The Owner's decision as to the equality of substitution shall be final and without further recourse.

2.3 FACTORY ASSEMBLED PRODUCTS

A. Manufacturers of equipment assemblies that include components made by others shall assume complete responsibility for the final assembled unit.

1. All components of an assembled unit need not be products of the same manufacturer.
2. Component parts, which are alike, shall be from a single manufacturer.
3. Components shall be compatible with each other and with the total assembly for the intended service.
4. Components of equipment shall bear the manufacturer's name or trademark model number and serial number on a name plate securely affixed in a conspicuous place, or cast integral with, stamped or otherwise permanently marked upon the components of the equipment.

B. Major items of equipment that serve the same function must be the same make and model.

C. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that a complete and fully operational system

will result.

D. Maximum standardization of components shall be provided to reduce spare part requirements.

PART 3 – EXECUTION

3.1 ROUGH-IN

A. Before construction work commences, the Contractor shall visit the site and identify the exact routing of horizontal and backbone cable pathways.

B. All equipment locations and cabling pathway shall be coordinated with other trades and existing conditions to eliminate interference with required clearances for equipment maintenance and inspections.

C. Coordinate work with other trades and existing conditions to determine exact location of equipment and routing of cable pathways.

1. Where more than one trade is involved in an area, space or chase, all shall cooperate and install their own work to utilize the space equally between them in proportion to their individual requirements. If, after installation of any equipment, piping, ducts, conduit, etc., it is determined that adequate space has not been provided for passage or maintenance, rearrange the work. Any changes in the size or location of the material or equipment supplied or proposed, which may be necessary in order to meet field conditions or in order to avoid conflicts between trades, shall be brought to the immediate attention of the Owner's Representative and approval received before such alterations are made.

D. Provide easy, safe and code mandated clearances at equipment racks and enclosures.

3.2 CUTTING, CORING AND PATCHING

A. The Contractor shall be responsible for all cutting, patching, coring and associated work to complete the security cabling pathway system.

B. Protect existing finishes from water damage during core/cutting work and cleanup all related water and debris. Patch adjacent work disturbed by installation of new work including insulation, walls and wall covering, ceiling and floor covering or other finished surfaces.

C. Contractor to submit all proposed concrete wall or floor penetrations to the Structural Engineer for approval prior to performing the work. Contractor shall locate and avoid cutting concrete reinforcing steel using current x-ray or pachometer equipment.

3.3 FIRESTOPPING

A. All penetrations through fire-rated building structures (walls and floors) shall be sealed with an appropriate fire stop system. This requirement applies to through penetrations (complete penetration) and membrane penetrations (through one side of a hollow fire rated structure). Any penetrating item i.e., riser slots and sleeves, cables, conduit, cable tray, and raceways, etc. shall be properly fire stopped.

B. Firestopping assemblies shall meet or exceed the rating of the wall or floor being penetrated.

C. Fire stopping References:

1. ASTM E814, Standard Method of Fire Tests of Through-Penetration Fire Stops.
2. ASTM E 119, Fire Tests of Building Construction and Materials (for fire-rated architectural barriers).
3. current NFPA edition adopted by the AHJ National Electrical Code, Section 800-52, Paragraph 2(b), Spread of Fire and Products of Combustion.

3.4 CONCEALMENT

A. Security cabling pathways including conduit, sleeves and tray shall be concealed above ceilings, in walls, below slabs, and elsewhere throughout building. If concealment is impossible or impractical, or in areas without ceilings, the Owner's Representative shall be notified of the proposed routing prior to starting that portion of the work.

B. All CAT 6 security cabling must be routed concealed above accessible ceilings or in conduit. No exposed security cabling is permitted with the exception of CAT 6 security cabling routed within the telecom rooms.

3.5 CONDUIT SEALING

A. All penetrations through slab-on-grade and concrete-filled metal decks to be sealed watertight. See Section 07 92 00 – Joint Sealants.

3.6 GENERAL INSTALLATION REQUIREMENTS

A. Coordinate ordering and installation of all equipment with long lead times or having a major impact on work by other trades so as not to delay the job or impact the schedule.

B. Where mounting heights are not dimensioned, install systems, materials and equipment to provide the maximum headroom possible.

C. Set all equipment to accurate line and grade, level all equipment and align all equipment components.

D. Provide all scaffolding, rigging, hoisting and services necessary for erection and delivery of equipment and apparatus furnished into the premises.

E. No equipment shall be hidden or covered up prior to inspection by the Owner's Representative. All work that is determined to be unsatisfactory shall be corrected immediately.

F. All work shall be installed level and plumb, parallel and perpendicular to other building systems and components.

G. The Contractor shall replace all ceiling tiles damaged by work performed as part of the communications contract.

H. Storage and security of material and equipment shall be the responsibility of the Contractor.

END OF SECTION 280000

SECTION 280500 - CONDUCTORS AND CABLES FOR ELECTRONIC SAFETY AND SECURITY

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs, testing, training and related items required to provide a complete and operational video surveillance cabling and rough-in system, together with access control and intrusion detection rough-in only where shown on the Drawings and described in the Specifications. Active access control and intrusion detection head-end equipment, controllers, readers, detection devices, programming, licensing and final system commissioning are excluded unless specifically indicated otherwise.

B. Provide video surveillance Category 6 cabling, terminations, patch cords, camera mounting raceway and related rough-in as shown on the Drawings. Provide access control and intrusion detection conduit, backboxes, device rough-in, pathways and pull strings only where shown on the Drawings; do not include active access control or intrusion detection devices unless specifically scheduled or detailed as contractor-furnished.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety & Security.
2. Section 28 05 28: Conduits and Backboxes for Electronic Safety and Security.
3. Section 28 05 53: Identification for Electronic Safety & Security.
4. Section 28 20 00: Video Surveillance.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

1. NFPA-70, 2023 - National Electrical Code (NEC).
2. FCC Regulations:
   a. Part 15 – Radio Frequency Devices & Radiation Limits
3. Underwriter's Laboratories (UL): Applicable listing and ratings.
   a. UL 294: Access Control System Units
   b. UL 1076: Proprietary Burglar Alarm Units and Systems
4. Electronic Industry Association (EIA) testing standards

5. American Society for Testing and Materials (ATSM)
6. National Electrical Manufacturers' Association (NEMA)

1.4 SUBMITTALS

A. Product Data: Submit manufacturer’s product data sheets for the following items:

1. Wire and Cable for each system identified in the Division 28 Specifications.

PART 2 - PRODUCTS

2.1 WIRE AND CABLE

A. Install Category 6 cabling to video surveillance cameras and other IP-based security devices shown on the Drawings. Category 6 cabling shall be plenum rated, gray jacket, Belden/CDT 2413 008U1000 or approved equal, and shall be installed, terminated, labeled and tested by the Telecom Contractor in accordance with the Division 27 Specifications and the Horizontal Telecom Cable and Termination Schedule.

B. All non-IP electronic safety and security cabling associated with rough-in shall be routed in conduit from field device locations to the designated telecom room, security panel location, or nearest accessible pathway as shown on the Drawings. No exposed cabling is permitted. Conduit shall be sized so as not to exceed 40 percent fill. Outdoor exposed conduit shall be rigid metal conduit, IMC, or as otherwise indicated on the Drawings; concealed conduit routed in walls or above ceilings shall be EMT.

C. Provide cable type, conductor size, conductor quantity and shielding as recommended by the manufacturer of the equipment.

D. Do not share conduits with fire alarm or electrical systems.

E. Provide required wire and cable sized to allow for voltage drop on long runs and effectively shielded as required to allow the routing of 12 & 24V power and signal cable in the same conduit without interference or signal noise.

F. Cable installed outdoors or in underground conduit shall contain a PVC or Polyethylene jacket, flooded to prevent water intrusion.

G. Acceptable Manufacturers:

1. Belden.
2. Commscope.
3. Honeywell Genesis
4. Tappan.
5. Westpenn.
6. Or approved equal.

PART 3 – EXECUTION

3.1 INSTALLATION

A. Identify and label all wire and cable clearly with permanent labels in accordance with Division 27 requirements, WCSD-SCS-015, and the cable designation shown on the approved submittals or record drawings. Assign wire or cable designations consistently throughout a given system; each wire or cable shall carry the same labeled designation over its entire run, regardless of intermediate terminations.

B. Secure all wire and cable run vertically in conduit for continuous distances greater than thirty (30) feet at the vertical run terminations. Non-coaxial cables shall be secured by screw-flange nylon cable ties or similar approved devices, Thomas and Betts or equal. Symmetrical clamping devices with split, circular or other wire conforming, nonmetallic bushings shall be provided for all other cables.

C. All wire and cable shall be continuous and splice-free for the entire length of run between designated connections or terminations.

D. Make all connections to screw-type barrier strips on panels and with insulated crimp-type spade lugs when appropriate. Size all lugs properly to assure high electrical integrity, i.e., low resistance connections.

E. Lace, tie or harness wire or cable as required herein, and in accordance with accepted professional practice. Dress, lace or harness all wire and cable to prevent mechanical stress on electrical connections; no wire or cable shall be supported by a connection point.

F. Wiring for shielding certain conductors from others or routing in separate raceways, shall be as recommended by the manufacturer's current requirements.

G. All wiring shall be installed in conduit and shall be of the size recommended by the equipment supplier.

H. Provide all necessary tie wires.

I. Follow manufacturers recommended guidelines for installation.

END OF SECTION 28 05 00

SECTION 280553 - IDENTIFICATION FOR ELECTRONIC SAFETY AND SECURITY

PART 1 - GENERAL

1.01 DESCRIPTION OF WORK

1. Provide all labor, materials, equipment, tools, transportation, storage costs and all necessary and related items required to provide a complete identification system for the Electronic Safety and Security (ESS) Systems included in the Contract Documents, including Video Surveillance and ESS rough-in/identification associated with access control and intrusion detection where indicated. Active access control and intrusion detection equipment is not included unless specifically shown or scheduled.

1.02 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety and Security.
2. Section 28 05 00: Conductors and Cables for Electronic Safety and Security.
3. Section 28 20 00: Video Surveillance.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1. Access control and intrusion detection work shown on the Drawings is limited to rough-in, pathway, cabling, identification, and coordination requirements only unless specifically noted otherwise. Active field devices, control panels, programming, licensing, monitoring, final connections, and system commissioning for those systems shall be provided by Owner or others as indicated in the Contract Documents.

1.03 REGULATIONS AND CODE COMPLIANCE

A. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid. Consider such codes or standards a part of this Specification as though fully repeated herein.

B. Perform all work in accordance with governing codes, rules and regulations including but not limited to the following:

1. National Electric Code (NEC), NFPA 70.

1.04 SUBMITTALS

A. Product Data: Submit manufacturer’s product data sheets for the following items:

1. Equipment cabinet and equipment enclosure labels.
2. Wire and cable labels.

B. Samples: Submit samples of the following items:

1. Include physical samples of each labeling material.

PART 2 - PRODUCTS

2.01 LABELS

A. Phenolic two tone for exterior mounting on equipment enclosures. White lettering on black background.

2.02 WIRE AND CABLE LABELS

A. Provide self-laminating adhesive laser labels.

B. Labels shall be machine printable with a laser printer.

C. Text Attributes:

1. Black
2. 1/8” high, minimum, or #12 font size
3. Font: Verdana preferred, SansSerif, or Arial acceptable
4. Printable area: 1.0” X .375” and 1.0” X 0.50”.
5. Cable size: 0.16 – 0.32” OD
6. Color: White

D. Manufacturer:

1. Brady wire marking labels WML–211-295 and WML-311-292.
2. Brother.
3. Thomas and Betts.
4. Or approved equal.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Physically label all of the ESS Systems components including but not limited to the following:

1. Cables:
   a. Label at all termination points.
   b. Label at pullboxes, junction boxes and outlet boxes.
2. Label Access Control and Intrusion Detection System Cabinets.
3. Label Field equipment cabinets.
4. Label equipment within the cabinets and enclosures indicating its function.
5. Label equipment with its IP address (where applicable).
6. Label Terminal blocks.
7. Label Relays.
8. Label Patch panels, and the termination positions within the patch panels.

B. Identify wire and cable clearly with permanent labels wrapped about the full circumference within one (1) inch of each connection. Indicate the number designated on

the associated field or shop drawings or run sheet, as applicable. Assign wire or cable designations consistently throughout a given system; i.e., each wire or cable shall carry the same labeled designation over its entire run, regardless of intermediate terminations. Label cables where cable first enters and exits from conduit, junction or distribution boxes; labels shall be located within six (6) inches of the point of exit.

C. Label all equipment mounted in the equipment enclosures indicating its function. This includes servers, switches, controllers, power supplies, batteries, etc.

D. Components, such as racks and patch panels, must be permanently marked with machine-generated labels, according to current practices and as approved by the Owner before installation.

E. Labels shall coincide with device id's use on the record drawings.

F. Equipment Enclosures.

1. Label all enclosures, alarm monitoring enclosures, and power supply enclosures associated with the security system with adhesive-backed phenolic labels. Use 12-point text.
2. Labels shall be represented in and match the security system record drawings.

G. Security Devices.

1. Label all equipment associated with the security system with a permanent machine generated, laminated, label. Use 12 point text with a clear background. Use white or black lettering depending upon the color of the device.
2. Label device in a concealed location with the system point number and address.
3. Label power supply batteries with the month and year they were installed.

H. Wire and Cable.

1. Label all wire and cable associated with the security system with permanent machine generated, laminated, labels. Use 12 point, black text on a white label.
2. All wire and cable labels shall be clearly visible without the need to remove wire management or any other obstructions.

END OF SECTION 280553

SECTION 282000 – VIDEO SURVEILLANCE SYSTEM

PART 1 – GENERAL

1.1 DESCRIPTION OF WORK

A. Provide all labor, materials, equipment, tools, transportation, storage costs, testing, training and all necessary and related items required to provide a complete and operational video surveillance system as shown on the Drawings and described in the Specifications.

B. Contractor shall furnish, install, mount, secure, aim, focus, configure, and update firmware for all scheduled IP video surveillance cameras. Contractor shall provide MAC address information and temporary login credentials to WCSD, assign IP addresses provided by WCSD, install patch cords, and cross-connect cameras to WCSD-designated PoE switch ports.

C. Install, mount, secure, aim, focus and adjust all IP video surveillance cameras. Aim cameras as directed by WCSD Project Manager.

D. Install CAT 6 cabling from each camera to patch panels as shown on the drawings. All CAT 6 cabling to be installed and tested in accordance with the Division 27 Specifications.

E. Furnish CAT 6 patch cords at the patch panel to connect the camera patch panel ports to owner furnished POE switches. WCSD Project Manager will provide designated pre-configured POE switch port numbers to the contractor. Contractor shall install patch cords and cross connect the cameras to the designated switch ports.

F. WCSD IT will furnish and install Milestone camera licenses and will provide, install, and configure Milestone recording server software, client viewing software, recording settings, and related VMS software entitlements unless specifically indicated otherwise in the Drawings.

G. WCSD IT will furnish and configure Milestone software.

1.2 RELATED SECTIONS

A. General: Consult all other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

B. Related Sections:

1. Section 28 00 00: Common Work Results for Electronic Safety & Security.
2. Section 28 05 00: Conductors and Cables for Electronic Safety & Security.
3. Section 28 05 28: Conduits and Backboxes for Electronic Safety and Security.
4. Section 28 05 53: Identification for Electronic Safety & Security.

C. Division 1 Specifications, General and Supplementary Conditions apply to this Specification Section.

1.3 QUALITY ASSURANCE

A. The Contractor installing the IP video surveillance cameras and video recording software must have a minimum of (5) years experience installing video surveillance systems of similar size and scope.

B. The Contractor installing the IP video surveillance system must be a firm normally engaged in the design, installation and maintenance of integrated security systems including access control, intrusion detection and video surveillance.

C. The contractor installing the Category 6 cabling to the cameras must comply with the qualification requirements and installation requirements listed in the Division 27 Specifications.

D. The Contractor must be licensed by the Nevada State Contractors Board.

E. Formal, written evidence of the following may be requested at any point during the Bid or installation processes:

1. If requested, the Contractor, including any subcontractor, shall show proven expertise in the implementation of video surveillance projects. This expertise can be illustrated through the inclusion of details of at least three (3) projects involving the design and installation of video surveillance systems within the past three year period of similar size and scope. Names, addresses, and telephone numbers of references for the three projects shall be included.
2. In the event subcontractors are used for any portion of the installation or acceptance testing, the Contractor shall be responsible for any subsequent corrective action required on that portion of the work.

1.4 SUBMITTALS

A. Prior to procurement, the Contractor shall compare this Section against the camera schedule and plan symbols shown in the Drawings. Any discrepancy in camera type, model number, mount accessory, PoE requirement, cable termination, or detail reference shall be submitted as an RFI before ordering equipment.

B. Camera quantities shall be based on the camera schedules and plan locations shown in the Drawings. The Contractor shall verify the total camera count for each building package before procurement and shall notify the Owner or Owner’s Representative of discrepancies between the camera schedule, plan symbols, and this Section.

C. Manufacturer Product Data Sheets

1. Submit product data sheets in electronic PDF (portable document format).
2. Provide a table of contents for each submittal indicating the items being submitted. Products listed in the table of contents should be in the same order as they appear in the Specifications.
3. Provide product data sheets for all items listed in each specification section. Partial submittals will not be accepted.
4. Where product data sheets include more than one distinct item, clearly mark data sheet with arrow or other identifying means to clearly indicate the items being submitted for approval. Delete or cross-out non-applicable data.
5. Provide a camera submittal matrix identifying each scheduled camera number, camera type, manufacturer, model number, mount part number, environment, PoE requirement, serving telecom room, patch panel port, MAC address, IP address assignment, and drawing detail reference.

    a. Indoor fixed vandal resistant dome cameras.
    b. Outdoor fixed vandal resistant dome cameras.

c. Indoor fixed 2-sensor vandal resistant dome cameras.
d. Outdoor fixed 4-sensor vandal resistant dome cameras.
e. Camera supports shall include all wall mount kits, corner mount kits, pole mount kits, gooseneck support arms, ceiling pendant kits, recessed ceiling mounts, back boxes, adapters, shrouds, weatherproof accessories, custom extension arms, fasteners, and miscellaneous hardware required for the scheduled camera type, mounting condition, and detail reference.
f. CAT 6 Cabling – Indoor Plenum Rated.
g. CAT 6A Field Mount Plugs.
h. 48-Port CAT 6A Patch Panels.
i. CAT 6 Patch Cords.

1.5 REGULATIONS AND CODE COMPLIANCE

A. The Contractor will comply with all applicable governmental regulations including Federal, State, City, and local applicable codes and ordinances.

B. References to codes and standards called for in the Specifications refer to the latest edition, amendments, and revisions to the codes and standards in effect on the date of these Specifications.

C. All work and materials shall conform to and be installed, inspected and tested in accordance with federal, state and local governmental agencies, including, but not limited to the following:

1. ANSI/NFPA-70, current edition adopted by the Authority Having Jurisdiction - National Electrical Code (NEC).
2. Underwriter's Laboratories, Inc. (UL).
3. Federal Communications Commission (FCC).
4. Americans with Disabilities Act (ADA).

1.6 INTENT OF DRAWINGS

A. All drawings are diagrammatic unless otherwise noted as detailed dimensioned drawings. Drawings show approximate locations of equipment and devices. Exact locations are subject to the approval of the Owner or Owner's Representative. The Contractor shall verify dimensions and shall be responsible for their accuracy

B. Items mentioned in the Specifications and not shown in the Drawings, or shown in the Drawings and not mentioned in the Specifications, shall be of like effect as if shown and mentioned in both. In the case of differences between the Drawings and the Specifications, the stricter provision as determined by the Owner or Owner's Representative shall govern.

C. Omissions from the Drawings or Specifications, or the incorrect description of details of Work which are necessary to carry out the intent of the Drawings and Specifications, or work which is customarily performed, shall not relieve the Contractor from performing such omitted or incorrectly described work.

D. No exclusion from, or limitations in, the language used in the Project Documents shall be interpreted as meaning that ancillary or accessory items necessary to complete any required system or item of equipment are to be omitted.

1.7 REVIEW OF SPECIFICATIONS

A. Prior to submitting a bid for the Project, the Contractor shall carefully study and compare the Drawings and Specifications and shall at once report to the Owner or Owner's Representative any error, inconsistency or omission discovered. During construction, if the Contractor performs any construction activity knowing it involves a recognized error, inconsistency or omission in the Specifications without such notice to the Owner or Owner's Representative, the Contractor shall assume appropriate responsibility for such performance and shall bear an appropriate amount of the cost for any correction.

B. The Contractor shall not deviate from the specified scope of work as indicated in the Project Documents. Deviations include (but are not limited to):

1. Alteration of video surveillance camera locations from those specified in Plans.
2. Installation of horizontal cables to a different Telecom Room than indicated on the Plans.

1.8 EXAMINATION OF THE PREMISES

A. The Contractor shall visit the Site(s) to become familiar with the local conditions under which the work is to be performed and correlate his observations with the requirements of the Drawings and Specifications. No allowance will be made for claims of concealed conditions which the Contractor learned or should have learned in exercising due diligence in its observations of the site and review of the local conditions.

B. Before ordering any materials or performing any work, the Contractor shall verify all measurements and be responsible for correctness of same. No extra charge or compensation will be allowed for duplicate work or material required because of an unverified difference between an actual dimension and the measurement indicated in the Drawings. Any discrepancies found shall be submitted in writing to the Owner or Owner's Representative for consideration before proceeding with the work.

1.9 DELIVERY, STORAGE AND HANDLING

A. All items to be installed as a component of the IP video surveillance system for the Project shall be stored according to manufacturer's recommendations. In addition, all items must be stored in a location protected from vandalism and weather. Items shall not be stored outside. If air temperature at the storage location shall be below 40 degrees F, the equipment shall be moved to a heated 50 degrees F (minimum) location. If necessary, equipment shall be stored off site at The Contractor's expense.

1.1 WARRANTY

A. See Division 1 Specifications and General Conditions regarding Guarantee and Warranty requirements which apply to this Specification Section.

B. The Contractor shall provide the following warranty for the Video Surveillance System described in this specification section:

1. Warranty Start Date: The warranty period will begin after substantial completion of the project.

2. Complete System Warranty: The complete Video Surveillance System including all devices, equipment, cabling, software and programming shall be guaranteed to be free from defects in workmanship and materials for a minimum period of one (1) year from date of substantial completion. Promptly remedy such defects and any subsequent damage caused by the defects or repair thereof at no expense to the Owner.

3. Labor Warranty: Contractor to provide all labor as necessary to complete warranty repairs for a period of one (1) year from the date of substantial completion. During this labor warranty period, all services including equipment, labor, travel, expenses, etc., shall be provided during normal working hours at no cost to the Owner. The Contractor shall provide the Owner with a phone number for service. The Contractor shall respond within one (1) business day of receipt of a service call. The Contractor shall provide an on-site response time of two (2) business day for repair of critical system items during normal business hours.

4. Warranty Exclusions: The guarantee shall exclude acts of God, vandalism, physical abuse or operator misuse.

1.10 FINAL ACCEPTANCE

A. General

1. All cameras mounted in accordance with the drawings.
2. IP address assigned to cameras and temporary login credentials provided to WCSD IT. Contractor to provide camera hardware MAC addresses to WCSD IT and WCSD IT will provide camera IP addresses to be assigned.
3. All CAT 6 cables installed, terminated, labeled and tested. Certified test reports submitted to WCSD.
4. All cameras properly aimed and focused as directed by WCSD IT.
5. All Punchlist items completed.

B. Inspection Of Work

1. WCSD Project Manager shall perform an inspection of all Contractor work prior to final acceptance. Any items that are found to be in error at this time shall be documented.
2. Documentation shall then be provided to the Contractor, who shall provide a date (within 30 days of WCSD Project Manager inspection) by which all items shall be corrected. The Contractor has the option to coordinate a site visit with the WCSD Project Manager in order to clarify and/or dispute the issues.
3. WCSD Project Manager shall perform a re-inspection of all Contractor work. Any remaining or additional items that are found to be in error shall again be documented. WCSD/IT reserves the right at this point to employ a separate contractor to make corrections at a cost to The Contractor.

PART 2 – PRODUCTS

2.1 FIXED INDOOR VANDAL RESISTANT 2 MP AND 4 MP DOME CAMERAS

A. Provide cameras meeting the following requirements:

1. The camera shall be of manufacturer’s official product line, designed for commercial/industrial 24/7/365 use.
2. The camera shall be based upon standard components and proven technology using open and published protocols.
3. 3. Provide fixed indoor vandal-resistant dome cameras as scheduled on the Drawings. Indoor dome camera models shall include Axis M3085-V, Axis M4215-V, and Axis M4216-V as indicated by camera location. Cameras shall provide minimum 2 MP or 4 MP resolution as scheduled, WDR/Lightfinder

performance, H.264/H.265 streaming, PoE operation, onboard analytics support, and vandal-resistant indoor dome construction.
4. RJ-45 Ethernet Connector. 10/100 Base-T.
5. IEEE 802.3af Compliant.
6. Mini-Dome.
7. Auto Zoom and Focus via Web Browser.
8. Vandal Resistant IK10 Rated.
9. H.264 video compression at 30fps.

B. Acceptable Products

1. Camera:
   a. Axis M3085-V, Axis M4215-V, and Axis M4216-V as indicated in the camera schedule and Drawings.
   b. No substitutions unless approved by WCSD and the Engineer prior to procurement.

2. Recess ceiling mount.
   a. Provide recess ceiling mount kit where shown on drawings (Axis P/N TP3206-E).
   b. Mounting accessories shall be included with the camera where indicated as “INCLUDED” in the camera schedule. Provide manufacturer-recommended adapters, back boxes, recessed mounting kits, pendant kits, or other accessories required for the scheduled mounting condition.
   c. No substitutions unless approved by WCSD and the Engineer prior to procurement.

2.2 FIXED INDOOR AND OUTDOOR VANDAL RESISTANT 5 MP AND 8 MP DOME CAMERAS

C. Provide cameras meeting the following requirements:

1. The camera shall be of manufacturer’s official product line, designed for commercial/industrial 24/7/365 use.
2. The camera shall be based upon standard components and proven technology using open and published protocols.
3. Minimum resolution shall be 5 MP for Axis P3277-LVE and 8 MP for Axis Q3548-LVE, or as otherwise indicated in the camera schedule and Drawings.
4. RJ-45 Ethernet Connector. 10/100 Base-T.
5. IEEE 802.3af Compliant.
6. Mini-Dome.
7. Auto Zoom and Focus via Web Browser.
8. Vandal Resistant IK10 Rated.
9. H.264 video compression at 30fps.

D. Acceptable Products

1. Camera:
   a. Camera: Axis P3277-LVE with AXIS TP3206-E mount where scheduled, mounting accessories, or other camera model specifically indicated in the Drawings for the camera type and Axis Q3548-LVE with AXIS TQ3601-E mount where scheduled.location.
   b. No substitutions unless approved by WCSD and the Engineer prior to procurement.

2.2 FIXED 10-MEGAPIXEL DUAL-SENSOR VANDAL RESISTANT DOME CAMERA

B. Provide fixed dome cameras meeting the following requirements:

1. Camera shall consist of two (2) individual 5MP image sensors integrated into a single vandal-resistant dome housing.
2. Each image sensor shall be independently repositionable within the dome via a perimeter-mounted rotational support track, allowing flexible field of view placement.
3. Each sensor shall support independent pan and tilt adjustments to achieve the desired field of view.
4. Each sensor shall support remote focus and zoom capabilities over the IP network via standard web browser interface.
5. Each sensor shall provide a minimum resolution of 2592 x 1944 pixels (5MP).
6. Camera shall support dual-stream encoding in H.264, H.265, and MJPEG formats.
7. Entire camera assembly shall utilize a single RJ-45 10/100/1000Base-T Ethernet connection.
8. Entire assembly shall consume only one (1) camera license within the Video Management System (VMS).
9. Power shall be provided via Power over Ethernet (PoE+), compliant with IEEE 802.3at Type 2 standard.
10. Dome housing shall be vandal resistant and rated IK10.
11. Camera shall be rated IP66/IP67 for protection against dust and water ingress.
12. Suitable for both indoor and outdoor installations.
13. Support video frame rates up to 30 frames per second (FPS) at full resolution per sensor.
14. Support configurable privacy masking.
15. Operating temperature range shall be -30˚C (-22˚F) to +50˚C (122˚F).

C. Acceptable Products

1. Camera:
   a. Camera: Axis P4708-PLVE where indicated in the Drawings. Provide scheduled mounting accessories and no substitutions unless approved by WCSD and the Engineer prior to procurement.
   b. No substitutions unless approved by WCSD and the Engineer prior to procurement.

2.3 FIXED 20 MEGAPIXEL 4-IMAGE SENSOR MULTIDIRECTIONAL VANDAL RESISTANT DOME CAMERAS

a. Provide cameras meeting the following requirements:

1. Camera will consist of 4 individual 5MP fixed cameras installed in a single vandal resistant dome.
2. Each of the 4 cameras within the dome shall be capable of being repositioned within the dome by moving it around the perimeter of a circular support track.
3. Each of the 4 cameras within the dome shall be capable of being independently aimed up and down, side to side.
4. Each of the 4 cameras within the dome shall be capable of being remotely focused and zoomed over the IP network via a web browser.
5. Each of the 4 cameras will have a minimum 5MP 2560x1440 Resolution per sensor.
6. Dual encoder (H.264 and MJPEG).
7. The entire camera assembly will one RJ-45 Ethernet Connector, 10/100 Base-T.

8. The entire camera assembly will require 1 software camera license within the VMS software.
9. Power shall be provided via Power over Ethernet Plus (PoE+), compliant with IEEE 802.3at, as required by the scheduled Axis P3737-PLE multi-sensor camera.
10. Vandal Resistant and IK10 Rated.
11. IP 66 Ingress and Weather Rated.
12. Indoor/Outdoor rated.
13. Video frame rate (up to) 30FPS @ full resolution.
14. Privacy masking.
15. Operating temperature -30˚C (-22 °F) to +50˚C (122 °F).

b. Provide corner mount kit, gooseneck support arm and shroud to mount cameras on exterior corners of buildings as shown on the drawings. Provide additional mounting plates, adapters and accessories as necessary for a vandal resistant and weatherproof installation.

c. Acceptable Products

1. Camera:
   a. Axis P/N P3737-PLE.
   b. No substitutions unless approved by WCSD and the Engineer prior to procurement.

2. Pendant Mount:
   a. Provide pendant mount kit where shown on drawings including AXIS TP3302-E and AXIS T94N01D mounting accessories, with custom length 1.5 NPT extension column as required to clear ceiling or canopy obstructions.
   b. No substitutions unless approved by WCSD and the Engineer prior to procurement.

3. Exterior Corner Mount:
   a. Provide exterior corner or wall mounting accessories as scheduled, including AXIS TP3302-E and AXIS T94N01D where indicated. Provide additional brackets, back boxes, adapters, fasteners, and weatherproof accessories required for a secure, vandal-resistant, and weatherproof installation.
   b. No substitutions unless approved by WCSD and the Engineer prior to procurement.

4. Exterior Pole Mount:
   a. Provide pole mount kit where shown on the drawings including stainless steel bands and mount (Axis P/N T91B57), mounting cabinet (Axis P/N T98A18-VE), wall mount arm (Axis P/N T91D61) and camera pendant kit (Axis P/N T94N01D).
   b. Where listed as “INCLUDED” in the camera schedule, provide the manufacturer’s standard mounting accessories and all additional hardware required for the installation condition shown on the Drawings.
   c. No substitutions unless approved by WCSD and the Engineer prior to procurement.

2.2 HORIZONTAL PLENUM RATED CATEGORY 6 CABLE.

A. See Section 271500 for requirements.

2.3 CATEGORY 6A FIELD MOUNT PLUGS

A. See Section 271500 for requirements.

2.4 CATEGORY 6 COPPER PATCH PANELS

d. See Section 271100 for requirements.

2.5 CATEGORY 6 COPPER PATCH CORDS

A. See Section 271100 for requirements.

2.6 VIDEO MANAGEMENT SOFTWARE SYSTEM

a. WCSD IT will provide and install Milestone camera licenses.

b. WCSD IT will provide, install and configure Milestone recording server and client viewing software.

PART 3 – EXECUTION

3.1 CAMERA SYSTEM INSTALLATION SEQUENCE AND COORDINATION WITH WCSD

A. The following is the installation sequence for the camera system. The contractor shall coordinate and schedule all work with WCSD's Project Manager.

1. Contractor shall procure cameras and provide a spreadsheet to WCSD Project Manager indicating the camera number, MAC address and camera name. The camera numbers shall match the numbers in the camera schedule. WCSD will provide IP addresses for each camera. Contractor shall configure the cameras with the provided IP addresses and shall update all cameras with current manufacturer firmware.
2. Contractor shall provide camera and temporary login credentials to WCSD Project Manager.
3. Contractor shall install, terminate and test cabling to the cameras. Contractor shall provide certified cable test results to WCSD Project Manager and provide patch cords for the cameras. WCSD IT will inspect the cabling installation and will issue a punchlist identifying any corrective action required.
4. After the contractor has completed all punchlist items, WCSD IT will install the POE switches and will provide designated pre-configured POE switch port numbers to the contractor. Contractor shall install patch cords and cross connect the cameras to the designated switch ports.
5. Contractor shall connect, aim, focus and adjust the cameras. Each camera view must be reviewed and signed off by WCSD Project Manager.
6. WCSD IT will complete all remaining Milestone Software configuration including:

    a. Installation of Milestone recording server and software at the project site.
    b. Installation of camera licenses. Camera licenses provided and installed by WCSD IT.
    c. Configuration of camera settings including frame rate, compression, motion detection, privacy masking, recording, etc.
    d. Installation of Milestone Smart Client software on workstation computers at the project site.

3.2 ROUGH-IN

A. Before construction work commences, the Contractor shall visit the site and identify the exact location and mounting of all cameras.

B. Camera mounting locations shall be coordinated with the work of other trades including ductwork, return and supply grills, lights, switches, exit signs, fire sprinklers, smoke detectors and structure. Cameras, mounts, raceway and cabling shall be installed so as not to interfere with required clearances for maintenance and inspection of equipment.

C. Notify the Owner's Representative of any obstructions that may block the camera views shown on the Drawings.

D. The contractor shall minimize the amount of exposed conduit and boxes exposed to view. Paint all interior and exterior conduit exposed to view to match adjacent surfaces. All exterior conduit shall be rigid RMC with water tight boxes and fittings.

E. All exposed screws and fasteners used for camera mounting hardware, conduit supports, j-boxes and pull boxes shall be vandal resistant (Torx Pin-Head Style).

3.3 CUTTING AND PATCHING

A. The Contractor shall be responsible for all cutting, patching, coring and associated work to complete the camera installation. Patch adjacent work disturbed or damaged by installation of new work including insulation, walls and wall covering, ceiling and floor covering or other finished surfaces.

B. The contractor shall be responsible for repairing any ceiling tile, ceiling grid, ceiling supports or adjacent surfaces damaged during the installation of the cameras.

C. All penetrations through the building envelope shall be sealed and made water tight.

D. All penetrations through fire rated walls, floors and ceilings shall be fire stopped with a UL listed fire stop system meeting or exceeding the rating of the assembly being penetrated.

E. No roof penetrations are permitted. Where cameras, conduits, or mounting supports are located near roof edges, canopies, fascia, or roof hatch areas, route raceway from accessible ceiling or wall locations and coordinate final routing to maintain the building envelope without penetrating the roof assembly.

3.4 GENERAL INSTALLATION REQUIREMENTS

A. Coordinate ordering and installation of all equipment with long lead times or having a major impact on work by other trades so as not to delay the job or impact the schedule.

B. Set all cameras and associated supports to accurate line and grade, level all equipment and align all equipment components.

C. Provide all scaffolding, rigging, hoisting and services necessary for installation of equipment.

D. Storage and security of material and equipment prior to installation shall be the responsibility of the Contractor.

3.5 CEILING DOME CAMERA MOUNTING AND NETWORK CONNECTION

A. Install ceiling mounted dome cameras and support brackets in accordance with the Manufacturer's instructions.

B. Verify ceiling mounted camera locations shown on the drawings. The contractor shall verify that adequate clearances exist above the camera to allow installation at the locations shown. The contractor shall make minor adjustments to the camera locations to avoid clearance conflicts.

C. Secure cameras to structure with mount kit called out in the camera schedule.

D. Furnish, install, and terminate Category 6 cabling from each IP camera to the telecom room or existing MDF location identified on the Drawings. At existing telecom locations, terminate camera cabling on existing 48-port patch panels where indicated and coordinate exact termination locations with WCSD.

E. Terminate CAT 6 cable at the camera on CAT 6A Field Mount Plug and connect directly to the camera.

F. The contractor shall work with the WCSD IT department to cross connect the cameras to the POE switches in the telecom rooms.

G. The contractor shall assign static IP addresses to the camera with the IP address scheme specified by WCSD IT.

H. Verify that the camera has the most current firmware version. If not, download and install the latest firmware version from the manufacturer's website.

3.6 EXTERIOR GOOSENECK CAMERA MOUNTING AND NETWORK CONNECTION

A. Notify the Owner's representative where obstructions exist that may block the view from the camera prior to installing the camera.

B. Install fixed dome cameras, corner mount kits, gooseneck supports and shrouds in accordance with the Manufacturer's instructions.

C. Core drill exterior building and install rigid conduit to feed the camera via the support bracket.

D. For cameras connected to existing surface-mounted junction boxes or existing conduit pathways, reuse existing pathways where indicated on the Drawings, field verify pathway capacity and condition, and provide new conduit, pull boxes, fittings, and watertight accessories as required for a complete installation.

E. Paint exposed conduit to match existing surfaces.

F. Securely anchor corner mount kit and/or gooseneck support bracket to structure.

G. Install camera shroud and connect camera to shroud.

H. Verify that camera and mounts are level and plumb.

I. Verify that all components are secure to prevent vibrating or unstable images caused by wind or vibration.

J. All exposed screws and fasteners shall be vandal resistant (Torx Pin-Head Style).

K. Furnish, install, and terminate Category 6 cabling from each exterior IP camera to the telecom room or existing MDF location identified on the Drawings. At existing telecom locations, terminate camera cabling on existing 48-port patch panels where indicated and coordinate exact termination locations with WCSD.

L. Terminate CAT 6 cable at the camera on CAT 6A Field Mount Plug and connect directly to the camera.

M. The contractor shall coordinate and work with the WCSD IT department to cross connect the cameras to the POE switches in the telecom rooms.

N. The contractor shall assign static IP addresses to the camera with the IP address scheme specified by WCSD IT.

O. Verify that the camera has the most current firmware version. If not, download and install the latest firmware version from the manufacturer's website.

3.7 FIXED CAMERA SETUP, FOCUSING AND ADJUSTMENT

A. Contractor shall connect, aim, focus, adjust, and assist with analytics configuration for each camera. Final camera orientation, field of view, focus, exposure settings, and analytics configuration shall be reviewed and approved by WCSD prior to system acceptance.

END OF SECTION

SECTION 28 31 00 - FIRE DETECTION AND ALARM

PART 1 – GENERAL

1.1 SUMMARY

A. Section includes fire alarm control panels, manual fire alarm stations, automatic smoke and heat detectors, fire alarm signaling appliances, and auxiliary fire alarm equipment and power and signal wire and cable.

B. Related Sections:
1. Section 08 71 00 - Door Hardware: Door closers, electric locks, electric releases.
2. Section 21 12 00 - Fire-Suppression Standpipes: Flow detection and alarm devices.
3. Section 21 13 13 - Wet-Pipe Sprinkler Systems: Flow detection and alarm devices.
4. Section 23 33 00 - Air Duct Accessories: Smoke dampers.
5. Section 25 50 00 - Integrated Automation Facility Controls.
6. Section 26 05 19 - Low-Voltage Electrical Power Conductors and Cables.
7. Section 26 05 26 - Grounding and Bonding for Electrical Systems.
8. Section 28 05 53 - Identification for Electronic Safety and Security.

1.2 REFERENCES

A. National Fire Protection Association:
1. NFPA 72 - National Fire Alarm Code.

1.3 SYSTEM DESCRIPTION

Division 28 31 00 is a performance specification. The Contractor shall include all labor and materials to design and complete the entire fire alarm work as herein specified and/or indicated.

The fire alarm system shall be a voice alarm communications system.

The Contractor is to serve as the complete system designer and installer. A complete fire alarm system shall be designed, furnished, and installed by the Contractor including locations, types, and quantities of all devices, monitoring devices, and equipment required. Contractor’s design shall be based on all bid documents, including but not limited to Electrical, Telecom, Mechanical, Fire Sprinkler, Kitchen, Architectural, and Structural documents. Contractor shall provide all devices, modules, etc. for a complete operating system as required by all applicable Codes and AHJ requirements. Therefore, it is the Contractor’s responsibility to include in the bid price the complete design and installation of all devices (whether shown or not), wiring, head-end equipment, etc. to meet the applicable code and AHJ requirements. The Fire Alarm System is indicated on the drawings and specifications in either criteria or schematic form only.

The Contractor shall refer to Telecom drawings for information regarding Code Red system integration and monitoring of all emergency communication/code red systems. Submit shop drawing indicating code red strobe device locations to Engineer of Record and Owner for review prior to installation.

A. Fire Alarm System: NFPA 72, addressable and automatic local fire alarm system with connections to central station.

B. Alarm Sequence of Operation: Actuation of initiating device causes the following system operations:
   1. Local fire alarm signaling devices sound and display with signal.
   2. Non-coded signal transmits to central station.
   3. Location of alarm zone indicates on fire alarm control panel and on remote annunciator panel.
   4. Signal transmits to building elevator control panel, initiating return to main floor or alternate floor and lockout for fire service.
   5. Signal transmits to building mechanical controls, shutting down fans and operating dampers.
   6. Signal transmits to release door hold-open devices.
   7. Signal releases magnetic door hold opens.
   8. Signal releases electric door locks.

C. Drill Sequence of Operation: Manual drill function causes alarm mode sequence of operation.

D. Trouble Sequence of Operation: System or circuit trouble causes the following system operations:
   1. Visual and audible trouble alarm indicates at fire alarm control panel.
   2. Visual and audible trouble alarm indicates at remote annunciator panel.
   3. Trouble signal transmits to central station.

1.4 SUBMITTALS

A. General Conditions: Submittal procedures.

B. Shop Drawings: Indicate system wiring diagram showing each device and wiring connection; indicate annunciator layout, and design calculations. Provide separate shop drawing for review of Code Red amber strobe locations.

C. Product Data: Submit catalog data showing electrical characteristics and connection requirements.

D. Test Reports: Indicate procedures and results for specified field testing and inspection.

E. Manufacturer's Field Reports: Indicate activities on site, adverse findings, and recommendations.

F. Contractor shall submit to the AHJ. Include all associated costs, fees, drawings, cut sheets, calculations for a complete submittal in bid price.

G. Contractor shall submit copies of installing company licensure, and individuals responsible on project site responsible for installation of all fire alarm devices and cabling. All individuals on site shall be at a minimum, NICET II certified and State of Nevada ‘F-card’ holders.

1.5 CLOSEOUT SUBMITTALS

A. General Conditions: Closeout procedures.

B. Project Record Documents: After construction “as-built” drawings shall be provided to the WCSD Plant Facilities and Capital Projects & Planning Departments. “As-built” drawings shall be as specified in Part 1 of these Guidelines. No marked “jobsite copies” will be allowed. As-built drawings shall show all horn/strobes, heat and duct detectors, splitter points, pull stations, and their specific addresses. As-built shall also show floor to floor penetrations. In addition, door magnets (and their power source), burglar alarm devices, HVAC connections, dampers and

contractors shall be shown. All other devices both electrical and mechanical not previously designated that are tied to Fire Alarm Panels or are a part of the Fire System Operation shall be shown.

C. Operation and Maintenance Data: Submit manufacturer's standard operating and maintenance instructions.

1.6 QUALITY ASSURANCE

A. Provide wiring materials located in plenums with peak optical density not greater than 0.5, average optical density not greater than 0.15, and flame spread not greater than 5 feet (1.5 m) when tested in accordance with NFPA 262.

1.7 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience, and with service facilities within 100 miles of project.

B. Installer: Certified fire alarm installer with service facilities within 100 miles of Project.

C. Design fire alarm under direct supervision of Professional Engineer or NICET II certification experienced in design of this Work and licensed in State of NV.

1.8 MAINTENANCE SERVICE

A. General Conditions: Maintenance service.

B. Furnish service and maintenance of fire alarm equipment for one year from Date of Substantial Completion.

1.9 MAINTENANCE MATERIALS

A. General Conditions: Spare parts and maintenance products.

B. Furnish five manual station break-glass rods.

C. Furnish two keys of each type.

1.10 EXTRA MATERIALS

A. General Conditions: Spare parts and maintenance products.

B. Furnish one of each type of automatic smoke detector without base.

PART 2 - PRODUCTS

2.1 CONTROL PANEL

A. Manufacturers – per WCSD Standards:
1. GE EST-4, no exceptions.

B. Product Description: Modular addressable fire alarm control panel with flush surface wall-mounted enclosure.

C. Power supply: Adequate to serve control panel modules, remote detectors, remote annunciators, smoke dampers, relays, and alarm signaling devices. Include battery-operated emergency power supply with capacity for operating system in standby mode for 24 hours followed by alarm mode for 15 minutes.

D. System Supervision: Component or power supply failure places system in trouble mode.

E. Initiating Device Circuits: Supervised zone module with alarm and trouble indication; occurrence of single ground or open condition place's circuit in trouble mode.

F. Indicating Appliance Circuits: Supervised signal module, sufficient for signal devices connected to system; occurrence of single ground or open condition places circuit in trouble mode.

G. Remote Station Signal Transmitter: Electrically supervised digital alarm communicator transmitter, capable of transmitting alarm and trouble signals over telephone lines to central station receiver. Provide and install cellular dialer communicator listed for fire alarm panel monitoring. Locate equipment and antenna as required for optimal cell signal reception on premises.

H. Auxiliary Relays: Sufficient SPDT auxiliary relay contacts to provide accessory functions specified.

2.2 MANUAL FIRE ALARM STATIONS

A. Product Description: Manual double-action station with break-glass rod. Manual Pull Stations shall be constructed of metal and double-action (not break-glass type). Provide with STI Stopper® II with Horn or equivalent (clear, tamperproof polycarbonate cover with sounder) unless noted otherwise on plans.

B. Mounting: Semi-Flush.

C. Type: Coded.

D. Backbox: Manufacturer's standard.

2.3 SPOT HEAT DETECTOR

A. Product Description: Addressable combination rate-of-rise and fixed temperature, spot heat detector.

B. Temperature Rating: 135 degrees F (57 degrees C).

C. Rate-of-Rise: 15 degrees F (8.3 degrees C).

2.4 CEILING SMOKE DETECTOR

A. Product Description: NFPA 72, addressable photoelectric type ceiling smoke detector with the following features:
   1. Adjustable sensitivity.
   2. Plug-in base.
   3. Auxiliary relay contact.
   4. Integral thermal element rated 135 degrees F (57 degrees C).
   5. Visual indication of detector actuation.

B. Mounting: 4 inch (102 mm) outlet box.

C. Furnish two-wire detector with common power supply and signal circuits.

2.5 DUCT-MOUNTED SMOKE DETECTOR

A. Product Description: NFPA 72, addressable with the following features:
1. Auxiliary SPDT relay contact.
2. Key-operated normal-reset-test switch.
3. Duct sampling tubes extending width of duct.
4. Visual indication of detector actuation.
5. Duct-mounted housing.

B. Furnish two-wire detector with common power supply and signal circuits.

C. See mechanical plans for additional information.

2.6 ALARM STROBE

A. Provide low profile wall mounted. Low profile strobes shall mount in a North American 1-gang box, and protrude less than 1” from the finished wall. The word FIRE shall be prominently displayed on the housing. All devices shall be WHITE with RED lettering (confirm with architect).

B. The strobes shall be EDWARDS Genesis G1 Series.

2.7 REMOTE ANNUNCIATOR

A. Product Description: Remote annunciator including audible and visual indication of fire alarm by zone, and audible and visual indication of system trouble. Provide microphone for system input where shown, all other annunciators shall be LCD display only.

B. Mounting: Semi-flush mounting in factory provided backbox with lockable door and viewing window.

2.8 DOOR RELEASE

A. Product Description: See architectural hardware specifications. Provide all required connections/wiring, relays, modules, and transformers as required.

2.9 WIRE AND CABLE

A. Cable located in Plenums: Power limited fire-protective signaling cable classified for fire and smoke characteristics, copper conductor, 300 volts insulation rated 105 degrees C, suitable for use in air handling ducts, hollow spaces used as ducts, and plenums.

B. All fire alarm conductors routed underground shall be wet location rated.

C. Fire alarm circuit conductors have insulation color or code as follows:
1. Power Branch Circuit Conductors: Black, red, white.
2. Initiating Device Circuit: Black, red.
3. Detector Power Supply: Violet, brown.
4. Signal Device Circuit: Blue (positive), white (negative).
5. Door Release: Gray, gray.

PART 3 - EXECUTION

3.1 EXAMINATION

A. General Conditions: Coordination and project conditions.

B. Verify products and systems receiving devices are ready for installation.

3.2 INSTALLATION

A. Install manual station with operating handle 48 inches above floor.

B. Install audible and visual signal devices 80 inches above floor to bottom of device.

C. Install 14 AWG minimum size conductors for fire alarm detection and signal circuit conductors in conduit.

D. Mount end-of-line device box with last device or separate box adjacent to last device in circuit.

E. Mount outlet box for electric door holder to withstand pulling force of specified door holder.

F. Connect conduit and wire to door release devices, sprinkler flow switches, sprinkler valve tamper switches, fire suppression system control panels, and duct smoke detectors.

G. Automatic Detector Installation: Conform to NFPA 72.

H. Install engraved plastic nameplates in accordance with Specifications.

I. Ground and bond fire alarm equipment and circuits in accordance with Section 26 05 26.

J. Fire Alarm Junction Boxes shall be painted RED with labeling indicating circuiting inside junction box, such as “FIRE ALARM – STROBE - BPS 2 CIRCUIT 1”.

K. Addressable devices shall be provided with labels indicating device address. Relays, control modules, monitor modules or other devices of similar type shall be labeled with their function and address, such as “HP-19 SHUTDOWN RELAY”.

L. All devices subject to physical damage where installed shall be provided with a manufacturer’s protective device cage.

3.3 FIELD QUALITY CONTROL

A. General Conditions: Field inspecting, testing, adjusting, and balancing.

B. Test in accordance with NFPA 72 and local fire department requirements.

3.4 MANUFACTURER'S FIELD SERVICES

A. General Conditions: Manufacturer’s field services.

B. Include services of certified technician to supervise installation, adjustments, final connections, and system testing.

3.5 DEMONSTRATION AND TRAINING

A. Furnish 4 hours of instruction each for two persons, to be conducted at project site with manufacturer's representative.

END OF SECTION 28 31 00

STEAM PROGRAM
(Science, Technology, Engineering, Art, Math)

PARTICIPANT GROUPS & TASKS

School construction projects that are constructed on an occupied campus present a unique opportunity to enhance the academic and pedagogic mission of the school. This document outlines the implementation for STEAM Focused Educational Engagement during the design and construction period, which often can last from 1-3 years depending on the size and complexity of the project. The process requires participation from WCSD capital projects staff, the design consultants, the contractor, sub-contractors and school leadership & teaching staff. It is the intention that this effort be focused and, integrated into the academic instruction of the school being modernized. The scope of educational engagement shall be appropriate to the size, scope, grade and engagement of the school. For example, the instructional activities for an elementary art school class can be quite different than a middle school math class or high school electronics class. This document is intended to be a guide only and can be expanded to meet the unique needs of each school and level. **See STEAM PROCESS.**

Each participant group below will identify 1-2 representatives/staff to participate in the STEAM program as defined below and appropriate for each task.

School staff, Contractor and Architecture and Engineering team shall plan, develop & implement the educational engagement during construction, relevant and appropriate to the K-5 age group.

School leadership will identify opportunities where in-class content and project team education activities are aligned for the purposes of in-class content. They will assist in scheduling teacher and staff time for educational planning.

General Contractor/CMAR and Trade Partners – The Contractor or Construction Manager at Risk (CMAR), in conjunction with, school leadership, will help develop education content for STEAM activities during construction. They will assist with developing the schedule for activities to ensure minimal disruption to construction & safety during all site visits. The Contractor or CMAR may choose to bring enhancements or outside experts to add further content to each activity.

Architect/Engineer(A/E) & Sub-Consultants – The consulting team will help develop education content. The A/E Team will, where needed, assist in the development of graphic material to support educational content delivery. The A/E and consulting team will, where needed, lead the educational content development and delivery.

District Capital Projects (CP) Staff – CP Staff will be involved throughout the planning and engagement process. The engagement plan and schedule will be reviewed and approved by CP Staff. Where appropriate, additional District input and review will be provided. Staff will coordinate all activities as appropriate.

STEAM ENGAGEMENT PROCESS EXAMPLE

Task	Personnel/Resources	Activity / responsibility	Duration/Timeline
Curriculum Planning Meeting #1: Overview of STEAM program with all school staff to discuss the program opportunities and objectives.	Design consultants 1-2 staff Contractor 1-2 staff Sub- contractors 1-2 staff WCSD Cap. Projects 1-2 staff WCSD Student Advisory 1-2 staff WCSD - All teaching staff and school leadership	Discuss how the STEAM process can enhance instruction and ideas and how to do so. Contractor and WCSD there for support. School leadership shall encourage participation	1 hour
Curriculum Planning Meeting #2: Meeting with interested teaching staff. Instructors start to establish education objective relative their course.	Design consultants 1-2 staff Contractor 1-2 staff Sub- contractors 1-2 staff WCSD Cap. Projects 1-2 staff WCSD Student Advisory 1-2 staff WCSD - All teaching staff and school leadership	Discussion to help identify areas where staff can utilize design and construction themes into their instruction and how the STEAM activities can overlap with additional mandates such as, Student Learning Objectives, Project based learning, School performance plan within the academic dept./team, student-led presentations or parent nights etc.	1 hour
Curriculum Planning Meeting #3: Meeting with interested teaching staff and site leadership to determine content areas that can be covered during STEAM process.	Design consultants 1-2 staff Contractor 1-2 staff Sub- contractors 1-2 staff WCSD Cap. Projects 1-2 staff WCSD Student Advisory 1-2 staff WCSD - All teaching staff and school leadership	Design Team help to facilitate the content areas to be covered with contractors during STEAM process. Identify and match the contractor/sub-contractors with the teaching staff based on the content.	1 hour
Café meeting # 1 Round tables This may shift to be more of a match of teachers with contractors based on content at these round tables to develop activities to enrich the STEAM content to be covered.	Design consultants 1-2 staff Contractor 1-2 staff Sub- contractors 1-2 staff WCSD Cap. Projects 1-2 staff WCSD Student Advisory 1-2 staff Interested STEAM teaching staff and school leadership	Design team/Contractor/WCSD will present their careers, including roles and responsibilities. Teachers can go to subject tables for a 10–15-minute presentation. Staff will connect these learning opportunities to their content standards and collaborate to generate a list of possible student activities to take place during the design/construction process.	1 - 1.5 hours
Café meeting # 2 Meeting to plan with contractors/sub-	Design consultants 1-2 staff Contractor 1-2 staff Sub- contractors 1-2 staff	Members of the Design and construction team will meet with staff to continue to	1-1.5 hours

contractors and teaching staff to finalize lessons and activities, identify dates for lessons, and determine additional resources needed.	WCSD Cap. Projects 1-2 staff WCSD Student Advisory 1-2 staff Interested STEAM teaching staff and school leadership	develop implementation of student activities and or establish a collection of ongoing STEAM engagements, presentation, teaching opportunities, tours, and references to building design/construction to be used annually as teaching tools for integrated curriculum.	
Student Activity/Lesson: These activities/lessons may be prepared collaboratively with the contractor, sub-contractors, engineers, Architect, and the teaching staff. These activities/lessons can be taught directly to students utilizing the teaching staff and or experts within the design & construction field.	Design team, construction team, Capital Projects, student advisory, teaching staff as required and appropriate for identified activities.		Depends on grade level & or activity. Learning activities could be a single event, or occur weekly, or monthly. Steam process could continue over multiple years or the process could restart annually if needed or requested by the school due to new staff & students.

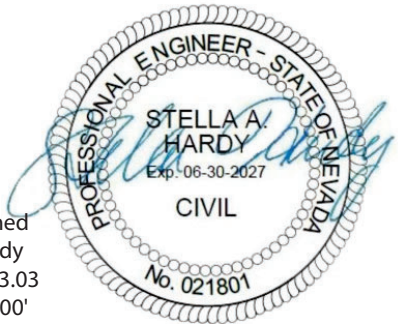
RE: Geotechnical Site Assessment
Libby Booth Elementary School Modernization
STEAM and The Media Center/Library
1450 Stewart Street
Reno, Washoe County, Nevada

Dear Ms. Poulsen:



Construction Materials Engineers Inc. (CME) is pleased to submit our geotechnical site assessment for the proposed Libby Booth Elementary School Modernization STEAM and The Media Center/Library project to be constructed at 1450 Stewart Street, in Reno, Washoe County, Nevada.

The following report includes the results of our subsurface investigation, laboratory testing, engineering analyses, and presents our recommendations for the design and construction of the project. We thank you for the opportunity to provide our services and look forward to working on future endeavors together.

Please feel free to call us should you have any questions or require additional information.

Sincerely,

CONSTRUCTION MATERIALS ENGINEERS, INC.

GEOTECHNICAL SITE ASSESSMENT
Libby Booth Elementary School Modernization
STEAM and The Media Center/Library
1450 Stewart Street
Reno, Washoe County, Nevada

1.0 INTRODUCTION

Presented herein are the results of Construction Materials Engineers, Inc.'s (CME) geotechnical investigation performed for the proposed Libby Booth Elementary School Modernization STEAM and The Media Center/Library project to be constructed at the southwest corner of the campus in Reno, Washoe County, Nevada. The general vicinity of the campus is shown on Figure 1.

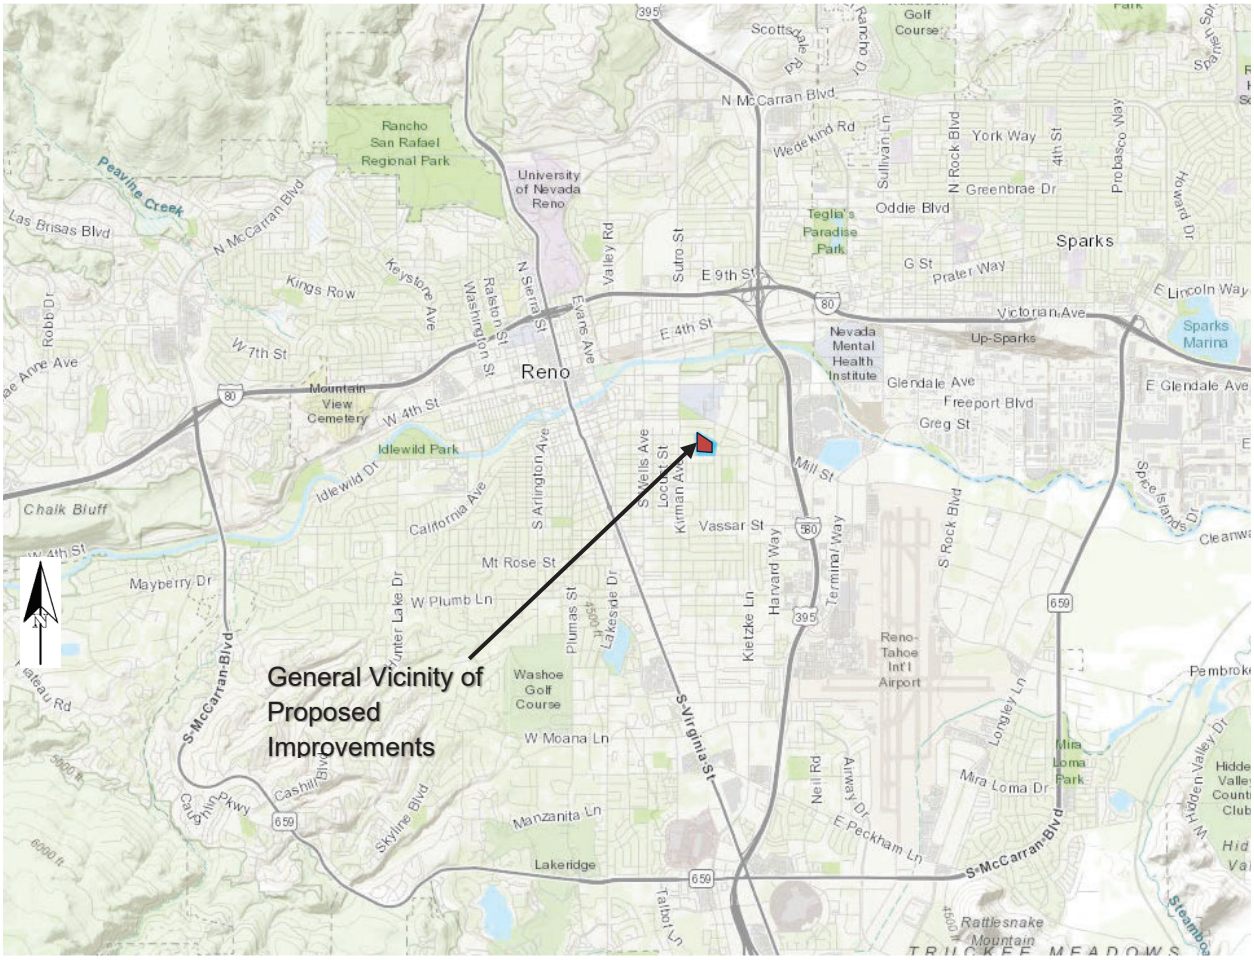

Figure 1: General Project Vicinity

The primary objectives of this study were to:

1. Investigate the general geologic profile and groundwater conditions at the subject site; and
2. Provide geotechnical recommendations for the design and construction of the project as currently proposed.

Results of the subsurface investigation, laboratory analysis, and details of the project as described in this report, form the basis for engineering analyses performed, conclusions, and geotechnical recommendations contained herein.

2.0 PROJECT DESCRIPTION AND SITE CONDITIONS

2.1 PROJECT DESCRIPTION

The STEAM and The Media Center/Library project includes a one-story stand-alone structure, with a footprint of nearly 5,000 square feet within the southwestern portion of the existing playground area. At the time of this report, the project was in the preliminary planning phase, planned improvements are expected to include:

- Construction of a new campus building:
  - **Structural Design**: The new structure will be supported using conventional shallow spread footings with concrete slab-on-grade. The foundation will include continuous spread footings along load-bearing walls and/or isolated column footings to support concentrated loads.
  - **Structural Loading**: Assumed maximum structural loads for design purposes include:
    - 1 to 6 kips per linear foot for continuous spread footings,
    - Up to 60 kips for isolated column footings, and
    - 100 to 200 pounds per square foot for interior slabs.
  - **Site Grading**: Cuts and fills of up to 2 feet may be required to create a level building pad and promote positive drainage
- Appurtenant construction will include ADA access improvements, sidewalks, and subsurface utilities.

The proposed site layout is presented as Figure 2.

Figure 2: Site Plan (Provided by Washoe County School District[1])

[1] Odyssey Engineering, Inc., & H+K Architects. (2026, January). *Libby Booth Elementary School Modernization – Preliminary Site Exhibit* (Preliminary, not for construction). Washoe County School District.

2.2 EXISTING SITE CONDITIONS

Photo 1: Looking East in the Vicinity of the Future Building Pad

Libby Booth Elementary School is situated on an approximate 6.6-acre, irregularly shaped parcel. The campus is bounded by Stewart Street to the north, Yori Avenue to the east, Roberts Street to the south, and residential development to the west.

The site is currently developed with the main school buildings and associated parking areas located in the eastern portion of the parcel. Paved athletic pads, playground areas, and open unpaved play space occupy the western portion of the campus.

Site topography slopes gently across the property with an overall elevation difference across the 6.6-acre site of approximately 10 feet. Irrigated landscaping is localized to the northern and eastern limits of the site near the school buildings and consists primarily of irrigated grass and scattered trees. The proposed improvement area is located in the southwest portion of the campus, outside the irrigated landscape zone, within an existing fill-covered dirt play area.

Google Earth Street View 1: Looking Northwest From Roberts Street at the Proposed Improvement Area

3.0 SUBSURFACE EXPLORATION

3.1 EXPLORATORY BORINGS

On January 19th, 2026, two (2) vertical test borings were drilled using a truck-mounted Diedrich 120 drill rig equipped with an automatic hammer. Soil samples were collected using the following methods:

Drilling Methods	The drilling methods included hollow-stem auger for soil exploration to the depth of termination.
Soil Sampling	Soils were sampled in-place at 2½-foot intervals using the following sampler types: • **SPT Sampler** – Unlined split-spoon drive samplers with an outside diameter of 2.0 inches, an inner shoe diameter of 1.4 inches, and an upset wall design. • **California Modified Sampler** – Split-spoon drive samplers with an outside diameter of 3.0 inches and an inner shoe diameter of 2.4 inches; samplers may be either lined or unlined. • **Bulk Samples** – Collected by hand from drill cuttings at the ground surface corresponding to specific sample intervals. Soil samplers were driven by a standard 140-pound drive hammer with a 30-inch stroke, and blow counts (N_{field}) were recorded for respective drive sample intervals[2]. Blow counts presented on the logs are uncorrected.
Soil Classification	CME personnel visually examined and classified the materials in general accordance with ASTM D2488. Where applicable, material classifications were subsequently updated based on laboratory testing in general accordance with ASTM D2487. The Unified Soil Classification System (USCS) chart is provided as Plate A-3.

The borings were advanced to depths of up to 15 feet below the existing ground surface (bgs). In Boring B-26-01, at a depth of approximately 0.5 feet bgs, heavy grinding was encountered due to oversized rock particles (e.g., cobbles and boulders). The borehole was relocated approximately 3 feet to the west, and drilling was then continued.

Photograph 1: Looking West at Boring B-2

[2] The number of blows to drive the sampler for the final 12 inches of an 18-inch penetration into undisturbed soil is an indication of the density and consistency of the material (Standard Penetration Test (SPT) - ASTM D1586). Boring logs indicate the type of sampler used for each boring and sample.

3.2 GEOPHYSICAL MEASUREMENTS

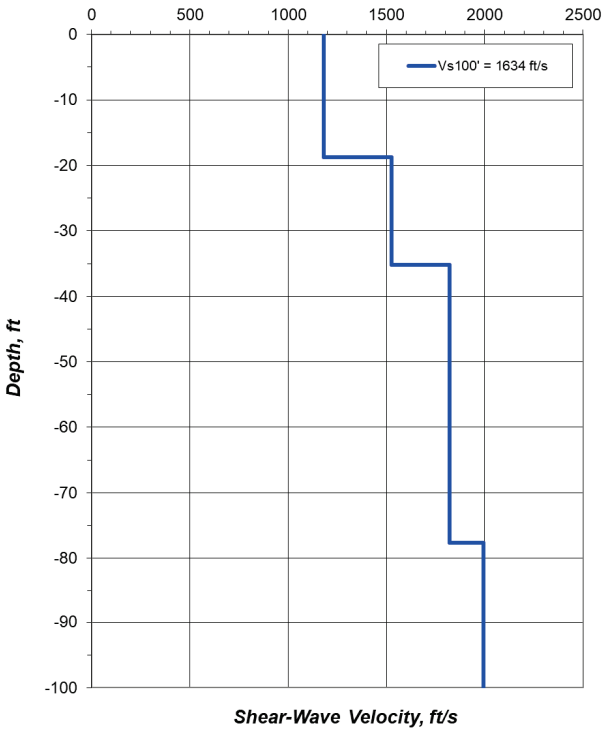

Figure 3: Shear Wave Velocity Profile

One shear wave velocity measurement was performed using Refraction Microtremor (ReMi). The DAQlink 4 24-bit acquisition system (Seismic Source/Optim) utilizing a multichannel geophone cable with twelve (12) geophones, placed at an approximate spacing of 25 feet, was used to obtain surface wave data.

Vertical geophones with resonant frequencies of 10 Hz measure surface wave energy from broad band ambient site noise across the geophone array (i.e., ReMi setup location) for multiple 30-second iterations.

The resulting 1-dimensional shear wave velocity model is included as Figure 3 .

The $Vs_{100'}$ represents the average shear wave velocity profile based on travel time from the ground surface to a depth of 100 feet at the tested location. Based on the ReMi data, the average $Vs_{100'}$ for the site is about 1,634 feet per second (ft/s).

The shear-wave velocity profile is generally classified by ASCE 7-22 as Site Class C, very dense sand or hard clay (1,450 to 2,100).

4.0 LABORATORY TESTING

Soils testing performed in CME's laboratory was conducted in general accordance with ASTM standards and methodologies. Representative soil types were selected and analyzed to determine index properties and engineering properties. The following laboratory tests were completed as part of this investigation:

- In-situ moisture content (ASTM D 2216)
- Grain size distribution (ASTM D6913)
- Atterberg Limits (ASTM D4318)

In addition, our firm contracted with an outside laboratory to complete the following analytical testing for the corrosion potential of the site soils:

- Soluble Sulfates (ASTM C1580)

4.1 SOIL INDEX TEST SUMMARY AND SHRINK/SWELL POTENTIAL

Table 1 provides a general summary of the laboratory index testing completed to date.

Table 1: Index Test Summary

Ex. ID	Sample ID	Sample Depth (ft to ft)	Moisture Content (%)	Plasticity Index [PI]	Liquid Limit [LL]	%Passing No. 40	%Passing No. 200	ASTM Soil Classification
B-26-01	Bulk	0.0-5.0	6.2	10	24	30	18.1	SC
	1B	5.0-6.5	11.8	NP	NV	72	24.9	SM
	1D	10.0-11.5	3.3	-	-	37.5	14.1	SM
B-26-02	Bulk	0.0-5.0	7.8	2	21	40	21.4	SM
	2B&2C	5.0-6.5 7.5-9.0	-	6	31	-	-	SM
	2E	12.5-14.0	11.0	-	-	15.5	7.2	GP

NOTES:

1. Generalized guideline for determining potential for shrink/swell soil based on plasticity index (PI), and liquid limit (LL) is included below:

Shrink/Swell Potential	Plasticity Index	Liquid Limit
Very Low	PI<15	LL<35
Low to Moderate	15<PI<25	35<LL<45
Moderate to High	25<PI<35	45<LL<50
High to Very High	PI>35	LL>50

Measured plasticity indices range from nonplastic (NP) to a maximum of 10, and liquid limits are all below 35 where tested. Based on the resulting index properties and the observed soil conditions, the onsite materials exhibit very low shrink/swell potential.

5.0 SUBSURFACE CONDITIONS

5.1 GEOLOGY

Based on our review of the *Preliminary Revised Geologic Maps of the Reno Urban Area, Nevada* (Ramelli, A.R., et al., 2011), the project site is mapped within younger and older Tahoe-aged Truckee River fluvial deposits (Qrt). Donner Lake-aged Truckee River fluvial deposits (Qrd) are mapped immediately west of the site. An excerpt of the referenced geologic map is included as Figure 4 below:

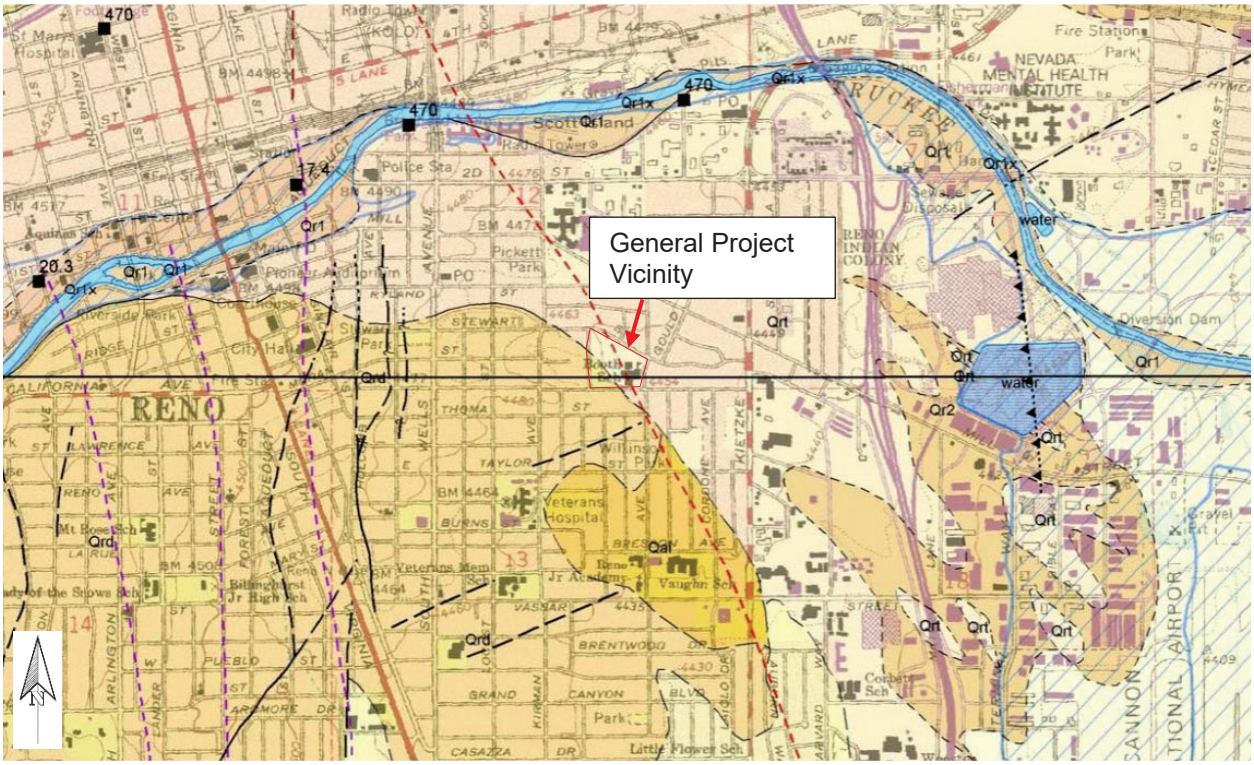

Figure 4: Geologic Map

The mapped geology suggests that native onsite material will be predominantly coarse grained granular soil with gravel, cobble, and occasional boulder sized fragments. Within the older Donner Lake–aged unit, localized *argillic* (clay-enriched) horizons overlying denser coarse-grained soil may be present.

The NRCS Web Soil Survey maps the site as Washoe gravelly sandy loam, which is described as mixed alluvium ranging from gravelly sandy loam to stratified gravelly loamy coarse sand to very cobbly loamy coarse sand, which is generally consistent with the mapped fluvial deposits.

5.2 GENERALIZED SUBSURFACE PROFILE

The subsurface profile at the subject site includes a thin upper layer of undocumented fill consisting of playground sand classifying as poorly graded sand with silt (SP-SM), observed to extend approximately 2 to 3 inches below the ground surface. Beneath this surficial material, the subsurface profile primarily consists of interbedded silty sand with gravel and cobbles (SM), silty sand (SM), clayey gravel with sand (GC), and poorly graded gravel with sand (GP). The materials are predominantly granular with varying amounts of gravel, cobbles, and non-plastic to low-plasticity fines.

5.3 GROUNDWATER AND SOIL MOISTURE

Groundwater was not encountered during the current exploration to the maximum depth explored. Based on the anticipated depth of excavation required for the development, groundwater is not expected to impact construction. Based on nearby well log data, static groundwater levels are anticipated to lie at depths greater than 15 feet and up to 30 feet below existing ground surface.

Seasonal seepage and/or runoff may be encountered depending on the season of construction and cumulative precipitation in the area. Temporary dewatering of opencut excavations affected by seasonal runoff may be required and shall be performed by the contractor. Construction planning shall include the assumption that groundwater fluctuations may occur due to precipitation, temperature, runoff, adjacent irrigation, or where conduits such as utility trenches are present. Regardless of the conditions encountered during the current exploration, CME recommends the contractor be prepared for dewatering during construction.

6.0 SEISMICITY AND FAULTING

6.1 SEISMICITY

Figure 5: Overview Map Showing the Basin and Range Physiographic Province

The western United States is a region of moderate to high seismicity related to crustal deformation associated with plate tectonics. Outside of Alaska, the most seismically active regions include coastal California along the San Andreas fault system and the Wasatch Front in Utah. The Wasatch Front forms the eastern boundary of the Basin and Range physiographic province, while the eastern front of the Sierra Nevada marks the western margin of the province. The STEAM and The Media Center/Library project is located within the western portion of the Basin and Range, a tectonically active region characterized by crustal extension and active faulting.

Nevada has a well-documented history of significant earthquakes, including several twentieth-century events exceeding magnitude 7, reflecting active crustal deformation associated with the Walker Lane and Basin and Range transition (Trugman et al., 2024). The Reno–Tahoe–Carson City region lies within the Walker Lane tectonic zone and is therefore subject to elevated regional seismic hazard (SCEC, 2020).

6.2 FAULTING

To determine the location of mapped earthquake faulting trending through or near the project site, a review of the following published information was completed:

1. USGS Website: *Earthquake Hazards Program Quaternary Faults in Google Earth*;
2. The USGS Interactive Fault Map U.S. Quaternary Faults (arcgis.com); and
3. University of Nevada Reno Interactive Quaternary Fault Map included as Figure 6 (http://gisweb.unr.edu/QuaternaryFaults/)

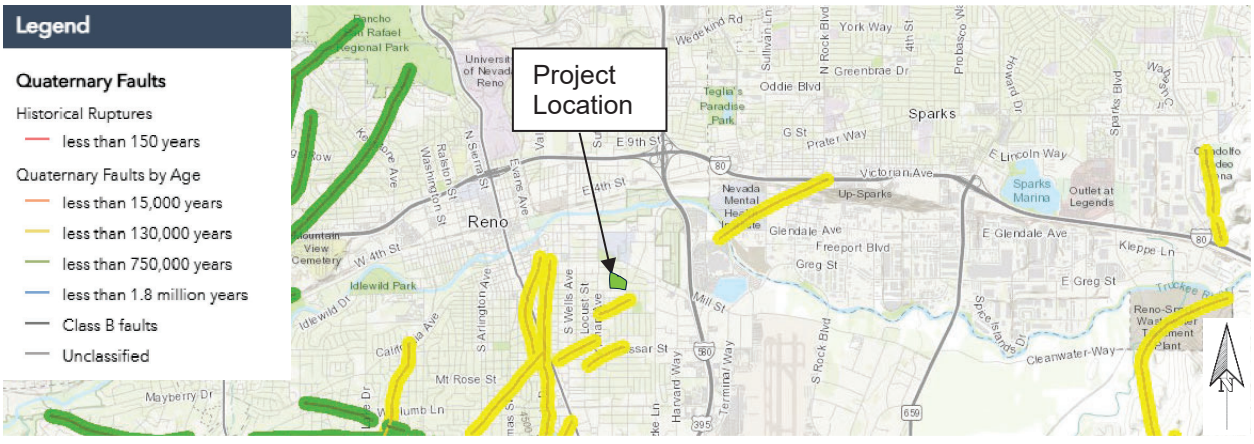

Figure 6: Excerpt from the UNR Quaternary Interactive Fault Map

10 ka	130 ka	750 ka	<1.8Ma
Holocene Active	Late Quaternary Active	Quaternary Active	Quaternary

ka = 1,000 years in the past; Ma = 1,000,000 years in the past

The Quaternary earthquake fault evaluation criteria were established by a professional committee for the State of Nevada Seismic Safety Council in 2006, as outlined above. Faults with more recent activity (e.g., Holocene-active faults) present a higher potential for surface rupture hazards.

No mapped faults are located traversing directly through the project site. The closest mapped fault to the site is located approximately 0.2 of a mile south/southeast of the project location. This fault is northwest to southeast trending associated with the Mount Rose fault zone and is late Quaternary Active.

6.3 LIQUEFACTION HAZARD

Liquefaction is defined as a loss of shear strength in saturated soils resulting from cyclic loading during earthquake-induced ground motion. The phenomenon occurs when cyclic shear stresses induce excess pore water pressure between soil grains, leading to a temporary loss of effective stress and subsequent seismically induced settlement or deformation.

Liquefaction is typically limited to non-plastic or low-plasticity soils (i.e., PI < 7). The soil types most susceptible include:

- Loose to medium dense cohesionless sands,
- Soft to stiff non-plastic to low-plastic silts, and
- Mixed silt to sandy soils located below the groundwater table.

A formal liquefaction hazard analysis based on SPT blow counts was not performed for this project due to the shallow depth of subsurface exploration and the limited soil profile encountered. To supplement the exploration data, a shear-wave velocity (Vs) based screening analysis was performed to evaluate the potential for liquefaction hazards at the site. This screening was conducted in general accordance with the procedure presented in *A New Vs-Based Liquefaction-Triggering Procedure for Gravelly Soils* (Rollins et al., 2022).

These methods provide a probabilistic framework for assessing liquefaction triggering based on shear-wave velocity and cyclic stress ratio. The risk levels are summarized as follows:

Estimated Probability of Liquefaction	Risk Level	Engineering Interpretation
≤ 5%	No Risk to Very Low	Liquefaction is unlikely; mitigation or further evaluation not typically required
> 5% – 15%	Low Risk	Possible liquefaction under extreme or rare loading, typically no further evaluation required
> 15% – 35%	Moderate Risk	Potential for triggering; may require further evaluation
> 35%	High Risk	High likelihood; mitigation or redesign is generally needed

For this evaluation, a groundwater elevation of approximately 20 feet below grade and a design earthquake moment magnitude of 6.7 were assumed.

Based on the subsurface conditions encountered, measured shear-wave velocity data (see Section 3.2), and the analysis summarized in Appendix D, the probability of liquefaction at the site is considered **no risk to very low risk**. Accordingly, no additional liquefaction evaluation or mitigation is considered necessary for the project.

7.0 DISCUSSION

7.1 GENERAL INFORMATION

The following definitions and standards are applicable for recommendations in this report related to design and construction of the proposed project:

Table 2: General Definitions for Report Recommendations	
Relevant Codes and Specifications	• 2024 International Building Code (IBC) • ASCE/SEI 7-22, Minimum Design Loads and Associated Criteria for Buildings and Other Structures • 2012 Standard Specifications for Public Works Construction, Revision 8 (SSPWC)
Onsite Soil Definition (For the Purposes of This Report)	
Fine Grained Soil	Soil with: • More than 35% by weight passing the No. 200 sieve, and • Plasticity Index (PI) < 15 or Expansion Index (EI) < 20.
Clay Soil	Soil with: • More than 15% by weight passing the No. 200 sieve, and • PI ≥ 15 or EI > 20.
Granular Soil	Soil not meeting the definitions of fine-grained or clay, with: • Maximum particle size ≤ 4 inches, • Less than 30% retained on the ¾-inch sieve, • Less than 35% passing the No. 200 sieve, and • PI < 15 or EI < 20.
Undocumented Fill	Soil/material placed and/or compacted but not observed, monitored, tested, or documented by a licensed materials test engineering firm. This material may be suitable for re-use pending further verification with the use of laboratory testing.
Mass Grading and Site Work (For the Purposes of This Report)	
Aggregate Base	Where referenced in this report, aggregate base shall consist of Type 2, Class B conforming to Section 200.01.03 or 200.01.04 Type 1 Recycled Base of the SSPWC.
Structural Fill	Structural fill shall comply with the following: • **Onsite Soil:** Soil generated from onsite grading may be reused as structural fill provided it meets the requirements of granular soil, screened to removed oversize particles, free of organics and deleterious materials. • **Imported Fill:** Imported structural fill shall meet the requirements described in Section 9.2 of this report.
Structural Areas	Includes all areas intended to support: • Concrete slabs-on-grade and flatwork, • Building or structure foundations, • Utility installations; and • Pavements.

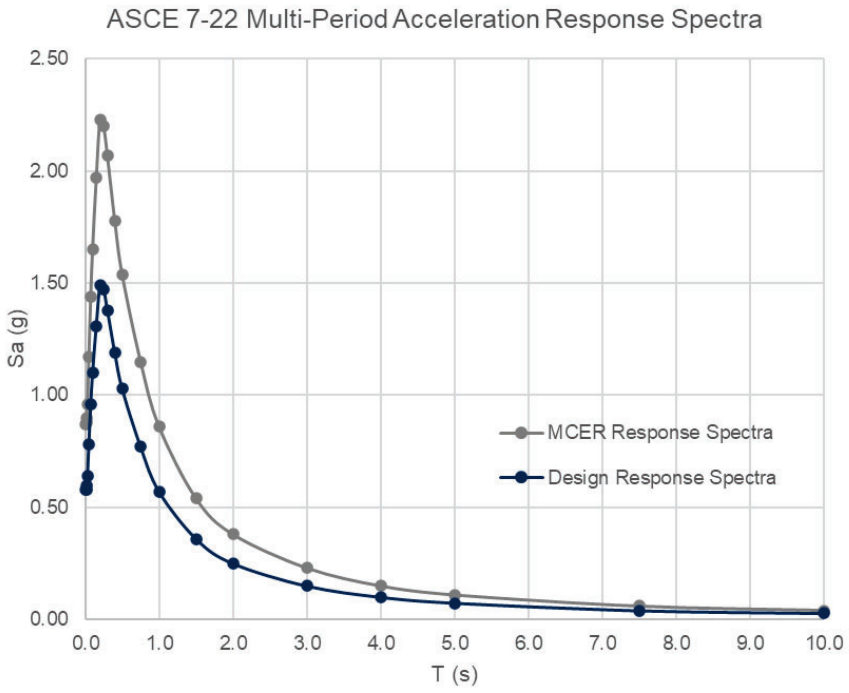
Table 2 (Continued): General Definitions for Report Recommendations	
Subgrade	Subgrade is defined as: • The elevation directly beneath concrete or asphalt pavement structural sections; • The bottom of excavations for foundations bottomed on native soil or fill; and • The native soil surface elevation beneath placed fill.
Relative Compaction and Optimum Moisture Content	The dry density of soil after field compaction, expressed as a percentage of the maximum dry density per ASTM D1557 (Modified Proctor). Optimum moisture content is the water content at which that maximum dry density occurs.

7.2 GEOTECHNICAL CONSIDERATIONS

Based on the results of our field and laboratory studies, the proposed project as described in this report may be constructed provided the recommendations in this report are adhered to. Table 3 provides a general summary of the construction considerations as they pertain to the project. Geotechnical recommendations for design and construction of the project are included as Section 8.0 and Section 9.0.

Table 3: Geotechnical Considerations and Overview Summary	
Groundwater/ Seasonal Runoff	Groundwater was not encountered during the subsurface exploration and is anticipated to occur at depths greater than the proposed improvements. However, seasonal runoff, perched water, or prolonged landscape irrigation adjacent to the improvements may create nuisance water conditions within the project limits. The contractor should be prepared to address localized wet or saturated soils during grading, trenching, or excavation activities.
Undocumented Fill	A thin layer of granular undocumented fill (e.g., playground sand) was observed at the ground surface within the playground area. The site is currently developed, and additional undocumented fill may be present, although it was not encountered in the borings. If undocumented fill is encountered during construction, we recommend it be removed and replaced with properly compacted structural fill. If thicker zones of undocumented fill are encountered, our office should be notified so that the material can be evaluated and appropriate remedial earthwork recommendations can be provided.
Reuse of Onsite Materials	Materials encountered during the subsurface exploration generally meet the definition of a granular soil and may be reused as structural fill, provided that oversized cobble- to boulder-sized fragments are removed prior to placement.
General Information	This report shall be reviewed by the design team and contractor in its entirety. The geotechnical recommendations provided herein shall be incorporated into the project design and implemented during construction. If clarification or additional information is needed, the geotechnical consultant should be contacted prior to proceeding with the work.

8.0 DESIGN RECOMMENDATIONS



8.1 SEISMIC DESIGN PARAMETERS

Based on the one-dimensional shear wave velocity profile obtained from the ReMi survey, a Site Class C is appropriate for the project design. Table 4 presents the acceleration response spectra for both the MCER and design ground motions for the project site. A copy of the Seismic Hazards Report is provided in Appendix C.

Table 4: Seismic Design Parameters (2024 IBC)

Latitude	Longitude	Method for Determining $V_{s(100)}$	$V_{s(100)}$ (ft/s)	Risk Category	Seismic Design Category	Site Class
39.520437	-119.79548	ReMi	1,634	III	D	C

T (s)	Sa(g)	
	MCE_R	Design

NOTES:
1. See requirements for Site Specific Ground Motion Procedures in ASCE 7-22 Section 11.4.7.
2. Reference https://ascehazardtool.org/

8.2 FOUNDATION DESIGN

Based on the assumed structural loading, proposed structure type, and soil conditions encountered during the subsurface exploration, foundation design parameters presented in Table 5 (Allowable Bearing Pressure) are recommended for project design.

Table 5: Allowable Bearing Pressure	
Allowable Bearing Pressures (psf)	
Footings bottomed at least 2 feet [(3)] below the proposed finished grade elevation on compacted structural fill or native granular soil	3,500
Allowable Friction Coefficient:	
For Cast-In-Place Concrete Foundations bottomed on structural fill or native granular soil	0.45
For Precast Concrete Foundations bottomed on structural fill or native granular soil	0.36
Allowable Passive Soil Pressure (psf/ft)	
Backfill soils consisting of compacted onsite granular soil or structural fill	295

NOTES:

1. Units:
   a. (psf): Pounds per square foot.
   b. (psf/ft): Pounds per foot of depth
2. Allowable Bearing Pressure:
   a. May be increased by one-third for total loading conditions, including wind and seismic forces.
   b. Is a net value, and the weight of the foundation extending below grade and backfill may be neglected when computing dead loads.
   c. Includes a minimum Factor of Safety (FOS) of 3.0 against bearing failure.
3. Minimum Foundation Width:
   a. The design is based on a minimum foundation width of 1 foot.
   b. Foundations shall be proportioned and located to maintain stability (e.g., bearing, overturning, sliding, uplift, eccentricity). Eccentric loading, where required, shall be evaluated for allowable bearing pressures.
   c. Overturning moments and uplift loading can be resisted by the weight of the foundation, weight of the structure, and any soil overlying the foundation.
4. Frost Protection for Footings:
   a. For frost protection, footings shall be set at least 2 feet below the adjacent exterior grade unless otherwise designed to resist uplift due to frost heave (e.g., PT slabs).
   b. Alternatively, foundations may be placed on non-frost susceptible material as defined in Section 4.2 (Foundations on Non-Frost Susceptible Ground or Fill Material) in ASCE 32. This non-frost susceptible material must extend below the jurisdictional frost line.
5. Passive Earth Pressure:
   a. The passive earth pressure is used as a triangular distribution.
   b. Frictional resistance and passive earth pressure provided in the table are "allowable" and can be used in combination without reduction. A factor of safety of 1.5 was applied.
   c. The material within the frost zone shall be neglected when designing for passive pressure.
   d. When sloping backfill is used near foundations, the design engineer shall contact the geotechnical engineer for additional recommendations.
   e. Lateral loads (such as wind or seismic) may be resisted by passive soil pressure and friction at the bottom of the footing.
6. Backfill Compaction:
   a. Assumes stem-wall backfill is compacted to at least 90 percent relative compaction (ASTM D1557).
7. Foundation Excavation Bottom:
   a. The bottom of all foundation excavations shall be free of ponded or standing water, frost, and loose or sloughing materials.
   b. CME recommends that footing excavations be observed by the project soils engineer prior to placing concrete reinforcing steel to confirm the subsurface conditions are similar to those described in this report.

8.2.1 ESTIMATED SETTLEMENT OF SHALLOW FOUNDATIONS

An elastic settlement response is expected for foundations bearing on compacted structural fill or native, medium-dense to dense granular soils. Most settlement is anticipated to occur quickly, generally within the construction timeframe.

Design structural loading and the proposed foundation layout were not available at the time this report was prepared. Once loading information is provided, settlement estimates can be refined. However, based on the assumed structural loads presented in Section 2.1, total static settlement is estimated to be about 1 inch or less. Differential settlement is anticipated to be on the order of one-half of the total settlement, provided foundations are supported on similar bearing materials (e.g., densified structural fill or native cut) and that differential fill thickness beneath the structure pad is less than 5 feet.

Localized increases in settlement may occur where foundations experience eccentric loading, significant load redistribution, or non-uniform contact pressures. If such load conditions are expected please contact our office to confirm settlement estimates presented in this section.

8.3 STATIC LATERAL EARTH PRESSURES

Static lateral earth pressures are dependent on the relative rigidity, allowable movement of the retaining structure, strength properties of the backfill soil, and drainage conditions behind the retaining wall. The lateral earth pressure is strongly dependent on the lateral deformations which occur in the soil.

Backfill Soil	For the purpose of estimating active and passive lateral earth pressures, the following soil parameters were assumed:
	• Backfill Type: Onsite granular soil, imported structural fill, or aggregate base.
	• Backfill Zone: Backfill material shall extend laterally behind the wall a distance at least equal to the retained height of the soil.
	• Compaction Requirement: Backfill shall be compacted to at least 90 percent (%) relative compaction (per ASTM D1557)
	• Estimated soil properties:
	  ○ Unit Weight (Active Pressure): 125 pcf
	  ○ Internal Friction Angle: Minimum 34°
	  ○ Cohesion: 0 psf

Wall Displacement and Earth Pressure Condition	A restrained retaining structure (i.e., displacement not permitted) will experience higher lateral earth pressures than a retaining structure that is free to move (cantilever conditions):
	• A non-yielding or restrained retaining structure cannot rotate sufficiently and therefore shall be designed based on the at-rest earth pressure (Ko),
	• For a yielding retaining structure that can rotate with the ability to deflect at the top of the wall, the following apply:
	  ○ Wall movement greater than $0.001H^3$ for granular backfill are required to mobilize active earth pressure (Ka); and
	  ○ Full mobilization of the passive earth pressure coefficient (K_p) typically requires outward wall movement on the order of 0.01H (1% of the wall height) within granular backfill. For restrained (non-yielding) walls, such movements may not be compatible with structural or serviceability criteria. Accordingly, any reliance on passive resistance in design should be evaluated by the structural engineer of record to determine whether the required displacement can be tolerated for the intended structure.

Static lateral earth pressure values are presented in Table 6.

Table 6: Static Lateral Earth Pressures

Earth Pressure Condition	Backfill Slope	Toe Slope	Wall Type	Earth Pressure Coefficient	Equivalent Fluid Weight (psf/ft)
Active (P_a)	Level	N/A	Yielding	0.28(k_a)	35
At-Rest (P_o)	Level	N/A	Non-Yielding	0.44 (k_o)	55
Passive (P_p)	N/A	Level	Refer to Table 5		

NOTES:
1. All pressures are in pounds per square foot per foot of depth (psf/ft).
2. Surcharge and dynamic (seismic) loads are not included, if wall heights will exceed 6 feet retained, please contact our office for additional guidance.
3. Assumes free draining backfill and no hydrostatic pressure.

[3] Where H is wall height

9.0 CONSTRUCTION RECOMMENDATIONS

9.1 SITE PREPARATION

9.1.1 CLEARING AND DEMOLITION

Stripping and Grubbing	Wood chips confined by plastic borders beneath existing play structures should be completely removed, including any underlying geotextile or separator fabric. This material is not suitable for reuse onsite and should not be incorporated into structural fill or backfill. Based on our understanding of the proposed building layout, the footprint is generally devoid of vegetation. If present within improvement areas, surface vegetation, duff, and topsoil should be stripped and grubbed prior to initiating fill placement or construction activities. Vegetation should be disposed of outside the construction limits of the site. Topsoil may be stockpiled onsite for later use in non-structural landscaped areas. Stripped and grubbed materials should not be incorporated into or permitted for use as structural fill.
Playground Sand	The upper approximately 2 to 3 inches of the site consists of imported playground sand. Playground sand should be completely removed in areas of proposed buildings, slabs, pavements, utilities, and other structural improvements. Playground sand may be reused as structural fill provided it is free of deleterious materials, fabric, and debris, and is moisture conditioned and compacted in accordance with the structural fill requirements of this report.
Demolition	Existing pavement, concrete, and manmade structures, including play equipment foundations, should be demolished and removed within areas of proposed improvements. Demolition debris should be removed from the site. Voids created by demolition should be cleaned of loose material, widened as necessary to permit access for compaction equipment, and backfilled with structural fill.

9.1.2 SUBGRADE PREPARATION

Scarification and Moisture Conditioning	Scarification and moisture conditioning shall include uniform mixing of soil to achieve recommended moisture contents . The moisture content of the in-situ soil shall be determined during construction to evaluate if moisture conditioning is required. Moisture conditioning and scarification depth will be dependent on the soil type: • Where coarse-grained soils contain nested cobbles or boulders larger than about 6 inches in nominal diameter, scarification is not required. The exposed subgrade should be cleaned of loose or sloughing material and confirmed during proof rolling to be firm, stable, and unyielding prior to fill placement. • Granular soils with particle sizes generally 3 inches or less shall be scarified to a depth of about 8 inches, moisture conditioned to within ±2 percent of optimum moisture, and compacted prior to fill placement. Moisture contents up to about +3 percent above optimum may be acceptable provided the soil remains stable under construction equipment and the required density can be achieved in subsequent lifts. • Clay subgrade soils shall be scarified to a depth of about 12 inches, moisture conditioned to within +2 to +4 percent above optimum moisture prior to compaction. This moisture condition shall be maintained by periodic surface wetting or other approved methods until the surface is covered by at least one lift of fill.
Compaction	Scarified material shall be compacted to at least 90 percent relative compaction (ASTM D1557). After the compaction process, a firm, stable surface shall be produced. Compaction of the subgrade soil will be dependent on soil type: • Granular soil is not considered cohesive and the particles generally require shaking or vibratory action (i.e., smooth drum roller) for densification. • Clay soil is considered cohesive and particles are best densified using high impact ram or sheepsfoot roller compactors.
Addressing Subgrade Instability	To assess the potential for subgrade pumping or instability, the prepared surface should be proof rolled using heavy, rubber-tired construction equipment, such as a fully loaded water truck. The contractor is responsible for maintaining subgrade stability throughout construction. Given the generally granular nature of the onsite soils, any instability encountered is expected to be localized. Localized soft or pumping areas should be overexcavated and replaced with properly moisture-conditioned aggregate base or structural fill. If instability is more widespread, CME should be notified to provide additional evaluation and recommendations. If subgrade soils become saturated during construction, the potential for instability increases significantly. The contractor should protect exposed subgrade areas from stormwater and precipitation using plastic sheeting, tarpaulins, or other waterproof coverings. Saturated or ponded areas are unsuitable for compaction or field density testing due to moisture contents exceeding the acceptable range specified in this report.

9.2 STRUCTURAL FILL

Material generated onsite that is proposed for reuse as structural fill shall meet the requirements of a granular soil as defined in Section 7.1 (General Information). Structural fill shall be free of vegetation, organic matter, and other deleterious material.

Imported structural fill, if required, shall comply with the specifications presented in Table 7 (Guideline Specification for Imported Structural Fill).

Table 7: Guideline Specification for Imported Structural Fill

Sieve Size	Percent by Dry Weight Passing
4-inches	100
¾ inch	70 – 100
No. 40	15 – 65

Percent Passing No. 200	Maximum Liquid Limit	Maximum Plastic Index
5 – 15	45	14
16 – 35	40	10

R-Value (Traffic Areas Only)	Water Soluble Sulfate (SO_4) in Soil (%) by Mass	Organic Content (ASTM D2974) (%)
30	<0.2	<3%

NOTES:
1. R-Value is required for materials placed in roadways or areas to receive vehicular traffic only. Not required for building foundations or ancillary improvements outside of traffic areas.
2. Water Soluble Sulfate required where structural fill will be located adjacent to, above, or in direct contact with concrete elements. Please contact the project geotechnical engineer for additional guidance.

9.2.1 PLACEMENT

Placement of structural fill shall comply with the following:

Moisture Content Requirements	• Prior to compaction, soils shall be moisture conditioned to within ±2 percent of optimum moisture. • Moisture contents exceeding +2 percent above optimum are acceptable provided the material remains stable and the required relative compaction can be achieved within the lift and in subsequent lifts.
Lift Thickness and Densification	• Structural fill shall be placed in level lifts not exceeding 8 inches in loose thickness. • Each lift shall be compacted to a minimum of 90% relative compaction.
Grading Restrictions	Structural fill shall not be placed: 1. When fill material is frozen. 2. On frozen or unstable subgrade soils. 3. In areas where ponded water is present.

9.3 TRENCHING & CONFINED EXCAVATIONS

9.3.1 TRENCH STABILITY

All excavations regardless of depth shall be evaluated for stability including scaling trench walls to remove loose material prior to occupation by construction personnel. Shoring or sloping of trench walls may be required to protect construction personnel and provide temporary stability. In areas where temporary confined excavations may be unstable, trench boxes may be used to provide safe ingress and egress for construction personnel.

Excavations shall comply with current OSHA safety requirements (Federal Register 29 CFR, Part 1926). Exposed materials are classified as either Stable Rock, Type A, B or C. Each material classification requires different temporary excavation slope gradients. Maximum allowable slopes for excavations less than 20 feet deep are presented as Table 8.

Table 8: Maximum Allowable Temporary Slopes

Soil or Rock Type	Maximum Allowable Slopes[1] for Excavations (< 20 Feet)[2]	
Stable Rock	Vertical	90º
Type A	3H:4V	53º
Type B	1H:1V	45º
Type C	3H:2V	34º

NOTES:

1. Angles are expressed in degrees from the horizontal and have been rounded off.
2. Sloping or benching for excavations greater than 20 feet deep shall be designed by a registered professional engineer.
3. For detailed description of the soil types outlined above visit the US Department of Labor Safety and Health Topics website at: https://www.osha.gov/SLTC/trenchingexcavation/construction.html

The contractor is responsible for determining soil classifications in the field during trenching activities and for selecting appropriate protective systems in accordance with OSHA requirements. Based on the subsurface conditions encountered during our exploration, trench excavations at the site are anticipated to generally comply with **Type B** soil conditions; however, subsurface conditions at the time of construction shall govern layback requirements.

Trench excavations shall be protected from surface water and runoff. Protection measures may include temporary drainage swales, berms, or shallow diversions to direct surface flow away from excavations. If necessary, dewatering of pipe trench excavations may be accomplished using a temporary dewatering system.

9.3.2 UNDERMINING OF ADJACENT INSTALLATIONS

The use of shoring or shielding may be required during excavation, to limit the potential for undermining of existing structures the contractor shall review the following:

- Trench boxes may be used (i.e., unshored trench excavations) where the proposed excavation is laterally offset from existing structure bottom of foundation elevation a distance determined by a 1 horizontal by 1 vertical (1H:1V) projection line (downward and outward) from the exterior edge of the structure foundation (e.g., “zone of influence”).
- At a minimum, shoring is required where trenches are located within or will intercept the zone of influence (1H:1V). Shoring systems will need to be designed to resist the lateral earth pressure forces, applicable hydrostatic forces, as well as contributing structural dead loads, and/or adjacent live loads.
- It should be noted that shoring systems such as slide rail require a “dig and push” method for installation. Care should be taken during installation that the excavation for the panels is done carefully to reduce the potential for gaps between the steel panels and existing soil. Gaps between the steel panels and trench sidewall may result in an increased potential for lateral movement of the soil below the adjacent structure foundations as material is pushed laterally into the steel sheet.
- Alternatively, where shoring is not possible, underpinning the adjacent structure foundations may be performed prior to excavation.
- All trenching shall be performed in general accordance with applicable OSHA regulations. The contractor is responsible for the safety of field personnel and to protect existing structures.
- Monitoring of movement of the adjacent structures should be performed during installation of the shoring system and/or during trenching activities within the zone of influence (1H:1V). Refer to Figure 7 for additional information.

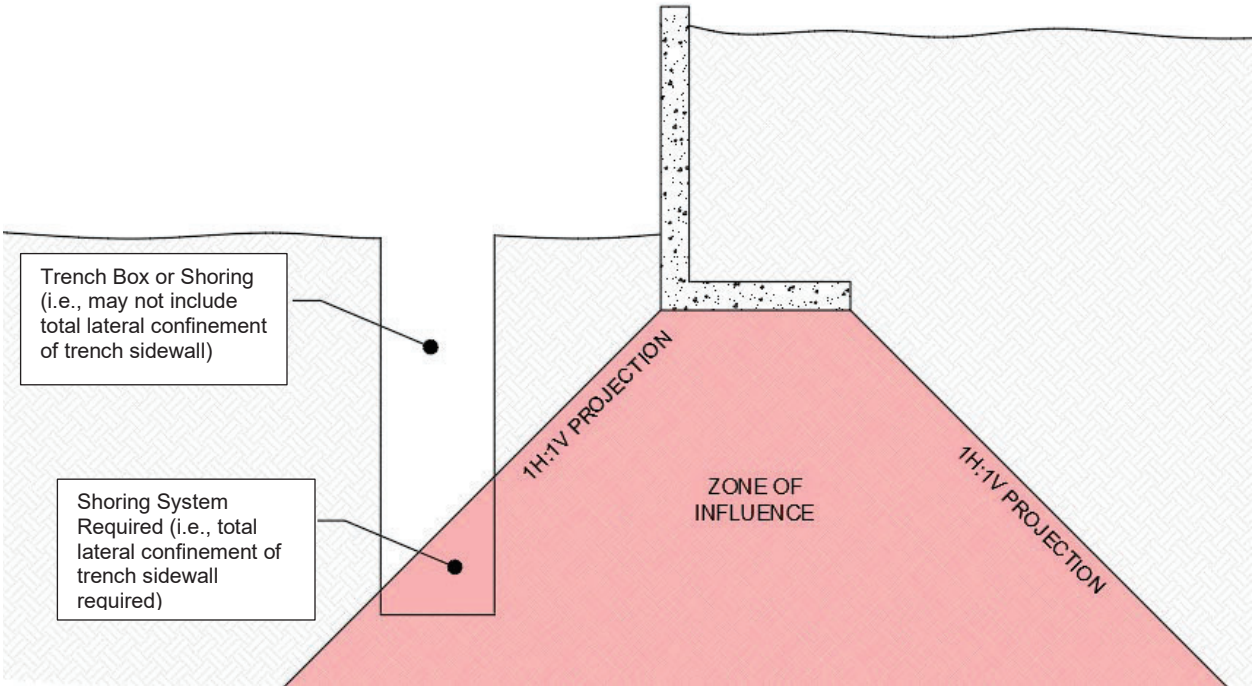

Figure 7: Zone of Influence and Shoring Requirement Schematic

9.4 CONCRETE

9.4.1 CORROSION POTENTIAL

Many external sources can affect the potential for sulfate attack against concrete ranging from soil type, marine/wetland environments, to deicing and industrial conditions. The American Concrete Institute (ACI) Committee 201 and ACI 318-14 have established guidelines for determining the potential for sulfate attack from external sources. Table 9 has been developed to provide the design engineer with guideline recommendations for cement type based on the severity of potential sulfate exposure associated with the tested soils encountered during the current exploration.

Table 9: General Guideline Requirements for Concrete Subject to Sulfate Exposure

Severity of Potential Exposure	Water Soluble Sulfate (SO_4) in soil (%) by mass	Sulfate (SO_4) in water (ppm)	Maximum Water Cementitious Materials Ratio	Cementitious Material Requirements
S0 (negligible)	$SO_4 < 0.10$	$SO_4 < 150$	No Requirement	No Requirement
S1 (Moderate)	$0.10 < SO_4 < 0.20$	$150 < SO_4 < 1,500$	0.50	ASTM C150 Type II Cement
S2 (Severe)	$0.2 < SO_4 < 2.0$	$1,500 < SO_4 < 10,000$	0.45	ASTM C150 Type V Type I Cement with 20% Class N Pozzolan Type I Cement with 20% Class F Fly Ash
S3 (Very Severe)	$SO_4 > 2.0$	$SO_4 > 10,000$	0.40	Refer to ACI 201.2R.16 and ACI 318-14

NOTES:
1. Table reference: ACI 201.2R.16, publication Table 6.1.4.1a and 6.1.4.1b and ACI 318-14, Table 19.3.1.1

Soil chemistry test results are included in Appendix B and on Table 10.

Table 10: Soil Sulfate Content Results

Exploration Designation	Sample ID	Sample Depth (ft-ft)	Sulfate Content (%)	Severity of Potential Exposure	w/cm by mass, maximum	Permitted Cement Type
B-26-01	BULK	0.0-5.0	0.02	S0 (negligible)	No w/cm restriction	No type restriction

NOTES:
1. A corrosion specialist should be consulted to determine if the site soil conditions warrant further investigation or if proposed structures require corrosion protection.

Based on the soil chemistry test results, no cement type restriction is required for sulfate exposure and Type II cement may be used for project design.

9.4.2 CONCRETE SLABS

All concrete slabs and flatwork shall be directly underlain by aggregate base. The minimum thickness of base material shall comply with the following:

Structure Type	Aggregate Base Minimum Thickness (in)
Curb and Gutter	6.0
Exterior Sidewalks and Slabs	4.0
Interior Structure Slabs	6.0

Subgrade soil below the aggregate base and the aggregate base shall be prepared in accordance with the recommendations of this report.

The contractor shall submit a concrete mix design to the owner at least 10 working days prior to construction for approval. Concrete mix proportions and construction techniques, including the addition of excess water and improper curing, can adversely affect the finished quality of the concrete resulting in cracking, curling, and spalling of slabs. We recommend that all placement and curing be performed in accordance with procedures outlined by the American Concrete Institute. Special considerations should be given to concrete placed and cured during hot or cold weather conditions. Proper control joints and reinforcing should be provided to minimize any damage resulting from shrinkage.

9.5 SITE DRAINAGE AND MOISTURE MIGRATION MANAGEMENT

Site Drainage	The project site will be subjected to seasonal runoff. Adequate surface drainage shall be constructed and maintained to convey the water away proposed structures. The permanent finished slope grade away from the structure should be at least 5 percent for a minimum distance of 10 feet away from the building (IBC Section 1804.4). The slope gradient can be reduced to 2 percent for impervious surfaces, such as concrete slabs-on-grade and pavement, constructed adjacent to the building. It is recommended that all runoff is collected within permanent drainage paths away from the structure to convey water off the property.
Stem-Wall Backfill	Stem-walls constructed for this project with retained heights of less than 3 feet will not require a retained backfill drainage system provided the backfill is compacted to at least 90 percent relative compaction and the recommendations for site drainage are adhered too.
Concrete Slab-on-Grade	The transmission of moisture to the base of the slab can occur through two physical processes: water vapor transmission and/or capillary action of the underlying soils. Water vapor can be transmitted through the slab and the transmission rate depends on the difference in the water vapor pressure between the air voids in the slab and the air above the slab. Moisture vapor migrating through the slab can cause the debonding and discoloration of tile, linoleum, or other products placed directly on the concrete slab. For heated facilities and where sensitive floor coverings or equipment are planned, or moisture sensitive materials will be stored, as noted in Section 1907 (Minimum Slab Provisions) of the 2024 IBC, a polyethylene vapor retarder is recommended for slab-on-grade construction[4]. The vapor retarder system shall conform to ASTM E1745. A Class A (ASTME-1745) vapor retarder is recommended for project design (such as a 15-mil Stego Wrap or approved alternate). The vapor retarder shall be placed between the base course and subgrade (ASTM E1643[5]) . Where specialty curing compounds or slab systems are proposed, installation should follow the manufacturer's recommendations.

[4] When a vapor retarder is required, a capillary break shall be installed.
[5] Standard Practice for Selection, Design, Installation, and Inspection of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs

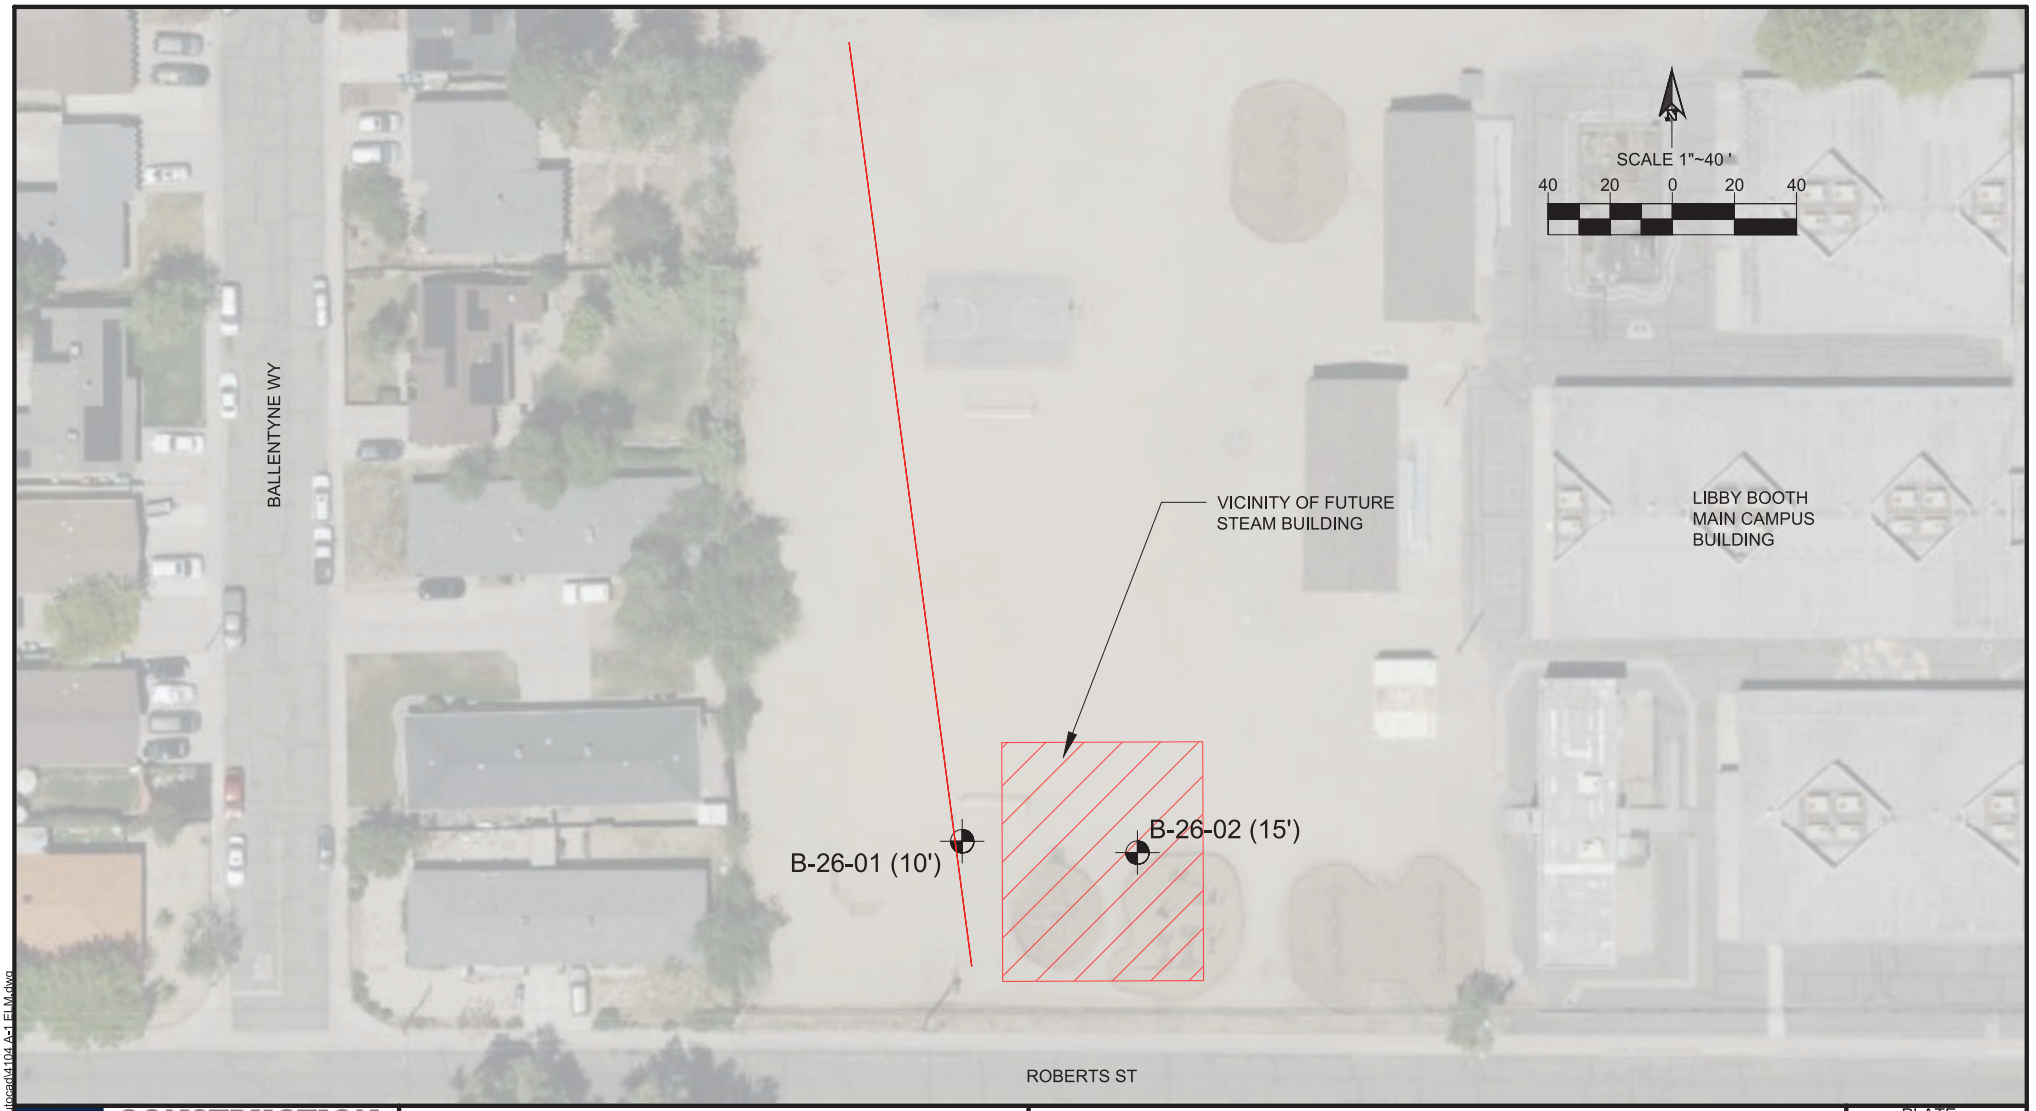
10.0 TESTING AND DOCUMENTATION

The recommendations presented in this report are based on the assumption that the owner or project manager will provide sufficient construction review and field testing during all phases of work. These construction observation and testing services should include, but not be limited to, the following:

- Observation, documentation, and field density testing during site preparation and grading
- Special inspection and structural observation in accordance with the applicable edition of the International Building Code for concrete and reinforcing steel
- Laboratory testing to confirm materials qualification and compliance with project specifications
- Field density testing of utility bedding sand and trench backfill

CME maintains a staff of certified inspectors, technicians, and materials testing personnel capable of providing these services.

Prior to construction, the owner or project manager should schedule a preconstruction meeting. Attendees should include, at a minimum, the owner or project manager, design engineer, general contractor, earthwork and materials subcontractors, and CME representatives. This meeting provides an opportunity to review the project plans, specifications, and recommendations contained in this report, and to discuss material requirements, testing procedures, and construction coordination items.



Additional client-requested pre-construction and construction-phase services that CME can provide include:

- Construction Management (CM) support to assist owners with schedule oversight, contractor coordination, and quality assurance throughout construction
- Independent Cost Estimating (ICE) services to support project budgeting, change-order review, and proactive cost control
- Engineer's Opinion of Probable Construction Cost (EOPCC) services prepared at key design milestones to support budgeting, funding decisions, and bid readiness

11.0 LIMITATIONS

Exploration Location and Geologic Variations	• This report has been prepared in accordance with generally accepted local geotechnical practices. The conclusions and recommendations of this report are provided for the design and construction of the proposed project as described in this report. The analyses and recommendations contained herein are based upon field exploration locations included on Plate A-1. • Exploration locations included as part of this report should be considered accurate only to the degree implied by the methods used. This report does not reflect soil, rock, or groundwater variations that may become evident during the construction period, at which time re-evaluation of the recommendations may be necessary.
General Intent and Information Distribution	• The intent of this report is to provide geotechnical information related to construction and design of the project. The owner/project manager is responsible for distribution of this report to all designers and contractors whose work is affected by geotechnical recommendations provided. In the event of changes in the design, location, or ownership of the project prior to construction, our recommendations should be reviewed by our geotechnical representative. • If our engineer is not accorded the privilege of making this recommended review, the CME can assume no responsibility for misinterpretation or misapplication of his recommendations or their validity in the event changes have been made in the original design concept without our prior review.
Warranties	• CME makes no other warranties, either expressed or implied, as to the professional advice provided under the terms of this agreement and included in this report. Any use, reliance on, or decisions which a third party makes based upon the information contained in this report, are the sole responsibility of such third parties. CME accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.
Clay Soil	• Clay soil may be present in discontinuous areas below the proposed improvements. Clay soil may potentially shrink or swell (volume changes) in response to changes in the moisture content of the soil. Moisture changes in this soil can occur as a result of seasonal variations in precipitation, poor site drainage, landscape irrigation, leaking underground pipes, capillary action, or from other sources. Volume changes in clay soil can cause differential movements in structural elements constructed in the sphere of influence or bearing on the clay soil. The project geotechnical engineer shall be notified where questionable soil is encountered.
Standard Owner Maintenance/ Monitoring	• All structures are susceptible to deterioration caused by environmental and human-made factors. Consequently, regular monitoring and maintenance are essential to prevent damage and deterioration. The owner bears the sole responsibility for carrying out these monitoring and maintenance activities. CME, Inc. assumes no responsibility for such issues or any resulting damages.
Environmental Hazards Evaluation	• Any evaluation of the site for the presence of surface or subsurface hazardous substances is beyond the scope of this study. When suspected hazardous substances are encountered during routine geotechnical investigations, they are noted in the exploration logs and reported to the client.
Fault Hazards	• Please be aware that our exploration and analysis are bound by the constraints inherent in the scope of our investigation and the available data. Unmapped faulting, which is common in Nevada, may remain unidentified or uncharted due to various factors, including the scale of published mapping, sediment coverage, depth within the earth, or a lack of prior study. Detection often relies on advanced techniques such as seismology, LiDAR, orthophoto review, and onsite exploration outside the parameters of our study. Should you desire a site-specific fault study, we recommend consulting our office or a qualified fault investigation specialist for further analysis.

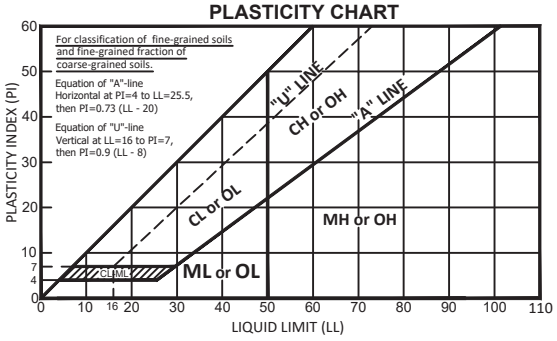
SOIL CLASSIFICATION CHART

PLATE A-3

SOIL CLASSIFICATION CHART

MAJOR DIVISIONS			SYMBOLS GRAPH	SYMBOLS LETTER	TYPICAL CLASSIFICATION NAMES
Course grained soils (More than 50% of the material is larger than No. 200 sieve size)	Gravel and gravelly soils	Clean gravels		GW	Well-graded gravels, gravel-sand mixtures, few or no fines
				GP	Poorly-graded gravels, gravel-sand mixtures, few or no fines
		Gravels with fines		GM	Silty gravels, gravel-sand-silt mixtures
				GC	Clayey gravels, gravel-sand-clay mixtures
	Sand and sandy soils	Clean sands		SW	Well-graded sands, gravelly sands, few or no fines
				SP	Poorly-graded sands, gravelly sands, few or no fines
		Sands with fines		SM	Silty sands, sand-silt mixtures
				SC	Clayey sands, sand-clay mixtures
Fine grained soils (More than 50% of the material is smaller than No. 200 sieve size)	Silts and clays	Liquid Limit less than 50		ML	Inorganic silts and very fine sands, rock flour, silty or clayey fine sands with slight plasticity
				CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
				OL	Organic silts and organic silt-clays of low plasticity
		Liquid Limit greater than 50		MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
				CH	Inorganic clays of medium to high plasticity
				OH	Organic clays of medium to high plasticity
				PT	Peat or other highly organic soils

NOTES:
1. Dual classifications may occur (e.g. SP-SM, CL-ML, GP-GC)



SOIL SAMPLE TYPES

- Bulk Sample
- Grab Sample
- Standard Penetration Test (2.0" OD, 1.42" ID)
- California Modified Sampler (3.0" OD, 2.42" ID)
- Thin walled Shelby Tube (3.0" OD)
- Rock Core

GROUNDWATER SYMBOLS

- Water level during drilling
- Water level after drilling

PLASTICITY CHART

PARTICLE ANGULARITY

Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular	Particles are similar to angular, but have rounded edges
Subrounded	Particles have nearly plane sides, but have well-rounded corners and edges
Rounded	Particles have smoothly curved sides and no edges

PARTICLE SHAPE

Flat	Particles with width/thickness >3
Elongated	Particles with length/width >3
Flat and Elongated	Particles meet criteria for both flat and elongated

MOISTURE

Dry	No discernable moisture
Moist	Moisture present, but no free water
Wet	Visible free water

CEMENTATION

Weak	Crumbles or breaks with handling or light finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

APPARENT DENSITY OF COHESIONLESS SOIL

	SPT (1.4" ID) N_{60}
Very Loose	< 5
Loose	5 - 10
Medium Dense	10 - 30
Dense	30 - 50
Very Dense	> 50

Based on 60% energy ratio (ER_i). $N_{60} = N_{measured} * (ER_i/60)$

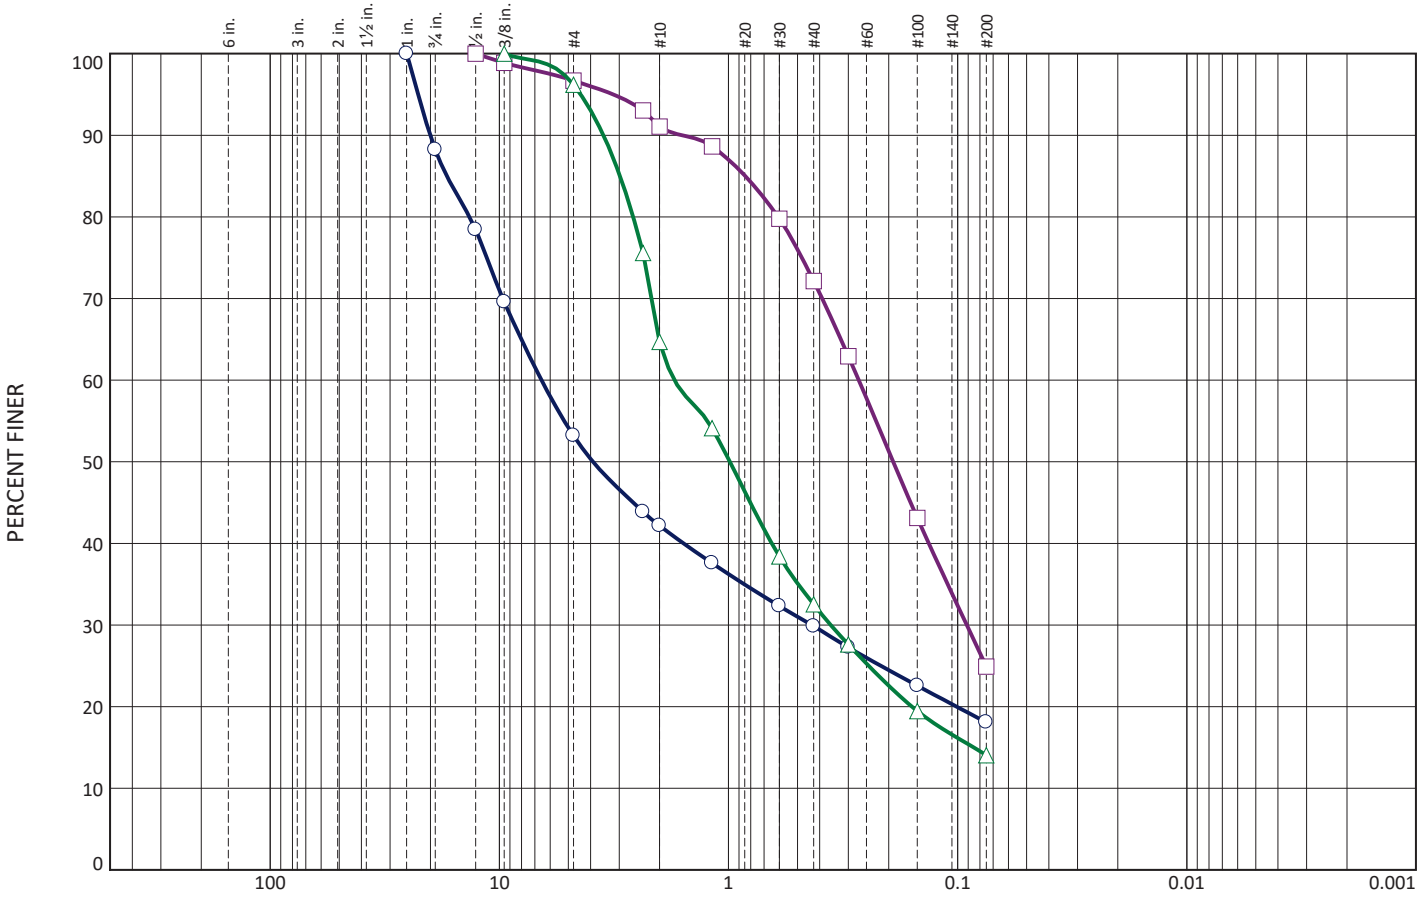
California Modified Sampler can be corrected to SPT by multiplying by 0.62

PARTICLE SIZE, Ps

Boulders		Ps > 12"
Cobbles		3" < Ps ≤ 12"
Gravel	coarse	$\frac{3}{4}$" < Ps ≤ 3"
	fine	$\frac{1}{5}$" < Ps ≤ $\frac{3}{4}$"
Sand	coarse	$\frac{1}{16}$" < Ps ≤ $\frac{1}{5}$"
	medium	$\frac{1}{64}$" < Ps ≤ $\frac{1}{16}$"
	fine	$\frac{1}{300}$" < Ps ≤ $\frac{1}{64}$"
Fines		Ps ≤ $\frac{1}{300}$"

PERCENT OF SOIL, Pp

Trace	Pp < 5%
Few	5 ≤ Pp ≤ 15%
Little	15 ≤ Pp ≤ 30%
Some	30 ≤ Pp ≤ 50%
Mostly	50 ≤ Pp ≤ 100%



CONSISTENCY OF COHESIVE SOIL

	SPT (1.4"ID) N_{60}	Unconfined Compressive Strength (psf)	Pocket Penetrometer (tsf)
Very Soft	0 - 1	< 500	< 0.25
Soft	2 - 4	500 - 1,000	0.25 - 0.5
Medium Stiff	5 - 8	1,000 - 2,000	0.5 - 1.0
Stiff	9 - 15	2,000 - 4,000	1.0 - 2.0
Very Stiff	16 - 30	4,000 - 8,000	2.0 - 4.0
Hard	31 - 60	8,000 - 16,000	> 4.0
Very Hard	> 60	> 16,000

Version 1.1 Updated 11/1/2021

NOTES:

1. Liquefaction screening based on *Liquefaction Resistance of Soils from Shear-Wave Velocity* by Andrus and Stokoe published November 2000 in Journal of Geotechnical and Geoenvironmental Engineering.
2. NP = No Probability; LP = Low Probability; MP = Moderate Probability; SP = Significant Probability
3. Due to limited exploration, some of the input parameters are assumed. If there is a Moderate Probability to Significant Probability, further investigation should be performed

Unified Hazard Tool

Please do not use this tool to obtain ground motion parameter values for the design code reference documents covered by the U.S. Seismic Design Maps web tools (e.g., the International Building Code and the ASCE 7 or 41 Standard). The values returned by the two applications are not identical.

Please also see the new USGS Earthquake Hazard Toolbox for access to the most recent NSHMs for the conterminous U.S. and Hawaii.

Design Criteria Summary

Code: **2024 IBC**

Structural Risk Category: **III** (IBC Table 1604.5)

Gravity Loads and Masses:

Roof:

Roof Live Load (Lr): **20 psf** (IBC Table 1607.1)

Snow (S): Per ASCE 7-22 Chapter 7.

$p_f = 0.7C_eC_tp_g$:

At Heated Roof: **36.0 psf**

At Unheated Roof: **36.3 psf**

C_e = *0.9* Per ASCE 7-22 Table 7.3-1.

C_t : Per ASCE 7-22 Table 7.3-2 and 7.3-3.

At Heated Roof: *1.19*

At Unheated Roof: *1.20*

p_g = *48* psf

p_m (at roof slope < 15^0) = **35** psf, Per ASCE 7-22 Sec 7.3.3.

$p_{m,max}$ = *35* Per ASCE 7-22 Table 7.3-4.

$p_s = C_sp_f$:

At Heated Roof: **36.0 psf**

At Unheated Roof: **36.3 psf**

C_s = *1.0*

See attached for unbalanced and drift snow loads

Typical New Roof
Dead (D)

	DL		
Roofing:	2.0	psf	
Future Re-Roof:	2.0	psf	
Insulation:	1.5	psf	
Metal Deck:	3.1	psf	
Roof Framing*:	5.0	psf	
Sprinklers:	0.5	psf	
Ceiling:	2.8	psf	
Mech/Misc:	2.5	psf	
Σ =	19.4	psf,	Say **20.0 psf**

*Load does not apply to metal deck

DL applied to Metal Deck: **15.0 psf**

Seismic Mass:

Average Roof D:	20.0	psf
Partitions	5.0	psf
Σ =	**25.0**	**psf**

Joist Point Load Allowance:	**500**	**lbs U.N.O., D**
Girder Point Load Allowance:	**3000**	**lbs, D**
Column Point Load Allowance:	**5000**	**lbs, D**

Loads applied at mechanical units/rooms in addition to basic roof load:
Mech. Unit Weight/Mass: **Actual weight as listed on plans.**

1st Floor:

Live (L) - Per IBC Table 1607.1:

Offices	50.0	psf
Classrooms	40.0	psf
First- Floor Corridors	100.0	psf

(E) Kindergarten Room
Dead (D)

Flooring	2.0	psf
5" Concrete Slab	60.0	psf
Mech/Misc.	3.0	psf
Σ =	**65.0**	**psf**

Walls:

Dead (D)/Seismic Mass:

	DL	
12" CMU Walls	**120.0**	**psf**
8" CMU Walls	**80.0**	**psf**

8.2 FOUNDATION DESIGN

Based on the assumed structural loading, proposed structure type, and soil conditions encountered during the subsurface exploration, foundation design parameters presented in Table 5 (Allowable Bearing Pressure) are recommended for project design.

Table 5: Allowable Bearing Pressure	
Allowable Bearing Pressures (psf)	
Footings bottomed at least 2 feet [(3)] below the proposed finished grade elevation on compacted structural fill or native granular soil	3,500
Allowable Friction Coefficient:	
For Cast-In-Place Concrete Foundations bottomed on structural fill or native granular soil	0.45
For Precast Concrete Foundations bottomed on structural fill or native granular soil	0.36
Allowable Passive Soil Pressure (psf/ft)	
Backfill soils consisting of compacted onsite granular soil or structural fill	295

NOTES:

1. Units:
   a. (psf): Pounds per square foot.
   b. (psf/ft): Pounds per foot of depth
2. Allowable Bearing Pressure:
   a. May be increased by one-third for total loading conditions, including wind and seismic forces.
   b. Is a net value, and the weight of the foundation extending below grade and backfill may be neglected when computing dead loads.
   c. Includes a minimum Factor of Safety (FOS) of 3.0 against bearing failure.
3. Minimum Foundation Width:
   a. The design is based on a minimum foundation width of 1 foot.
   b. Foundations shall be proportioned and located to maintain stability (e.g., bearing, overturning, sliding, uplift, eccentricity). Eccentric loading, where required, shall be evaluated for allowable bearing pressures.
   c. Overturning moments and uplift loading can be resisted by the weight of the foundation, weight of the structure, and any soil overlying the foundation.
4. Frost Protection for Footings:
   a. For frost protection, footings shall be set at least 2 feet below the adjacent exterior grade unless otherwise designed to resist uplift due to frost heave (e.g., PT slabs).
   b. Alternatively, foundations may be placed on non-frost susceptible material as defined in Section 4.2 (Foundations on Non-Frost Susceptible Ground or Fill Material) in ASCE 32. This non-frost susceptible material must extend below the jurisdictional frost line.
5. Passive Earth Pressure:
   a. The passive earth pressure is used as a triangular distribution.
   b. Frictional resistance and passive earth pressure provided in the table are "allowable" and can be used in combination without reduction. A factor of safety of 1.5 was applied.
   c. The material within the frost zone shall be neglected when designing for passive pressure.
   d. When sloping backfill is used near foundations, the design engineer shall contact the geotechnical engineer for additional recommendations.
   e. Lateral loads (such as wind or seismic) may be resisted by passive soil pressure and friction at the bottom of the footing.
6. Backfill Compaction:
   a. Assumes stem-wall backfill is compacted to at least 90 percent relative compaction (ASTM D1557).
7. Foundation Excavation Bottom:
   a. The bottom of all foundation excavations shall be free of ponded or standing water, frost, and loose or sloughing materials.
   b. CME recommends that footing excavations be observed by the project soils engineer prior to placing concrete reinforcing steel to confirm the subsurface conditions are similar to those described in this report.

Table 1608.2.1 Ground snow loads for Northern Nevada locations

*Add Table **1608.2.1** to read as follows:*

Table 1608.2.1

GROUND SNOW LOADS, Pg, FOR NORTHERN NEVADA LOCATIONS [1,2,3,4]

Footnotes:

1. Final roof snow design load Ps or Pf shall not be less than 29 psf

2. Refer to local jurisdiction ordinances for other Ground Snow Load information S.R. = State Route

3. Intermediate values may be determined by interpolation U.S. = U.S. Highway

4. The City of Elko shall not have ground snow loads less than 30 psf and Churchill County shall not have ground snow loads less than 20 psf

* Ground snow loads in Washoe County shall be taken from Tables 1608.2.1 or the ASCE Hazard Tool. Ground snow loads from the ASCE Hazard tool shall use the ASCE/SEI 7-22 standard. The minimum ground snow load for a structure shall not be less than the lower of the two values from Table 1608.2.1 and the ASCE Hazard Tool.

				1.8	######			#VALUE!	######	######	####	#VALUE!	#####	######	######	#VALUE!	######	#####		

1. $l_{u,\ high}$: High Roof Length (ft), Fetch opposite vertical face
2. $l_{u,\ low}$: Low Roof Length (ft), Fetch facing vertical face
3. Controlling Drift Width is taken as max of leeward and windward. This is conservative since the windward width is not required to be applied to the leeward drift.
4. Windward/Parapet Drift Ht. is taken as minimum of h_c and $0.75h_d$

Table 1609.3.2 Special wind region defined: minimum basic wind speeds

*Add Table **1609.3.2** to read as follows:*

TABLE 1609.3.2
SPECIAL WIND REGION DEFINED:
MINIMUM BASIC WIND SPEEDS

For Carson City, City of Reno, City of Sparks, Douglas, Lyon, Storey and Washoe Counties the design wind speed values shall be:

Risk Category	Ultimate Wind Speed V_{ult} (mph)	V_{asd} Wind Speed 3-sec gust (mph)
I	110	85
II & 2024 IRC	120	93
III	130	101
IV	135	104

Table notes:

a) Air density corrections to design wind pressures are prohibited. The conversions from Vult to Vasd are based on Table 1609.3.1

Section 1704.2 Special inspections and tests

*Amend Section **1704.2** to read as follows:*

1704.2 Special inspections and tests. Where application is made to the *building official* for construction as specified in Section 105, the *owner* or the *owner's* authorized agent, other than the contractor, shall employ one or more *approved agencies* to provide *special inspections* and tests during construction on the types of work specified in Section 1705 and identify the *approved agencies* to the *building official*. These *special inspections* and tests are in addition to the inspections by the *building official* that are identified in Section 110.

Exceptions:

1. *Special inspections* and tests are not required for construction of a minor nature or as warranted by conditions in the *jurisdiction* as *approved* by the *building official*.

2. Unless otherwise required by the *building official*, *special inspections* and tests are not required for Group R-3 occupancies as applicable in section 101.2 and Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

3. *Special inspections* and tests are not required for portions of *structures* designed and constructed in accordance with the cold-formed steel *light-frame construction* provisions of Section 2206.1.2 or the *conventional light-frame constructions* provisions of Section 2308.

4. The contractor is permitted to employ the *approved agencies* where the contractor is also the *owner*.

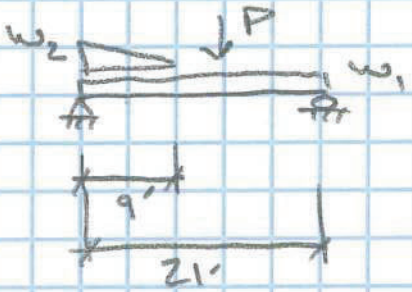
DESIGN GRID 2 GIRDERS

32' GIRDER

$w_{1D} = 30'(20\ PSF) = 600\ PLF$

$w_{1S} = 30'(36\ PSF) + \frac{25\ PSF(9')3'}{2(33')} + \frac{27\ PSF(8')3'}{2(26')} = 1103\ PLF$

$w_{2S} = 17'(29\ PSF) = 493\ PLF$



$P_D = 3k$

$w_{1W} = 30'(-32\ PSF) = -960\ PLF$

USE W21x44 MIN

CC = 0.95 < 1, OK

21' GIRDER - NOT USED

$w_{1D} = 35'(20\ PSF) = 700\ PLF$

$w_{1S} = 35'(36\ PSF) + \frac{25\ PSF(9')3'}{2(33')} + \frac{29\ PSF(9')3'}{2(37')} = 1285\ PLF$

$w_{2S} = 493\ PLF$

$P_D = 3k$

$w_{1W} = 35'(-32\ PSF) = -1120\ PLF$

USE W16x31 MIN

CC = 0.92 < 1, OK.

Project Title:
Engineer:
Project ID:
Project Descr:

Steel Beam

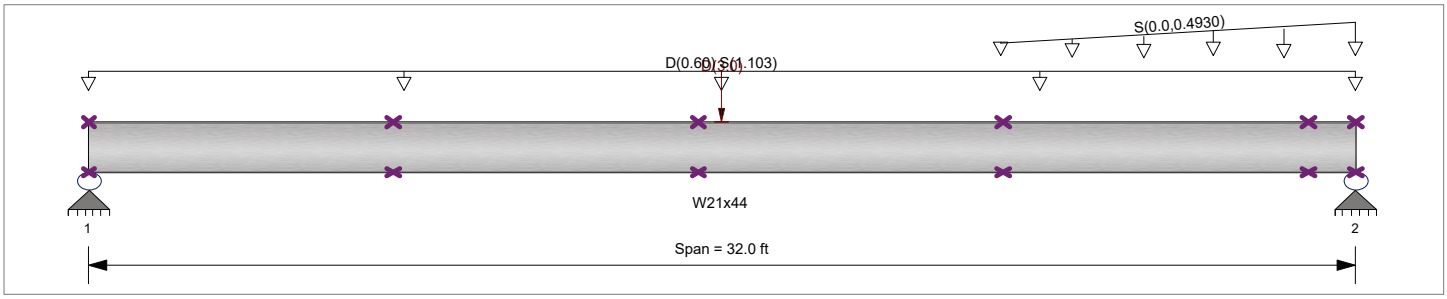
Project File: Libby Booth.ec6

LIC# : KW-06015779, Build:20.26.02.18 Will Engineering LLC (c) ENERCALC, LLC 1982-2026

DESCRIPTION: 32' Girder on Grid 2 - Downward Load

Code References

Governing Code : IBC 2024
Referenced Design Standard(s) : AISC 360-22
Load Combination Set : ASCE 7-22 / IBC 2024



Material Properties

Analysis Method : Allowable Strength Design
Beam Bracing : Beam bracing is defined as a set spacing over all spans
Bending Axis : Major Axis Bending

Fy : Steel Yield : 50.0 ksi
E: Modulus : 29,000.0 ksi

Unbraced Lengths

First Brace starts at 7.70 ft from Left-Most support
Regular spacing of lateral supports on length of beam = 7.70 ft

Applied Loads

Service loads entered. Load Factors will be applied for calculations.

Beam self weight NOT internally calculated and added
Uniform Load : D = 0.60, S = 1.103 k/ft, Tributary Width = 1.0 ft
Varying Uniform Load : S= 0.0->0.4930 k/ft, Extent = 23.0 -->> 32.0 ft, Trib Width = 1.0 ft
Point Load : D = 3.0 k @ 16.0 ft

DESIGN SUMMARY

Design OK

Maximum Bending Stress Ratio =	0.949 : 1	Maximum Shear Stress Ratio =	0.172 : 1
Section used for this span	W21x44	Section used for this span	W21x44
Ma : Applied	201.958 k-ft	Va : Applied	24.861 k
Mn / Omega : Allowable	212.789 k-ft	Vn/Omega : Allowable	144.90 k
Load Combination	+D+0.70S	Load Combination	+D+0.70S
		Location of maximum on span	32.000 ft
Span # where maximum occurs	Span # 1	Span # where maximum occurs	Span # 1

Maximum Deflection

Max Downward Transient Deflection	0.768 in	Ratio =	499	>=360	Span: 1 : +0.70S
Max Upward Transient Deflection	0 in	Ratio =	0	<360	n/a
Max Downward Total Deflection	1.496 in	Ratio =	257	>=240.	Span: 1 : +D+0.70S
Max Upward Total Deflection	0 in	Ratio =	0	<240.0	n/a

Steel Beam

Project File: Libby Booth.ec6

LIC# : KW-06015779, Build:20.26.02.18 Will Engineering LLC (c) ENERCALC, LLC 1982-2026

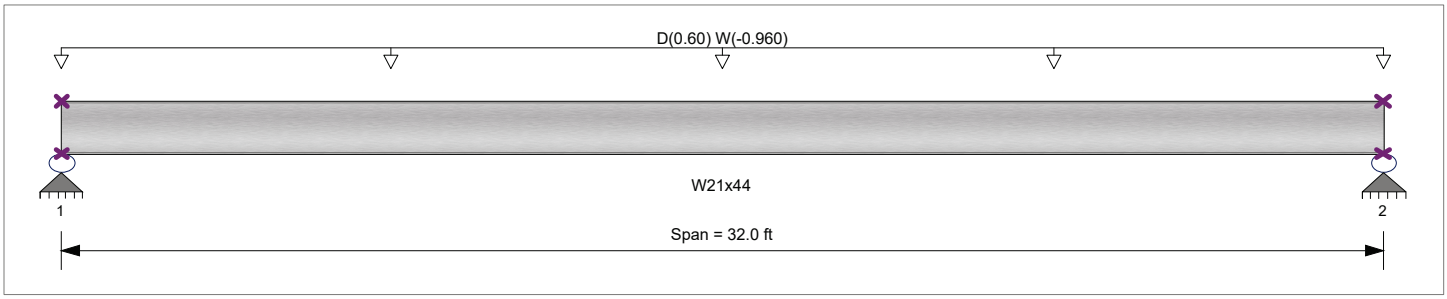
DESCRIPTION: Girder on Grid 2 - Uplift Case Load



Code References

Governing Code : IBC 2024
Referenced Design Standard(s) : AISC 360-22
Load Combination Set : ASCE 7-22 / IBC 2024

Material Properties

Analysis Method : Allowable Strength Design
Beam Bracing : Completely Unbraced
Bending Axis : Major Axis Bending

Fy : Steel Yield : 50.0 ksi
E: Modulus : 29,000.0 ksi

Applied Loads

Service loads entered. Load Factors will be applied for calculations.

Beam self weight NOT internally calculated and added
Uniform Load : D = 0.60, W = -0.960 k/ft, Tributary Width = 1.0 ft

DESIGN SUMMARY

Design OK

Structural Walls and Their Anchorage Per ASCE 7-22, Section 12.11

For 12" CMU:

Out-of-Plane Forces (Sec. 12.11.1)			
S_{DS} =	*1.34*		
I_e =	*1.25*		
W_p =	*120*	psf	
$F_p = 0.4S_{DS}I_eW_p$ =	**80.4**	psf	Controls
$F_{pmin} = 0.1W_p$ =	12	psf	

Wall Anchorage Forces At The Roof (Sec. 12.11.2)			
Worst Case			
L_f =	*64*	ft	
$k_a = 1.0+L_f/100$	1.64		
$F_p = 0.4S_{DS}k_aI_eW_p$ (psf)	**132**	psf	Controls
$F_{p,min} = Max(5\ psf, 0.2k_aI_eW_p)$	49	psf	

DESIGN WALLS FOR OOP LOAD

$w_w = 48$ PSF

$w_e = 80$ PSF

$P_D = 19'(20\ PSF) = 380$ PLF

$P_b = 19'(36\ PSF) + \frac{29\ PSF(9')}{2} = 815$ PLF

USE SOLID GROUTED 12" CMU ($f'_m = 2.5$ ksi)
W/ #6 VERTS AT 16" O.C. E.F. MIN

$CC = 0.75 < 1$, OK

Project Title:
Engineer:
Project ID:
Project Descr:

Combined Footing

Project File: Libby Booth.ec6

LIC# : KW-06015779, Build:20.26.07.01 Will Engineering LLC (c) ENERCALC, LLC 1982-2026

DESCRIPTION: Wall Ftg

Z-Axis Footing Flexure - Maximum Values for Load Combination

Load Combination...	Mu (ft-k)	Distance from left (ft)	Tension Side	As Req'd (in^2)	Governed by	Actual As (in^2)	Phi*Mn (ft-k)	Mu / PhiMn

Notes:

1. Web-height to thickness ratio exceeds 200. Web Stiffeners are required at all support points and concentrated loads.

*Where Ma is noted with an asterisk, cold-work of forming is applicable and has been used.

DESIGN STUDS

$W_L = 1.33'(5\ PSF) = 6.7\ PLF$

UNDER TYP JOIST

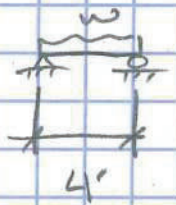
$P_D = 1.33'(5')\ 15\ PSF = 100\#$

$P_L = 1.33(5')(100\ PSF) = 665\#$

$\Sigma P = 765\#$

UNDER JOISTS SUPPORTING SHIPS LADDER

$P_D = 500\#$



$P_L = 1K$

$\Sigma = 1.5K$

USE 362S162-43 MIN @ 16" o.c.

$P_{ALLOW} = 1.72K > \Sigma P$, O.K.

DESIGN OPNG HDR

$W_D = 6'(15\ PSF) = 90\ PLF$

$W_L = 6'(100\ PSF) = 600\ PLF$

$M_{MAX} = \frac{wL^2}{8} = 1380\#\text{-}ft = 16.6\ K\text{-}in$

USE (2)600S162-43 MIN

$M_{ALLOW} = 2(14.46\ K\text{-}in) = 28.9\ K\text{-}in$

$> M_{MAX}$, OK.

Bare Deck Variable Position Concentrated Load (VPCL)

Detailed Analysis for Span Length of 8 ft

Calculated in accordance with IAPMO ER-0423, AISI S100-16 (2020) w/S2-20, IBC 2024, ASCE 7-22

Hilti X-ENP19 PAF Connections to Supports	End Bearing Length of 2 in.
24 / 3 Perpendicular Connection Pattern to Supports	Interior Bearing Length of 3 in.
A36 Support Member or Equivalent	End Condition: Both Ends Butted
0.25 ≤ Support Thickness (in.) ≤ ∞	L/240 Deflection Limit

Summary

Variable Position Concentrated Load (VPCL) refers to single or multiple concentrated loads that can be applied at any position along the span.
The maximum magnitude of the VPCL is determined using the governing effect at the critical section, regardless of the actual applied load location(s).
The sum of all applied concentrated loads per rib in a given span shall not exceed the Total VPCL unless shown by more detailed analysis.

Span		L_v =	8.000	ft
Deflection Criteria			L/240	
Inward Roving Load				
	Total VPCL for All LRFD Load Combinations		952	lb/rib
	Total VPCL for Live Service Load		952	lb/rib
	Total VPCL for Roof Live Service Load		920	lb/rib
	Total VPCL for Snow Service Load		770	lb/rib
	Total VPCL for Wind Service Load		952	lb/rib
Outward Roving Load				
	Total VPCL for All LRFD Load Combinations		248	lb/rib
	Total VPCL for Live Service Load		248	lb/rib
	Total VPCL for Roof Live Service Load		248	lb/rib
	Total VPCL for Snow Service Load		248	lb/rib
	Total VPCL for Wind Service Load		248	lb/rib

Hilti X-ENP19 PAF Connection to Support

Shear Strength, Tension Strength, Stiffness

Detailed Analysis for Span Length of 8 ft

Calculated in accordance with IAPMO ER-0423, AISI S100-16 (2020) w/S2-20, AISI S310-20 w/S1-22

For Tension/Shear Interaction, MWFRS Design Net Wind Uplift (LRFD) = 90 psf
A36 Support Member or Equivalent
0.25 ≤ Support Thickness (in.) ≤ ∞

Steel Deck Properties

t_1 =	0.0478	in.
t_{1c} =	0.0478	in.
F_{y1} =	50.0	ksi
F_{u1} =	65.0	ksi

Support Steel Properties

t_2 =	0.250	in.
F_{y2} =	36.0	ksi
F_{u2} =	58.0	ksi

Perforation Adjustment Factor [ER-0423]

ρ =	0.712	Shear
ρ =	0.850	Pullover
ρ =	1.150	Flexibility

Fastener Properties [ER-0423]

d =	0.177	in.
d_w =	0.591	in.

Shear Strength

Material		P_{nvp} =	3.838	kips	[ER-0423]
		ϕ_{nvp} =	0.60		[ER-0423]
		$\phi_{nvp} \cdot P_{nvp}$ =	2.303	kips	
Typical Condition	$P_{nf} = \rho \cdot 56 \cdot t_1 \cdot (1 - t_1)$ =		1.815	kips	[ER-0423 Eqn H-1]
		ϕ_{nf} =	0.70		[ER-0423]
		$\phi_{nf} \cdot P_{nf}$ =	1.271	kips	
		$\min(\phi_{nvp} \cdot P_{nvp}, \phi_{nf} \cdot P_{nf})$ =	1.271	kips	
		$P_{nf} \le P_{nvp}$ =	1.815	kips	
Corner Condition	$P_{nfc} = \rho \cdot 56 \cdot t_{1c} \cdot (1 - t_{1c})$ =		1.815	kips	[ER-0423 Eqn H-1]
		$\phi_{nf} \cdot P_{nfc}$ =	1.271	kips	
		$\min(\phi_{nvp} \cdot P_{nvp}, \phi_{nf} \cdot P_{nfc})$ =	1.271	kips	
		$P_{nfc} \le P_{nvp}$ =	1.815	kips	

Flexibility

$S_f = \rho \cdot \frac{0.75}{1000 \cdot \sqrt{t_1}}$ =	0.0039	in./kip	[ER-0423 Eqn H-3a]

Tension Strength

Material	P_{nts} =	6.397	kips	[ER-0423]
	ϕ_t =	0.60		[ER-0423]
	$\phi_t \cdot P_{nts}$ =	3.838	kips	
Pull-out	P_{not}=	2.625		[ER-0423 Eqn H-5]
	ϕ_{not} =	0.65		[ER-0423 Eq H-5]
	$\phi_{not} \cdot P_{not}$ =	1.706	kips	
Pullover - Typical Condition	$P_{nov} = \rho \cdot 1.5 \cdot t_1 \cdot d_w \cdot F_{u1}$ =	2.341	kips	[S100 Eqn J5.2.3-1]
	ϕ_{tov} =	0.50		
	$\phi_{tov} \cdot P_{nov}$ =	1.171	kips	
	$\phi \cdot P_{tf} = \min(\phi_t \cdot P_{nts}, \phi_{not} \cdot P_{not}, \phi_{nov} \cdot P_{nov})$ =	1.171	kips	
Pullover - Corner Condition	$P_{novc} = \rho \cdot 1.5 \cdot t_{1c} \cdot d_w \cdot F_{u1}$ =	2.341	kips	[S100 Eqn J5.2.3-1]
	$\phi_{tov} \cdot P_{novc}$ =	1.171	kips	
	$\min(\phi_t \cdot P_{nts}, \phi_{not} \cdot P_{not}, \phi_{nov} \cdot P_{novc})$ =	1.171	kips	

Tension and Shear Interaction

Required Tensile Strength of Connection (T)	T =	0.600	kips	
Combined Shear and Pullout - Typical Condition	$P_{nft} = P_{nf} \cdot \left(1 - \frac{T}{\phi_{tot} \cdot P_{not}}\right)$ =	1.177	kips	[S310 Eqn D3.1.3-1b]
Combined Shear and Pullout - Corner Condition	$P_{nftc} = P_{nfc} \cdot \left(1 - \frac{T}{\phi_{tot} \cdot P_{not}}\right)$ =	1.177	kips	[S310 Eqn D3.1.3-1b]
Combined Shear and Pullover - Typical Condition	$P_{nft} = P_{nf} \cdot \left(1 - \frac{T}{\phi_{tov} \cdot P_{nov}}\right)$ =	0.885	kips	[S310 Eqn D3.1.3-1b]
Combined Shear and Pullover - Corner Condition	$P_{nftc} = P_{nfc} \cdot \left(1 - \frac{T}{\phi_{tov} \cdot P_{novc}}\right)$ =	0.885	kips	[S310 Eqn D3.1.3-1b]
Residual Shear Strength - Typical Condition	P_{nft} =	0.885	kips	[S310 Eqn D3.1.3-1b]
Residual Shear Strength - Corner Condition	P_{nftc} =	0.885	kips	[S310 Eqn D3.1.3-1b]

Required End Distance Governed by Rupture

Typical Condition	$e_{di} = \frac{\min(\phi_{nvp} \cdot P_{nvp}, \phi_{nf} \cdot P_{nf})}{\phi_{nv} \cdot 2 \cdot F_{u1} \cdot t_1} + \frac{d}{2}$ =	0.429	in.	[ER-0423 Eqn R-1]
	ϕ_{nv} =	0.60		[ER-0423 Eqn R-1]
Corner Condition	$e_{dc} = \frac{\min(\phi_{nvp} \cdot P_{nvp}, \phi_{nf} \cdot P_{nfc})}{\phi_{nv} \cdot 2 \cdot F_{u1} \cdot t_{1c}} + \frac{d}{2}$ =	0.429	in.	[ER-0423 Eqn R-1]

Minimum End Bearing Length Governed by Material and Fasteners

Minimum distance between fastener and end of deck

$e_d = \max(e_{di}, e_{dc}) =$ 0.429 in.

Minimum distance between fastener and end of support limited by rupture

For design, $t_2 \le 3/16$ in. $t_{2\,max} =$ 0.1875 in. [S100 Sec J6]

$$e_{si} = \frac{\min(\phi_{nvp} \cdot P_{nvp}, \phi_{nf} \cdot P_{nf})}{\phi_{nv} \cdot 0.6 \cdot F_{u2} \cdot 2 \cdot t_2} + \frac{d}{2} =$$ 0.283 in. [S100 Eqn J6.1-1]

$\phi_{nv} =$ 0.50 [S100 Tbl J6-1]

$$e_{sc} = \frac{\min(\phi_{nvp} \cdot P_{nvp}, \phi_{nf} \cdot P_{nfc})}{\phi_{nv} \cdot 0.6 \cdot F_{u2} \cdot 2 \cdot t_2} + \frac{d}{2} =$$ 0.283 in. [S100 Eqn J6.1-1]

$e_s = \max(e_{si}, e_{sc}) \ge 0.500 =$ 0.500 in.

Minimum spacing between fasteners $s_{min} =$ 1.000 in.

For a single row of fasteners $N_{e\,min} = e_d + e_s =$ 0.929 in.

For a double row of fasteners $N_{e\,min} = e_d + s_{min} + e_s =$ 1.929 in.

Minimum Interior Bearing Length Governed by Material and Fasteners

For a single row of fasteners $N_{i\,min} = 2 \cdot e_s =$ 1.000 in.

For a double row of fasteners $N_{i\,min} = 2 \cdot e_s + s_{min} =$ 2.000 in.

Detailed Bare Deck Web Crippling Strength Analysis

Calculated in accordance with IAPMO ER-0423, AISI S100-16 (2020) w/S2-20

End Bearing Length of 2 in. Interior Bearing Length of 3 in.

Web Crippling Strength Summary

End One-Flange Loading	$\phi_w \cdot P_{ne1}$ =	2,241	lb/ft
End Two-Flange Loading	$\phi_w \cdot P_{ne2}$ =	2,435	lb/ft
Interior One-Flange Loading	$\phi_w \cdot P_{ni1}$ =	4,007	lb/ft
Interior Two-Flange Loading	$\phi_w \cdot P_{ni2}$ =	4,805	lb/ft

Panel Properties

t =	0.0478	in.	h_w =	3.110		d_p =	0.156	in.
F_y =	50.0	ksi	θ =	70.8	deg	c_p =	0.375	in.
N_e =	2.000	in.	R =	0.188		W_p =	0.000	in.
N_i =	3.000	in.	w_c =	24.000	in.			
			d =	8.000	in.			

Web Crippling Properties

Webs per foot width $n = 2 \cdot (12 / d)$ = 3.000

Web crippling strength of a web, P_n

$$P_n = C \cdot t^2 \cdot F_y \cdot \sin\theta \left(1 - C_R \sqrt{\frac{R}{t}}\right)\left(1 + C_N \sqrt{\frac{N}{t}}\right)\left(1 - C_h \sqrt{\frac{h_w}{q_s \cdot t}}\right)$$

[S100 Eqn G5-1 with modifications per ER-0423]

$$p_o = 0.9069 \cdot \frac{{d_p}^2}{{c_p}^2} = 0.157$$ [ER-0423 Eqn W-2]

For $p_o < 0.2$: $k = 1 - 2.175 \cdot p_o$ = 0.659 [ER-0423 Eqn W-3]

For $0.2 \le p_o \le 0.58$: $k = 0.9 + {p_o}^2 - 1.875 \cdot p_o$ = 0.630 [ER-0423 Eqn W-3]

k = 0.659

$$q_s = 1 - (1 - k)\left(\frac{W_p}{h_w}\right) = 1.000$$ [ER-0423 Eqn W-1]

Bare Deck Wall Anchorage

18 gage 3.5D-24 Grade 40 with 8' - 0" Deck Span

Project: Libby Booth STEAM
Description: 3.5DS-24 Wall Anchorage

Job No. 0
Engineer: 0

Connections to Support (Ledger/Chord) at WALL

Hilti X-ENP-19 PAF
24/6 Perpendicular Connection Pattern
0.654 in. Steel Deck Minimum End Distance
2.0DS-30 AC

A36 Support Member or Equivalent
0.25 in. ≤ Support Thickness in.
0.50 in. Support Member Minimum Edge Distance
2.00 in. Steel Deck Bearing on Support at Wall

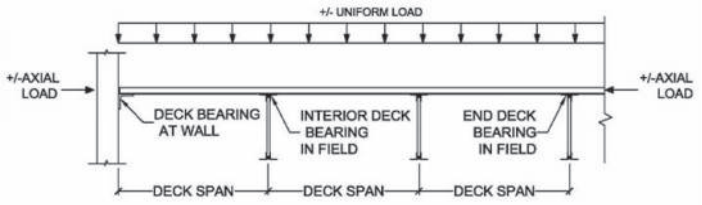
0.00 in. Connection Prying Action for Seismic at Wall
0.00 in. Connection Prying Action for Wind at Wall

Connections in FIELD of Diaphragm

Hilti X-ENP-19 PAF
24/6 Perpendicular Connection Pattern
0.573 in. Steel Deck Minimum End Distance

A36 Support Member or Equivalent
0.25 in. ≤ Support Thickness in.
0.50 in. Support Member Minimum Edge Distance
3.00 in. Steel Deck Bearing on Supports in Field of Diaphragm
2.00 in. Steel Deck Sheet End Bearing on Support in the Field

Summary of Calculations in accordance with ASCE 7-16, AISI S100-16 (2020) w/S2-20, and ER-0423



1-Span	Steel Deck Axial and Bending Check	0.37	≤1.0 Pass		
	Connection Strength Check	0.69	≤1.0 Pass at wall	0.69	≤1.0 Pass in field
	Web Crippling Check	0.30	≤1.0 Pass at wall	0.30	≤1.0 Pass in field
2-Span	Steel Deck Axial and Bending Check	0.34	≤1.0 Pass		
	Connection Strength Check	0.70	≤1.0 Pass at wall	0.70	≤1.0 Pass in field
	Web Crippling Check	0.23	≤1.0 Pass at wall	0.41	≤1.0 Pass in field
3-Span	Steel Deck Axial and Bending Check	0.28	≤1.0 Pass		
	Connection Strength Check	0.70	≤1.0 Pass at wall	0.70	≤1.0 Pass in field
	Web Crippling Check	0.24	≤1.0 Pass at wall	0.36	≤1.0 Pass in field

Vertical Loads

Dead Load for Inward Wind Combo, Di (psf)	19.3
Dead Load for Wind Uplift Combo, Do (psf)	19.3
Live Load, L (psf)	0.0
Roof Live Load, Lr (psf)	20.0
Rain Load, R (psf)	0.0
Snow Load, S (psf)	65.0
Inward Wind, W_i (psf)	17.5
Wind Uplift on Steel Deck , Wo (psf)	90.0
Wind Uplift for Connections, Wo (psf)	123.0

Horizontal Loads and Factors

Wall Inward Wind Anchorage Load, Wi (plf)	0
Wall Outward Wind Anchorage Load, Wo (plf)	0
Notional Load for Wall Anchorage, ±N (plf)	0
Seismic Wall Anchorage Load, ±FD (plf)	2631
Seismic Parameter, SDS	1.34
Seismic Design Category	C, D, E or
Wall Construction	Concrete or Masonry
Steel Element of Structural Wall Anchorage System Increase (ASCE 7 Section 12.11.2.2.2)	1.4

Bare Deck Wall Anchorage V2.1.1 Date: 6/30/2026
Based on ASCE 7-16, AISI S100- 16 w/ S2-20 and, IAPMO ER-0423

Design Criteria Summary

Code: **2024 IBC**

Structural Risk Category: **III** (IBC Table 1604.5)

Gravity Loads and Masses:

Roof:

Roof Live Load (Lr): **20 psf** (IBC Table 1607.1)

Snow (S): Per ASCE 7-22 Chapter 7.

$p_f = 0.7C_eC_tp_g$:

At Heated Roof: **36.0 psf**

At Unheated Roof: **36.3 psf**

C_e = *0.9* Per ASCE 7-22 Table 7.3-1.

C_t : Per ASCE 7-22 Table 7.3-2 and 7.3-3.

At Heated Roof: *1.19*

At Unheated Roof: *1.20*

p_g = *48* psf

p_m (at roof slope < 15^0) = **35** psf, Per ASCE 7-22 Sec 7.3.3.

$p_{m,max}$ = *35* Per ASCE 7-22 Table 7.3-4.

$p_s = C_sp_f$:

At Heated Roof: **36.0 psf**

At Unheated Roof: **36.3 psf**

C_s = *1.0*

1st Floor:

Live (L) - Per IBC Table 1607.1:

Offices	50.0 psf
Classrooms	40.0 psf
First- Floor Corridors	100.0 psf

(E) Kindergarten Room

Dead (D)

Flooring	2.0 psf
5" Concrete Slab	60.0 psf
Mech/Misc.	3.0 psf
Σ =	**65.0 psf**

Table 1608.2.1 Ground snow loads for Northern Nevada locations

*Add Table **1608.2.1** to read as follows:*

Table 1608.2.1

GROUND SNOW LOADS, Pg, FOR NORTHERN NEVADA LOCATIONS [1,2,3,4]

Elevation (feet)	West of U.S. 395, Eastern Sierra Slope, Carson City, Reno, Washoe County*, Douglas County and West of S.R. 88.[1]				East of U.S. 395 for Carson City, Reno, Sparks, Washoe County*, Douglas County and East of S.R. 88.[1]				Lyon County, City of Fernley				Storey County[1]				All Nevada Counties*, Lake Tahoe Basin, Western Sierra Slope

Footnotes:

1. Final roof snow design load Ps or Pf shall not be less than 29 psf

2. Refer to local jurisdiction ordinances for other Ground Snow Load information S.R. = State Route

3. Intermediate values may be determined by interpolation U.S. = U.S. Highway

4. The City of Elko shall not have ground snow loads less than 30 psf and Churchill County shall not have ground snow loads less than 20 psf

* Ground snow loads in Washoe County shall be taken from Tables 1608.2.1 or the ASCE Hazard Tool. Ground snow loads from the ASCE Hazard tool shall use the ASCE/SEI 7-22 standard. The minimum ground snow load for a structure shall not be less than the lower of the two values from Table 1608.2.1 and the ASCE Hazard Tool.

Table 1609.3.2 Special wind region defined: minimum basic wind speeds

*Add Table **1609.3.2** to read as follows:*

TABLE 1609.3.2
SPECIAL WIND REGION DEFINED:
MINIMUM BASIC WIND SPEEDS

For Carson City, City of Reno, City of Sparks, Douglas, Lyon, Storey and Washoe Counties the design wind speed values shall be:

Risk Category	Ultimate Wind Speed V_{ult} (mph)	V_{asd} Wind Speed 3-sec gust (mph)
I	110	85
II & 2024 IRC	120	93
III	130	101
IV	135	104

Table notes:

a) Air density corrections to design wind pressures are prohibited. The conversions from Vult to Vasd are based on Table 1609.3.1

Section 1704.2 Special inspections and tests

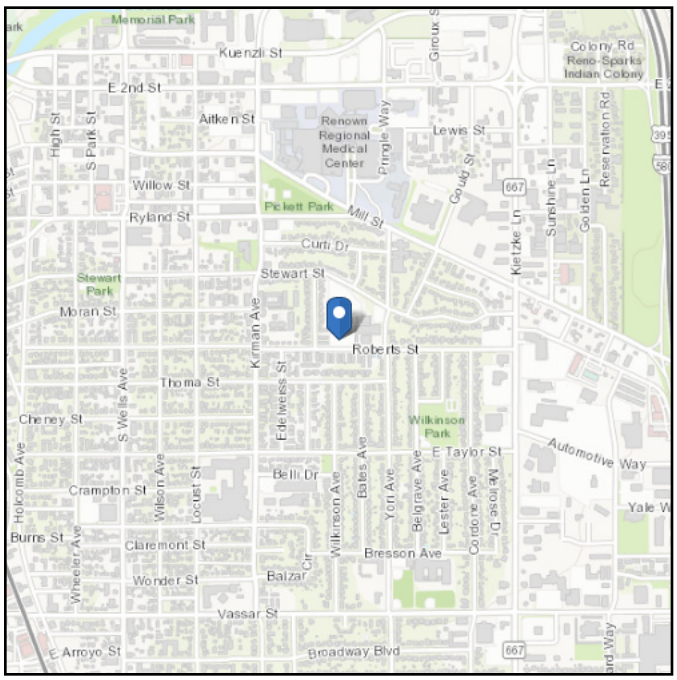
*Amend Section **1704.2** to read as follows:*

1704.2 Special inspections and tests. Where application is made to the *building official* for construction as specified in Section 105, the *owner* or the *owner's* authorized agent, other than the contractor, shall employ one or more *approved agencies* to provide *special inspections* and tests during construction on the types of work specified in Section 1705 and identify the *approved agencies* to the *building official*. These *special inspections* and tests are in addition to the inspections by the *building official* that are identified in Section 110.

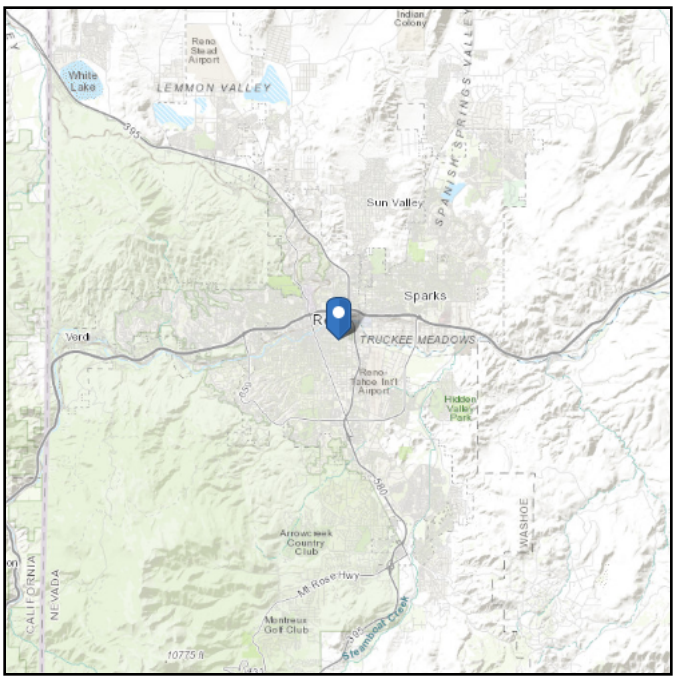
Exceptions:

1. *Special inspections* and tests are not required for construction of a minor nature or as warranted by conditions in the *jurisdiction* as *approved* by the *building official*.

2. Unless otherwise required by the *building official*, *special inspections* and tests are not required for Group R-3 occupancies as applicable in section 101.2 and Group U occupancies that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.



3. *Special inspections* and tests are not required for portions of *structures* designed and constructed in accordance with the cold-formed steel *light-frame construction* provisions of Section 2206.1.2 or the *conventional light-frame constructions* provisions of Section 2308.



4. The contractor is permitted to employ the *approved agencies* where the contractor is also the *owner*.

Seismic Design Category = A

Cross Section & Reinforcing Details

Rectangular Section, Width = 12.0 in, Height = 22.0 in
Span #1 Reinforcing....
3-#8 at 2.750 in from Bottom, from 0.0 to 20.0 ft in this span

Load for Span Number 1
Uniform Load : D = 0.4720, L = 0.9330 k/ft, Tributary Width = 1.0 ft

DESIGN SUMMARY

Design OK

Maximum Bending Stress Ratio = **0.901** : 1
Section used for this span **Typical Section**
Mu : Applied 102.960 k-ft
Mn * Phi : Allowable 114.260 k-ft
Location of maximum on span 9.982 ft
Span # where maximum occurs Span # 1

Design Limits
Tensile Strain >= Min Strain Limit (Section 9.3.3.1)
0.01459 in / in >= 0.00424 in / in OK
As Provided >= As,min (Section 9.6.1.2)
2.370 in^2 >= 2.357 in^2 OK

Maximum Deflection

Max Downward Transient Deflection	0.188 in	Ratio =	1273 >=360.0	L Only
Max Upward Transient Deflection	0.000 in	Ratio =	0 <360.0	L Only
Max Downward Total Deflection	0.317 in	Ratio =	756 >=240.0	Span: 1 : +D+L
Max Upward Total Deflection	0.000 in	Ratio =	0 <240.0	Span: 1 : +D+L

Vertical Reactions

Support notation : Far left is #1

Load Combination	Support 1	Support 2
Max Upward from all Load Conditions	14.050	14.050
Max Upward from Load Combinations	14.050	14.050
Max Upward from Load Cases	9.330	9.330
D Only	4.720	4.720
+D+L	14.050	14.050

Shear Stirrup Requirements

Between 0.00 to 5.39 ft, Max spacing per 9.7.6.2.2, use #3 stirrups spaced at 9 in
Between 5.43 to 14.57 ft, Ties Not Req'd, Stirrups are not required.
Between 14.61 to 19.96 ft, Max spacing per 9.7.6.2.2, use #3 stirrups spaced at 9 in

+0.90D					
Span # 1	1	20.000	21.24	114.26	0.19

Overall Maximum Deflections

Span	Load Combination	Max. "-" Defl (in)	Location in Span (ft)	Load Combination	Max. "+" Defl (in)	Location in Span (ft)
1	+D+L	0.3174	10.000		0.0000	0.000

DESIGN STRONG-BACK TO BRACE WALL/COL AT BATHROOM

$F_p = 0.4\, S_{DS}\, K_a\, I_e\, W_p = 107$ PSF

USE $K_a = 2.0$
$I_e = 1.25$
$W_p = 80$ psf
$S_{DS} = 1.34$

$W_E = 2.7'(107\ \text{PSF}) = 289$ PLF

FOR $\Delta_{O.T.E} < \frac{L}{240}$, USE HSS 4x4x 3/16 MIN

$CC = 0.31 < 1$, $\Delta_{O.T.E} = \frac{L}{362} < \frac{L}{360}$, OK.

- SEE ATTACHED.

TO MATCH STRENGTH OF (E) 6" PIPE STD
NEED $Z_{HSS} = 10.6\ in^3 \left(\frac{35\ ksi}{50\ ksi}\right) = 7.4\ in^3$

USE HSS 6x6x 3/16 MIN
$Z = 8.6\ in^3$

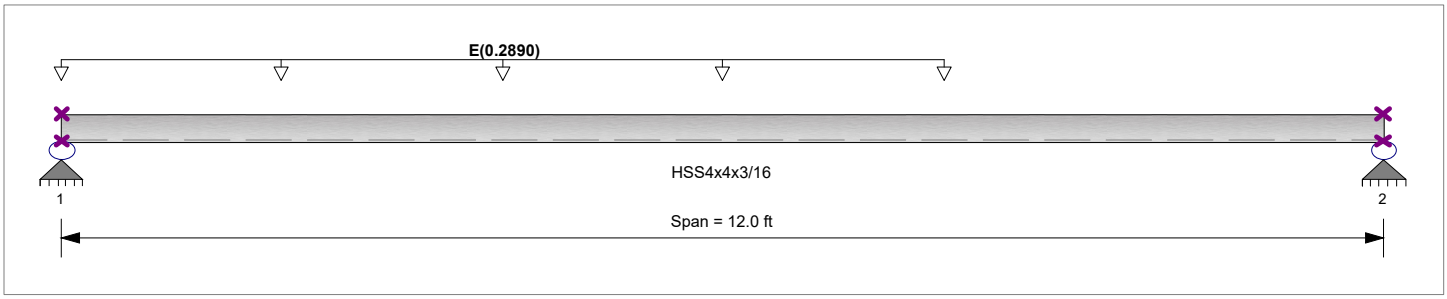
DESCRIPTION: Strongback

Code References



Governing Code : IBC 2024
Referenced Design Standard(s) : AISC 360-22
Load Combination Set : ASCE 7-22 / IBC 2024

Rho (or Omega) = 1.00

Material Properties

Analysis Method : Allowable Strength Design
Beam Bracing : Completely Unbraced
Bending Axis : Major Axis Bending

Fy : Steel Yield : 50.0 ksi
E: Modulus : 29,000.0 ksi

Applied Loads

Service loads entered. Load Factors will be applied for calculations.

Beam self weight NOT internally calculated and added
Load for Span Number 1
Partial Length Uniform Load : E = 0.2890 k/ft, Extent = 0.0 -->> 8.0 ft, Tributary Width = 1.0 ft

DESIGN SUMMARY

Design OK

Maximum Bending Stress Ratio =	0.314 : 1	Maximum Shear Stress Ratio =	0.050 : 1

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT

FACILITY AND MATERIAL LOCATION: Libby Booth Elementary School **MDP #26-173**

DESCRIPTION OF WORK TO BE PERFORMED: Interior Remodel and New STEAM/Media Center Building

IT IS THE RESPONSIBILITY OF THE CONTRACTOR/WORKER TO IDENTIFY MATERIAL TYPE PRIOR TO DISTURBANCE. ONLY MATERIALS LISTED ON THIS PERMIT MAY BE DISTURBED. ANY NEW MATERIAL DISCOVERED OR ANY MATERIAL WHOSE EXACT NATURE OR CHARACTER IS UNCERTAIN REQUIRES A NEW PERMIT PRIOR TO DISTURBANCE. ANY CITATIONS OR ASBESTOS/LEAD CONTAMINATION RESULTING FROM THE IMPROPER OR UNAUTHORIZED DISTURBANCE OF ASBESTOS OR LEAD MATERIALS IS SOLELY THE RESPONSIBILITY OF THE CONTRACTOR. A COPY OF THIS PERMIT MUST BE SIGNED BY THE CONTRACTOR AND SUBMITTED TO THE DISTRICT PRIOR TO STARTING THE PROJECT.

REFER TO THE MAP ON THE LAST PAGE OF THIS PERMIT FOR ADDITIONAL INFORMATION ON BLDG/ROOF AREA ALPHABETICAL IDENTIFICATION LETTERS BEING REFERRED TO IN THIS PERMIT. DO NOT USE ANY OTHER SOURCE TO DETERMINE WHAT AREAS ARE IDENTIFIED IN THIS PERMIT. THE BUILDING/ROOF IDENTIFICATION LETTERS USED IN THIS PERMIT MAY NOT NECESSARILY MATCH WHAT IS FOUND OR REFERENCED IN THE FIELD OR IN OTHER CONTRACT DOCUMENTS.

ITEM #1	MATERIAL DESCRIPTION: **GYPSUM BOARD BUILDING SYSTEM**
AHERA MATERIAL NUMBER: M-01	CONTAINS ASBESTOS ?: **NO**
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB.	

ITEM #2	MATERIAL DESCRIPTION: **BLOCK/MORTAR**
AHERA MATERIAL NUMBER: M-02B	CONTAINS ASBESTOS ?: **NO**
MATERIAL DISTURBANCE INSTRUCTIONS: THE BLOCK/MORTAR HAS BEEN SAMPLED IN ACCORDANCE WITH AHERA AND ASTM PROTOCOLS AND DOES NOT CONTAIN ASBESTOS. OK TO DISTURB. COMPLETE SURVEY RESULTS AVAILABLE UPON REQUEST.	

ITEM #3	MATERIAL DESCRIPTION: **CONCRETE**
AHERA MATERIAL NUMBER: M-02C	CONTAINS ASBESTOS ?: **NO/UNKNOWN**
MATERIAL DISTURBANCE INSTRUCTIONS: CONCRETE SLATED FOR REMOVAL OR DISTURBANCE ON THIS PROJECTS DRAWINGS HAS BEEN SAMPLED AND IT DOES NOT CONTAIN ASBESTOS. IF ANY OTHER CONCRETE THAT IS NOT IDENTIFIED ON THE DRAWINGS MUST BE DISTURBED, THE CONTRACTOR MUST TREAT THIS CONCRETE AS ASBESTOS CONTAINING, AND IN ACCORDANCE WITH ALL APPLICABLE ASBESTOS REGULATIONS AND REQUIREMENTS UNTIL THIS MATERIAL HAS BEEN PROPERLY SAMPLED BY THE ES&A DEPARTMENT AND DETERMINED IT DOES NOT CONTAIN ASBESTOS. ALL CONCRETE CONTAINS SILICA SO IF THE CONTRACTOR MUST CUT, ABRADE, OR GRIND THIS MATERIAL; THE CONTRACTOR MUST ALSO COMPLY WITH THE FEDERAL SILICA REGULATION AND ITS REQUIREMENTS REGARDLESS OF ASBESTOS CONTENT.	

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

ITEM #4	MATERIAL DESCRIPTION: **METAL BUILDING MATERIALS**
AHERA MATERIAL NUMBER: M-03	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB.	

ITEM #5	MATERIAL DESCRIPTION: **TRANSITE/CEMENTITIOUS PANELS**
AHERA MATERIAL NUMBER: M-04P	CONTAINS ASBESTOS ?: **YES**
MATERIAL DISTURBANCE INSTRUCTIONS: CONTAINS ASBESTOS	

ITEM #6	MATERIAL DESCRIPTION: **TRANSITE PIPE**
AHERA MATERIAL NUMBER: M-04P	CONTAINS ASBESTOS ?: **YES**
MATERIAL DISTURBANCE INSTRUCTIONS: CONTRACTOR IS RESPONSIBLE FOR THE DISTURBANCE AND REMOVAL OF DAMAGED TRANSITE PIPE AS REQUIRED TO PERFORM REPAIR/INSTALLATION PROPERLY. CONTRACTOR WILL ONLY UTILIZE WORKERS WITH A MINIMUM OF 16 HOURS OF ASBESTOS TRAINING. AND ABSOLUTELY NO CUTTING OF THE PIPE IS AUTHORIZED. ONLY SNAP CUTTING CAN BE CONDUCTED AND THE CONTRACTOR MUST COMPLY WITH ALL LOCAL, STATE AND FEDERAL REGULATIONS. THE PIPE MUST BE DISPOSED OF PROPERLY TO INCLUDE IMMEDIATE WRAPPING WITH TWO LAYERS OF 6 MIL POLY ON THE SITE UPON REMOVAL. ANY DISTURBANCE MUST BE NOTIFIED TO ES&A AT 325-8490 IMMEDIATELY PRIOR TO DISTURBANCE.	

ITEM #7	MATERIAL DESCRIPTION: **WOOD BUILDING PRODUCTS**
AHERA MATERIAL NUMBER: M-06	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB.	

ITEM #8	MATERIAL DESCRIPTION: **WOOD/METAL DOOR**
AHERA MATERIAL NUMBER: M-08	CONTAINS ASBESTOS ?: YES - ASSUMED
MATERIAL DISTURBANCE INSTRUCTIONS: DOORS ARE TO BE SAMLED DURING CONSTRUCTION IF REQUIRED.	

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

ITEM #9	MATERIAL DESCRIPTION: **CEILING TILE – ACT - FCP**
AHERA MATERIAL NUMBER: M-10	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB. NOTE THERE ARE TRANSITE CEILING PANEL LOCATED IN THE D-WING THAT CONTAIN ASBESTOS. THE NON ASBESTOS CEILING TILES ARE NOT MADE OF TRANSITE WHICH IS A MATERIAL MADE OF CONCRETE AND ASBESTOS MATERIAL.	

ITEM #10	MATERIAL DESCRIPTION: **FLOOR TILE AND MASTIC – VSF - VFT**
AHERA MATERIAL NUMBER: M-12	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB.	

ITEM #11	MATERIAL DESCRIPTION: **BASE COVE AND MASTIC**
AHERA MATERIAL NUMBER: M-13	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: THIS MATERIAL DOES NOT CONTAIN ASBESTOS BUT THE PAINTS AND COATING ON THE WALLS DOES CONTAIN LEAD. IF THIS BASE COVE MUST BE REMOVED, AS A PART OF A FLOORING PROJECT, THE CONTRACTOR MUST COMPLY WITH DISTRICT SUPPLED BASE COVE LEAD REMOVAL SPECIFICATIONS PROVIDED BY THE DISTRICT'S HIRED LEAD CONSULTANT. IN ADDITION, THE DISTRICT HIRED LEAD CONSULTANT WILL BE REQUIRED TO WATCH THE BASE COVE REMOVAL. THE CONTRACTOR MUST SCHEDULE ALL DISTURBANCES WITH THE DISTRICT'S LEAD CONSULTANT AND NO DISTURBANCE CAN BE CONDUCTED WHEN THEY ARE NOT THERE.	

ITEM #12	MATERIAL DESCRIPTION: **SHEET VINYL AND MASTIC**
AHERA MATERIAL NUMBER: M-14	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB.	

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

ITEM #13	MATERIAL DESCRIPTION: **CARPET AND MASTIC – INCLUDES WALK OFF**
AHERA MATERIAL NUMBER: M-15	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: VERIFY THAT NO FLOOR TILE IS PRESENT UNDER CARPET. OK TO DISTURB IF NO TILE IS PRESENT. IF TILE IS PRESENT REFER AND COMPLY WITH ALL MATERIAL INSTRUCTION IDENTIFIED FOR MATERIAL #M-12, FLOOR TILE AND MASTIC. NO REMOVAL OF CARPET GLUED TO FLOOR TILES IS AUTHORIZED.	

ITEM #14	MATERIAL DESCRIPTION: **FIBERGLASS BUILDING INSULATION**
AHERA MATERIAL NUMBER: M-17	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB.	

ITEM #15	MATERIAL DESCRIPTION: **ASBESTOS PIPE INSULATION**
AHERA MATERIAL NUMBER: T-40	CONTAINS ASBESTOS ?: **ABATED BUT SEE BELOW**
MATERIAL DISTURBANCE INSTRUCTIONS: ALL EXPOSED AND ACCESSIBLE ASBESTOS PIPE INSULATION HAS BEEN ABATED. THERE MAY BE ASBESTOS PIPE INSULATION THAT WAS INACCESSIBLE DURING THE ASBESTOS ABATEMENT ACTIVITIES THAT INTENDED TO ABATE ALL PIPE INSULATION IN THIS FACILITY. CARE MUST BE TAKEN AND IF ANY HARD PIPE INSULATION IS ENCOUNTERED, ANY SUSPECT PIPE INSULATION THAT IS NOT VERIFIED FIBERGLASS MUST BE TREATED AS ASBESTOS CONTAINING OR SAMPLED AND VERIFIED AS NON-ASBESTOS CONTAINING BEFORE ANY DISTURBANCE TAKES PLACE.	

ITEM #16	MATERIAL DESCRIPTION: **FIBERGLASS PIPE INSULATION**
AHERA MATERIAL NUMBER: T-41	CONTAINS ASBESTOS ?: NO
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB HOWEVER IF HARD ELBOWS ARE ENCOUNTERED THESE CANNOT BE DISTURBED. HARD ELBOWS CONTAIN ASBESTOS.

MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

ITEM #17	MATERIAL DESCRIPTION: **PLUMBING/MECHANICAL GASKETS**
AHERA MATERIAL NUMBER: N/A	CONTAINS ASBESTOS ?: **YES**
MATERIAL DISTURBANCE INSTRUCTIONS: PLUMBING AND MECHANICAL GASKETS HAVE BEEN FOUND TO CONTAIN ASBESTOS IN THE DISTRICT. THE CONTRACTOR MUST ASSUME ANY GASKET THAT NEEDS TO BE REMOVED OR DISTURBED CONTAINS ASBESTOS AND THE CONTRACTOR IS RESPONSIBLE TO HIRE AN ASBESTOS CONTRACTOR THAT WILL BE SUPERVISED BY THE DISTRICT TO PROPERLY REMOVE (AS PER DISTRICT ASBESTOS ABATEMENT SPECIFICATIONS AND/OR DISTRICT HIRED ASBESTOS CONSULTANT SPECIFICATIONS) OR CUT OUT THOSE GASKETS AND DISPOSE OF AS ASBESTOS CONTAINING MATERIALS. THE CONTRACTOR IS RESPONSIBLE FOR VISITING THE SITE AND DETERMINING IF ANY GASKETS NEED REMOVAL OR WILL BE DISTURBED PRIOR TO BIDDING AND THIS COST IS TO BE ADDED TO THE PRICE PROVIDED TO THE DISTRICT BY THE CONTRACTOR TO COMPLETE THE ABOVE DESIGNATED PROJECT. ABATEMENT MUST BE COMPLETED WHEN SCHOOL IS UNOCCUPIED. DELAYS DUE TO ABATEMENT ISSUES OR SCHEDULES MAY BE ENCOUNTERED. NOTIFY THE WCSD ES&A DEPARTMENT AND ANY DISTRICT HIRED ASBESTOS CONSULTANT TO SCHEDULE ANY REQUIRED ABATEMENT AT LEAST TWO WEEKS IN ADVANCE PRIOR TO REMOVAL.	

ITEM #18	MATERIAL DESCRIPTION: **TACKABLE SURFACES - TACK BOARD**
AHERA MATERIAL NUMBER: N/A	CONTAINS ASBESTOS ?: **NO**
MATERIAL DISTURBANCE INSTRUCTIONS: OK TO DISTURB.	

ITEM #19	MATERIAL DESCRIPTION: **HVAC FIRE DAMPERS**
AHERA MATERIAL NUMBER: N/A	CONTAINS ASBESTOS ?: **YES – ASSUMED**
MATERIAL DISTURBANCE INSTRUCTIONS: HVAC FIRE DAMPERS ARE TO BE SAMLED DURING CONSTRUCTION IF REQUIRED.	

ITEM #20	MATERIAL DESCRIPTION: **SINK COATING (BLACK)**

AHERA MATERIAL NUMBER: N/A	CONTAINS ASBESTOS ?: **YES/NO**

MATERIAL DISTURBANCE INSTRUCTIONS: THE ROOFING MATERIALS AT THIS SCHOOL HAVE BEEN SURVEYED BY HMS. THE HMS SURVEY DATED 1/3/11 SHOWS THE FOLLOWING:

ASBESTOS ROOF AREAS – (SEE ATTACHED MAP ON LAST PAGE)
ROOF AREA "D" HAS AN AREA WITH ASBESTOS CONTAINING BLACK MASTIC ON A BELL VENT THAT CONTAINS ASBESTOS; IF THIS MATERIAL HAS TO BE DISTURBED COMPLY WITH ALL ASBESTOS REQUIREMENTS LISTED BELOW.

NON-ASBESTOS ROOF AREAS– (SEE ATTACHED MAP ON LAST PAGE)
ROOF AREAS "A", "B", "C", "E", & "F", DO NOT CONTAIN ASBESTOS, OK TO DISTURB. THE CONTRACTOR CAN REQUEST A COPY OF THE DRAWING SHOWING THE AREAS IDENTIFIED WHICH HAS ADDITIONAL INFORMATION BY CONTACTING THE ES&A DEPARTMENT @ 325-8490.

ASBESTOS REQUIREMENTS
IF THE CONTRACTOR MUST DISTURB THE ASBESTOS CONTAINING AREAS IDENTIFIED ABOVE, THE CONTRACTOR IS RESPONSIBLE FOR PROPERLY COMPLETING THE WORK AND THE CONTRACTOR WILL INSURE THAT ALL PERSONNEL PERFORMING REMOVAL OR DISTURBANCES ARE PROPERLY ASBESTOS TRAINED AND PERSONAL AIR MONITORING MUST BE CONDUCTED THROUGHOUT ANY DISTURBANCE OR REMOVAL. AIR SAMPLING RESULTS MUST BE PROVIDED TO THE ES&A DEPARTMENT, DIRECTLY FAXED OR E-MAILED FROM THE LABORATORY WITHIN 48 HOURS AFTER DISTURBANCE OR REMOVAL. IN ADDITION, A HEPA VACUUM MUST BE ON SITE AND USED TO CLEAN UP ALL DEBRIS. THE REQUIREMENTS LISTED ABOVE, ARE THE DISTRICTS MINIMUM DISTURBANCE REQUIREMENTS. IF REMOVAL OF ROOFING MATERIALS, RATHER THEN DISTURBANCES IS REQUIRED, THE CONTRACTOR MUST COMPLY WITH A MORE INVOLVED SET OF DISTRICT PROCEDURES/SPECS AND THAT PROCEDURE/SPEC IS AVAILABLE UPON REQUEST BY CONTACTING THE ES&A DEPARTMENT AT 325-8490. IN ADDITION, THERE ARE OSHA TRAINING REQUIREMENTS, SPECIFIC TO ROOFING MATERIALS, AND THE CONTRACTOR IS REQUIRED TO COMPLY WITH OSHA AS WELL AS ANY ADDITIONAL REGULATORY REQUIREMENT NOT LISTED.

NOTE: THE ASBESTOS MATERIAL DISTURBANCE INSTRUCTIONS LISTED ABOVE ARE BASED ON THE AHERA REGULATION. THERE MAY EXIST OTHER REGULATIONS THAT MAY BE MORE STRINGENT THEN THESE RECOMMENDATIONS. IT IS THE RESPONSIBILITY OF THE CONTRACTOR TO ENSURE COMPLIANCE WITH ALL REGULATIONS THAT ARE APPLICABLE TO THE DISTURBANCE OF ASBESTOS/LEAD CONTAINING MATERIALS. ASBESTOS IS A MICROSCOPIC FIBER AND THE CLEANING OF ASBESTOS DEBRIS MUST BE CONDUCTED TO A MICROSCOPIC LEVEL. IN THE EVENT THAT ANY VISIBLE DEBRIS IS DISCOVERED FROM A DISTURBANCE OR AIR SAMPLING RESULTS ARE NOT PROVIDED TO THE DISTRICT, THE DISTRICT WILL IMMEDIATELY HIRE A THIRD PARTY LEAD/ASBESTOS CONSULTANT TO INVESTIGATE POSSIBLE LEAD/ASBESTOS CONTAMINATION AND AN LEAD/ASBESTOS ABATEMENT CONTRACTOR TO PERFORM ANY RECOMMENDED CLEAN-UP. THE CONTRACTOR WILL BE REQUIRED TO REIMBURSE THE DISTRICT FOR ALL COSTS INCURRED. IF AIR MONITORING IS REQUIRED, AIR MONITORING MUST BE CONDUCTED THROUGHOUT THE PROJECT. AIR MONITORING RESULTS FAXED DIRECTLY FROM THE LAB TO THE ES&A DEPARTMENT @ 851-5695, WITHIN 48 HOURS OF THE DISTURBANCE

DATE ISSUED: September 10, 2026

MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

Material Water & Lead Disturbance Permit, Water System Disturbance Permit Appendix Page #1

Contractors, their sub-contractors or workers are responsible in completing all work without impacting the water quality of District facilities and the domestic water supplies which feed district facilities. This Water System Disturbance Permit identifies the minimum requirements that Contractors, their sub-contractors and all workers will utilize to perform disturbance to the Districts water systems.

The following general requirements shall apply to any person who will be disturbing a District water system. In addition, they must contact the Environmental, Safety and Assessment Department (ES&A Dept) prior to any disturbance at 325-8494. This phone number has an answering machine and can be accessed 24 hours a day. These disturbances will be logged in and documented by the ES&A department.

All requirements for isolation are designed to protect the facility's potable water source from existing as well as potential cross-connections and to prevent any backflow occurrences in the form of backpressure or backsiphonage. The Water Disturbance Procedures listed are not site or incident specific and great care must be taken by technicians during all valving and isolation activities within a facility to prevent a potential backflow occurrence. There may be additional requirements that must be utilized to prevent any cross-connection or backflow occurrence, and each entity performing the disturbance is responsible for ensuring none occur and utilizing any additional steps as necessary to ensure none result from the completion of this project.

Any costs to correct any cross-connections and/or any backflow occurrences that result from the performance of this project are solely the responsibility of the Contractor, their sub-contractor and workers and the signing of this ES&A Department Disturbance Permit on acknowledges and agrees to this requirement.

FACILITY ISOLATION MINIMUM REQUIREMENTS

MECHANICAL ROOMS:

When turning off or disrupting the water service to a mechanical room all applicable requirements below must be conducted per this permit

1. **Remove all hoses from custodial faucets and bibs in location to be effected.**
2. **Shut down all boiler and chiller circulating pumps. Heating, Cooling and Domestic.**
3. **Shut down boiler, chiller and cooling tower if present.**
4. **Isolate boiler, cooling tower, chiller and relieve pressure from boiler.**
5. **Shut down hot water return pump, isolate any hot water heaters and turn off heating source.**
6. **Isolate domestic service to mechanical room.**
7. **Re-establish service to mechanical room in reverse order.**

BASIC WING:

When turning off or disrupting the water service to a facility wing all applicable requirements below must be conducted per this permit

1. **Remove all hoses from custodial, art and science faucets along with bibs in location to be effected.**
2. **Isolate all water utilizing chemical dispensers in location to be effected.**
3. **Shut down and isolate any water using equipment if applicable. Hot water heaters, domestic make ups for heat exchangers, photo labs, etc.**
4. **Isolate domestic cold water main to wing.**
5. **Re-establish service to wing in reverse order. Flush system at the end of each lateral to remove any and all foreign material and air.**

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

FACILITY:

When turning off or disrupting the water service to a facility all applicable requirements below must be conducted per this permit. Turning off or disturbing the waters services to a facility should only be done as a last resort. If it is possible to isolate the area of disturbance without disrupting facilities entire water service that is the way the project is to be accomplished. This will also keep the contractor, his sub-contractors or workers from having to perform all the listed requirements.

1. **Remove all hoses from custodial, art and science faucets along with bibs in entire facility.**
2. **Isolate mechanical room. See above requirements.**
3. **Isolate each individual wing where possible. See above requirements.**
4. **Isolate all irrigation laterals connected to the domestic potable water supply.**
5. **Isolate domestic cold water main at all locations present to allow as little drain back as possible.**
6. **Re-establish service to facility in reverse order. Flush system at the end of each lateral to remove any foreign material and air.**

MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

PAINTS AND COATINGS – Material Disturbance Permit Appendix - Lead in Paints and Coatings in WCSD Facilities

Lead containing paints and coating are present in WCSD facilities. Bidders/Contractors that disturb lead containing or potentially lead containing paints or coatings, by law, are required to know all applicable regulations applicable and comply with all state and federal regulations that apply to the disturbances to lead paints and coating they are conducting. The regulations that requires by a contractor to be properly trained and knowledgeable, related to lead disturbance includes, but is not limited to the following:

- **OSHA Regulation CFR 1926.62 – Lead & Appendix A, B, C, & D – Lead Construction Standard.**
- **OSHA Regulation CFR 1910. 1025 - Lead & Appendix A, B, C, & D – General Industry Standard.**
- **EPA, 40 CFR Part 745 – Lead; Renovation, Repair, and Painting Regulation.**

Bidders/Contractors accept and acknowledge by signing this Material Disturbance Permit, the existence of lead related regulations, and accept all liability related to the disturbance of lead containing materials, citation resulting from, or any other costs the District may incur by the action of all parties of the bidders company or companies hired by the successful bidder to complete this project.

CONSTRUCTION AGE OF BUILDINGS AT THIS FACILITY

Lead sampling has shown that lead containing paints, coatings and ceramic tiles DO routinely exist, even in our newest facilities even constructed after 1978. Since age does not determine the presence of lead, Contractors need the date a facility was constructed to determine if the RR&P rule applies. To that end, we are providing construction date information for RR&P applicability. There are 2 lead category's tables addressed in this lead portion of the permit: The category 1 table addresses buildings built before 1978 and Category 2 table addresses buildings built after 1978

LEAD CATEGORY #1	**PAINTS, COATINGS & CERAMIC TILE IN BUILDINGS CONSTRUCTED BEFORE 1978**
CONTAINS LEAD?:**YES/NO – for NO see Appendix 1**	**Buildings: "A", "B", "C", & "D"**

Lead Containing or Assumed Lead Containing Paints and Coatings Disturbance Instructions

If project lead specific paints and coating sampling has been requested by the District Project Manager, and completed by the ES&A department for this project, the results of that lead sampling are attached at the end of this permit. It is titled: **Project Specific Lead Sampling Results – Appendix #1.** The Contractor **must** treat all paints and coating as lead containing in the buildings except any exclusions on Appendix #1 and comply with all lead requirements. Contractor must plan and bid accordingly.

OSHA Requirements

All persons performing any disturbance to coatings or paints to paints and coating in and on the buildings listed above must have taken an OSHA lead action level training class from a WCSD, ES&A department approved training provider, and utilize lead safe work practices. In addition, all work must be completed, as a minimum, utilizing the lead safe work practices identified in the EPA guidance document titled "steps to lead safe renovation, repair and painting", pages 12 thru 23. This document is available electronically at the following link: HTTP://WWW.EPA.GOV/LEAD/PUBS/STEPS.PDF.

EPA Renovation, Repair and Painting Regulation Requirements

In general, all firms that disturb 6 square feet of painted surface in a room or 20 square feet on the exterior within a 30 day period in **this** facility must comply with the EPA's Renovation, Remodel and Repair (RR&P) regulation and must be registered with the federal EPA. Per the Regulation, the area of disturbance is calculated, by adding up the entire surface areas being removed/disturbed, which then determines the amount of painted surface area disturbed. Work that involves window replacement or demolition of a painted surface, the RR&P regulation applies regardless of size. This regulation also requires that the contractor must assign a RR&P trained supervisor that is responsible for ensuring and documenting all work is conducted in compliance with the RR&P regulation and there are extensive record keeping and notification requirements that the Contractor must perform. In addition, This is a general overview of the regulation and the contractor must refer to regulation for additional requirements and information. Fines are expensive and the compliance with this regulation rests solely on the Contractor so it is very important that Bidders/Contractors are well versed in this regulation.

– CONTINUED SEE NEXT PAGE #9

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

LEAD CATEGORY #1	PAINTS, COATINGS & CERAMIC TILE IN BUILDINGS CONSTRUCTED BEFORE 1978
CONTAINS LEAD?:**YES/NO – for NO see Appendix 1**	**Buildings: "A", "B", "C", & "D"**

– CONTINUED FROM PAGE #8

WCSD Requirements

In addition to regulatory requirements, the WCSD has requirements that must be met by the Contractor/Bidder. The contractor is responsible for submitting to the ES&A department lead disturbance procedures that outline the lead safe work practices to be utilized and that procedure must comply with the Districts minimum lead disturbance requirements. The current minimum lead disturbance requirements, which will apply to this project, follow these tables.

OSHA action level training and RR&P training certification and RR&P firm certification must be submitted to the project manager and they are to submit a copy to the ES&A department. The ES&A department must review, verify, and approve all required documentation **prior** to the contractor being able to perform any disturbance, so time for review must be taken into account when developing schedules. Once the ES&A department has approved the procedures and training and firm certification, the contractor may proceed but they must notify the ES&A department at 325-8490 of **any** paint/coating disturbance immediately disturbance prior to the disturbance**.** ES&A department personnel, project managers and assistant project managers and other district personnel will spot check in the field, to ensure compliance with the contractors submitted and approved procedures.

Refer to section listed below regarding lead sampling that may be available.

LEAD CATEGORY #2	PAINTS, COATINGS & CERAMIC TILE IN BUILDINGS CONSTRUCTED AFTER 1978
CONTAINS LEAD?:**YES/NO – for NO see Appendix 1**	**Buildings: "E", & "F".**

Lead Containing or Assumed Lead Containing Paints and Coatings Disturbance Instructions

If project lead specific paints and coating sampling has been requested by the District Project Manager, and completed by the ES&A department for this project, the results of that lead sampling are attached at the end of this permit. It is titled: **Project Specific Lead Sampling Results – Appendix #1.** The Contractor **must** treat all paints and coating as lead containing in the buildings except any exclusions on Appendix #1 and comply with all lead requirements. Contractor must plan and bid accordingly.

RR&P Regulation - The building(s) listed above in Lead Category #2 were/was constructed after 1978, so the EPA RR&P regulation does not apply to these buildings.

Material Disturbance instructions: The buildings listed above was/were constructed after 1978 and lead sampling has verified that the paints and coating at this facility, other than exclusions listed above, do indeed contain lead. The Contractor **must** comply with all Lead Containing or Assumed Lead Containing Paints and Coatings Disturbance Instructions requirements listed in Lead Category 1 (if present) above or as listed below. No additional sampling is to be done by the district or the Contractor. Contractor must plan and bid accordingly.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

A NOTE ABOUT SAMPLING AND SAMPLING REQUEST PROCEDURES

Only approximately 20% of the paints and coatings in the District have been found to contain lead. The majority of white and off-white paints on sheetrock and block walls does not contain lead in facilities constructed after approx. 1990. Brighter or more colorful paints/coatings on any surface, or all paints and coatings on metals, are much more likely to be found to contain lead in all facilities. In addition, ceramic tile in any age facility is very likely to contain lead. It is highly recommended that sampling be done to confirm lead content unless time does not allow a delay for processing samples through the WCSD ES&A department. If paints and coatings are not sampled, all paints and coatings must be assumed to be lead containing, above 5000 parts per million (lead based), and treated in accordance with all lead regulations, lead specifications, and requirements identified in this permit.

The process to request lead sampling is for anyone requiring sampling to submit through their project's Project Manager. The designated WCSD Project Manager will submit the required sampling forms, and sampling will be coordinated by the ES&A department. A minimum of 10 days will be allowed before sampling results are provided to the Project Manager for them to be distributed to all interested parties. All lead sampling must be processed through the ES&A department, and sampled by ES&A approved and trained lead professionals.

If project lead specific paints and coatings sampling has been requested by the District Project Manager, and completed by the ES&A department, the results of that lead sampling will be attached at the end of this permit. It will be titled: Project Specific Lead Sampling Results – Appendix #1. If there is no Project Specific Lead Sampling Results – Appendix #1 attached that means no project specific lead sampling has been requested and the Contractor must utilize only the information provided in the lead instructions of this permit.

Any paints or coatings that are not specifically addressed on this permit, or on the project drawings, has to be assumed to be lead containing, and above 5000 parts per million (lead based) – no exceptions. Any disturbance to those paints and coatings not specifically addressed on this permit or on the project drawings must be done by properly trained (Minimum of OSHA action level training) personnel, and those disturbances must be performed in accordance with all lead requirements listed in this permit, as well as any applicable regulations and local requirements. Many times scope modifications are required after the bid, and new areas of the facility may need to be disturbed. These areas would not have been addressed on this permit, since they were unknown at the time of issuance. Additional sampling could be conducted by requesting lead sampling through their project's Project Manager, but there will be a delay getting sampling requests and a new MDP would be required. The District reserves the right to direct the Contractor to assume new paints and coatings, due to scope changes, are lead containing and the contractor would then be required to treat all paints and coatings as lead containing in compliance with all requirements of this permit.

REPLACEMENT PAINTS, COATINGS, CERAMIC TILE, AND OTHER LEAD CONTAINING MATERIALS

Unless otherwise specifically allowed by this projects specifications, the Contractor shall not reinstall any lead containing paints/coatings in any detectable levels during the process of completing this project. "lead containing" is defined as any paint or coating that has ANY detectable lead level when paint chip sampling is conducted and chip is analyzed by the ICP method. The District may perform sampling of replacement materials and if analysis finds any detectable levels of lead, the Contractor will be liable for all costs to properly remove that material and re-apply paints and coatings with no detectable levels of lead. Contractors are encouraged to pre-sample paints they may be using to determine the actual amount in paint/coatings used.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

MINIMUM REQUIREMENTS TO PERFORM ATTACHMENTS AND PENETRATIONS IN WCSD FACILITIES

Below are the minimum requirements to perform any Attachment and Penetration activity to a known or assumed asbestos and/or lead containing material in Washoe County School District (WCSD) facilities. This document is not provided to address demolition, stabilization, abatement, or removal activities. If any work to known or assumed asbestos or lead materials need to be done on this project, and it is anything other than the installation of screws, the removal of screws, or the drilling of holes, the successful bidder must comply with, in addition to these minimum requirements, all applicable District asbestos and lead specifications and requirements. Regarding these procedures, the District has done its best to provide a complete and regulatory compliant attachment and penetration procedure, but by signing this MDP, the Contractor acknowledges that it is the successful bidder's sole responsibly for compliance with this MDP, as well as any other applicable regulatory requirements.

ASBESTOS/LEAD PROCEDURE SUBMISSION PROCESS

Prior to starting this project, each contractor working on this project is required to submit to the WCSD ES&A department an asbestos/lead procedure that includes all District requirements listed below. To simplify the procedure submittal process, an electronic PDF fillable template of these requirements will be provided to the successful bidder of this project. This document is available by contacting the assigned WCSD Capital Projects Project Manager for this project. Contractors must utilize the most current above-mentioned electronic template and fill out all required information, add company letterhead, sign, and date the document. The completed procedures will be e-mailed to the Project Manager by all contractors working on this project that will performing any applicable disturbances. Once submitted, the WCSD Project Manager will pass the document onto the ES&A department for approval. Successful bidders are required to add time to their project schedule for this procedure submittal and approval process.

The Contractor has the option to submit a site-specific or blanket district-wide applicable procedure. A district-wide blanket procedure applies to a scheduled project, as well as all future sites where a contractor will be performing disturbances. The site specific procedure will apply to just one site or project. District-wide procedures are valid for one year from the date the procedure is signed by the ES&A department. Site specific procedures will be valid for the term of the project. Each Contractor must receive a signed and approved procedure prior to performing any disturbances to all asbestos/lead paint or assumed asbestos/lead paint materials. The procedure is a combined procedure and it addresses both asbestos and lead disturbances. A minimum of one work day will be required by the ES&A department for the review and approval process.

In addition to the Material Disturbance Permit (MDP), the Contractors must also have a copy of the approved procedures on site at all times. The purpose of this procedure is to document the agreement between the Contractor and the District that all lead and asbestos disturbances performed by staff of the Contractor will be done per all noted District requirements, District Specifications, and project specifications. Again, Contractors must ensure that their procedure has been approved, and the approved signed procedure is on site prior to any disturbance.

MINIMUM REQUIREMENTS

1. Receive approved Lead/Asbestos procedures as identified above.

2. Technicians performing disturbances will be required to have a minimum of AHERA 16 Hour O&M training and OSHA action level training per 29 CFR 1926.62 (i) (2) lead training. In addition, as applicable, contractors must comply with the EPA RR&P training and certifications requirements listed in the RR&P section of this appendix. Copies of training certifications, including a refresher within the last 12 months, will be provided to the ES&A Department **prior** to the start of any project. Only personnel with the proper minimum training will be authorized to perform any disturbance to asbestos/lead paint or assumed asbestos/lead paint containing materials, or be in the adjacent area of a disturbance.

3. Notify the ES&A Department at **325-8490** and leave a message with the time, name of the technician doing the work, date and exact locations in the school where they will be performing any disturbance. This call should take place immediately prior to disturbance, this phone number (**325-8490**) will go to voice mail, and the contractors are to provide notifications with above identified information, 24 hours a day. The Contractor is also required to notify their assigned WCSD Construction Department Project Managers and Assistant Project Managers of scheduled disturbances so they can also verify compliance with the contractors approved disturbance procedures.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

4. Contractors must refer to this Material Disturbance Permit to determine what materials contain asbestos or lead and utilize the applicable lead/asbestos procedures. Some materials cannot be disturbed, and each specific material disturbance permit will identify what can be disturbed and provided material disturbance instructions. The minimum disturbance permits in this section of the material permit are in addition to any requirements listed in the material disturbance instructions. Any instance where 100% of the minimum asbestos/lead requirements are not followed, the District will immediately hire an environmental remediation contractor as well as an environmental consultant to properly clean up the contamination and perform air sampling. The contractor will be responsible for reimbursing the District for all costs due to any improper or unauthorized disturbances.

5. Contractors or technicians who are new to performing asbestos/lead paint or assumed asbestos/lead paint disturbances for the District must contact the Capital Projects PM/PCI Department and schedule a disturbance. A Capital Projects PM/PCI employee will be scheduled to review the technician's compliance with the disturbance procedures in the field. Once a technician has demonstrated on a minimum of two (2) occasions to the Capital Projects Department that he has an understanding of the District disturbance requirements and has proper equipment, the ES&A Department will then authorize that technician to perform disturbances without prior approval of the Capital Projects Department. Notifications prior to starting all disturbances as listed above will still be required and technicians should expect unannounced random compliance inspections, from the ES&A Department. A list of approved technicians is available upon request form the ES&A department.

6. Post the appropriate "Danger Lead - Keep Out" or "Danger Asbestos Keep Out" signs on the entry side of all doors leading into classrooms, hallways, bathrooms, offices or mechanical rooms where drilling is to occur. Doors will be closed. It is the contractor /technician's responsibility to take adequate means to keep the public or school staff out of the disturbance area.

7. Large rooms, such as multipurpose rooms, will have yellow caution tape placed across all entries to the room in addition to signage but access to these areas must be restricted to ensure no unprotected person can enter the areas where disturbances are taking place. If unprotected personnel can see the activity, this is not a large enough area of demarcation.

8. A 6 ml plastic drop will be placed under the disturbance in a manner that extends 6' out in all directions from the disturbance area. This poly drop can be reused if properly wet-wiped or HEPA-vacuumed off after use.

9. Worker will don the respiratory protection and a protective suit, (protective suits are optional for lead disturbance, "attachments and penetration" disturbances if the Contractor will not exceed the lead action level) and initiate personal air monitoring procedures per item #10 below. Respiratory protection is required throughout all asbestos/lead paint or assumed asbestos/lead paint disturbances in WCSD regardless of air sampling results.

10. If a Contractor is performing a **lead** attachments and penetrations (see the definition in #20 below), air sampling will be conducted at the start of the project. If air sampling results show the technicians performing the work is below the OSHA Lead Action Level, air sampling can be suspended unless the work being performed is changed. Air sampling will be performed for each type of lead attachment and penetration activity to develop a representative sample for each lead activity. Air sampling will be performed during **all** asbestos disturbances, no exceptions.

11. Drill the hole or holes as required using an HEPA VAC and a shrouded or dust collecting apparatus (i.e. Bit Buddy. A HEPA VAC is to remain running during this whole process to ensure all debris is cleared from hole. All clean-up must be conducted the HEPA Vacuum. If a contractor fails to properly control the asbestos/lead containing dust, the District will then hire an environmental remediation contractor as well as an environmental consultant to properly clean up the contamination. The contractor will be responsible for reimbursing the District for all costs due to improper disturbances that result in debris exiting the area of disturbance.

12. All HEPA vacuums used will have been DOP challenge tested prior to first use and annually thereafter. If this project involves 30 or more disturbances over the span of this project, the HEPA vacuum will be DOP tested on-site prior to the start of the project.

WASHOE COUNTY SCHOOL DISTRICT
MATERIAL, WATER, AND LEAD DISTURBANCE PERMIT
CONTINUATION PAGE – SCHOOL #106

13. If required, to be determined by the technician, an encapsulant material may be sprayed or brushed on to the area of the holes.

14. A device, backing, box or raceway, or any other equipment will then be mounted using anchors installed per #11 above, with the HEPA VAC running and properly directed at the area of the disturbance.

15. A HEPA VAC or wet methods will be used to clean up any debris on 6ml poly drop, around device box, technician's suit, and any surfaces below holes, such as tops of chalkboards and base boards.

16. The poly drop, if utilized, will be folded into itself in such a manner as to not spread any debris, the HEPA vacuum hose sealed, and personal air monitoring time logged appropriately. This poly drop can be reused if it is properly wet-wiped or HEPA-vacuumed off after use.

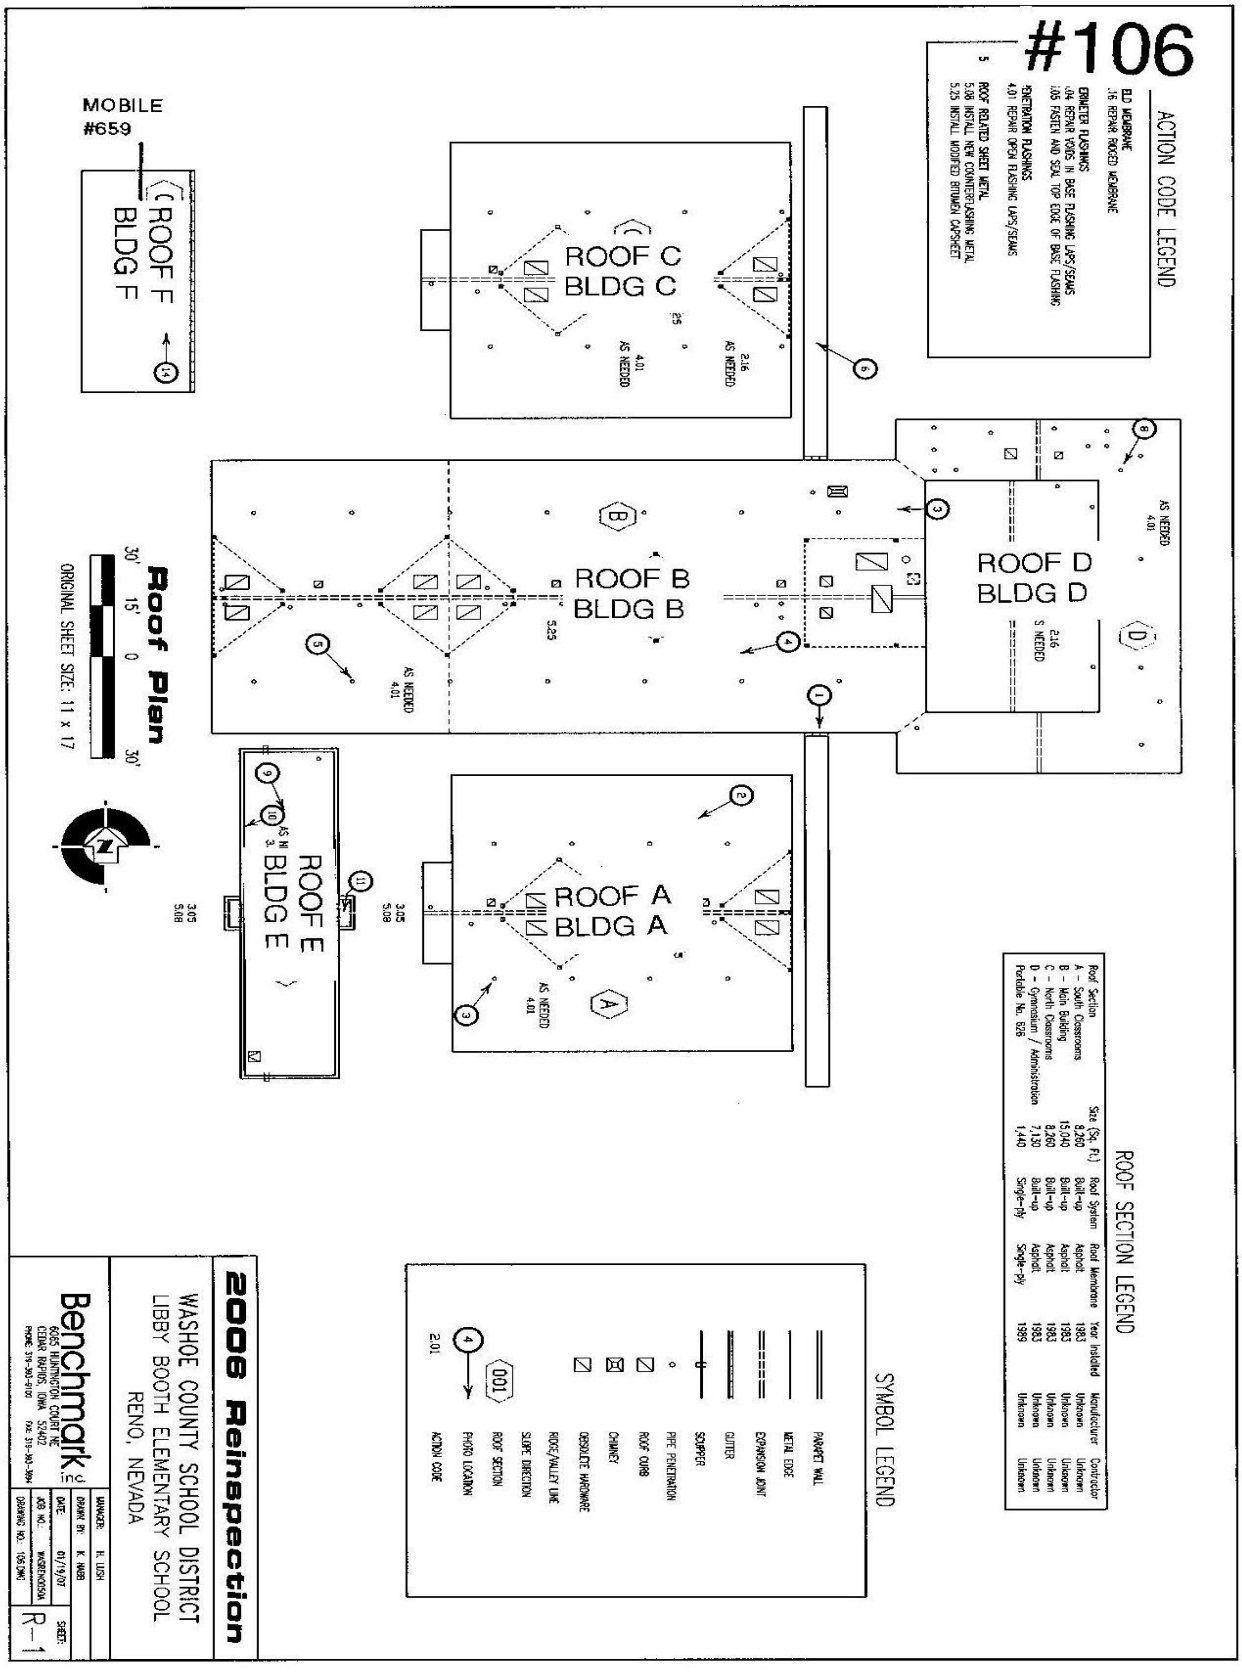
17. All signs and equipment are to be removed, and the technician is to move to the next location. The contaminated suit should be removed and a new suit utilized at the new disturbance location, unless the suit can be properly decontaminated.

18. Upon completion of a shift, air samples will be dated and sent in to a properly accredited lab to be analyzed. Results will be forwarded to WCSD. Lab results will be e-mailed directly from the lab to the ES&A Department within 48 hours of the disturbance. All lab results will reference the Material Disturbance Permit (MDP) # located on the top of the first page of this permit. Results without the MDP number prefix will be returned to the lab for clarification and the addition of the MDP tracking number

19. All debris, waste, poly drop, suits, etc. will be placed in 6 mil poly waste bags (double bagged) and disposed of properly.

20. The definition of "Attachment and Penetrations" in this document is **only** the drilling of holes through a HEPA shrouded device, the installation of screws through a HEPA shrouded device, or the removal of screws through a HEPA shrouded device. **Any other activity** that is not attachments and penetrations as listed in item #20 must be designed by an asbestos or lead project designer, done per a lead specification, and supervised by the District or District hired outside asbestos/lead consultant. Contractors cannot perform any work, other than "Attachments and Penetrations" without an onsite District or District hired asbestos or Lead Consultant being present.

21. All asbestos abatement or lead disturbances, other than "Attachment and Penetrations", must be completed in full compliance with applicable regulations, the District's Asbestos Abatement Specifications, and District hired asbestos or lead consultants supplement specifications. If in error, an asbestos abatement bid or quote is put forth without the District Asbestos Abatement Specifications, Contractors are required to request a copy of the most current asbestos abatement specifications from the bid or quote entity through the formal bid inquiry process



THE UNDERSIGNED AGREES TO COMPLY WITH THE CONDITIONS OF THIS MATERIAL, WATER & LEAD DISTURBANCE PERMIT, APPENDIXES, & ALL APPLICABLE REGULATIONS. UNDERSIGNED ACKNOWLEDGES LIABILITY FOR ANY COSTS THE DISTRICT MAY INCUR TO INVESTIGATE & CLEAN UP ANY DISCOVERY OF IMPROPER AND/OR UNAUTHORIZED DISTURBANCES DONE BY UNDERSIGNED'S EMPLOYEE(S) OR SUB-CONTRACTOR(S) TO MATERIALS LISTED AS LEAD/ASBESTOS-CONTAINING BY THE DISTRICT. IN ADDITION, THE UNDERSIGNED AGREES TO ALL REQUIREMENTS OF THE WATER & LEAD APPENDIX.

CONTINUATION PAGE – SCHOOL #106

Project Specific Lead Sampling Results – Appendix #1.

A limited project lead-specific paints and coatings survey has been conducted. The sampling has been requested by the District Project Manager, and completed by the ES&A department. The results of that lead sampling are below. The results listed below apply ONLY to the locations and paint and coating colors listed below. This information cannot be applied to other areas that are not specifically addressed below. If additional sampling is required in the Contractor's opinion, the Contractor must relay that information to the District Project Manager. The Project Manager will determine if additional sampling will be conducted. If additional sampling will be done, a new MDP will be required. Contractors or their representatives cannot perform any asbestos or lead sampling.

Any paints or coatings that are not specifically addressed on this permit, or on the project drawings, has to be assumed to be lead containing, and above 5000 parts per million (lead based) – no exceptions. Any disturbance to those paints and coatings not specifically addressed on this permit, or on the project drawings must be done by properly trained (Minimum of OSHA action level training) personnel, and those disturbances must be performed in accordance with all lead requirements listed in this permit, as well as any applicable regulations and local requirements. Many times scope modifications are required after the bid, and new areas of the facility may need to be disturbed. These areas would not have been addressed on this permit, since they were unknown at the time of issuance. Additional sampling could be conducted by requesting lead sampling through their project's Project Manager, but there will be a delay getting sampling requests and a new MDP would be required. The District reserves the right to direct the Contractor to assume new paints and coatings, due to scope changes, are lead containing and the contractor would then be required to treat all paints and coatings as lead containing in compliance with all requirements of this permit.

LEAD CONTAINING PAINTS AND COATING

Executive Summary

Forensic Analytical Consulting Services, Inc. (FACS) was retained by Washoe County School District to perform a project-specific asbestos and lead paint survey of Booth Elementary School, located at 1450 Stewart Street in Reno, Nevada. The survey was limited to suspect asbestos-containing materials (ACM) and suspect paints and coatings which will be disturbed during an upcoming modernization project at the site. Appendix A of this report includes a Functional Spaces Notes Report for all spaces, suspect materials and components inspected during this survey. Appendix B of this report includes a lead paint sample summary table and an XRF Survey Data Table for all suspect paints and coatings sampled for lead as part of this survey. This survey was performed on various dates between February 19 and March 2, 2026.

Asbestos

The following material at the site was found to **contain asbestos** by laboratory analysis:

- **Cementitious Panels (20% Chrysotile)**

The following materials were identified as suspect materials but were not sampled to avoid damage to the integrity of the material or the function of the mechanism.

- **Fire Doors**
- **Vibration Dampener**

These materials should be assumed to contain asbestos until they are accessible for testing to determine if they are asbestos-free.

Please refer to the attached Functional Spaces Notes Report in Appendix A for identification of materials and asbestos-content on a space-by-space basis. Materials will be listed as being non-suspect for asbestos, sampled and found to be none-detect for asbestos, or will be identified as assumed, known, or quantified with a percentage of asbestos.

Any suspect materials not included in this inspection must be assumed to be asbestos-containing materials until tested and proven to be asbestos-free.

Lead

Multiple paints, coatings and components were found to be **lead-based** or **lead-containing** by XRF analysis or laboratory analysis. The spaces noted with components are spaces of sampling and these materials may exist in additional spaces.

Please refer to the summary tables and XRF Report Forms in Appendix B for a complete listing of lead-based, lead-containing, and lead-free paints.

Any paints or coatings not included in testing must be handled as lead-containing unless sampled and proven otherwise.

Introduction

Forensic Analytical Consulting Services, Inc. (FACS) was retained by Washoe County School District to perform a project-specific asbestos and lead paint survey of Booth Elementary School, located at 1450 Stewart Street in Reno, Nevada. The survey was limited to suspect asbestos-containing materials (ACM) and suspect paints and coatings which will be disturbed during an upcoming modernization project at the site. This survey was performed on various dates between February 19 and March 2, 2026.

Scope of Work

The purpose of this survey was to identify asbestos-containing materials (ACMs) and lead-containing paints and coatings in project-specific areas of Buildings B, D, and E, and select exterior locations, as part of the upcoming modernization project at the site. The visual inspection, bulk sampling, and survey documentation were performed by Daniel Prado, Ryan Hettich, Sydney Stedman, and Ty Bigham. Mr. Prado and Mr. Hettich are licensed by the Division of Industrial Relations (DIR) as Asbestos Abatement Consultants (AAC). Ms. Stedman and Mr. Bigham are licensed by the DIR as AAC Trainees. All are US EPA-accredited Asbestos Hazard Emergency Response Act Building Inspectors. Mr. Prado is also a US EPA Certified Lead Inspector/Assessor. The scope of the survey and the services provided by FACS included:

- Performing a visual inspection of the site to identify accessible suspect asbestos-containing materials (ACMs) present;
- Collection of bulk material samples for asbestos analysis by polarized light microscopy (PLM);
- Performing a visual inspection of the buildings and structures for suspect lead-containing paints and coatings and analyzing these materials using a x-ray fluorescence spectrum analyzer;
- Collection of bulk paint chip samples for lead analysis by inductively coupled plasma (ICP) analysis;
- Ensuring the technical quality of all work by using Asbestos Hazard Emergency Response Act (AHERA) accredited Building Inspectors;
- Ensuring the technical quality of all work by using US EPA Certified Lead Inspector / Assessors;
- Consolidating data and findings into a report format.

Site Characterization

Booth Elementary School is comprised of several single-story buildings on the campus. This survey was limited to project areas in Buildings B, D and E along with various outdoor locations on the west portion of the campus. Building B is a classroom wing, Building D contains the administration spaces and multipurpose room, and Building E is a modular building. The exterior areas included multiple playground structures and an awning.

The project areas in the buildings and the exterior locations are comprised of common building materials including, but not limited to, concrete, cementitious panels, duct insulation, drywall, carpet, baseboards, linoleum, false ceiling tile systems, vinyl floor tile, and associated mastics and sealants.

Survey Methods

Document Review

Original site plans and other documents provided by the Washoe County School District's planning department contact, Teresa Poulsen, were reviewed prior to conducting the survey.

Documents available from the Washoe County School District's Environmental Safety and Assessment Department were reviewed for past sampling results which were incorporated into this report based on the results of FACS' visual survey and identification of materials on District records.

Visual Inspection

Accessible building materials were visually inspected using the methods presented in the Federal AHERA regulations (40 CFR, Part 763). AHERA inspection methodology is required to be used for inspections of K-12 schools and is generally accepted as the industry standard for all ACM inspections regardless of structure or facility type. Suspect ACMs were also physically assessed for friability, condition and possible disturbance factors.

All areas were accessible during this inspection. Destructive methods used to investigate behind materials or above ceilings were performed as available, but not completed for areas with non-destructive materials, such as concrete or CMU walls. Review of provided plans were used to make determinations of potentially hidden materials within these areas as necessary.

Asbestos Inspection

Bulk Sample Collection

Bulk samples of identified homogeneous materials were collected from materials that may be impacted by the planned renovation activities. Samples were collected of each separate homogeneous area. A homogeneous area is defined as a surfacing material, thermal system insulation, or miscellaneous material that is uniform in use, color and texture. Examples of homogeneous areas could include:

Vinyl floor tiles
False ceiling panels
Drywall
Concrete

The specific number of samples collected was determined by using the methods required by the Federal AHERA regulations (40 CFR, Part 763.86) and ASTM standards as noted below:

1) For Surfacing Material:
   1,000 ft^2 or less – collect 3 samples
   1,001 to 5,000 ft^2 – collect 5 samples
   5,001 ft^2 or greater – collect 7 samples

2) For Thermal System Insulation:
   "In a randomly distributed manner" – collect 3 samples
   6 linear feet of patching or less – collect 1 sample
   cementitious pipe fittings – "In a manner sufficient to determine"

3) For all Miscellaneous Material:
Collect samples “In a manner sufficient to determine whether material is ACM (asbestos-containing material) or not ACM”…" – AHERA

The suspect ACMs were sampled using a knife, chisel, scraper, drill or other similar coring device suitable to the type of material sampled to cut through its entire thickness and to ensure that a cross-section of the material was obtained. The material was then placed in an appropriately labeled container that was sealed and delivered to the WCSD Environmental Safety and Assessment (ES&A) Department. A unique sample number was assigned to each sample.

Bulk Sample Analysis

A total of one hundred sixteen (116) bulk samples were collected from a total of thirty-eight (38) suspect materials.

All bulk samples were delivered to WCSD ES&A Department for submission to Schneider Laboratories Global, Inc. (SLG) in Richmond, Virginia.

SLG is accredited by the National Institute of Science and Technology’s (NIST) National Voluntary Laboratory Accreditation Program (NVLAP). SLG participates in the National Institute for Occupational Safety and Health (NIOSH) Proficiency Analytical Testing Program and has substantial experience in the analysis of asbestos.

Samples were analyzed using Polarized Light Microscopy with Dispersion Staining (PLM/DS) techniques in accordance with the methodology approved by the U.S. Environmental Protection Agency (EPA). The percentage of asbestos present in the samples was determined on the basis of a visual area estimation. The EPA defines asbestos-containing materials (ACM) as any material containing more than one percent (1%) asbestos as determined using the method specified in Appendix A, Subpart F, 40 CFR Part 763, Section 1, Polarized Light Microscopy (PLM). 40 CFR Part 763 identifies the lower limit of reliable quantification for asbestos using the PLM method as approximately one percent (1%) by volume. In addition to the percentages, the types of asbestos minerals are also reported. The PLM method is the standard method used to analyze asbestos bulk samples.

When "None Detected" (ND) appears in the laboratory results, it should be interpreted as meaning asbestos was not observed in the sample material.

Lead Inspection

The client-defined lead inspection was modeled upon the sampling protocol described in “Chapter 7: Lead Based Paint Inspection” of the HUD Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (1997 Revision).

OSHA, in Title 29 Code of Federal Regulations (CFR) Part Number 1926, Standard Number 1926.62, regulates all construction work where an employee may be occupationally exposed to lead. Paints, coatings, or materials with any detectable level of lead is considered lead-containing by OSHA. Paints or coatings containing lead above 1.0 mg/cm^2, 0.5% by weight, or 5,000 parts per million are considered lead-based by the US EPA.

For purposes of this report, materials containing lead shall be defined as materials that XRF testing has identified as containing a lead content at or above 0.01 mg/cm^2, or 0.00 mg/cm^2 readings which have not been confirmed with laboratory analysis of bulk samples. In addition, any laboratory analysis of bulk samples that find detectable concentrations of lead will be handled as lead-containing.

XRF Testing Methodology

Surfaces and components were surveyed for lead content utilizing a portable X-ray fluorescence (XRF) analyzer, Sci-Aps Model X-550PB, serial number 03539. The XRF analyzer contains an electrically powered x-ray cathode tube which bombards tested surfaces with X-rays and gamma rays. This external energy source excites any lead atoms within the tested paint or coating, causing their atoms to emit X-ray photons with a characteristic energy profile. The instrument analyzes the emitted energy to identify and quantify the amount of lead in the tested paint or coating, with lead content reported in milligrams per square centimeter.

Testing combinations of homogeneous components in one area are representative of similar components found in other areas with similar construction and painting histories. During this survey, the inspector visually identified the painted or coated component to test, an XRF reading was collected, and the reading was documented in the XRF data table contained in Appendix B. For each test reading, the data table identifies the room equivalent/space designation, the tested component name, the substrate material, the sample location, paint/coating color, condition assessment, and the XRF result expressed as lead content by weight in milligrams per square centimeter (mg/cm^2).

Bulk Sample Methodology

XRF testing performed during this survey was used to determine which paints or coatings at the site have detectable concentrations of lead, and to determine which paints or coatings at the site are lead-based paint. OSHA does not accept XRF test results for use in determining that a paint or coating does not contain lead. OSHA requires laboratory analysis of a bulk sample to classify a paint or coating as lead-free.

During this inspection, FACS personnel collected fifty-one (51) bulk paint chip samples from seventeen (17) suspect paints for laboratory confirmation of lead-content. These samples were scraped from the substrate using a knife or chisel to obtain sufficient material for analysis. Each sample was given a unique marker number, identified on a chain-of-custody, packaged, and were analyzed by Schneider Laboratories Global, Inc. (SLG) in Richmond, Virginia.

SLG is accredited by the American Industrial Hygiene Association's Environmental Lead Laboratory Accreditation Program for the analysis of lead in bulk paint chips by inductively coupled plasma.

Findings and Recommendations

Forensic Analytical Consulting Services, Inc. (FACS) was retained by Washoe County School District to perform a project-specific asbestos and lead paint survey of Booth Elementary School, located at 1450 Stewart Street in Reno, Nevada. This survey was performed on various dates between February 19 and March 2, 2026.

Asbestos

The following material at the site was found to **contain asbestos** by laboratory analysis:

- **Cementitious Panels (20% Chrysotile)**

The following materials were identified as suspect materials but were not sampled to avoid damage to the integrity of the material or the function of the mechanism.

- **Fire Doors**
- **Vibration Dampener**

These materials should be assumed to contain asbestos until they are accessible for testing to determine if they are asbestos-free.

Please refer to the attached Functional Spaces Notes Report in Appendix A for identification of materials and asbestos-content on a space-by-space basis. Materials will be listed as being non-suspect for asbestos, sampled and found to be none-detect for asbestos, or will be identified as assumed, known, or quantified with a percentage of asbestos.

Any suspect materials not included in this inspection must be assumed to be asbestos-containing materials until tested and proven to be asbestos-free.

Asbestos abatement at this site would fall under the regulatory requirements of Northern Nevada Public Health. A 10-working day notification will need to be filed prior to the abatement of asbestos-containing materials if they are categorized as a regulated asbestos-containing material (RACM) or if they are non-friable materials that will be removed using mechanical means. Material disposal would be based on the friability of material, method of removal, and requirements of any other project-specific obligations.

To comply with the AHERA regulation and OSHA requirements, workers performing asbestos abatement will need to have AHERA Worker training with at least one worker trained to the AHERA Contractor-Supervisor level. Workers will need to use asbestos work practices required by OSHA for the appropriate abatement class of work being performed along with any project-specific work plans. A notification must be submitted to the local OSHA office for the abatement of asbestos-containing materials.

The contractor performing abatement of asbestos-containing materials will need to hold the A-23 license from the Nevada State Contractors Board and as required by the Nevada Administrative Code (NAC) 624.150(23).

Lead

Multiple paints, coatings and components were found to be **lead-based** or **lead-containing** by XRF analysis or laboratory analysis. The spaces noted with components are spaces of sampling and these materials may exist in additional spaces.

Please refer to the summary tables and XRF Report Forms in Appendix B for a complete listing of lead-based, lead-containing, and lead-free paints and coatings.

OSHA regulates the handling of paints and coatings containing lead down to any detectable concentration. Therefore, workers that will handle paints or coatings on this project must have lead training. For work with Washoe County School District, this training must be OSHA Action Level training at minimum. Any contractor with workers disturbing any quantity of detectable lead must perform an initial determination regarding worker exposures to lead, which may be based on personal air monitoring at the start of the project, prior employee monitoring from the past 12 months under workplace conditions closely resembling the current project, or objective data demonstrating that exposures will not exceed the OSHA action level (30 micrograms per cubic meter of air). It is the employer's responsibility to conduct the initial determination and comply with any relevant OSHA requirements.

Workers must use lead-safe work practices when disturbing paints or coatings that contain lead. Disturbance of lead-containing paints or coatings must be performed within a contained area to prevent the spread and build-up of lead dust. HEPA vacuums, dustless tools or shrouds, and/or intact removal of components should be employed to minimize lead dust generation and work areas must be properly cleaned following disturbance to lead-containing materials during this project. Waste generated during disturbance to lead-containing materials must be profiled in a hazardous waste determination to ascertain proper disposal requirements.

FACS recommends that the results of this report be incorporated into any renovation plans provided for this project for informational purposes.

Limitations

This investigation is limited to the conditions and practices observed, and information made available to FACS. The methods, conclusions and recommendations provided are based on FACS' judgment, expertise, and the standard of practice for professional service. They are subject to the limitations and variability inherent in the methodology employed. As with all environmental investigations, this investigation is limited to the defined scope and does not purport to set forth all hazards, nor indicate that other hazards do not exist.

Please do not hesitate to contact our office at 775-993-7389 with any questions or concerns. Thank you for the opportunity to assist Washoe County School District with promoting worker safety and a healthy environment.

Respectfully,
FORENSIC ANALYTICAL

PO Number: PO134874

Method: EPA 600/R-93/116 & 40 CFR App. E Sub. E Pt. 763

PLM Analysis

Sample ID	Collected	Cust. ID	Location	Asbestos Fibers	Other Materials
675677-001	02/27/26	106-6058-36379	SW Center		
Layer 1: Concrete Gray/Black, Hard/Granular				No Asbestos Detected	2% CELLULOSE FIBER 98% NON FIBROUS MATERIAL
675677-002	02/27/26	106-6058-36380	N Side W End @ DR		
Layer 1: Concrete Gray/Black, Hard/Granular				No Asbestos Detected	2% CELLULOSE FIBER 98% NON FIBROUS MATERIAL
675677-003	02/27/26	106-6058-36381	W Side S End @ DR		
Layer 1: Concrete Gray/Black, Hard/Granular				No Asbestos Detected	2% CELLULOSE FIBER 98% NON FIBROUS MATERIAL
675677-004	02/27/26	106-6058-36382	S Side E End		
Layer 1: Vinyl Floor Tile Light Gray, Organically Bound No mastic found.				No Asbestos Detected	2% CELLULOSE FIBER 98% NON FIBROUS MATERIAL
675677-005	02/27/26	106-6058-36383	W Side S End		
Layer 1: Vinyl Floor Tile Light Gray, Organically Bound				No Asbestos Detected	2% CELLULOSE FIBER 98% NON FIBROUS MATERIAL
Layer 2: Mastic Yellow, Soft				No Asbestos Detected	100% NON FIBROUS MATERIAL

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. Laboratory estimated asbestos error rates available upon request. The test results apply to the sample as received.

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. Laboratory estimated asbestos error rates available upon request. The test results apply to the sample as received.

Reporting Limit: 1% Gravimetrically Reduced Reporting Limit: 0.01% PLM analysis is based on Visual Estimation and NESHAP recommends that any friable sample with an asbestos content less than 10 percent be verified by Point Count or TEM Analysis. The EPA recommends that any attic loose fill vermiculite should be treated as asbestos containing material. This report must not be reproduced except in full with the approval of the laboratory. Laboratory estimated asbestos error rates available upon request. The test results apply to the sample as received.

Appendix B

Lead Paint Chip Summary, Sample Chain-of-Custody, Laboratory Results Report and XRF Report Form

Lead-Based Paints & Coatings

- White Porcelain Toilets

Lead-Containing Paints & Coatings

The following paints and coatings were found to be lead-containing by laboratory analysis:

- Dark Navy Paint on Metal Doors/Frames
- Grey Flecked Paint on Epoxy/Concrete Floor
- Grey Paint on Metal Beam
- Light Grey Paint on Drywall Wall
- Pastel Yellow Paint on CMU Wall

Lead-Free Paints & Coatings

- Blue Paint on Metal Pole
- Brown Paint on Metal Beam
- Golden Yellow Paint on Metal Railing
- Grey-Blue Paint on Metal Column
- Orange Paint on Plastic Tunnel
- Tan Paint on Metal Column
- White Paint on Acoustic Wall
- White Paint on Asphalt Basketball Court
- White Paint on Drywall Wall
- White Paint on FCP Ceiling
- Yellow Paint on Metal Pole
- Yellow Paint on Plastic Panel

All other paints and coatings in the surveyed areas were found to be lead-containing by XRF analysis.

All internal QC parameters were met. Unusual sample conditions, if any, are described. Surrogate Spike results designated with "D" indicate that the analyte was diluted out. "MI" indicates matrix interference. Concentration and *Reporting Limit (RL) based on areas provided by client. Values are reported to three significant figures. Solid PPM = mg/kg | PPB = µg/kg and Water PPM = mg/L | PPB = µg/L. The test results apply to the sample as received.

Metals Analysis							
Lead		EPA 6010D / ME-003	**<9.40**	9.39	mg/kg	03/12/26	DM

All internal QC parameters were met. Unusual sample conditions, if any, are described. Surrogate Spike results designated with "D" indicate that the analyte was diluted out. "MI" indicates matrix interference. Concentration and *Reporting Limit (RL) based on areas provided by client. Values are reported to three significant figures. Solid PPM = mg/kg | PPB = µg/kg and Water PPM = mg/L | PPB = µg/L. The test results apply to the sample as received.

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 101150-0

Schneider Laboratories Global, Inc.

Richmond, VA

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Asbestos Fiber Analysis

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique on ISO/IEC 17025).

2025-04-01 through 2026-03-31

Effective Dates

For the National Voluntary Laboratory Accreditation Program

AIHA Laboratory Accreditation Programs, LLC

acknowledges that

Schneider Laboratories Global

2512 West Cary Street, Richmond, VA 23220-5117

Laboratory ID: LAP-100527

along with all premises from which key activities are performed, as listed above, has fulfilled the requirements of the AIHA Laboratory Accreditation Programs, LLC (AIHA LAP) accreditation to the ISO/IEC 17025:2017 international standard, General Requirements for the Competence of Testing and Calibration Laboratories in the following:

LABORATORY ACCREDITATION PROGRAMS

☑	**INDUSTRIAL HYGIENE**	Accreditation Expires: September 01, 2027
☑	**ENVIRONMENTAL LEAD**	Accreditation Expires: September 01, 2027
☑	**ENVIRONMENTAL MICROBIOLOGY**	Accreditation Expires: September 01, 2027
☐	**FOOD**	Accreditation Expires:
☐	**UNIQUE SCOPES**	Accreditation Expires:
☐	**BE FIELD/MOBILE**	Accreditation Expires:

Specific Field(s) of Testing/Method(s) within each Accreditation Program for which the above named laboratory maintains accreditation is outlined on the attached Scope of Accreditation. Continued accreditation is contingent upon successful on-going compliance with ISO/IEC 17025:2017 and AIHA LAP requirements. This certificate is not valid without the attached Scope of Accreditation. Please review the AIHA LAP website (www.aihaaccreditedlabs.org) for the most current Scope.

Site Address

Libby Booth Elementary School
1450 Stewart Street
Reno, NV 89502

Background

Washoe County School District (WCSD) will be performing an upcoming modernization project at their existing Libby Booth Elementary School site. This project will include various upgrades in classrooms in Buildings B and throughout Building D at the campus. The work onsite will involve the handling of lead-based components and lead-containing paints/coatings.

This set of specifications is to account for known and potential work to take place during all phases of the project.

Scope of Work

This project partly consists of the renovation and retrofit of multiple classroom and restroom spaces in Building B along with various upgrades, including a single-point entry and flooring upgrades throughout Building D which will impact lead-based components and lead-containing paints and coatings.

Construction of a new building on the southwest portion of the campus will also occur as part of this project.

This narrative is not a definitive scope of all work to be completed, including hazardous materials work, and is primarily intended to provide a general overview of the project. Project drawings and other construction documents developed shall be consulted to determine exact scope of work.

Forensic Analytical Consulting Services, Inc. (FACS) conducted a project-specific survey in the spring of 2026 to identify the hazardous materials within the planned project areas. This survey also incorporated previous sampling results from the Washoe County School District's (WCSD) Environmental Safety and Assessments (ES&A) Department.

Asbestos-Containing Materials

All materials in the project's planned scope of work were found to **not contain** asbestos.

Asbestos-containing materials are in various spaces adjacent to the project area. The WCSD Material Disturbance Permit (MDP) and FACS' hazardous materials survey report should be consulted if the project scope expands outside of the planned locations to determine asbestos content of the materials to be disturbed. As asbestos-containing materials are not anticipated to be impacted, requirements for the handling of asbestos-containing materials have not been included in these specifications. In the event that asbestos-containing materials will be disturbed, WCSD will retain FACS to provide an asbestos work plan for Contractor to comply with during abatement activities.

Lead-Based/Containing Paints & Coatings

All paints and coatings within the project area of this phase were found to be lead-containing except for the following:

- Blue Paint on Metal Poles
- Brown Paint on Metal Beams
- Golden Yellow Paint on Metal Railing
- Grey-Blue Paint on Metal Column
- Orange Paint on Plastic Tunnel
- Tan Paint on Metal Column
- White Paint on Acoustic Wall
- White Paint on Asphalt Basketball Court
- White Paint on Drywall Wall
- White Paint on FCP Ceiling
- Yellow Paint on Metal Pole
- Yellow Paint on Plastic Panel

The following components were found to be **lead-based**:

- White Porcelain Toilets

Any work disturbing lead components, paints, or coatings must be performed using lead-safe work practices by personnel with OSHA Action Level training.

Project Requirements

These specifications identify only a general narrative for the scope of work for this project. The contractor is responsible for reviewing project drawings and construction plans, along with completion of own measurements, inspection of site conditions, and any other items required to submit their bids and complete the project.

Within these specifications are means and methods for the removal of materials that will be followed on the project for all known work to be completed and additional work that may potentially be required. As not all potential circumstances or conditions can be anticipated, minimal field adjustment of the means and methods listed within this document may be required.

The general contractor and any sub-contractors working onsite will need to consult the WCSD ES&A Department's Material Disturbance Permit (MDP) to verify asbestos and lead content of materials prior to impacting any materials. In addition, FACS has provided a site survey report for the areas inspected as reference, but this document does not take precedence over MDP or project drawings and other construction directives.

Testing of materials not previously sampled or testing to verify asbestos and lead content of materials will only be performed by WCSD ES&A Staff or District's independent third-party consultant. Testing by another third-party consultant will not be accepted as proof of the asbestos-content of building materials or lead-content of paints or coatings.

The lead paint inspection conducted by FACS identified lead-based components within the project area. However, the EPA's Renovation, Repair and Painting (RRP) rule does not apply since the lead-based ceramic body/glaze is neither a surface coating nor a painted surface as defined by 40 CFR Part 745.

The contractor must meet requirements set forth in these specifications, and applicable Federal, State, and local requirements, namely the OSHA Lead in Construction Standard, when handling paints or coatings that do contain lead.

As noted above, many of the paints and coatings in the project areas contain lead. Thus, the contractor shall be cognizant that not all work disturbing lead may be reflected in the drawings. For example, work involving the removal of baseboard materials from painted surfaces or removal of equipment from painted surfaces may require lead work activities to be performed but may not be explicitly listed on project drawings as lead work activity.

Many of the materials that may be disturbed as part of the project contain silica. The contractor is responsible for complying with the requirements of 29 CFR 1926.1153 – OSHA's Crystalline Silica Standard for Construction. Proof of compliance with the Standard shall be provided by contractors at the District or independent third-party request.

Contractor shall be approved by the WCSD ES&A Department to perform asbestos and lead activities within the District. **Firms which have not previously performed activities impacting asbestos or lead for the District will need to submit for approval all necessary documentation outlined in the WCSD ES&A Technical Specifications for the project at least fifteen (15) business days prior to work commencing.** The approval of firms includes contractors that will be performing work impacting lead-containing paints, even if that firm is not primarily a lead remediation contractor.

All worker asbestos and lead training certifications shall be submitted for approval to the WCSD ES&A Department at least fifteen (15) working days prior to project commencement at minimum. Online training of employees is not sufficient to meet the requirements of District policy and all training must be provided in-person with each individual receiving a training certificate from the training provider.

Contractor is responsible for reviewing WCSD ES&A worker roster for the company to ensure that all workers to be used on the project have been approved prior to arrival onsite. Workers not identified on the approved WCSD ES&A worker list for the contractor will not be allowed to perform any activities onsite, even if documentation is provided onsite at time of the project commencement or work. This applies to any personnel impacting lead-containing surfaces, even if not primarily a lead remediation contractor.

The contractor performing work on this project will be responsible for following all plan requirements to complete the project. Neither WCSD personnel, nor any independent consultant providing project oversight, will be responsible for identifying materials or components as part of this contract. The contractor's onsite supervisor(s) shall have a copy of these Specifications on site at all times and shall be familiar with the project requirements prior to arrival on site for the project. Failure to follow requirements of these Specifications, or lack of knowledge of requirements to be followed during the project are grounds for replacement of contractor's onsite supervisor.

No work impacting hazardous materials shall be performed when staff and students are present within buildings or in adjacent exterior areas of the site.

Only the hazardous materials contractor will be allowed to occupy the designated work area once lead activities are scheduled to start. This applies to all WCSD non-ES&A staff/personnel, general contractor, and other sub-contractors. The designated work area shall only be occupied by the hazardous materials contractor, WCSD ES&A staff, and District's independent third-party abatement consultant.

Work that is deemed "penetration and attachment" by the District's ES&A Department or District's onsite third-party hazardous materials consultant shall be performed in accordance with the District's policy for this type of work. These specifications may have applicable requirements that may be included for overall project compliance, but do not identify all work practices or engineering controls that would need to be met for compliance with the District's penetration and attachment policy.

Water, HVAC, and Electricity

Water and electricity are available onsite currently; however, long hoses and cords may be necessary. Contractor shall provide a GFCI at the primary plug-in of all electrical trains used for electrical equipment. Hose washers shall be provided at all connections to prevent leakage of water and potential damage to District facilities. Contractor is responsible for any damage caused by their usage to any District water or electrical systems.

Contractor shall coordinate with the WCSD Project Manager for the shut-down of all HVAC systems within the project area prior to commencing setup for lead removal activities. Contractor is responsible for the lock-out / tag-out of all electrical circuits and HVAC systems that may be impacted by the project. Contractor shall follow requirements of WCSD for the lock-out / tag-out of equipment.

Lighting

If exterior work will take place in the evenings or in non-lit areas, the Contractor shall provide temporary lighting as required for workers to clearly see materials to be abated, traverse through the work area, and move waste to the waste receptacle. Sufficient lighting shall be provided to allow visual inspection to be performed at the conclusion of each work shift by the District's independent third-party consultant; additional lighting may be necessary for a final clearance visual inspection.

Lighting used shall meet requirements for safety as set forth by OSHA requirements. All lighting shall have a sturdy base and guards to protect bulbs from breakage in the event they are dropped or knocked over.

Pre-Cleaning

No pre-cleaning of asbestos or lead contamination at project areas is required to complete this project; however, small amounts of garbage and build-up of dust may be required to be cleaned to allow sufficient adherence of containment barriers.

Notifications

No notification is required for the removal or disturbance of lead-containing components, but the contractor performing lead work shall provide notice of work to the WCSD ES&A Department and District's independent third-party consultant at least 48 hours prior to commencing activities, including setup of containment.

Equipment

Contractor is responsible for providing all necessary equipment in sufficient quantities to complete the work in the schedule provided for the project. All equipment must arrive onsite clean and in proper functioning order. Any equipment that arrives onsite dirty or not in proper functioning order shall be removed from the project site for cleaning and/or repairs.

The requirement for clean equipment in proper working order extends to any rental equipment used on the project. If rental equipment is used, contractor shall provide notification in writing to the rental agency that equipment will be used within a lead regulated work area. Proof of this notification being filed shall be provided to District's independent third-party consultant upon request.

Operators of lifts or other similar powered equipment must be trained in the use of equipment to meet manufacturer and OSHA requirements. Proof of training shall be provided if requested to WCSD and District's third-party consultant.

Training

Workers performing tasks impacting lead paints or coatings, regardless of level of lead present, must have OSHA Lead Action Level training. This requirement extends to any contractor and their personnel performing penetration and attachment activities.

As noted previously, all workers certifications must be approved by the WCSD ES&A prior to arrival onsite to start work. Certifications shall clearly identify the name/level of the training and provide the complete name of the worker. Failure to meet these requirements may cause a delay in approval or a complete rejection of certifications until corrections can be made and new copies obtained by the contractor.

Copies of the worker certs will also be requested to be provided to the District's onsite third-party consultant as well. Web-based or virtual training is prohibited by District policy.

As this project may take place over multiple phases, contractors are responsible for continuing to ensure worker roster is up to date with staff certifications. Certifications cannot be approved onsite by the District's independent third-party consultant.

Personal Protection Equipment

All personnel entering a regulated area, regardless of level of work to be performed, shall wear disposable coveralls, tight-fitting half-face, negative-pressure air purifying respirators fitted with HEPA (P-100) filters, hard hats and safety glasses at minimum. Street clothes may be worn beneath disposable coveralls for any exterior lead activities, but street clothes will be HEPA-vacuumed clean if coveralls are torn or ripped. Requirements of PPE extend to any contractors disturbing hazardous materials, even if they are not primarily a remediation contractor.

All employees shall have a valid medical clearance and fit test for the respirators to be worn. Copies of the medical clearance and fit test must be provided to the District's onsite independent third-party consultant. The contractor may opt to include additional PPE items based on their own job hazard assessment for the project, but they may not reduce level/type of PPE below what is required in this Specification.

Personal Air Monitoring

The contractor is responsible for the collection of personal air samples on 50% of workers entering a regulated work area during lead disturbance activities. If an odd number of workers are entering the regulated work area, the contractor shall round up for the number of workers to be monitored (i.e., five workers entering a work area

would require collection of three samples). These samples shall be collected in accordance with OSHA sampling protocols and analyzed by a laboratory with the proper accreditation and approval from the WCSD ES&A Department.

The contractor shall have their laboratory submit or fax, within **48 hours** of the date the sample was collected, the final laboratory result documents (including legible chain-of-custody) for air monitoring to the WCSD ES&A Department. No handwritten results reports will be allowed. The laboratory reports will reference the air monitoring cassette's factory assigned number and the personal air monitoring results must be properly applied to an 8-hour time weighted average. Failure to submit results within the required 72-hour period (48-hour turnaround with 24-hour grace period) may result in the District temporarily stopping the applicable remediation project until results are received. Continued failure may also result in the termination of the contract.

The District's independent third-party consultant reserves the right to halt work or increase respiratory protection in the event that personal air sample results are not received in the manner as specified above, or if area air sampling shows current respiratory protection does not sufficiently protect employees.

Security and Safety

The Contractor is responsible for security of all equipment and safety of all employees. Contractor shall provide any storage containers or security needed for tools and equipment if they are to be left onsite. Contractor shall coordinate with the WCSD Project Manager for placement of any storage container brought onsite.

Contractor is responsible for security of the building at locations that have components removed before replacement (for example, after removal of wall-mounted louvers, doors, windows, etc.) or components removed to create openings for the exhaust of negative air machines. In addition, contractor is responsible for enclosing any decontamination chambers sited at exterior areas of a structure in plywood. Security measurements must meet the approval of general contractor and WCSD.

Contractor is responsible for all worker safety and following all applicable regulations, namely Nevada and Federal OSHA. Contractor or their designated supervised shall hold a safety meeting on the first day of the project that addresses all safety hazards workers may encounter.

Safety meetings shall be held at least weekly thereafter, or in the event that job hazards change or an accident occurs. The safety meeting topics shall be documented and all attendees sign the document for recordkeeping. A copy of the safety meeting shall be provided to the District's independent third-party consultant.

Work Hours and Dates

A specific schedule of calendar dates for the project will be provided in other contract documents. However, it is anticipated that workdays and hours will be Monday through Friday, 07:00 am to 03:30 pm. Work hours will be 03:30 pm to 11:00 pm when school is in session.

WCSD holidays are excluded dates of work and no work shall be scheduled for these dates. As noted above, a detailed schedule of project events, including shift hours, shall be provided for approval by WCSD.

The contractor may request alternate days or hours in writing to the WCSD Project Manager for approval, but it does not guarantee acceptance. The request must be filed at least 48 hours prior to the first alternate shift commencing.

Occupancy

As noted previously, the immediate project area will be limited to the hazardous materials contractors, WCSD ES&A staff, and District's independent third-party consultant once remediation activities are ready to commence. Once the area has been cleared, other parties may occupy.

Emergency services may also occupy areas in the event of an emergency during the project.

Challenge Testing

All HEPA-filtered equipment to be used on this project shall be challenge tested (DOP or equivalent) at the project site prior to use. If the remediation on this project extends over multiple mobilizations, the HEPA-filtered equipment shall be tested prior to use for each mobilization.

Copies of the challenge testing results shall be provided to the WCSD ES&A and/or District's independent third-party consultant.

No HEPA-filtered equipment will be allowed to remain onsite after a contractor demobilizes from the site or stored onsite when the contractor cannot guarantee security of the equipment.

Air Pressure Differential Requirements

All interior containment areas where more than six (6) square feet of lead-containing painted or coated materials are to be removed shall be placed under negative air pressure. An air pressure differential of -0.050" WC must be established and maintained through all remediation activities until clearance sample results are received. The air pressure differential shall be displayed and recorded by a properly functioning manometer at each negative pressure enclosure location. Failure to have a properly recording manometer will require the Contractor-Supervisor to record the air pressure differential by hand at 10-minute intervals, including recording of any pressure differential loss and re-establishment of sufficient air pressure differential. The manometer display shall have the correct date and time for the data being recorded and this requirement extends to any handwritten data. Copies of the air pressure differential readings shall be provided to the ES&A Department and District's independent third-party consultant.

Interior Lead-Based or Lead-Containing Painted Component Removal

The following requirements are intended to cover all work at the interior of the building where lead-based components or lead-containing paints/coatings are to be impacted by renovation activities.

All interior containment areas where more than 6 square feet of lead-containing painted or coated materials are to be removed/disturbed shall be placed under negative air pressure. The requirements will still apply to areas where less than 6 square feet of lead-containing painted or coated materials are to be removed/disturbed except for the negative pressure requirements. This work will occur in a regulated area or mini containment as directed by the District's third-party consultant based on the potential amount of debris generated by the removal process.

All poly used on this project shall be 6-mil in thickness and fire-retardant, unless exempted below.

1. Critical barriers shall be erected at all openings within the work area and shall be sealed with two layers of 6-mil poly. Examples of openings include, but are not limited to, doors, HVAC registers, windows, etc.
2. Two layers of 6-mil poly shall be placed over the floor surface of the work area, extending out at least 10 feet in each direction. This poly sheeting may be extended if materials being disturbed cannot be contained to the poly drop sheets. Poly may also be reduced if vertical containment is used to isolate work.
3. Fixed objects that cannot be re-located shall be covered with one layer of 6-mil poly and fully-sealed.
4. One layer of poly shall cover wall surfaces within areas that ceiling finishes are being removed and wall surfaces shall remain in place, in addition to the required floor poly.
5. Contractor shall install a 4-mil poly ceiling as needed to establish and maintain sufficient air pressure differential within the negative pressure enclosures.
6. All seams in poly shall be overlapped at least four inches (4") to prevent debris or dust from falling behind poly barriers.
7. A wash station shall be sited at all lead regulated areas to allow workers to decontaminate tools, waste bags, and themselves as they exit the regulated area. This area shall consist of poly drop sheet with wash station consisting of wet-wipes, towels, and soap. A waste bag for the disposal of applicable PPE and decontamination waste shall be in the area as well.
8. A three-stage decontamination chamber system shall be attached to the negative pressure enclosure. The requirements for this system are detailed below.
9. Sufficient negative air machines shall be installed within the containment area to generate the required air pressure differential of -0.05" WC or greater.
10. All negative air machines shall be exhausted to the exterior of the building. This may require the contractor to secure doorways, windows or other openings with plywood and tamper-proof bolts for negative air machine exhaust.
11. An airless sprayer with amended water and HEPA-vacuum shall be within the containment area prior to approval of work commencing.
12. All poly barriers that may allow access into a regulated area shall have signs installed at clearly visible locations to prevent tampering or breaching of containment areas. These barriers may be at doorways, free-standing poly walls, or similar locations.
13. Viewports shall be installed in poly walls to allow unobstructed view of the work area by inspectors. Location of viewports may be installed in areas at the direction of ES&A or District-hired independent third-party consultant.
14. Posting of signs and barrier tape may require the contractor to supply pylons or similar to mount barrier tape around the regulated area.
15. Signs shall meet requirements set forth in 1926.62(m) for a lead regulated area. Signs shall be posted once the containment area has been approved, but before any remediation begins.
16. Any use of a mechanical tool to cut through paints or coatings must have a shroud that is attached to a HEPA-vacuum providing sufficient local exhaust. Insufficient capture of painted debris by the shroud system will stop work until the issue can be resolved to the satisfaction of the ES&A Department or District's independent third-party consultant.
17. Contractor shall ensure that any remaining paints or coatings at the edge of removal area or components that are to remain, are tight to the substrate. Contractor is responsible for stabilizing any loose paints caused by their work or required as part of the work.
18. Material waste shall be bagged as it is generated to prevent a build-up within the work area. No un-bagged waste may remain within a work area at the conclusion of a work shift, including lunch breaks.
19. Once all lead work is completed, all work surfaces shall be wet-wiped and HEPA-vacuumed clean of all dust and debris.

20. All waste shall be double-bagged and labeled as necessary for disposal prior to removal from the work area. At least one of the waste bags shall be sealed in a "gooseneck" fashion to create a leak-tight container.
21. All waste, non-essential supplies, and equipment shall be removed from the containment area prior to a final visual inspection. To pass a final visual inspection, all removal shall be completed as indicated by project plans or direction from general contractor, paints remaining in work area shall be tight to the substrate, and the work area must be clean of all dust and debris.

Regulated Area Signage

Lead Hazard signs shall be posted at all entrances to a containment or regulated area as appropriate for work being performed. Signage will be posted after a pre-start visual is passed and work may begin in the containment, but no work shall start until all signs are posted.

Signage shall meet the revised requirements for lead set forth in 29 CFR 1926.62(m).

Decontamination Requirements

No consumption of food or fluids shall take place in the decontamination or load-out systems. Workers that wish to consume food or fluid shall fully exit the containment and decontamination system, including the doffing of all contaminated PPE.

Workers that fail to meet this requirement and remove PPE within a regulated area will be immediately removed from the project.

A three-stage decontamination chamber for worker ingress/egress shall be attached to all negative pressure enclosures. One system shall be required for every 10 workers that may be working within a containment area (i.e, 10 workers = 1 system, 11 workers = 2 systems). This chamber system shall consist of a dirty chamber, a shower, and a clean chamber. The decon chambers shall be constructed of 6-mil poly and each chamber shall be at least 3'L x 3'W x 7'H. A curb of at least 4" shall exist between each chamber to prevent the movement of debris or material from chamber to chamber. Each chamber shall be separated with a Z-flap that will seal closed in the event of a power outage.

The water in the shower shall be supplied by a properly functioning shower head. Both hot and cold water must be available and water temperature shall be controllable by workers using the shower. A splash pan may be required if workers cannot keep water contained into the shower system. The shower system shall have a filtration system that filters water down to 5 microns prior to discharge into a storm drain system. Soap, shampoo, towels and a waste bag for disposal of contaminated disposable PPE is required to be in the decontamination chamber system.

The floor of the dirty chamber shall have two layers of 6-mil poly. The top layer of the poly shall be replaced daily or more often if needed to maintain an acceptably clean decontamination system at the third-party consultant's discretion. Failure to keep any chamber of decon system in acceptable condition will be grounds for a work stoppage until cleaning has occurred and procedures have been corrected.

The contractor may opt to construct waste load-out chambers at containment areas. These chambers can be larger than worker decontamination systems, but the required air pressure differential must be maintained at all times and system shall be of reasonable size for the contractor to manage. Load-out chambers must be

constructed of 6-mil poly and framing shall be sufficient to provide a sturdy construction. There must be self-sealing flaps between chambers of the load-out chamber. Load-out chambers can be reduced to no less than two chambers and only upon approval by the District's third-party representative. Asbestos and/or lead signage shall be posted as appropriate at the load-out chamber and required PPE shall be worn in the load-out chambers as needed to comply with posted signage.

At no time will any ride-on equipment be used to access the load-out chambers to move waste. At no time will flaps of the waste load-out chambers or the worker decontamination system be pinned back to create a "tunnel" that does not provide an airlock between air chambers. At no time will a waste bin be directly attached to a containment or load-out chamber. At no time will waste be loaded into the load-out or decontamination system which prevent egress/ingress in the event of an emergency.

Failure by the contractor's onsite supervisor to monitor work crew and prevent this from occurring is grounds for dismissal of the supervisor and potentially crew members that fail to correct actions.

Disposal Requirements

Lead

Contractor is responsible for the waste characterization profiling of all lead waste to be disposed of. Copies of the laboratory results, including chain-of-custody, must be provided to WCSD ES&A or independent third-party consultant prior to disposal.

Lead-containing materials may be recycled, but a letter signed by the recycling facility acknowledging the lead-content of materials must be provided by the contractor prior to removal of such materials from the site.

The contractor will need to provide a fully enclosed, lockable waste bin for all waste created on this project. Waste bin will need to be labeled with lead signage once the waste is loaded into the bin. Waste bins shall be lined with one layer of 6-mil poly prior to waste being loaded.

General Waste Bin Requirements

Waste bins will need to arrive onsite clean of debris or any other waste and in proper functioning order. Waste bins may be rejected by WCSD ES&A staff or District's independent third-party consultant if these conditions are not met, with no extra charge to the District. Plywood or similar material shall be placed below the casters or feet of the bin to prevent damage to site grounds. The contractor will be responsible for any damage to the site grounds by waste bin delivery, storage, or haul-off.

In the event that work will be conducted during the school year, any waste bins onsite shall be isolated from students using temporary construction fencing. In addition, waste bin collection and delivery shall only be conducted when students are not present on campus.

Lead Wipe Sampling Criteria

The District will hire the independent third-party consultant to perform lead wipe sampling prior to commencement of work. The consultant will collect wipe samples from floor and/or adjacent horizontal surfaces within the work areas to verify lead dust levels prior to work commencing. If cleaning of a surface to remove a detected lead hazard is required, the contractor shall be notified, and the hazardous materials contractor will be required to pre-clean to remove the hazard.

At the conclusion of lead disturbances, a post wipe sample will be collected from the interior work area, following removal of the containment poly. If post project wipe samples indicate that an EPA lead hazard exists, or if samples indicate a higher level of lead on surfaces than pre-project wipe samples showed, then recleaning of the work area will be necessary. Recleaning process will be required to be repeated until wipe samples indicate lead levels are below both current EPA hazard levels and below pre-wipe sample levels.

Clearance

Once an area passes visual clearance for the materials removed, wipe sampling will be performed by the District's independent third-party consultant. Following are the requirements that must be met for clearance to be met and allow containment removal so that non-remediation personnel may re-occupy the space:

Lead

As noted previously, pre-job and post-job lead wipe samples will be collected in spaces to verify the contractor has not created a lead hazard by removal of their containment area and to verify that the spaces can be re-occupied by non-lead trained personnel. Lead wipes will be collected at **all** locations where lead-containing paint is disturbed in a manner that exceeds the WCSD ES&A Attachments and Penetrations procedures.

In the event that a lead hazard has been created by a contractor, such as improper disturbance of painted surfaces outside of a contained area, the District's ES&A staff or independent third-party consultant will collect clearance dust wipes in the affected area. If a lead hazard has been created, the contractor performing the improper disturbance will be responsible for all cleaning costs required for the lead remediation contractor to abate the hazard and for collection of clearance dust wipe or soil samples to document that the lead hazard has been remediated.

The contractor is responsible for all costs of labor and laboratory analysis for the collection of clearance air or wipe samples past the initial sample set collected within a containment area. This includes collection of samples due to failure to meet clearance requirements on the initial set of samples, contractor setting up more containment areas that reasonably expected, and contractor improper disturbance to surfaces after samples are collected but before analysis is completed.

ASBESTOS ABATEMENT TECHNICAL SPECIFICATIONS – EFFECTIVE 1/25/23

PART 1 – GENERAL REQUIREMENTS

1.1 LOCATION

This asbestos abatement is to take place at: Libby Booth ES, Remodel 2026, Issued 9/9/26

1.2 DESCRIPTION

The work shall include the furnishing of all labor, tools, and equipment, material, transportation, ALL waste disposal fees and services to include waste characterization sampling costs and the performance of all operations required to properly provide the work. The Contractor will be supervised by District AHERA certified personnel or District Hired Asbestos Consultants and the abatement work will be coordinated through the Regulated Systems and Assessment department. The work shall also include obtaining required permits and notifying regulating agencies as required by all applicable state, local and federal laws and regulations for the work to be performed. Notification fees and disposal manifest fees are to be paid by the Contractor. Contractors are reminded that non-friable asbestos projects may not require regulatory notification, but non-friable materials that have been made friable in the opinion of the regulatory agency require notification. Mastics removed with buffers require notification. It is the responsibility of the Contractor to determine if regulatory notification is required and any monetary citations that result from failure to notify or improperly done notifications will be fully the responsibility of the Contractor. Should the District be named in addition to the contractor, due to a Contractors failure or improper notification, the contractor shall be required to reimburse legal fees to defend the District, as well as the cost of any monetary citation that results. The work shall also include the cleanup and removal from the site of all debris resulting from the operations performed. Waste disposal of all materials removed from the site shall be performed in a manner consistent with these specifications and all applicable regulations and the Contractor is required to complete properly and pay for all waste characterization sampling costs. The Contractor shall be responsible for submitting the application for the waste disposal permit and the contractor will be responsible for the picking up and the payment of the fee for the permit. The Contractor will submit the waste application to the District prior to submittal to the Health Department for signature. It shall also be the Contractors responsibility to take all necessary safety precautions and to furnish security barricades, and/or any safety measures as may be required to properly separate the abatement areas from the public. All taxes/fees associated with the disposal of asbestos containing wastes, regulated or not, shall be the responsibility of the abatement contractor.

As the District may decide to pay a third party consultant to supervise projects, the District would have to pay the consultant additional money or pay overtime to district employees for weekend and overtime work. The work schedule of this project will be set by the Construction Department Project Manager. If the contractor must work additional time or hours not identified in the initial schedule, due to the contactors inability to man the job with enough workers, the District may require the contractor to reimburse the district for additional costs for consultants incurred by the District. **The Contractor will be required to staff this project with enough personnel to ensure completion within the required timeline.** The Contractor shall provide at all times sufficient and competent labor to carry on the work

properly and insure completion of each part in accordance with schedule and within the time agreed to. An employee of the Contractor or subcontractor, who is deemed incompetent, disorderly, or otherwise objectionable by the Owner, shall be removed promptly by the Contractor, and not re-employed on the work. Any employee of the Contractor that is observed that is not utilizing his personal protective equipment will be immediately removed from a project and not allowed on any other District projects. Should any disagreements result regarding the identification of the employee or his/her proper use of personal protective equipment, the determination of the District Regulated Systems Supervisor or District hired Consultant will be considered final and conclusive. The Contractors Asbestos Abatement Supervisors who allow employees to not utilize their personal protective equipment will be immediately removed from a project and not allowed on any other District projects. Contractors will be required to replace removed employees/Supervisors and no additional time will be allowed to complete the project.

When possible without the disturbance of asbestos-containing materials, it shall be the responsibility of the **OWNER** to remove and replace all loose and attached furniture, cabinets, bookcases, etc. before the project commences. The removal of these items, where removal impacts asbestos-containing materials, and re-hanging of doors that have to be removed because they impede removal will be the responsibility of the contractor.

The **OWNER** will be responsible for air sampling for the purpose of project clearance. The Contractor shall not include the cost associated with clearance sampling in his bid. The Contractor shall be responsible for all personal and area air monitoring required by regulation, the technical specifications or required by the Contractor's asbestos liability insurance carrier.

The **OWNER** shall be responsible for the cost associated with the initial air sample clearance requirements. If the initial sample analysis results do not pass for clearance, the Contractor will be responsible for the cost of all additional air sample analysis until clearance is achieved.
In the case that a project requires the isolation of toilet facilities it shall be the responsibility of the Contractor to provide alternative facilities as needed, if no alternative facilities are available on-site. If the Contractor utilizes District toilet facilities, the Contractor will be required to maintain the cleanliness of the designated District toilet facilities.

The contractor will be required to assign enough personnel and equipment to complete all projects scheduled for completion during each site's normal work hours. Costs to provide access to facilities after normal work hours, due to a Contractors inability to meet the schedule during normal hours will be passed on to the Contractor and deducted from a project's final payment.

There may be supplemental asbestos abatement specifications created by an outside asbestos consultant and provided to the Contractor to provide additional information. The Contractor must refer to all specifications provided in the bid package, and comply with all specification requirements. If there are any conflicts regarding asbestos abatement specification requirements, Contractors are required to comply with the most stringent requirement. Conflicts/disagreements regarding specification requirements will be settled based upon direction from the WCSD ES&A Department AHERA Project Designer certified staff.

1.3 EQUIPMENT

If requested the Contractor shall provide proof acceptable to the District that Contractors has disposal is enough equipment to support this project. Delays of up to 48 hours are to be anticipated for TEM Laboratory analysis result turnaround and abatement project schedule will reflect this delay. Additional equipment needs may result and the Contractor will be required to have enough equipment to proceed with work as schedule in spite of delays in awaiting final clearance sampling.

1.4 ASBESTOS LIABILITY INSURANCE REQUIREMENTS

The Contractor will be required to written proof by way of an insurance certificate of a minimum of Five Million Dollar ($5,000,000.) Occurrence Based Asbestos Environmental Risk Liability Insurance from a domestic Insurance company that has an A, A+ or A++ rating in Best's Insurance Guide, OAE. The Asbestos Abatement Contractor shall name the WCSD additionally insured on a primary and non-contributory basis for the contract term as well as any asbestos consultants the District may hire for job design and/or supervision and shall provide an insurance certificate specifically naming them as additionally insured, primary and stating that the policy cannot be cancelled in less than 30 days for any reason including non-payment.

1.5 LOCK OUT/TAG OUT PROGRAM

The Contractor will be required to comply with the Districts Lock Out/Tag out procedures. Requirements are available to contacting the WCSD safety officer.

1.6 WORK HOURS

The work schedule of this project will be set by the Construction Department Project Manager. Contractor must determine the work hours by reviewing the other contract documents and specifications or address these issues with the Project Manager so all Contractors are clear of the required abatement schedule prior to bidding on this project. These asbestos abatement specifications are not meant to set work hours or schedules rather the procedures to be used to abate asbestos containing materials within the district. The WCSD, ES&A department will be the entity ensuring the abatement specification are being properly being addressed by Contractors but the day to day scheduling and project specifics, not related to abatement procedures, will be administered by the Construction Department of WCSD.

SECTION 02110

ASBESTOS ABATEMENT: GENERAL

PART 1 - GENERAL

1.01 SCOPE OF WORK

A. These specifications cover the removal of specific types of asbestos containing material for the Washoe County School District. Refer to the project drawing for exact abatement information and locations. The work may include the abatement of asbestos containing material (ACM) on floors. New flooring materials will be installed over abatement areas so mastic removal techniques employed by the abatement contractor are to be done so that installed flooring products are able to be warranted by the flooring manufactures. If the abatement contractor is being hired by a flooring contractor the abatement contractor must consult the flooring installer and ensure their employed removal techniques do not void any warranties for new installed products. It is quite possible that chemical mastic removers may not be able to be utilized to achieve this requirement. No power tools may be used to remove asbestos containing materials unless approved by the District and the applicable regulatory authority. All carpeting in the areas shall be removed and disposed of as ACM, as directed by the District. Work will require use of a negative air pressure system and depending upon personal air sampling may require Type "C" supplied air respirators. Transmission Electron Microscopy (TEM) or Phase Contrast Microscopy (PCM) will be used by the District to establish final airborne asbestos levels prior to acceptance of the work by the District; final levels of airborne asbestos fibers at the completion of the work shall be in accordance with AHERA Regulations (40 CFR Part 763).

B. Polished Concrete and Concrete Grinding: The district may be grinding and or polishing concrete in scheduled areas after a flooring asbestos abatement project has been completed. In cases that polished concrete will be a part of the scope, **or concrete grinding will be required after abatement**, Contractors will **not** be allowed to utilize solvent mastic removers or any other method that liquefies the matrix of the mastic which could contribute to the mastic entering into cracks, and pores of the concrete. The exception to this would be the use of a fully HEPA vacuum shrouded techniques, such as water jet or hydro blasting. The intent of this requirement is that all mastic will be removed and no liquefied mastics will remain at the conclusion of work. If grinding of the concrete is required, it will happen after the final asbestos air clearance has passed and the asbestos abatement is complete. The poly containment that has been built, during the asbestos abatement phase, might be very helpful and cost effective if it were left in place for the concrete grinding contractor to use. So once the final clearance and abatement contractor has removed all signage, asbestos contaminated materials and the negative pressure machines, the grinding contractor may want to make arrangements with the abatement contractor to leave the poly containment up. All arrangements regarding the logistics of this agreement are up to the contractors' responsibility to determine. Contractors performing concrete grinding will be required to comply with District specifications regarding silica exposure during the grinding phase.

C. INTENT

1. These specifications are intended to describe all material, labor, and equipment necessary for asbestos material removal.

2. The listing or mention of any method of installation, erection, fabrication, or workmanship shall not operate to make the Contractor an agent, but shall be for the sole purpose of setting a standard of quality for the finished work; an alternate method may be approved in writing by the District if it results in quality equal to that intended by these documents, without increasing the District's liability. Unless an alternate method is approved, all work shall be in strict accordance with all methods of installation, erection, fabrication, and ownership listed or mentioned herein. In addition, while the methods are provided, the Contractor will be required to ensure any method utilized complied with all applicable regulations.

3. It is the responsibility of the Contractor to verify the square footage of asbestos containing material that needs to be removed on this project. The Contractor shall remove all asbestos-containing material from the areas as directed.

1.02 DESCRIPTION OF WORK

A. Furnish all labor, licenses, notifications, payment of notification and waste manifest fees, permits, materials, services, insurance, associated taxes, and equipment to complete and dispose of all asbestos containing materials and asbestos-contaminated material as directed by the District. Base cove materials inhibit the removal process and trap contaminated materials, therefore all removable base cove materials must be removed as a apart of the abatement process of flooring materials.

B. CORRELATION OF DRAWINGS AND SPECIFICATIONS

1. In general, the specifications will describe the "quality" of the work. The specifications are cooperative and supplementary; however, each item of work is not necessarily mentioned in the specifications. All work necessary to complete the projects so described is to be included in this Contract.

2. In case of disagreement within the specifications, the better quality of the work shall be estimated and the matter drawn to the District's attention for decision and/or adjustment. Any work done by the Contractor without consulting with the District, when the same requires a decision, shall be done at the Contractor's risk.

3. Omissions or Errors. If any omissions or errors in technical specifications are noted, or instructions at variance with the obvious intent of the document, it is the responsibility of the Contractor to call them to the District's attention before performing the work.

C. INTERPRETATION OF "OR EQUAL"

1. The use of trade names, with a notation such as "or equal" in these specifications is to establish quality required; there is no attempt to limit competitive bidding, but, in like manner, the quality specified will be rigidly maintained.

2. The words "approved", "equal to", "as directed". etc., are interpreted and will be taken to mean "to the satisfaction of the District."

D. UTILITIES (each of the following apply to this project as stated, unless otherwise noted in the project documents.)

1. Water - Existing service is available for the Contractor's use.

2. Electrical Service

   a. Existing service is available for the Contractor's use.

   b. The Contractor shall be responsible for furnishing necessary light bulbs, temporary lighting, temporary power stations, GFI outlets and extension cords as may be essential to the execution of their respective branches of the work. In addition, for extensions of lines to sheds or to power tools and remote areas which cannot be reached with extension cords.

   c. The Contractor shall be responsible for replacement cost of transformers, panels, circuit breakers and any other item of electrical equipment and installation thereof which is destroyed or broken as a result of or during the course of the Contractor's abatement activity.

3. Utility charges for electric power and water service will be paid by the Owner.

E. GUARANTEE

1. The Contractor shall, in case of work performed by his Subcontractors and where guarantees are required, secure warranties from said Subcontractors and deliver copies of same to the District upon completion of the work and prior to final retention payment.

2. All portions of the work shall also be maintained in perfect condition during this period. Such written guarantees as may be requested shall be submitted in duplicate at the completion of the work. These will be supplementary to and not in any way canceling specific guarantees which apply to various portions of the work.

3. If, in the Contractor's opinion, any work that is called for in the specifications in such a manner as to make it impossible for him to produce and guarantee a first-class piece of work, he shall refer the same to the District in a timely manner before proceeding.

1.03 DEFINITIONS

A. GENERAL TERMINOLOGY FOR ASBESTOS ABATEMENT

1. Owner - Washoe County School District, hereinafter referred to as the Owner, or the District, or the authorized representative of the Owner, or the District's consultant.

2. Authorized Visitor - Any visitor to the site whose visit has been authorized by the District.

3. Asbestos - The term asbestos includes chrysotile, amosite, crocidolite, tremolite, anthophyllite, and actinolite. Materials are considered to contain asbestos if any amount of asbestos is present.

4. ACM - Asbestos-containing material(s).

5. Visible Asbestos - Visible Asbestos Containing Material

6. Abatement - Procedure to control fiber release from asbestos-containing building materials. Includes encapsulation, enclosure and removal.

7. Removal - All herein specified procedures necessary to strip all ACM from the designated areas and to dispose of these materials at an acceptable site. **The preferred method of removal of flooring material mastic is by wet method utilizing a chemical mastic remover.**

8. Work Area - A room or location in which ACM is indicated to be removed by this Contract.

9. Containment Area - A work area or zone which is prepared with plastic sheeting, barriers, negative air, etc., for asbestos abatement work.

10. Enclosure - All herein specified procedures necessary to completely enclose all ACM behind airtight, impermeable, permanent barriers.

11. Encapsulation - All herein specified procedures necessary to treat ACM with an encapsulant to control the possible release of asbestos fibers into the ambient air.

12. Encapsulant (Sealant) - A liquid material which can be applied to ACM and which controls the possible release of asbestos fibers from the material either by creating a membrane over the surface (bridging encapsulant) or by penetrating into the material and binding its components together (penetrating encapsulant). Any encapsulant installed must be compatible with any new products that will installed over the encapsulate such as flooring products.

13. Air Monitoring (Air Sampling) - The process of measuring the fiber content of a specific volume of air in a stated period of time.

14. Area Monitoring - Air monitoring of fiber concentrations within the asbestos control area and outside the asbestos control area which is representative of the ambient airborne concentration of fibers.

15. Personal Monitoring - Air monitoring of fiber concentrations within the breathing zone of an employee.

16. HEPA Filter - A High Efficiency Particulate Air (HEPA) filter capable of trapping and retaining 99.97% of particles greater than 0.3 micron in size.

17. Negative Air Pressure System - A local exhaust system capable of maintaining a minimum pressure differential of minus 0.03 inch of water gauge in work area relative to adjacent areas. Documentation of negative air pressure is mandatory.

18. Negative Air Machine (NAM, "HOG") - A self-contained local exhaust machine utilized in a negative air pressure system. This equipment must use HEPA filters when used in asbestos work areas to collect and retain asbestos fibers.

19. HEPA Filter Equipment - Vacuuming equipment, which uses HEPA filters capable of collecting and retaining asbestos fibers. Filters shall be of 99.97% efficiency for retaining fibers of 0.3 micron or larger in size.

20. Surfactant - A chemical wetting agent added to water to improve penetration.

21. Amended Water - water to which a surfactant has been added.

22. Removal Encapsulate - a penetrating encapsulate specifically designed for removal of asbestos-containing materials rather than for on site encapsulation.

23. Chemical Remover - A pre-mixed chemical-penetrating agent designed specifically for removal of asbestos-containing material.

24. Airlock - A system for permitting ingress or egress without permitting air movement between a contaminated area and an uncontaminated area, typically consisting of two curtained doorways.

25. Curtained Doorway - Device to allow ingress or egress from one room to another while permitting minimal air movement between the rooms

26. Decontamination Facilities - A series of connected rooms, with doorways between any two adjacent rooms, for the decontamination of workers or of materials and equipment. The facility minimally consists of a clean room, a shower room, and an equipment room.

27. Clean Room - An uncontaminated area or room, which is part of the worker decontamination facility, with provisions for storage or workers' street clothes and clean or unused protective equipment.

28. Shower Room - A room between the clean room and the equipment room in the worker decontamination facility, with hot and cold running water, soap, shampoo, and suitably arranged for complete showering during decontamination.

29. Equipment Room - A contaminated area or room that is part of the worker decontamination facility, with provisions for storage of contaminated clothing and equipment.

30. Wet Cleaning - The process of eliminating asbestos contamination from building surfaces and objects by using cloths, mops, or other cleaning tools which have been dampened with water, and by afterwards disposing of these cleaning tools as asbestos-contaminated waste.

31. Water Filtration System - A local water-filtering system capable of trapping and retaining 99.9% of asbestos fibers greater than 5 micron in size.

32. Fixed Object - A unit of equipment or furniture in the work area which is not removed from the work area. To include chalk boards, bulletin boards, TV stands etc.

33. Movable Object - A unit of equipment or furniture in the work area, which can be feasibly removed from the work area without disassembly.

34. MSDS - Material Safety Data Sheet - OSHA Form 20 or equivalent form containing health hazard information about chemical products.

35. NESHAPS - The National Emission Standards for Hazardous Air Pollutants (40 CFR Part 61).

36. NIOSH - National Institute for Occupational Safety and Health.

37. OSHA - Occupational Safety and Health Administration.

38. EPA - Environmental Protection Agency.

39. ASTM - American Society for Testing and Materials.

40. ULI - Underwriters Laboratories, Inc.

41. Chemical Mastic Remover - A non-flammable solvent manufactured especially for the removal of mastic materials. **The flash point of the mastic remover used on District projects must be no less than 140 degrees Fahrenheit**.

PART 2 - APPLICABLE STANDARDS AND GUIDELINES

2.01 REFERENCE DOCUMENTS AND RESOURCES

A. All work covered by these regulations shall be performed in accordance with all applicable federal, state, and local regulations, standards, and codes governing asbestos abatement, transportation, and disposal. The current issue of each document shall govern. Where conflict among requirements or with these specifications, the more stringent requirements shall apply. Requirement shall include but not be limited to:

B. Department of Transportation

- Title 49 CFR 172 – Special Provisions, Hazardous Materials Communications, Emergency Response Information and Training requirements.
- Title 49 CFR 173 – General Requirements for Shipments and Packaging.

C. Environmental Protection Agency (EPA)

- Title 40 CFR, Part 763, Asbestos Containing Materials in Schools (AHERA)
- Title 40 CFR 61, Subparts A & M – National Emission Standard for Asbestos (Neshaps)
- Title 40 CFR, Part 763 – Revised Model Accreditation Plan

D. Federal Occupational Safety and Health Administration (OSHA)

- Title 29 CFR 1910.20 – Access to Employee Exposure and Medical Records
- Title 29 CFR 1910.38 – Emergency Procedures
- Title 29 CFR 1910.134 – Respiratory Protection
- Title 29 CFR 1926.20 – General Safety and Health Provisions
- Title 29 CFR 1926.21 – Safety Training and Education
- Title 29 CFR 1926.23 – First Aids
- Title 29 CFR 1926.24 – Fire Protection
- Title 29 CFR 1926.25 – Housekeeping
- Title 29 CFR 1926.28 – Personal Protective Equipment
- Title 29 CFR 1926.51(f) – Washing Facilities
- Title 29 CFR 1926.55 – Gases, Vapors, Fumes, Dusts, and Mists
- Title 29 CFR 1926.56 – Illumination
- Title 29 CFR 1926.57 – Ventilation
- Title 29 CFR 1926.59 – Hazard Communication Standard
- Title 29 CFR 1926.103 – Respiratory Protection
- Title 29 CFR 1926.300, 301, 302 – Hand and Power Tools
- Title 29 CFR 1926.451 – Scaffolding
- Title 29 CFR 1926.500, 502, 503 – Fall Protection
- Title 29 CFR 1926.1101 – Asbestos Standard for the Construction Industry

E. Nevada Division of Environmental Protection (NDEP)

- NAC 444.965 to 444.976 – Sanitation of Asbestos

F. Nevada Occupational Safety and Health Enforcement Section (OSHES)

- NAC 618.850 to 618.907 – Abatement of Asbestos, General Provisions
- NAC 618.910 to 618.948 – Abatement of Asbestos, Licensing and Accreditation to Perform Services
- NAC 618.950 to 618.962 – Abatement of Asbestos, Performance of Activities for Abatement
- NAC 618.970 to 618.986 – Abatement of Asbestos, Disciplinary Action

G. Washoe County District Health Department, Environmental Health Services Division. (WCHD)

- 030107A to 030.107C – District Board of Health Regulations Governing Air Quality Management (regarding asbestos)
- 030.184 to 030.185 - District Board of Health Regulations Governing Solid Waste Management

H. STATE AND LOCAL REQUIREMENTS

1. The Contractor shall comply with the State of Nevada, Division of Occupational Safety and Health Regulations for construction and handling of asbestos. All Contractor personnel will have the applicable Nevada OSHES card on their person at all times during the completion of the project. Personnel will be required to present the license to District personnel upon request. Personnel without their Nevada OSHES card, or with unreadable or mutilated cards, or expired cards will not be allowed to work on the project until a readable, unexpired card is produced.

2. The Contractor shall comply with the Federal Environmental Protection Regulations pertaining to handling and disposal of asbestos-containing materials as well as the State of Nevada and any local governmental agencies which have delegated responsibility for the administration and enforcement of NESHAPS and other federal regulations.

3. The Contractor shall comply with all requirements of the EPA approved landfill which is selected as the disposal site.

I. OTHER REQUIREMENTS

- ANSI - American National Standards Institute: ANSI Z9.2 Fundamentals Governing the Design and Operation of Local Exhaust Systems.

J. The Contractor shall comply with said regulations, requirements, and standards (noted in B through I) and require and be directly responsible for compliance therewith on the part of his agents, employees, and subcontractors; and shall directly receive and be responsible for all citations, assessments, fines or penalties which may be incurred by reason of his agents, employees, or subcontractors failing to so comply.

PART 3 - REQUIRED DOCUMENTATION

3.01 SUBMITTALS AND NOTICES

A. PRIOR TO COMMENCEMENT OF WORK, ALL THE FOLLOWING MUST BE SUBMITTED TO THE WCSD, ES&A DEPARTMENT

1. Notification in writing of proposed asbestos work, with copy to the WCSD, ES&A Department, the EPA Regional Office, OSHA or OSHA Regional Office, local air pollution agency, and local authority with responsibility for enforcement of occupational health and safety regulations and enforcement of NESHAPS regulations and with jurisdiction in the State in which this project is located, not fewer than ten (10) working days before work commences on this project. Courtesy notifications will be submitted on **all** projects regardless of the regulatory requirement.

2. Submit proof satisfactory to the WCSD, ES&A Department that all required permits, site locations, and arrangements for transport and disposal of asbestos-containing materials, supplies and the like have been obtained.

3. Submit documentation to the WCSD, ES&A Department indicating that all employees have had medical examinations (See Section 02110, PART 3, 3.01, B, 6) and instruction on the hazards of asbestos exposure, use of protective clothing, on use of showers, on entry and exit from work areas, on work procedures and protective measures, and on all aspects of 29 CFR 1910.134 (See also Section 02130, PARTS 3 and 4).

4. Submit documentation to the WCSD, ES&A Department that fifty (50) percent of the work force (exclusive of job foremen, superintendents, etc.) have at least one year's experience in asbestos abatement work for any employee not already approved and verified.

5. Submit to the WCSD, ES&A Department documentation that all superintendents, and supervisors have been certified as supervisors for at least two (2) year's and possess two (2) years' experience supervising asbestos abatement projects in that capacity for any employee not already approved and verified.

6. Submit documentation that **all** of the work force members are licensed by the State of Nevada in the field of asbestos control. Personnel will be required to present the license to District personnel upon request. Personnel without their Nevada OSHES card, with unreadable or mutilated cards, or expired cards will not be allowed to work on the project until a readable unexpired card is produced.

7. Submit documentation that each negative air machine and HEPA vacuums have been "thermally DOP tested" by a "third party" testing agency within a 6 month period prior to the start of each project. The "third party" testing must be conducted by a testing agency with its own testing equipment and may have no relationship with the contractor. The District's decision regarding the issue of when a testing agency meets the "third party"

requirement will be regarded as final and conclusive. The Contractor will be required to submit DOP test result certification for each unit prior to its use. The DOP testing company will be required to strictly comply with the manufacture procedures and testing media. The District may require access to review the DOP testing conducted during the contract period**. Any negative air machine or vacuums that are to be exhausted outside of a negative pressure enclosure must be DOP tested on-site prior to the start of any project. In addition equipment inside a containment larger than 2000 square feet will require on-site DOP testing of all negative air machines and vacuums prior to the start of the project.** Contractor will be required to add this delay for DOP testing into the project schedule and supplement the workforce accordingly to maintain the required abatement schedule.

8. Submit documentation that each negative air recording device (manometer) has been calibrated within 12 months prior to the start of each project.

9. Various manufacturers' information, including MSDS's, for approval, prior to its use on any project. In addition to submitting a copy to the ES&A department, Contractors will also be required to provide to the site's administration office and the Site Coordinator (head custodian) one complete copy of all MSDS's for all chemicals used on site.

10. Proof of insurance coverage prior to the start of each project.

11. Submit documentation from the Contractors asbestos liability insurance company, information on all area and personal area monitoring requirements. A complete copy of the insurance policy including any riders must be provided.

12. Submit documentation to the District indicating that all employees have taken the required AHERA training for the type of work they will be performing. Legible copies of each employee's initial training class and copies of the most recent refresher must be submitted. All employees will be required to have in their possession when performing abatement work the original copies of the initial training and refresher training certificates. District inspectors will review certificates in the field. Personnel without their AHERA training certificates, with unreadable or mutilated certificates, or expired certificates will not be allowed to work on the project until a readable initial or unexpired refresher certificate is produced.

B. The following procedure is to be implemented in an effort to reduce the time and cost to submit worker/employee training certs, Nevada State license, and physical documentation, items #3, #6 and #12 listed above. The required compliance will reduce the time the Contractor must put forth submitting training/physical documents as well as reduce the time it takes to review and approve the documents submitted. Contractors **will not** submit duplicate documentation to the ES&A department or representatives in the field that the ES&A department already has on file. Contractor can request a complete list of documents the ES&A department has on-file by calling the ES&A department at 851-5675 and one will be provided.

1. **<u>At least two weeks prior to the start of the project</u>**, contractor shall provide all worker/employee training certs and physical documentation for employees not already in the WCSD training database, to the ES&A Department at 7495 South Virginia Street, Reno, Nevada. To do this electronic copies will be provided through e-mail to the ES&A department Administrative Secretary. Contact the ES&A department Administrative Secretary. At 851-5675 if you do not their e-mail address. The ES&A Department will review the submitted training documentation and pre-approve workers and supervisors so they can work on the assigned WCSD project.

2. New workers added to the project after the start of the project will be approved by the ES&A department within one 8 hour period of the standard Monday thru Friday normal work schedule. Certification submittal will be serviced by the ES&A Department on a first come, first served basis. Delays to review the documentation will be anticipated and taken into account on any project schedule developed.

3. Workers or technicians will not report to the job site until they have been added to the ES&A database and properly documented on the contractors training report which is provided to ES&A or lead supervisory consulting staff in the field. ny way that requires certification on that project.

4. Contractors should request and will be provided a copy of the most current WCSD Company Training Report for their company which will identify training and physical documentation on file with WCSD for each employee. This database should be kept current by perspective bidders by providing to the ES&A department any new documentation when it is received for their employee so no delays are encountered due to a contactor not keeping this companies documentation current. Do not wait till you get a bid to provide updated data for your employees otherwise delays can occur.

5. ES&A staff in the field or environmental lead consulting staff will not be allowed to let anyone work or show up to the job site of they are not up to date on their documentation as identified on the WCSD Company Training Report.

C. The Contractor shall submit to the WCSD, ES&A Department, upon request, any other information the District may require, including, but not limited to, the following:

1. Weekly work schedule.
2. Type and brands of materials for worker protection.
3. Method of application and materials to be used.
4. Medical examination results of all employees (OSHA 1910.1001), including chest roentgenogram, pulmonary function and forced expiratory volume at one second (Contractor is responsible for obtaining the appropriate medical releases).
5. Schedule for changing filters in negative air pressure system and water filtration system.
6. Copies of all OSHA Form 101 or equivalent accident/injury/incident reports.

D. The Contractor shall submit directly to the WCSD, ES&A Department, **not Capital Projects Construction personnel**, or the Districts Consultant, upon each jobs completion And prior to final invoice submittal, a complete original documents job package including the following, **this is in addition to any other contract required documentation or documentation requested by others like asbestos consultants:**

1. Asbestos Removal Certification Letter signed and dated by the Contractors representative with language certifying that all asbestos materials have been properly removed in accordance with all Federal, State and Local regulations.
2. Asbestos insurance certificates
3. Manometer documentation that records air pressure differential between work areas and external air).
3. Copies of all daily manpower, work logs, and containment sign in logs indicating area(s) and type of work performed.
4. An original copy of all certifications of disposal.
5. Copies of permits.
6. Copy of the submitted notifications or courtesy notifications
7. Personal air sampling logs and an original air sampling results of each personal air sample taken on the project. The submitted log and sample results must include all the required data listed under air monitoring, Section 02120, part 2 of the technical specifications on page 23 and 24. The submittal of all personal sampling data identified above is in addition to the submittal of daily sample logs.

E. It is the Districts intention that the Contractors are responsible for supplying to the WCSD ES&A Department all Contractor generated documents. WCSD District-hired asbestos abatement consultants will be required to supply the following documents as a minimum, to the WCSD ES&A Department, at the end of the project and prior to final billing. The cost for development and submittal of the following is to be included in the asbestos consulting cost estimates provided to WCSD. Any costs for asbestos consultants to gather and/or submit a duplications of Contractor items listed above is not to be added to the Consultant's cost estimate. The District will not pay for this service twice, as the document submission of Contractor documents will be included in a Contractor's bid.

1. Summary letter explaining what was done, with a certification statement that observed work was done in accordance with Contract Specifications.

2. Drawing identifying what was done with post abatement notes, with information as required to identify all abatement work done.

3. Consultant's Daily logs documenting what was done, notes and narratives of the daily progress of the Contractor, and the steps taken to enforce contract specifications. Important project milestones should be addressed, as well in these daily logs, and pictures are encouraged.

4. Clearance air sampling maps identifying the outline of the abatement containment, date that the samples were taken, times that pumps were turned on and off, and flow measurements for each set of clearance air samples.

5. Copy of each clearance air sample laboratory chain of custody forms.

6. A copy of each clearance air sample laboratory results.

7. Area air sampling maps identifying the location samples were taken, date that the samples were taken, times that pumps were turned on and off, and flow measurements for each set of area air samples.

8. Copy of each area air sample laboratory chain of custody forms.

9. A copy of each area air sample laboratory results.

10. Bulk sampling map(s) identifying the locations any bulk samples were taken (if applicable).

11. Copy of any bulk sample laboratory chain of custody forms (if applicable).

12. A copy of each bulk sample laboratory results (if applicable).

F. The Contractor will submit daily by fax or e-mail to the WCSD, ES&A Department a copy of a daily air monitoring log with the numbers of all air monitoring cassette taken that day and the location taken or activity conducted by the personnel wearing the sample. A copy of each projects sample logs will not be acceptable. The daily sampling data listed above must be combined from all projects and listed on one daily air-monitoring log.

G. The Contractor shall have his laboratory e-mail or fax within **48 hours** of the date the sample was taken final laboratory result documents for air monitoring to the WCSD, ES&A Department. No hand written result report will be allowed. The laboratory reports will reference the air monitoring cassette's factory assigned number and the personal air monitoring results must be properly applied to an 8 hour time weighted average. Failure to submit results within the required 72 hour period may result in the District temporarily stopping the applicable abatement projects until results are received. Continued failure may also result in the termination of this contract.

H. The contractor may only invoice for a percentage of the project as agreed upon by the WCSD Project Manager & Contractor at the completion of work. but prior to submitting the final complete job package to the WCSD, ES&A Department at the Contrator discretion. The remaining agreed upon % may not be invoiced, and will not be authorized for payment until a complete job package has been submitted to the WCSD, ES&A Department and the completed package has been reviewed for correctness and accepted and all restoration of damage has been completed.

I. The Contractor will submit **daily** by fax or e-mail to the WCSD, ES&A Department an activity log with the location that contractor conducted activities that day, with a complete listing of workers assigned to each project.

J. Upon submittal, job packages will be reviewed for completeness by the WCSD, ES&A Department. In the event that a job package must be returned more than once, due to omissions or corrections, the contractor shall deduct a $200.00 processing fee from the projects final invoice, one fee per each occurrence after the first that the WCSD ES&A Department, district consultant or WCSD project Manager must contact the contractor due to omissions or errors.

PART 4 - SPECIAL PROCEDURES

4.01 ACCEPTANCE CRITERIA

A. Before any building or section of any building can be occupied by any personnel without respiratory protection, the level of airborne fibers must be less than or equal to the AHERA clearance level.

B. After the final cleaning, projects will be cleared by laboratory analysis of 5 air monitoring cassettes taken by the Owner, or Owner representative, inside the containment using aggressive methods. The analysis of cassettes from projects under 160 square feet will be analyzed by Phase Contrast Microscopy (PCM), NIOSH 7400. Projects over 160 square feet will analyzed by Transmission Electron Microscopy (TEM). Acceptable clearance levels for PCM analysis is all samples must be less than or equal to .01 fibers/cc. The Acceptable clearance level for TEM analysis is the average of the 5 samples taken inside the containment must be equal to or less than 70 asbestos structures per square millimeter. Fiber levels outside of the containment **cannot** be deducted from samples inside the containment to meet clearance criteria. It is the Contractor's responsibility to filter make-up air if so deemed necessary. Failure to filter a containments make up air will not relieve the Contractor from reimbursing the District for additional clearance samples that exceed clearance levels and fibers from outside the containment are suspected.

C. In the event that the initial clearance samples do not meet with the above protocol for air sampling clearance, the Contractor shall bear all costs required to perform additional sampling.

D. The District or Districts hired asbestos consultant will only perform as many air clearances as time allows. All attempts will be made to accommodate all requested requests for air clearance but the Contractor will be required to anticipate this requirement. Any delays or equipment tie ups due to the Contractors requiring more clearance samples then time allows on any given District work day is solely the responsibility of the Contractors and no additional fees will be paid to the contractor by the District. The Contractor will be required to have enough equipment available to maintain the required schedule in spite of any delays due the contractor requiring more samples then time allows. Locations requiring clearance sampling must be scheduled with the District one (1) day in advance by mail or fax. The containment must be ready for clearance sampling by 12:00 PM or earlier the day the samples are scheduled to be taken or the samples will be taken the next day. Contractor will anticipate an up to a 48 hour delay in receiving from the District TEM laboratory results.

4.02 STOPPING THE WORK

A. If, at any time, the WCSD, ES&A Department decides that work practices are violating pertinent provisions of the Contract, endangering workers, innocent bystanders, or endangering District facilities, they will immediately notify the Contractor in writing that operations shall cease until corrective action is taken and the Contractor shall take such corrective action before proceeding with the work.

B. If, at any time, the negative air pressure system is not operating in compliance with Sections 02120, PART 3, 3.02 and 02140, PART 1, 1.01H, and/or units are non-operational, operations shall cease until corrective action is taken and the Contractor shall take such corrective action before proceeding with the work.

C. Delays caused by inappropriate work practices as noted in 4.02A or 4.02B (Section 02110, PART 4) and/or excessive airborne fiber concentrations (defined as concentrations in excess of 0.2 fibers/cc, TWA) shall be at the Contractor's expense. No later claims for extra compensation which result from action taken under 4.02A, 4.02B or 4.02C (Section 02110, PART 4), or other delays caused by the Contractor failure to comply this Contract specifications will be recognized by the District.

D. In case of disagreement between the District and the Contractor regarding the analysis of any air monitoring data, either personal or area, the results of the District will be regarded as final and conclusive.

4.03 SITE SECURITY

A. The work area is to be restricted only to authorized, trained, and protected personnel. These may include the Contractor's employees, employees of subcontractors, District employees and representatives, State and local inspectors and any other designated individuals. The Contractor is responsible to ensure that the security of the building is not diminished and install all outside negative air machine exhaust ports in a secure manner. Failure to provide adequate security measures will leave the Contractor responsible to loss or damage of property if it is determined that access was gained through an inadequate security measure employed by the Contractor. A list of authorized personnel shall be established prior to job start and posted in the clean room of the worker decontamination facility and in the Contractor's office. The Contractor will not restrict access to District asbestos personnel to any asbestos containment at any time.

1. Contractor shall be notified by the District of any other authorized visitors prior to their entry to the job site.

B. Entry into the work area by unauthorized individuals shall be reported immediately to the District by the Contractor.

C. A log sheet shall be maintained in the clean-room area of the worker decontamination system or Contractor's office. Anyone who enters the work area must record name, affiliation, time in, and time out for each entry (See Section 02140, PART 1, 1.04G).

D. Should any keys that have been signed out to the Contractor become lost and cannot be found, the Contractor may be responsible for all cost associated with re-keying all locks at the site that the lost key opened.

4.04 EMERGENCY PLANNING

A. Emergency planning and procedures shall be developed by the Contractor prior to abatement initiation and agreed to by the Contractor and District.

B. Emergency procedures shall be in written form and prominently posted in the clean change area and equipment room of the worker decontamination area. All employees must read and sign these procedures to acknowledge receipt and understanding of work site layout, location of emergency exits and emergency procedures.

C. Emergencies may arise during the progress of work which may require special effort or require extra shifts of personnel to continue the work beyond the normal working hours. Be prepared in case of such emergency to do all necessary work promptly, at no additional cost to the District.

D. The Contractor shall file with District the names, addresses and telephone numbers of local personnel who can be contacted at any time in case of emergency. These persons must be fully authorized and equipped to correct unsafe conditions on short notice.

E. The Contractor shall provide the District with means to contact the Contractor or his representative, available 24 hours a day, in the case of emergencies while asbestos projects are in progress. Acceptable means would be a home or office phone plus a cell phone or beeper for when the Contractor is out of the home or office. Vehicle phone will not be acceptable. If the Contractor assigns this responsibility to one of his employees, the employee must have authorization and the ability to perform any emergency response requested.

4.05 PRE-CONSTRUCTION MEETING

A. The Contractor shall attend as specified a pre-construction job meeting at a time agreed upon by the Contractor and the District. Attending this meeting will be representatives of the District who will actually participate in the District's asbestos project monitoring program. The preconstruction meeting may be held via the telephone at the District's option. This meeting may be waived at the Districts discretion.

B. At this meeting or prior to starting work, the Contractor shall provide all submittals as required in Section 02110, PART 3. They shall be prepared to discuss the following information:

1. Preparation of work area.
2. Personal protective equipment including respiratory protection and protective clothing.
3. Employees who will participate in the project, including delineation of experience, training, and assigned responsibilities during the project.
4. Decontamination procedures for personnel, work area and equipment.
5. Abatement methods and procedures to be utilized.
6. Required air monitoring procedures.
7. Procedures for handling and disposing of waste materials.
8. Procedures for final decontamination and clean-up.
9. Detailed work and performance schedule.
10. Emergency procedures.

SECTION 02120

MATERIALS AND EQUIPMENT

PART 1 - GENERAL

1.01 It should not be inferred that all materials, tools and equipment listed in Part 2 are required or that all required materials, tools and equipment necessary are listed herein.

PART 2 - MATERIALS

2.01 Deliver all materials in the original packages, containers or bundles bearing the name of the manufacturer, the brand name, and labeling as required by 29 CFR 1910.1200.

A. Store all materials subject to damage off the ground, away from wet or damp surfaces, and under cover sufficient to prevent damage or contamination.

B. Damaged or deteriorating materials shall not be used and shall be removed from the premises. Material that becomes contaminated with asbestos shall be disposed of in accordance with the applicable regulations.

2.02 Polyethylene sheeting of a **true** 4 mil and 6 mil thickness unless otherwise specified, clear in color and in sizes to minimize the frequency of joints. All Polyethylene sheeting will be **Fire retardant.**

2.03 Polyethylene bags, properly labeled, of a **true** 6 mil thickness, clear in color, for disposal of asbestos debris.

2.04 Tape - capable of sealing joints of adjacent sheets of plastic sheets and for attachment of plastic sheet to finished or unfinished surfaces of dissimilar materials and capable of adhering under dry and wet conditions, including use of amended water, chemical removers, or removal encapsulant.

2.05 Surfactant (wetting agent) - shall consist of 50% polyoxyethlene ester and 50% polyoxyethlene ether, or equivalent and shall be mixed with water to provide a concentration of 1.25 kg/cubic meter of water.

2.06 Chemical Remover - suitable to aid in removal of ACM such as EPA 55 or equivalent.

2.07 Removal Encapsulant - suitable to aid in removal of ACM such as Asbestite 1000, Serpiflex Shield #4, BWE 5000, or equivalent; the removal encapsulant shall act as its own solvent and be capable of binding and encapsulating individual asbestos fibers.

2.08 Impermeable containers (Drums) - suitable to receive and retain any asbestos-containing or contaminated materials until disposal at an approved site. (The containers shall be labeled in accordance with OSHA Regulations 29 CFR 1910.1001).

2.09 Warning labels and signs - as required by Regulation.

2.10 Encapsulant - Penetrating type, such as Asbestite 2000, American Coatings' Cable Coating 22p, SK 13-1C, BWE 3000, or equivalent. The encapsulant should have a coverage of 80 square feet per gallon and shall be compatible with new applications of flooring mastic. The encapsulant **must** be **clear** in color.

2.11 Encapsulant - Bridging type, such as American Coating FNE High Temperature Sealant, Ocean 666, or equivalent. Bridging encapsulant shall have a coverage of 25 square feet per gallon. Any encapsulant installed must be compatible with any new products that will installed over the encapsulate such as flooring products.

2.12 Spray Poly - Spray applied water resistant film with minimum coverage of 16 mil thickness when wet, such as Isotek Spray Poly or equivalent.

2.13 Other Materials - provide all other materials as specified in drawings; also, other materials such as lumber, nails, and hardware, which may be required to construct and dismantle the decontamination area and the barriers that isolate the work area.

2.14 Chemical Mastic Remover - A non-flammable solvent manufactured especially for the removal of mastic materials such as Control Low Odor, Sentinel 747, or equivalent. The flash point shall be no less than 140 degrees Fahrenheit.

PART 3 - TOOLS AND EQUIPMENT

3.01 Provide suitable tools for asbestos removal. The minimum acceptable amount of equipment to support this contract is estimated at 4 recording manometers, 4 standard incline manometers, 4 shower and water filter units, and twenty four 1500 cfm negative air units. This is an estimate of the minimum equipment and additional equipment may be required to comply with Contract Specifications and Documents.

A. If the Contractor is unable to keep up with the requested work schedule due to the lack of required equipment or inoperable equipment, the District reserves the right to purchase or rent equipment which will then be supplied to the Contractor. The Contractor will then be responsible to reimburse the District for the cost associated with the rental or procurement. The District would only exercise this option in the event the Contractor fails to take reasonable steps on his own to repair his own equipment or rent or procure equipment necessary to keep up with the requested schedule.

B. Under no circumstance will contaminated tools or equipment, be placed inside of a District room outside of a containment. Contaminated tools and equipment will be sealed in impermeable plastic bags (minimum of six-mil think) and **immediately** transported into the containment from the transporting vehicle directly into a containment that has already had its critical barriers completed and is under negative pressure. This includes equipment or tools that is placed in bags or sealed in plastic.

3.02 Negative Air Pressure System - a negative pressure must be established in the work area by means of a local exhaust system. The equipment shall exhaust through a **three** or more stage HEPA filtration system to the outside of the work area. The equipment shall be in operation for 24 hours per day until decontamination and final clean-up of the work area is completed. A recording device shall be used to provide documentation of the pressure differential of 0.03 inches of water gauge. The system shall have the following additional characteristics:

A. Filtration equipment in compliance with ANSI Z9.2, Local Exhaust Ventilation.

B. Capable of maintaining a minimum pressure differential of minus 0.05 inch of water gauge in the work area relative to adjacent areas. The 0.05 inch of water gauge requirement must be maintained throughout the removal process including the waste load out and during the entrance and exit of the containment through the Decon. It is suggested that this is considered when calculating the negative air requirements of each containment.

C. Negative air pressure system units shall be employed in sufficient quantity to provide no less than **eight** (**8**) air changes per hour in the work area.

D. Negative pressure units **must** be exhausted to the outside of the building through a reinforced **Owner** approved opening. In the event a window or door to the outside is removed, the opening installed will be vandal proof and not reduce the security of the building. As a minimum, when a window or door is removed, the contractor must install a plug constructed of 1/2" plywood. The plug must be larger than the hole and secured inside the opening with two or more wood 2 x 4s installed crosswise and secured with 3/8" tamper proof bolts.

E. **Pre-fabricated** metal reinforced exhaust tube will be utilized to exhaust all negative air machines. The exhaust tubing utilized must be the same size throughout the exhaust run and the same size as the negative air machine exhaust port. Continuous runs of tubing without splices are required for runs less than twenty-five feet (25'). The Pre-fabricated exhaust tubes will be replaced at the first signs of wear. Contaminated, taped or damaged tubes will not be allowed to be used. The Districts decision regarding when an exhaust tube requires replacement will be regarded as final and conclusive.

F. At the discretion of the Owner and at no extra cost the contractor may be required to install an extension to the negative air exhaust tube where it exits a containment. The extension will be constructed of metal reinforced exhaust tubing. Typically the extension would extend from the plug to a point on the roof determined by the District inspector.

G. The negative air machine exhaust tubing will be routed as per the direction of the District inspector. The routing of the negative air machine exhaust tubing through rooms not included in the containment will not be allowed unless there are no exterior windows or doors present inside the containment area. In the case of inoperable windows, Contractors will be required to hire a window company or perform the work themselves to remove and properly re-install inoperable windows as required so the negative air machine exhaust tubing is routed through windows. Only the WCSD ES&A department AHERA Project Designer certified staff are allowed to sign off on any instance, where a negative air machine tube is routed through a room that is not a part of the asbestos abatement containment area, instead of using a window or other exterior openings. No exceptions and Contractors must bid accordingly.

3.03 Water Filtration System - Water used for showering in the decontamination area and any other asbestos-contaminated water must be filtered prior to disposal as waste water. The system shall contain at a minimum a three-stage filtering system with the following additional characteristic:

A. Capable of trapping and retaining 99.9% of asbestos fibers greater than 3 microns in size.

B. All water systems equipment to include showers and filter systems will comply with all (including the District's) applicable backflow/cross connection prevention requirements. The District will enforce all backflow/cross connection prevention requirements

3.04 Airless Pump - Encapsulant, if spray-applied, shall be applied with an airless pump in order to minimize fiber dispersion during the decontamination process. The tip shall have an orifice of .019 to .026 or as required by the manufacturer of the encapsulant selected for use.

3.05 Type "C" Supplied Air System - A continuous flow or pressure-demand, supplied air respirator, NIOSH/MSHA certified or other suitable air filtration system, as required by OSHA regulations for performance of work of this nature, is suggested for all workers. Type "C" system shall have visual and audible alarms to warn of carbon monoxide levels in excess of 20 ppm. Such system shall meet all criteria prescribed by OSHA for supplied air respirators. It also must be fully certified for hose length combinations up to 300 feet. Either half-mask or full facepiece units fitted with HEPA filter back-up units are acceptable.

3.06 Temporary electrical cords and outlets shall be of an approved type and connected to a source of power outside of the work area as directed by the District (see Section 02140, 1.01). All temp power cords must be plugged into a ground fault interrupter equipped power source.

SECTION 02130

COMPLIANCE REQUIREMENTS

PART l - PERSONAL PROTECTION

1.01 RESPIRATORY PROTECTION

A. Provide workers with clean and properly maintained respiratory equipment approved by NIOSH/MSHA as specified in Section 02120, PART 3, 3.05. The Contractor must present documentation of no less than five (5) similar projects with personal sampling results indicating that employee exposure levels were at “clean air levels” (0.01 f/cc) inside the respirator. Half-mask air-purifying respirators equipped with high-efficiency particulate air (HEPA) filters may be utilized with written permission of the Owner. Initially, temporary approval for the use of half-mask respirators will be granted after receipt of the proof requested above. Continued authorization will be considered based thereafter on personal monitoring samples taken on projects completed under this contract. If the Contractor consistently maintains personal monitors levels at or below “clean air levels” (0.01 f/cc inside the respirator) on a 8 hour time weighted average, continued use of half-mask respirators will be authorized. Should the personal monitoring or area monitoring levels show the contractor is unable to maintain levels at the “clean air levels” (0.01 f/cc), inside the respirator, the half-mask authorization will be rescinded. Area or personnel monitoring level above 1.0 fibers/cc TWA will require that personnel utilize type "C" respiratory protection. The Contractor will be responsible for providing sample results that have been applied over the 8 hour time weighted average. When utilized, the Contractor shall provide a sufficient quantity of filters during the work day. The clean respirator filters shall be stored at the job site in the change room and shall be totally protected from exposure to asbestos prior to their use.site in the change room and shall be totally protected from exposure to asbestos prior to their use.

1. Single-use or disposable respirators will not be permitted at the job site.

2. Contractor shall also monitor and provide documentation indicating that the workers are properly protected against over exposure to any of the chemicals contained in the chemical mastic remover(s).

3. Additional air filter protection will be required when chemical solvents are used.

1.02 PROTECTIVE CLOTHING

A. Provide workers with sufficient sets of protective full-body clothing. Such clothing shall consist of full-body coveralls and headgear. Provide eye protection and hard hats as required by applicable safety regulations. Non-disposable type protective clothing and footwear shall be left

in the Contaminated Equipment Room until the end of the asbestos abatement work, at which time such items shall be disposed of as asbestos waste, or shall be thoroughly cleaned of all asbestos or asbestos-containing material. Disposable type protective clothing, headgear, and footwear may be used and shall be disposed of as asbestos waste. Bare feet will not be permitted.

1.03 WORKER PROTECTION PROCEDURES

A. Each worker shall, upon entering the job site: Remove street clothes in the clean change room, put on a respirator and clean protective clothing before entering the equipment room or work area, except that workers intending to rewear contaminated protective clothing stored in the equipment room shall enter equipment room wearing respirators.

B. Each worker shall, each time he leaves the work area: Remove gross contamination from clothing before leaving the work area; proceed to the equipment room and remove all clothing except respirators; still wearing the respirator, proceed to the showers; clean the outside of the respirator with soap and water while showering; remove the respirator; thoroughly shampoo and wash themselves, remove filters (where required) and place them in the container provided for the purpose; and wash and rinse the inside of the respirator.

C. Following showering, each worker shall proceed directly to the clean change room and dress in clean clothes at the end of each day's work, or before eating, smoking or drinking. Before re-entering the work area from the clean change room, each worker and authorized visitor shall put on a clean respirator with filters (where required) and shall dress in clean protective clothing, except that workers intending to rewear contaminated protective clothing stored in the equipment room shall enter the equipment room wearing respirators.

D. Contaminated work footwear shall be stored in the equipment room when not in use in the work area. Upon completion of asbestos abatement, dispose of footwear as contaminated waste or clean thoroughly inside and out using soap and water before removing from work area or from equipment and access area. Store contaminated protective clothing in the equipment room for reuse or place in receptacles for disposal with other asbestos contaminated materials.

E. Workers shall not eat, drink, smoke or chew gum or tobacco, or utilize sanitary (toilet) facilities at the worksite except in established locations outside the work and containment areas, and enclosures.

F. Workers shall be fully protected with respirators and protective clothing immediately prior to the first disturbances of asbestos-containing or contaminated materials and until final clean-up is completed. This includes removal of fixtures, ceilings, or anything else which may disturb the ACM.

PART 2 - AIR MONITORING

2.01 Throughout the removal and subsequent cleaning operations AMBIENT (AREA) MONITORING may be conducted by the District to ensure that the Contractor is complying with all regulations and is conducting the work in a manner which minimizes airborne asbestos levels as well as minimizes the contamination of the District's facilities.

A. The Contractor is responsible to complete all regulatory required area monitoring and all area monitoring that is required by the Contractors liability insurance company.

2.02 Throughout the removal and subsequent cleaning operations, PERSONAL AIR MONITORING shall be conducted by the Contractor. Such samples shall be taken in order to establish an 8-hour TWA (for example, a minimum time of 480 minutes at 2.0 lpm) and exposure for each type of employee operation. Analytical results of personal air samples shall be sent to the Districts ES&A Department and provided to the Districts asbestos consultant on a 72 hour turn-around basis. Electronic PDF final reports shall be e-mailed directly to the District ES&A department directly from the Contractor's laboratory. Personal monitoring will be conducted on 50% of the workers. The workers shall wear personal monitoring devices, and all sampling will be conducted in each workers breathing zone only. Asbestos Consultants hired by WCSD, and supervising asbestos abatement projects, are required to strictly enforce these Personal Air Monitoring requirements, so Contractors must plan accordingly. Failure for the Contractor to provide air sampling results within 72 hours requires that the District's consultant supervising the project must stop the job. No exceptions. To that end, District Consultants must monitor the situation and provide the Contractor a written 24 hours notification, after 48 hours that results have not been received. After these 24 hours have transpired, the Consultant must stop the job awaiting submittal of required sampling results. No exceptions.

A. For each set of air samples submitted to a laboratory by the Contractor for analysis, the Contractor shall submit a blank cassette for analysis (minimum of 10 percent). Each blank cassette shall be submitted as a part of the Contractor's quality control program.

B. Any PCM air sample submitted by the Contractor for analysis shall be to an independent laboratory currently enrolled in the AIHA/NIOSH proficiency Analytical Testing (PAT) program.

C. The Contractor shall use factory pre-numbered air monitoring cassettes and note each cassette's numbers on the daily log or a separate monitoring cassette log. The number on each cassette shall be recorded **PRIOR** to use. Each cassette's number will also be listed on the laboratory analysis request form and also be referenced on the Laboratory sample analysis report. A copy of the daily log or separate monitoring cassette log will be e-mailed to the ES&A department **and** the District's asbestos consultant **daily** for all projects in progress. Asbestos Consultants hired by WCSD and supervising asbestos abatement projects are required to strictly enforce these requirements so they must monitor and document this process as a part of the Consultants project monitoring process.

D. Daily project personal air sample logs must be kept and submitted. As a minimum the sample log must include, date sample taken, air flow measurements taken at the start and finish of the sampling duration, time started and stopped, the factory assigned cassette number, employee sampled, and the activity of the employee. Legible sample logs will be submitted in the completed job package along with an original laboratory analysis report. Consultants hired by WCSD and supervising asbestos abatement projects are required to strictly enforce these requirements so they must monitor and document this process as a part of the Consultants project monitoring process.

E. A credit of $25.00 per sample will be deducted from the Contractors final invoice for each documented case, that a required sample per contract specifications (50% of the workforce is NOT monitored) was not taken or submitted for analysis. In addition, this credit will also apply to samples that were not taken properly or the data required by contract specifications is not provided. Consultants hired by WCSD and supervising asbestos abatement projects are required to strictly enforce these requirements so they must monitor and document this process as a part of the Consultants project monitoring process.

PART 3 - SUPPORT ACTIVITIES AND PERSONNEL

3.01 TRAINING

A. Training by a EPA accredited training provider shall be provided by the Contractor to **all** employees or agents or subcontractors who may be required to disturb asbestos-containing or asbestos-contaminated materials for abatement and auxiliary purposes and to all Contractor supervisory personnel who may be involved in planning, execution, or inspection of abatement projects. **No on-line training certificates for Lead or Asbestos training will be accepted.**

B. Training shall provide, at a minimum, information on the following topics:

1. The health hazards of asbestos including the nature of various asbestos related diseases, routes or exposure, known dose-response relationships, the synergistic relationship between asbestos exposure and cigarette smoking, latency periods for disease and health basis for standards.

2. The physical characteristics of asbestos including fiber size, aerodynamic properties, physical appearance and uses.

3. Employee personal protective equipment including the types and characteristics of respirator classes, limitations of respirators, proper selection, inspection, donning, use, maintenance and storage of respirators, field testing the facepiece-to-face seal (positive and negative pressure fitting tests), qualitative and quantitative fit testing procedures,

variations between laboratory and field fit factors, factors that affect respirator fit (e.g., facial hair), selection and use of disposable clothing, non-skid shoes, gloves, eye protection, and hard hats.

4. Medical monitoring requirements for workers including required and recommended tests, reasons for medical monitoring, and employee access to records.

5. Air monitoring procedures and requirements for workers including description of equipment and procedures, reasons for monitoring, types of samples, and current standards with recommended changes.

6. Work practices for asbestos abatement including purpose, proper construction and maintenance of plastic barriers, job set-up of airlocks, worker decontamination systems and waste transfer airlocks, posting of warning signs, engineering controls, electrical and ventilation system lockout, proper working techniques, waste cleanup, and storage and disposal procedures.

7. Personal hygiene including entry and exit procedures for the work area, use of showers and prohibition of eating, drinking, smoking, and chewing in the work area.

8. Special safety hazards that may be encountered including electrical hazards, air contaminants (CO, wetting agents, encapsulant, materials from Owner's operation), fire and explosion hazards, scaffold and ladder hazards, slippery surfaces, confined spaces, heat stress, and noise.

9. Workshops affording both supervisory personnel and abatement workers the opportunity to see (and experience) the construction of containment barriers and decontamination facilities.

C. Training is to have occurred within 12 months prior to the initiation of abatement activities.

D. Contractor must document training by providing date(s) of training, training entity, course outline, and names and qualifications of trainers.

E. Submit documentation to the District indicating that all employees have taken the required AHERA training for the type of work they will be performing per Section 02110, Part 3, 3.01, B, of these specifications.

F. An employee of the Contractor or subcontractor who is deemed incompetent, disorderly, or otherwise objectionable by the Owner, shall be removed promptly by the Contractor, and not re-employed on the work. Any employee of the Contractor that is observed that is not utilizing his personal protective equipment will be immediately removed from a project and not allowed on any other District projects. Should any disagreements result regarding the identification of the employee or his/her proper use of personal protective equipment, the determination of the District AHERA Program Supervisor/ Technicians or District hired Consultant will be considered final and

conclusive. The Contractors Asbestos Abatement Supervisors who allow employees to not utilize their personal protective equipment will be immediately removed from a project and not allowed on any other District projects. Contractors will be required to replace removed employees/Supervisors and no additional time will be allowed to complete the project.

PART 4 - MEDICAL MONITORING

A. Medical monitoring must be provided by the Contractor to any employee or agent that may be exposed to asbestos in excess of background levels during any phase of the abatement project. The purposes of a medical monitoring program, in addition to meeting the requirements of the law, are to document the state of health of workers for workers' compensation and to determine work relatedness of disease as well as to ensure fitness for duty, particularly ability to wear a respirator. Smokers should be made aware of the synergistic effects of cigarette smoking and asbestos exposure. The medical monitoring program provides the appropriate setting to share this information. Employers should also be aware of the potential cost of this additional risk. Medical monitoring shall include at a minimum the requirements of OSHA 29 CFR 1910.1001 (1).

1. A work/medical history to elicit symptomatology of respiratory disease (see CFR 1910.1001), Appendix D, Medical Questionnaires).

2. A chest X-ray (posterior-anterior, 14 x 17 inches) taken by a certified radiology technician and evaluated by a certified B-reader.

3. A pulmonary function test, including forced vital capacity (FVC) and forced expiratory volume at one second (FEV.), and FEV/FVC ratio (administered by a NIOSH or A.T.S. Certified Pulmonary Technician and interpreted and compared to standardized normals by a Board Certified Occupational Physician or Pulmonary Specialist).

4. Employees shall be given the opportunity to be evaluated by a physician to determine their capability to work safely while breathing through the added resistance of a respirator. (Examining physicians shall be aware of the nature of respiratory protective devices and their contributions to breathing resistance. They shall also be informed of the specific types of respirators the employees shall be required to wear and the work they will be required to perform, as well as special workplace conditions such as high temperatures, high humidity, and chemical contaminants to which they may be exposed. Evaluation of groups of workers should take into consideration epidemiologic principals as suggested by the American Thoracic Society in their statement on the work relatedness of disease adopted in 1982).

SECTION 02140

EXECUTION

PART 1 - PREPARATION

1.01 WORK AREA;

A. The following procedures are to be utilized to establish a work area and containments for all projects except mini work areas and mini-containments;

1. Shut down electrical power as necessary. When and where required, provide temporary power and lighting and ensure safe installation of temporary power sources and equipment per applicable electrical code requirements and provide safety lighting and ground fault interrupter circuits as power source for electrical equipment.

2. Shut down and isolate heating, cooling, ventilating air systems to prevent contamination and fiber dispersal to other areas of the structure. During the work, vents or openings within the work area shall be sealed with tape and at least 2 layers of 6 mil poly sheeting.

3. As directed by the District, pre-clean fixed objects within the proposed work areas using HEPA filtered vacuum equipment and wet cleaning methods, and enclose all fixed objects with a minimum of clear 6 mil plastic sheeting sealed with tape. This is in addition to the splash protection layer specified in item F below. All edges of the 6 mil will sealed with duct tape.

4. As directed by the District, pre-clean the proposed work areas using HEPA-filtered vacuum equipment and wet cleaning methods. Methods that raise dust, such as dry sweeping or vacuuming with equipment not equipped with HEPA filters shall not be used. Failure to pre-clean may increase the nuisance fiber level inside the containment and thereby raise personal monitoring results.

5. Seal off all openings with critical barriers, including, but not limited to, windows, corridors, doorways, skylights, duct, grille, or diffuser openings and any other penetrations of the work areas, with clear 6 mil plastic sheeting sealed with tape. Doorways, windows and corridors which will not be used for passage during work must be sealed with two layers of 6 mil plastic barriers. Doors and windows can be taped around the edges and then covered with one layer of clear 6 mil plastic to achieve the two layer requirement. Any opening that requires support such as hallways or large opening or other large criticals must be supported with 2x4 studs, 24 inches on center

6. All doors will be left in place unless approved by the ES&A Director. Doors are much more secure than plastic critical which is why these will not allowed to be removed. If there is tile/mastic under the door in the door opening the following is the only procedure that will be allowed. The contractor shall create the entire containment except for sealing the doors that have tile under them. The containment and negative air will be in place and running and the containment, other than the doors will have been inspected and

approved. Once this has happened, the contractor shall have a worker don proper personal protective equipment (PPE) and then do a spot abatement in the area under the door using manual methods. The worker shall complete spot abatement under the door and the door will be secured and sealed per #5 above. No abatement shall take place inside the containment, other than doorway spot abatement. The number of doorways that can be spot abated at one time will be no more than two at a time.

7. If the Contractor is removing asbestos containing materials, and the flooring material within the containment is not identified for abatement, cover floor surfaces with at least 2 layers of 6 ml poly. Use a minimum of two layers of clear 6 mil poly. Cover the floor **first** so that the 2 layers of plastic that extends at least 12 inches up on the walls. Depending on the material of the roof and its practicality of being wet wiped the Owner may require that one clear layer of 4 or 6 mil plastic layer be installed for a ceiling.

8. Cover wall surfaces with plastic sheeting sealed with tape. Use a minimum of one (1) clear layer of 4 mil plastic on walls. Cover walls so that the plastic extends eight (8) feet above the area of work. Seams should overlap a minimum of six (6) inches.

9. Build airlocks at entrances to and exits from the work area. Airlocks should be built in a manner which allows for in-flow air. The installation of air locks which restrict the air flow of make-up air through the Decon will not be permitted. Additional make-up air, if required to achieve eight (8) air changes, shall be admitted through specially constructed vents which prevent contaminated air from leaving the work area.

10. Contractor may be required to install one clear layer of 4 or 6 mil plastic layer for a ceiling in the containment depending upon the ceilings construction, asbestos design considerations, and its air permeability and the ability to maintain negative pressure inside the containment.

11. Establish negative air pressure system which produces no less than eight (8) air changes per hour in the work area and maintains a pressure differential of 0.05 inch water gauge between the inside and outside of the work area. The location and identification of each individual negative air unit shall be provided to the District for each work area. The District, as certified Project managers reserves the right to direct the contractor to relocate the negative air machines. Identification (for example, labels) shall be clearly visible in the work area and at the unit's exhaust location.

12. The Contractor shall provide two manometers, located as directed by the Owner. The first manometer shall be a continuous printout type with an adjustable set-point audible alarm. The alarm may not be deactivated. The second shall be a standard inclined manometer, Dwyer Model 250.5 AF or approved equal.

13. As directed by the District, remove and clean ceiling or wall mounted objects, such as lights and other items not previously sealed off, that interferes with asbestos abatement. Use localized water spraying or HEPA filtered vacuum equipment during fixture removal to reduce the fiber dispersal.

14. Maintain emergency and fire exits from the work areas, or establish adequately marked alternative exits satisfactory to the District. The contractor will have on site before the start of the project a fire extinguisher and first aid kit.

15. The Contractor shall place a job board with all MSDS, emergency numbers (24 Hour), safety procedures, air monitoring results, etc., at an accessible location to employees and visitors. The job board may be placed in the clean room overnight if the entrance to a containment is outside and the board's security is in question.

16. Contractor shall provide a clear 18" x 18" plexi-glass view windows at locations designated by the Owner. Contractor will add or move viewing windows at any time throughout the project at the Owners request. View windows will never be covered once installed.

17. Use smoke methods to test effectiveness of barriers and the negative pressure system when directed by the District.

B. The following procedures shall be utilized to establish a work area and mini-containment for small scale/short duration projects. The Owner shall determine if a mini-containment is more practical or cost affective then the containment of the entire room space;

1. Prior to the construction of the mini-containment enclosure, the Contractor will consult with the Owner and receive Owner approval of the containments proposed design prior to the start of a mini-containment enclosure.

2. Contractor shall construct a 2 layer, clear 6 mil poly enclosure with walls, a roof and a floor. The containment will be supported by means of wooden studs, PVC pipe, or other rigid materials. It will be sufficiently supported to ensure that negative pressure will not damage the containment. It will be large enough to ensure the material can be removed without puncturing the containment.

3. Negative pressure inside the mini-containment will be provided by a small adjustable flow negative air machine. All mini-containments will require negative pressure and a HEPA vacuum cleaner will not be allowed to provide negative pressure except in very small mini-containments and only with prior written approval of the Owner.

4. A two cell decontamination enclosure shall be installed to provide access to the containment and serve as a decontamination enclosure. Air-locks shall be installed at the entrance to the decontamination cell and the abatement containment. Minimum size of the decontamination enclosure shall be six feet high by 5 feet wide.

5. Waste load-out and double bagging will be accomplished in the decontamination enclosure.

6. All other provisions of these contract documents and specifications apply to mini-containment enclosures except for the modification to the work area, decontamination enclosure and waste load-out addressed in 1 thru 4 above.

C. The following procedures shall be utilized to establish a work area and perform abatement for windows and window sealant abatement. The following window procedure will be utilized to remove the window frame with possible asbestos containing putty, and asbestos containing window sealant (Caulking) from WCSD window openings.

1. From the inside of the school, inside of each classroom install Plywood ½" over the window opening. Install 2 layers of 6-mil polyethylene plastic (poly) on the exterior surface of the plywood, to assist with clean up of the plywood surface prior to installation of the plywood. After the plywood is installed, install 2 layers of 6 mil poly over the interior surface extending out past the edge of the plywood, and attach with tape in an adequate fashion to completely seal off the exterior window opening from the inside of the building. The removal cannot proceed until an airtight poly seal has been created between the inside and the outside of the window opening. This contractor will not be able to proceed with any removal until District's ES&A personnel or District's asbestos consultant approves the prep of each window. This will be documented in the contractor's daily log and initialed by the District's ES&A personnel or the District's asbestos consultant.

2. Washoe County Health Department personnel can be expected to visit the abatement site. The contractor will be required to cooperate and comply with all WCHD requests.

3. Isolate the HVAC for the entire wing or area being abated, prior to the start of abatement.

4. It may be necessary to isolate the wings adjacent to the building being abated, based upon the discretion of the District's ES&A personnel or assigned asbestos consultant.

5. Install 6-mil poly drop that extends out at least 20'out and adjacent from each window opening. If any window debris leaves the poly drop area, the contractor will be required to HEPA vacuum the ground as directed by the District's ES&A personnel or the District's asbestos consultant.

6. Place safety tape to isolate the area of the broken window from the public. At least 50 ' has to be isolated. Contractor will need to ensure that only abatement workers or the District's ES&A personnel or the District's asbestos consultant enter this area during abatement. No personnel or school staff will be allowed to work on the same side of the school wing when abatement activates are taking place. If a wing is directly across from the abatement activity that wings classrooms on the side of the abatement cannot be occupied.

7. As needed, use a glasscutter to score the inside of window glass to ease with glass removal. **A power tool cannot be used** for the removal of the window frame. Hand tool may be utilized.

8. As needed, remove glass by tapping on scored part of glass breaking it out, remove all glass present except the pieces behind putty. This makes it easier and safer to remove the frame without the glass being in the way.

9. Damage to and disturbance to the putty and sealant should be limited to the extent possible, and removed as intact as possible.

10. Pick up and dispose of the glass, asbestos debris and frame, in contractor's vehicle or dumpster for transport for proper asbestos disposal at a remote site. Do not dispose of debris in the District dumpster.

11. From the outside, clean up the internal area of the window frame, ledge and window jamb up to the poly window opening seal of any debris. The block opening will need to scraped, so that no sealant material is left behind before the window frame will pass a visual clearance, conducted by the District's ES&A personnel or the District's asbestos consultant. HEPA vacuum all areas of abatement surfaces, including the inside of the window opening prior to requesting a visual clearance.

12. When the window frame has been completely removed and the removal passes a visual clearance conducted by the District's ES&A personnel or District's asbestos consultant, carefully roll up the exterior poly drop that is on the ground, with the debris in it, and dispose at a remote location as asbestos waste. Do not dispose of any window poly/debris in the District dumpster.

13. Spray on encapsulate will be sprayed onto the window opening and poly surface of the plywood on the exterior side of the window opening.

14. Air Quality Air Samples may be taken once a wing is completed inside a number of the classrooms inside the wings by the District's ES&A personnel or the District's asbestos consultant and analyzed by TEM analysis. No personnel except the District's ES&A personnel or the District's asbestos consultant properly protected will be allowed inside the building being abated prior to receiving air sampling results or visual clearance. The plywood on the window openings will be left in place, and secured until air-sampling results or a visual clearance is received from the District's ES&A personnel or the District's asbestos consultant.

15. The window replacement contractor can work in the window opening, once the removal has passed a visual clearance, but cannot enter the area of demarcation or work on the same side of a building, while abatement is being conducted. Once abatement activities have been completed for the day, the replacement contractor could then work on that side of the building until abatement activities are resumed.

1.02 DECONTAMINATION ENCLOSURE SYSTEM AND WASTE LOAD-OUT AREA

A. Construct a worker decontamination enclosure system contiguous to the work area as follows:

1. The decontamination enclosure shall be constructed of two layers of 6 mil poly sealed with tape. At the discretion of the Owner the contractor may be required to construct a decontamination enclosure outside of the building. The exterior Decon shall be constructed with a minimum of 2x4 studs 24 inches on center and 1/2 inch plywood and to a standard which insures the security of the building. The outside chamber shall have a solid lockable door that shall remain locked whenever the Contractor is not on site. A key will be given to the Owner. The location of any decontamination enclosures will be determined by the Owner.

2. An equipment or dirty room with two doorways, one to the work area and one to the shower room. Pop-up Decon chambers typically will not be approved for use by the District. The use of Pop- up Decon Chambers will be reviewed on a case by case basis and the District reserves the right to require that they not be used.

3. A **metal** shower room with two doorways, one to the equipment room and one to the clean room. The shower room shall contain at least one shower with hot and cold water. Careful attention shall be paid to the shower enclosure to ensure against leaking of any kind. Ensure a supply of soap and shampoo at all times in the shower room. Clean and dry towels shall be available for employees and owner-authorized visitors and personnel. A three-stage water filtration system must be employed prior to release of shower water into the local sewage system. The shower must comply with all applicable backflow prevention/cross connection requirements including the Districts. Any shower or water device that does not meet the minimum air gap requirement will have to be fitted with the appropriate backflow prevention device. Proof of the required testing of any employed backflow prevention assembly will be required. Non-metal pop up showers are not acceptable.

4. A clean room with one doorway into the shower and one entrance or exit to non-contaminated areas of the building or outside. The clean room shall have sufficient space for storage of the workers' street clothes, towels and other non-contaminated items. Individual lockers shall be available to workers within the clean room. Pop-up Decon chambers typically will not be approved for use by the District. The use of Pop- up Decon Chambers will be reviewed on a case by case basis and the District reserves the right to require that they not be used.

B. As directed by the District, construct using (2) two layer of 6 mil. Poly, a waste load-out area contiguous to the work area which is utilized for transportation of ACM to a landfill.

1. The decontamination enclosure may only be used as a waste load out area with Owner approval, and only when it exits to the exterior of a building and there are no other exterior doors inside the containment. All waste load out activities will be accomplished through a waste load out enclosure exiting an exterior door whenever one is available.

The Decontamination enclosure will only be considered for use as a waste load out enclosure when all other avenues of exit are not deemed practical by the Owner.

1.03 MAINTENANCE OF ENCLOSURE SYSTEMS:

A. Ensure that barriers and plastic linings are effectively sealed and taped. Repair damaged barriers and remedy defects immediately upon discovery.

B. Visually inspect enclosures and negative air units at the beginning of each work period or shift. Details of the inspections are to be included in the Contractor's daily log. The contractor will be required to note the manometer readings of the containment in the daily log at the start and end of the shift and every 1/2 hour while on the job site. **The Contractor will be required to inspect containments at locations that are awaiting final clearance sampling results twice daily, once in the morning and once late in the afternoon before the building is scheduled to be locked up.**

C. Use smoke methods to test effectiveness of barriers and the negative air pressure system when directed by the District.

1.04 ASBESTOS REMOVAL WORK SHALL NOT COMMENCE UNTIL;

A. Arrangements have been made for disposal of waste at an acceptable site.

B. Arrangements have been made for containing and/or disposal of waste water resulting from showering and other abatement activities.

C. Work areas, decontamination enclosure system, and waste load-out area are effectively segregated.

D. Tools, equipment and material waste receptacles are on-site.

E. The Type "C" supplied air respirator system(s) or other approved air filtration system is (are) on-site and fully operative, when required by the District.

F. All other preparatory steps have been taken and applicable notices posted and permits obtained.

G. A visitor and employee log-in/log-out system is in place at the job site. All persons entering the site will be required to sign-in and sign-out.

H. Plexi-glass view windows have been installed in all locations requested by the Owner.

I. The containment has been inspected and written approval has been given by the Owner.

PART 2 - ASBESTOS REMOVAL

2.01 ORDER OF OPERATIONS

A. In general, work shall progress in the following order of operations; this listing is not provided to suggest that abatement sequences or additional requirements may not be required of the Asbestos Abatement Contractor to comply with regulatory requirements depending on the specific nature of each particular asbestos abatement projects:

1. Site preparations (See Section 02140, PART 1).

2. Removal of all asbestos debris and contaminated fixtures from the work site.

4. Rough clean and remove all remaining asbestos debris.

5. Detail clean and removal all asbestos containing asbestos debris and residual asbestos contaminants.

4. Encapsulate all areas from which asbestos was removed. Any encapsulant installed must be compatible with any new products that will installed over the encapsulate such as flooring products. Encapsulation will be done prior to taking air clearance samples or after air samples have been sampled to ensure that the project encapsulation activity complies with Nevada regulations. (See Section 02140, Part 2, 2.03)

5. Clean up site (See Section 02140, PART 2, 2.04).

6. Remove final (splash protection) layer of polyethylene sheeting from walls.

7. Nothing in Section 02140, PART 2, 2.01 is meant to supersede the inspection procedures noted in Section 02150, PART 2.

2.02 REMOVAL PROCEDURES

A. Floor covering may be removed physically, mechanically, or chemically. The work may include the abatement of asbestos containing material (ACM) on floors. New flooring materials will be installed over abatement areas so mastic removal techniques employed by the abatement contractor are to be done so that installed flooring products are able to be warranted by the flooring manufactures. If the abatement contractor is being hired by a flooring contractor the abatement contractor must consult the flooring installer and ensure their employed removal techniques do not void any warranties for new installed products. It is quite possible that chemical mastic removers may not be able to be utilized to achieve this requirements. No power tools may be utilized to remove flooring materials. As feasible, all removal shall be conducted using wet methods to reduce the release of fibers. If chemical mastic removers are used, follow

the manufacturers recommended procedures.

B. Remove the asbestos material in small sections. As it is removed, pack the wetted material in impermeable plastic bags (2) of 6 mil minimum thickness. Plastic waste bags will be then placed into waste containers prior to removal from the abatement area. Material shall not be allowed to leak out or dry out prior to insertion into the containers.

1. Contractor shall adhere to disposal authorities' size and weight requirements for containers (bags or packages).

2. All ACM or asbestos-contaminated material that has been removed shall be bagged at the end of each work shift (that is, debris on the floor cannot be allowed to accumulate).

3. All ACM or asbestos-contaminated material which has been bagged or wrapped in the work area cannot be allowed to accumulate; all bagged or wrapped material must be placed in the dumpster after every shift.

C. Remove bagged or wrapped material to waste load-out area. Re-bag or re-wrap all material in a second impermeable 6 mil bag or second 6 mil layer of plastic, respectively and then place into a waste container, except carpet rolls. Clean external surfaces of bags by wet sponging prior to being put into the waste container. The exterior of the containers shall be wet wiped inside the waste load out decon and place caution labels on containers in accordance with OSHA regulation 29 CFR 1926.58. **No abatement activities may be taking place inside the containment during waste load out. The decon shall be sealed up during waste load out.** Egress through the decon shall take place prior to or after waste load out.

1. **Under no circumstance will waste bags or containers be allowed to be stored inside a building.** The waste will be removed from the containment and **immediately** be transported outside the building and placed into the waste disposal receptacle.

D. In the event that no work is performed in a given area for any period which exceeds thirty-six (36) hours, all visible ACM on the plastic walls and all bagged and containered ACM or asbestos-contaminated material shall be locked and secured in the dumpster. If the amount of material exceeds the storage capacity of the dumpster, all material must be properly disposed of at the landfill prior to that 36-hour, non-work period.

E. The chemical mastic remover(s) shall be used in accordance with the manufacturer's directions at all times. Due to the combustible nature of chemical mastic removers, the District reserves the right to limit the amount of mastic remover used at any one time.

2.03 ENCAPSULATION PROCEDURES:

A. On friable asbestos abatement projects, the State of Nevada requires that air clearance samples be taken prior to encapultaion. Contractors will take direction from the District ES&A personnel

or District hired asbestos consultant to determine if encapsdulation will be done prior to taking air clearance samples or after air samples have been sampled to ensure that the project encapsulation activity complies with Nevada regulations. Prior to air clearance sampling or after and upon approval by the Owner, either Contractor shall apply a penetrating encapsulant to bind any remaining non-visible asbestos fibers; encapsulant shall be applied according to manufacturer's directions. Contractor shall submit product information for prior approval by the District.

B. The encapsulant shall be clear in color. Any encapsulant installed must be compatible with any new products that will installed over the encapsulate such as flooring products.

2.04 CLEAN-UP

A. Remove all visible accumulations of asbestos material and debris. Wet clean all surfaces within the work area.

B. The windows, doors, and HVAC vents shall remain sealed and any HEPA filtered negative air pressure systems, waste load-out, and decontamination enclosure systems shall remain in service.

1. All equipment used in the work area shall be included in the clean-up and shall be removed from work areas via the decontamination enclosure system or waste load-out, at appropriate times in the cleaning sequence.

2. **Under no circumstances will contaminated materials, tools or equipment that has been removed from the containment be allowed to be placed inside a building outside containment.** All items will be **immediately** transported to a lockable storage unit or placed inside a Contractor's vehicle. Items will also not be allowed to accumulate outside of a building.

C. As directed by the District, clean all remaining surfaces in the work area (including the HVAC system, see Section 02160) and any other contaminated areas with water and with HEPA filtered vacuum equipment. After cleaning the work area, wait an appropriate period of time to allow for settlement of dust, and again wet clean a second time and clean with HEPA filtered vacuum equipment all surfaces in the work area. After completion of the second cleaning operation, perform a complete visual inspection of the work area to ensure that the work area is free of visible asbestos debris.

1. If the District, after the second cleaning finds visible accumulations of asbestos debris in the work area, the Contractor shall repeat the wet cleaning until the work area is in compliance, all at the Contractor's expense.

2. Wet clean as necessary.

3. Remove splash guards as directed by the District.

4. Nothing in this section is meant to relieve the Contractor of his responsibility to meet the

final clean criteria as established by these contract documents or any other applicable laws or regulations.

D. When a final inspection determines that the work area is free of accumulations of visible asbestos debris, and fiber levels continue to remain at or below .010 fibers/cc the District will proceed with the final TEM clearance sampling (see criteria as set forth in Section 02110, PART 4, 4.01).

E. WHEN CLEAN-UP IS COMPLETE, AFTER AIR CLEARANCE IS RECEIVED;

1. Remove final polyethylene barriers from windows, doors, corridors, and so on; remove negative air pressure system from area.

2. Relocate objects moved to temporary locations in the course of the work to their former positions.

3. Where applicable, establish HVAC, mechanical and electrical systems in proper working order. Install new filters, furnished by the Owner, and dispose of used filters as asbestos-contaminated waste.

4. When more than one work or containment area is required, install new clean barriers (6 mil plastic or better) to separate adjoining areas.

5. Contractor shall mop the abatement area floor with two coats of a product that will remove any residue but does not void and product being installed over the abatement areas such as flooring materials. Additional coats of clear water will then be mopped onto the floor until the product utilized to do the final wash residue is removed.

2.05 DISPOSAL

A. As the work progresses, and to prevent exceeding available dumpster storage capacity on site, remove asbestos waste and dispose of such at an authorized disposal site in accordance with the requirements of the disposal authority. Submit documentation regarding disposal to the District. Contractor is responsible for all costs regarding waste including waste characterization sampling.

1. All ACM or asbestos-contaminated material must be double-bagged (or wrapped) in 6 mil bags and then placed into a waste container (drum). All materials that are generated from the asbestos containment must be disposed of as asbestos waste to include the poly containment materials or any other materials used to create the containment that are present inside or with surfaces that are inside the containment.

2. All ACM or asbestos-contaminated material must be damp when delivered to the disposal site.

3. **Under no circumstance will waste bags or containers be allowed to be stored inside a building.** The waste will be removed from the containment and **immediately** be transported outside the building and placed into the waste disposal receptacle.

4. Chemical mastic remover will be separated from the asbestos waste and disposed of in accordance with all applicable regulations. It is the Contractors responsibility to determine the proper disposal based upon the type and amount of mastic remover.

5. All waste load out activities will be scheduled for and inspected by the Owner.

B. Sealed plastic bags may be dumped into the burial site unless the bags have been broken or damaged. Damaged bags shall remain in the drum and the entire contaminated drum shall be buried. Uncontaminated drums may be recycled.

C. Dumpsters or any EPA-approved hazardous waste container system capable of being totally secured can be used in lieu of drums for transport to the disposal site. Absolutely no uncovered, unlockable dumpsters will be allowed to be used as a waste container system. This includes dumpster for construction debris that is associated with an asbestos abatement project. Open dumpsters, vehicles or trailers with wood covering installed will not be allowed for use as a waste container system.

1. All loads are to be delivered in an enclosed vehicle. No open pick-ups will be allowed.

D. Each load must be accompanied by a Uniform Hazardous Waste Manifest (EPA Form-22) or equivalent and any other certificate required by State or local agencies.

1. Original copies of the Hazardous Waste Manifest shall be provided to the District.

SECTION 02150

WORK SCHEDULE AND INSPECTION PROCEDURES

PART 1 - WORK SCHEDULE

1.01 The work is to be carried out diligently to completion with utmost speed. The Contractor shall furnish to the District a final working schedule showing anticipated starting and completion dates for each removal zone or area. This schedule shall be furnished to the District within at least five (5) calendar days from issuance of the District's written Notice to Proceed.

1.02 If, in the opinion of the District, it becomes necessary to work additional men for maintaining the schedule and for the completion of any phase of the project within the specified time, the Contractor must immediately do so upon written request by the District.

1.03 Work shall proceed immediately upon receipt of Contractor's Notice to Proceed from the District. Facilities shall be available to the Contractor as agreed upon. All work must be completed no later than agreed upon.

PART 2 - INSPECTIONS BY THE DISTRICT

2.01 The District shall inspect the site preparation work within the building as outlined in Section 02140, PART 1 to ensure that the facility is adequately sealed off, the negative air pressure system is functioning properly, the decontamination enclosure system, and waste area are in place. The Contractor SHALL NOT PROCEED with the gross removal until such time as the District has inspected the site preparation work and given the Contractor a Notice to Proceed (PREP).

2.02 The District shall inspect the removal work and work area upon its completion within the building or section thereof to ensure that all visible ACM or asbestos-contaminated material has been removed. The Contractor SHALL NOT PROCEED with the next phase of the work or spray any materials on the building systems until such time as the District has inspected the facility and given the Contractor a Notice to Proceed (REMOVAL AND DETAIL).

2.03 After encapsulation, the District will inspect the adequacy of encapsulation within each building or section thereof. The Contractor SHALL NOT PROCEED with final clean-up until a Notice to Proceed has been issued (ENCAPSULATION).

2.04 The District will inspect the facilities on a daily basis as necessary to ensure compliance with this Contract. Representatives of the District may be on-site at all times during the performance of this Contract.

A. The District is not limited by the inspection requirements as noted above in Sections 2.01 through 2.03; additional safety and health inspections as well as inspections by the Owner will occur randomly. Contractor will not attempt to control access to asbestos containments to District asbestos personnel.

SECTION 02160

MECHANICAL

PART 1 - SCOPE OF WORK

1.01 Remove as directed all HVAC ventilation grilles and registers, including ceiling or wall access panels. Each shall be wet-cleaned and stored by the Contractor except those designated to be disposed of as asbestos waste. Or seal all grilles, registers, and ceiling or wall access panels in plastic sheeting.

1.02 Contractor will ensure that the all equipment has been properly locked out and all procedures to secure all equipment, including mechanical equipment, will comply with all requirements of the OSHA and the Districts Lock out/tag out procedures.

1.03 As directed by the District, during final cleaning, wet-clean and vacuum all HVAC ventilation ducts with HEPA filtered vacuum equipment.

A. Cleaning may include, but is not limited to, the first six feet of all supply, return and exhaust air ducts adjacent to the work area.

SECTION 02170

ELECTRICAL

PART l - SCOPE OF WORK

1.01 Disconnect all circuits in the work area at the main panel box and lock out same as approved by the District.

1.02 Where required, remove all existing electrical fixtures including, but not limited to, ceiling and wall lights, clocks, alarms, and sound system fixtures. Each shall be wet-cleaned, location tag attached and store as directed by the District.

A. Nonfunctional electrical fixtures or systems shall be brought to the attention of the District in writing prior to commencement of work. Failure to notify the District in writing of any nonfunctional electrical fixtures or systems will not act to relieve the Contractor of the provisions of Section 02170, PART 2, 2.04.

1.03 Protect all exposed wires.

1.04 Contractor will ensure that the all equipment has been properly locked out and all procedures to secure all equipment, including electrical equipment, will comply with all requirements of the OSHA and the Districts Lock out/tag out procedures.

SECTION 02180

RESTORATION

PART 1 - RESTORATION WORK

1.01 Existing conditions disturbed by the Contractor's operations shall be restored to a condition satisfactory to the District and shall match existing adjacent surfaces. Damage due to tape, staples, nails, spray-poly, water, including unforeseen actions, is the responsibility of the Contractor and must be restored to the prior to final acceptance of the facility by the District.

1.02 The Contractor shall survey and detail all existing damage to walls, floors and floor coverings, fixtures and so on. This survey shall be submitted to the District in writing prior to set-up and preparation of the worksite.

1.03 All restoration must be completed within two weeks after the abatement project containment is torn down. Failure to complete the restoration in the two week time frame will result in the District hiring an outside vendor to complete the restoration. The cost of services for the restoration will be deducted from the projects final payments or any payments outstanding to the contractor.

1.04 The contractor is responsible for supplying all labor and materials to properly perform the restoration.

1.05 The contractor is responsible for the security of items removed by the contractor that require reinstallation. The District assumes not responsibility for the security of items left in District facilities. The contractor is responsible for replacing at no cost to the District any item removed by the contractor that is found to be missing or damaged at the time of reinstallation.

PART 2 - WALL AND FLOOR COVERING

2.01 It is the Contractor's responsibility to ensure that all wall areas are adequately sealed with 6 mil plastic in order to prevent water accumulation and asbestos contamination. Any wall material which is stained or otherwise damaged during any phase of the work shall be replaced in its entirety with materials of equal quality and selected by the District.

2.02 The Contractor shall restore all painted, varnished, lacquered, paneled or enameled surfaces (including factory finished surfaces) should damage occur from tape, staples, nails, water, and so on. Should such procedures be unacceptable to the District, the District may require, at its option, the entire replacement, refinishing, repainting or resurfacing of the damaged surface area.

PART 3 - FIXTURES

3.01 Any electrical fixtures, HVAC grilles, registers, and access doors lost or damaged by the Contractor shall be replaced at Contractor's expense.

3.02 Any other fixtures, furniture, appliances, and equipment not specifically mentioned must be replaced or repaired at Contractor's expense if lost or damaged.

PART 4 - SEWER SYSTEM

4.01 Should the Contractor, his employees, or subcontractors utilize existing sewer facilities for disposal of any ACM, asbestos contaminated material, or asbestos contaminated water, Contractor shall thoroughly clean the entire building's sewage system including, but not limited to, all sink, shower, floor, and toilet drains and traps, all primary and secondary sewage lines, and all lines wherever located and extending underground to the main sewer service connection.

PART 5 - EXTERIOR OF BUILDING

5.01 It is the Contractor's responsibility to repair or replace any and all damaged external areas of the building including, but not limited to, walls, doors, sidewalks, driveways, parking lots, concrete curbs, shrubbery, grass, sprinkler systems, and so on.

A. Damaged areas will be repaired or replaced at the option of the District.

5.02 Any ground areas external to the building which may become contaminated with asbestos shall be decontaminated at the Contractor's expense.

A. Decontamination procedures shall require removal of dirt to a depth of 4 inches which shall be disposed of as asbestos waste.

B. All areas from which soil was decontaminated shall be restored to its original condition at the option of the District.

SECTION 02190

TRANSITE SUPPLEMENTAL SPECIFICATIONS

Asbestos Abatement Specifications
Washoe County School District
Transite Panels at District Sites

Background

Washoe County School District (WCSD) will be performing the abatement of transite wall, ceiling panels, pipes and/or window panels at various District sites. This supplemental spec as well as the District specs will apply to the removal of all transite materials. The abatement contractor shall be prepared to abate the transite materials as identified in the site-specific architectural drawings provided for the individual site or information provided prior to bidding.

The contractor will need to note when additional asbestos-containing materials are to be abated within the same containment area and perform that work within the same negative pressure enclosure, if applicable. The contractor's onsite supervisor, or project estimator during bidding, will need to confer with either WCSD or the District's independent third-party consultant, for the expected containment areas and number of containments at a particular site.

Scope of Work

The contractor awarded the project will be responsible for all costs associated with the abatement of the transite.

The project scope shall be determined by the site-specific architectural drawings prepared for the individual site. The Contractor is responsible for reviewing the architectural drawings and the WCSD Regulated Systems and Assessment (ES&A) Material Disturbance Permit to determine which materials, including any sealants, in the project area are asbestos-containing.

The District has retained an independent third-party abatement consultant to draft these specifications, who may provide oversight during the projects, conduct visual clearance inspections and collect clearance air samples at the conclusion of these abatement projects. All oversight or additional oversight and collection of air samples may be performed by the District's ES&A Department as well at their discretion.

In addition to complying with these supplemental specifications, the Contractor must also comply with all other asbestos abatement requirements listed in these asbestos abatement specifications. If Contractors find any conflicting information in the supplemental specifications, the Contractor must comply with the requirements listed herein that are deemed most stringent by the District or District hired asbestos consultant supervising the abatement.

Project Requirements

Contractor shall be approved by the WCSD ES&A Department to perform asbestos abatement activities within the District. **Approval of firms that have not performed activities impacting asbestos for the District previously, will need to submit all necessary documentation outlined in the WCSD ES&A Technical Specifications for the project at least ten (10) business days prior to work commencing for approval.**

All workers certifications – asbestos training and licensing and medical clearance – shall be submitted to the WCSD ES&A at least five (5) working days prior to project commencement at minimum for approval. Contractor is responsible for reviewing WCSD ES&A worker roster for the company to assure all workers to be used on the project have been approved prior to arrival onsite. Workers not identified on the approved worker list for the contractor will not be allowed to perform any activities onsite, even if documentation is provided onsite at time of the project commencement.

The abatement contractor's onsite supervisor shall have a copy of these Specifications onsite at all times and be familiar with the project requirements prior to arrival onsite at the project. Failure to follow requirements of these Specifications, or lack of knowledge of requirements to be followed during the project, are grounds for replacement of the abatement contractor's onsite supervisor.

Only the abatement contractor will be allowed to occupy the project area once abatement activities are scheduled to start. This applies to all WCSD non-ES&A staff/personnel and site staff/personnel. The area shall only be occupied by the abatement contractor, WCSD ES&A staff, and District's independent third-party abatement consultant. Other personnel will not be allowed to occupy the building during asbestos abatement activities.

Contractor shall adhere to the requirements of these Specifications, WCSD ES&A Technical Specifications, Federal, State, and Local regulations.

Water and Electricity

Water and electricity are available onsite, but long hoses and cords may be necessary. The contractor is responsible for any damage to water or power systems caused by their use of those systems.

Contractor shall provide a GFI at the primary plug-in of all electrical trains used for electrical equipment. Hose washers shall be provided at all hose connections to prevent leakage of water and potential damage to District facilities.

Pre-Cleaning

Pre-cleaning is not expected to be necessary; however, Contractor may need to remove some debris or clean surfaces to facilitate building containment area.

Notifications

Contractor is responsible for timely notifications (including courtesy notifications if applicable) to Nevada Division of Industrial Relations and Washoe County Health Department. Notifications shall be filed in advance of any waiting periods in lieu of the proposed project start date or other requirements for pre-work notification. Any revisions to notifications including project scope, start date, duration of project, or any other changes are the Contractor's responsibility. Valid notifications shall be posted onsite during the project, and copies shall be provided to the District's onsite third-party consultant.

Equipment

Contractor is responsible for providing all necessary equipment in sufficient quantities to complete the project in the schedule provided for the project. All equipment must arrive onsite clean and in proper functioning order. Any equipment that arrives onsite dirty or not in proper functioning order shall be removed from the project site for cleaning and/or repairs.

Training

Workers performing asbestos abatement activities as part of this project must have AHERA Worker training with at least one worker trained to the AHERA Contractor-Supervisor level. All workers shall be licensed by the Nevada DIR for asbestos work. The crew lead Contractor-Supervisor may not leave the site anytime asbestos abatement operations are being performed.

As noted previously, all workers certifications must be approved by the WCSD ES&A prior to arrival onsite to start work. Copies of the worker certs shall be provided to the District's onsite third-party consultant as well.

Personal Protection Equipment

The contractor is responsible for adhering to Nevada Division of Industrial Relations and OSHA requirements for worker respiratory protection. At a minimum, workers shall wear half-face, negative pressure respirators with HEPA (P-100) filters during any activities which disturb asbestos-containing materials.

Workers shall wear Tyvek-level disposable coveralls, hard hats, work gloves, and safety glasses (if not using a full face-piece respirator.) Street clothes may be worn under disposable coveralls.

All employees shall have a valid medical clearance and fit test for respirators to be used. Medical clearance shall be provided for approval to the WCSD ES&A prior to the project commencement. Copies of the medical clearance and fit test shall be provided to the District's onsite third-party consultant as well.

Personal Air Monitoring

The contractor is responsible for the collection of personal air samples on workers during all abatement activities for asbestos. Personal air samples shall be collected in accordance with OSHA sampling protocols and analyzed by a laboratory with the proper accreditation.

Laboratories to be used for personal air sample analysis must be approved by WCSD ES&A.

Copies of the personal air sampling results, along with laboratory accreditation, shall be submitted to the WCSD ES&A and District's independent third-party consultant.

In addition, the contractor will comply with all requirements regarding personal air monitoring listed in Section 02130, Part 2- - Air Monitoring, 2.02.

Security and Safety

The contractor is responsible for security of all equipment and safety of all employees. Contractor shall provide any storage containers or security needed for tools and equipment if needed.

Contractor is responsible for all worker safety and following all applicable regulations, namely Nevada and Federal OSHA, including for asbestos and respirable crystalline silica exposures.

Occupancy

As noted previously, the project area will be limited to the abatement contractor, WCSD ES&A staff, and District's independent third-party consultant once abatement activities are ready to commence. Once the area has been cleared, other parties may occupy.

Emergency services may also occupy areas in the event of an emergency during the project.

Challenge Testing

All HEPA-filtered equipment to be used on this project shall have been challenge tested (DOP or equivalent) within the previous 30 days prior to use onsite. Copies of the challenge testing results shall be provided to the WCSD ES&A and/or District's independent third-party consultant.

Asbestos Abatement Containment and Abatement Requirements

ALL POLY USED ON PROJECT SHALL BE 6-MIL AND FIRE-RETARDANT UNLESS EXEMPTED IN REQUIREMENTS BELOW.

WHERE POSSIBLE, TRANSITE PANELS SHALL BE REMOVED FROM THE EXTERIOR SIDE.

Interior Transite Panel Abatement

1. Contractor shall seal all critical barriers (HVAC, windows, doors, etc.) in each area with one layer of 6-mil poly. Doors leading outside of the containment area shall remain in place for security.

2. All walls, floors, and any fixed objects that cannot be removed from the containment shall be covered with one layer of 6-mil poly. An additional layer of 4-mil poly may be applied to covered surfaces for use as a cleaning barrier. Vertical barriers may be installed to decrease the size of containment areas; however, such barriers shall be constructed with wood framing and ½" plywood backing.

3. Poly critical barriers with wood framed ½" plywood backing shall be installed on the exterior side of the transite panel to contain the interior space and secure the wall opening. Two layers of poly shall be used to cover the plywood with an additional two layers installed on exterior side of the plywood which will extend out 2" on each side of the plywood.

4. A minimum three-stage decontamination unit with operable shower shall be contiguous with each containment. See "Decontamination Chamber Requirements" in this specification for further requirements.

5. Negative pressure shall be established and a recording manometer shall be attached to each containment. Copies of the manometer recordings shall be provided on 8.5"x11" paper by the Contractor.

6. An air pressure differential of -0.050" WC must be established and maintained throughout all phases of abatement and through receipt of passing air clearance.

7. Workers shall wet all materials prior to, and during, removal using amended water.

8. Transite panels shall be removed intact wherever possible.

9. Any sealants at edges of transite panels, or other suspect materials that may need to be disturbed by the transite panel removal shall be considered to be asbestos-containing materials unless sampled and proven otherwise.

10. Following removal of all transite panels, all poly shall be wet-wiped or HEPA-vacuumed clean as part of detail cleaning. Any 4-mil poly cleaning barriers may be removed as part of this detail cleaning.

11. All waste shall be placed into two separate waste bags of 6-mil thickness. The outer waste bag shall be sealed in a "goose-neck" fashion to create a leak-tight container.

Exterior Transite Panel Abatement

1. Contractor shall seal all critical barriers (HVAC, windows, doors, etc.) within 20 feet of the work area with one layer of 6-mil poly.

2. Poly drop sheets shall be installed in the work area, extending 20 feet out from any transite panel to be removed, and this work area shall be demarcated with warning signs / tape. The Contractor shall control access to this regulated area to a distance of 50 feet out, demarcating the perimeter with caution tape.

3. Poly critical barriers with wood framed ½" plywood backing shall be installed on the interior side of the transite panel to seal off the interior space and secure the wall opening. The plywood will be covered with two layers of 6-mil poly on both the interior and exterior side. The interior poly barriers shall extend out two inches on each side.

4. Decontamination facilities shall be sited adjacent to the work area, and shall include a drop sheet. A water source shall be provided, along with soap and towels. Dirty water shall be contained. A privacy barrier shall also be installed as needed.

5. Workers shall wet all materials prior to, and during, removal using amended water.

6. Transite panels shall be removed intact wherever possible.

7. Any sealants at edges of transite panels, or other suspect materials that may need to be disturbed by the transite panel removal shall be considered to be asbestos-containing materials unless sampled and proven otherwise.

8. Following removal of all transite panels, all poly shall be wet-wiped or HEPA-vacuumed clean as part of detail cleaning.

9. All waste shall be placed into two separate waste bags of 6-mil thickness. The outer waste bag shall be sealed in a "goose-neck" fashion to create a leak-tight container.

Decontamination Requirements

A three stage decon unit including a shower is required for any interior asbestos containments. Each chamber of the decon must have self-closing Z-flaps that seal air tight. A four-inch barrier must exist at the floor of each chamber to prevent the transfer of water and debris from chamber to chamber. This barrier will also provide a seal for the flaps between each chamber. Equipment and bag out chambers do not require a shower, but a washing station must exist and they must be three-stages. The washing station must be constructed in a manner that prevents water from splashing or traveling out of the central decon chamber. Equipment and bag out chambers must also have flaps that seal air tight.
Shower units must be equipped with an overflow pan to catch water which overfills the drain system, or is splashed out of the chamber during employee showers. Showers must be supplied with hot water, soap, shampoo, and towels for the workers. Showers shall be sited in the central decon chamber. Showers and washing station must also be equipped with a filtering system that includes a 0.5 micron filter. If filtering system is not available or is not functioning correctly, shower water must be bagged and disposed of as asbestos-containing waste.
All chambers of the decon, including the clean chamber, must be kept clean and dry (except shower) at all times. Abatement work will be stopped if decon is not kept in acceptable condition.

Regulated Area Signage
Asbestos Danger signs shall be posted at all entrances or exits to the containment area, even if the entrance or exit is sealed as a critical barrier. Signs shall also be posted on the flap leading into the shower station of

decontamination chambers. Signage will be set once a pre-start visual is passed and work may begin in the containment, but no work will start until all signs are posted.
Signage shall meet the revised requirements set forth in 29 CFR 1926.1101(k)(7).

Air Pressure Differential – Full Containment Areas Only

Air pressure differential must be established and maintained at -0.05 inches water differential or better before start of abatement and air pressure differential must be maintained through all phases of project, including collection of clearance air samples and receipt of results. A minimum of eight air changes per hour is required for the project. Work will be halted if the air pressure drops below -0.05 inches water differential and can resume when air pressure differential of -0.05 inches is established again.
Air pressure differential must be displayed and recorded on a properly calibrated and fully functioning manometer. Copies of the manometer recording must be provided by the contractor on 8.5" x 11" paper at completion of project.
All negative air machines must be exhausted to the exterior of the building using wire-reinforced flex duct. All negative air machines must be used inside containment. No machines shall be attached to the exterior of the containment with the intake only inside.
Any exterior or interior barricades need to be constructed of a minimum ½" plywood and shall be made secure.

Make-Up Air Sources

Available, but may need to be HEPA-filtered. Any make-up holes in critical barriers must be equipped with a challenge/DOP-tested HEPA filter. Placing a pre-filter in the make-up air hole will not be allowed.

Disposal Requirements

All asbestos waste generated on this project will need to be double-bagged in 6-mil poly waste bags, or double-wrapped in 6-mil polyethylene sheeting. All waste bags must be sealed in a “gooseneck” fashion and “burrito-wrapped” materials shall have staggered seams. All non-friable debris shall be properly labeled and identified for disposal as an asbestos-containing waste. Materials that have become friable or which removal methods have made friable shall be labeled and identified for disposal as regulated asbestos-containing material (RACM).

The contractor will need to provide a lockable waste bin for all waste created on this project. Waste bin will need to be labeled with asbestos signage once the waste is loaded into the bin. Waste bins shall be lined with one layer of 6-mil poly prior to waste being loaded.

Waste bins will need to arrive onsite clean of debris or any other waste and in proper functioning order. Waste bins may be rejected by WCSD ES&A staff or District’s independent third-party consultant if these conditions are not met, with no extra charge to the District.

Clearance

Upon completion of asbestos abatement activities, a final visual inspection will be performed by either WCSD ES&A staff or District's independent third-party consultant. This inspection will be performed only after the abatement contractor crew supervisor has performed their own final visual clearance. Areas must be free of all three-dimensional material with all surfaces clean of dust and debris and all materials abated within the containment area.

The visual inspection will serve as final clearance for exterior transite panel removal. Following a successful visual clearance inspection, the Contractor shall apply a lock-down encapsulant, then remove containment drop sheets, signage, equipment, etc. The barriers at window / wall openings shall be left in place.

For interior removal of transite panels within full containment, final clearance shall be through aggressive air sampling conducted by the District's independent third-party consultant. A set of five air samples will be collected inside the containment to be analyzed in accordance with AHERA completion of response action criteria using either phase contrast microscopy (PCM) or transmission electron microscopy (TEM), depending on the quantity of materials abated.

Clearance criteria for PCM sample analysis, in accordance with AHERA, is 0.01 fibers per cubic centimeter (0.01 f/cc) or less for each of the five samples.

Clearance criteria for TEM sample analysis, in accordance with AHERA, is an average of 70 structures per square millimeter (70 s/mm^2) or fewer for the inside-containment set of five samples.

Contractor shall return to the site to apply a lock-down encapsulant, remove poly barriers and equipment upon notification of passing clearance air samples. The barriers at window / wall openings shall be left in place.

SECTION 02200

SUPPLEMENTAL FLOOR TILE & MASTIC SPECIFICATIONS
Asbestos Abatement Specifications
Washoe County School District
Floor Tile and Mastic at District Sites

Background

Washoe County School District (WCSD) will be performing the abatement of vinyl floor tile (VFT) and mastic at various District sites. This supplemental spec as well as the District specs will apply to the removal of all Floor Tile and Mastic materials. The abatement contractor shall be prepared to abate flooring materials as identified in the site-specific architectural drawings provided for the individual site or information provided prior to bidding.

The contractor will need to note when additional asbestos-containing materials are to be abated within the same containment area and perform that work within the same negative pressure enclosure. The contractor's onsite supervisor, or project estimator during bidding, will need to confer with either WCSD or the District's independent third-party consultant, for the expected containment areas and number of containments at a particular site.

Scope of Work

The contractor awarded the project will be responsible for all costs associated with the abatement of flooring materials.

The project scope shall be determined by the site-specific architectural drawings prepared for the individual site. The Contractor is responsible for reviewing the architectural drawings and the WCSD Regulated Systems and Assessment (ES&A) Material Disturbance Permit to determine which materials, including baseboards and mastic, in the project area are asbestos-containing.

The District has retained an independent third-party abatement consultant to draft these specifications, who may provide oversight during the projects, conduct visual clearance inspections and collect clearance air samples at the conclusion of these abatement projects. All oversight or additional oversight and collection of air samples may be performed by the District's ES&A Department as well at their discretion.

In addition to complying with these supplemental specifications, the Contractor must also comply with all other asbestos abatement requirements listed in these asbestos abatement specifications. If Contractors find any conflicting information in the supplemental specifications, the Contractor must comply with the requirements listed herein that are deemed most stringent by the District or District hired asbestos consultant supervising the abatement.

Most floors in the District are concrete, but wood floors may be encountered. Since cleaning flooring mastics are difficult if not impossible on wood floors, whenever there is more than is one layer of flooring sub-floor, one layer will be removed as a part of the abatement process and properly disposed as asbestos containing materials.

Project Requirements

Contractor shall be approved by the WCSD ES&A Department to perform asbestos abatement activities within the District. **Approval of firms that have not performed activities impacting asbestos for the District previously, will need to submit all necessary documentation outlined in the WCSD ES&A Technical Specifications for the project at least ten (10) business days prior to work commencing for approval.**

All workers certifications – asbestos training and licensing and medical clearance – shall be submitted to the WCSD ES&A at least five (5) working days prior to project commencement at minimum for approval. Contractor is responsible for reviewing WCSD ES&A worker roster for the company to assure all workers to be used on the project have been approved prior to arrival onsite. Workers not identified on the approved worker list for the contractor will not be allowed to perform any activities onsite, even if documentation is provided onsite at time of the project commencement.

The abatement contractor's onsite supervisor shall have a copy of these Specifications onsite at all times and be familiar with the project requirements prior to arrival onsite at the project. Failure to follow requirements of these Specifications, or lack of knowledge of requirements to be followed during the project, are grounds for replacement of the abatement contractor's onsite supervisor.

Only the abatement contractor will be allowed to occupy the project area once abatement activities are scheduled to start. This applies to all WCSD non-ES&A staff/personnel and site staff/personnel. The area shall only be occupied by the abatement contractor, WCSD ES&A staff, and District's independent third-party abatement consultant. Other personnel will not be allowed to occupy the building during asbestos abatement activities.

Contractor shall adhere to the requirements of these Specifications, WCSD ES&A Technical Specifications, Federal, State, and Local regulations.

Water and Electricity

Water and electricity are available onsite, but long hoses and cords may be necessary. The contractor is responsible for any damage to water or power systems caused by their use of those systems.

Contractor shall provide a GFI at the primary plug-in of all electrical trains used for electrical equipment. Hose washers shall be provided at all hose connections to prevent leakage of water and potential damage to District facilities.

Pre-Cleaning

Pre-cleaning is not expected to be necessary; however, Contractor may need to remove some debris or clean surfaces to facilitate the building of negative pressure enclosure.

Notifications

Contractor is responsible for timely notifications (including courtesy notifications if applicable) to Nevada Division of Industrial Relations and Washoe County Health Department. Notifications shall be filed in advance of any waiting periods in lieu of the proposed project start date or other requirements for pre-work notification. Any revisions to notifications including project scope, start date, duration of project, or any other changes are the Contractor's responsibility. Valid notifications shall be posted onsite during the project, and copies shall be provided to the District's onsite third-party consultant.

Equipment

Contractor is responsible for providing all necessary equipment in sufficient quantities to complete the project in the schedule provided for the project. All equipment must arrive onsite clean and in proper functioning order. Any equipment that arrives onsite dirty or not in proper functioning order shall be removed from the project site for cleaning and/or repairs.

Training

Workers performing asbestos abatement activities as part of this project must have AHERA Worker training with at least one worker trained to the AHERA Contractor-Supervisor level. All workers shall be licensed by the Nevada DIR for asbestos work. The crew lead Contractor-Supervisor may not leave the site anytime asbestos abatement operations are being performed.

As noted previously, all workers certifications must be approved by the WCSD ES&A prior to arrival onsite to start work. Copies of the worker certs shall be provided to the District's onsite third-party consultant as well.

Personal Protection Equipment

The contractor is responsible for adhering to Nevada Division of Industrial Relations and OSHA requirements for worker respiratory protection. At a minimum, workers shall wear half-face, negative pressure respirators with HEPA (P-100) filters during any activities which disturb asbestos-containing materials.

Workers shall wear Tyvek-level disposable coveralls, hard hats, work gloves, and safety glasses (if not using a full face-piece respirator.) Street clothes may not be worn under disposable coveralls.

All employees shall have a valid medical clearance and fit test for respirators to be used. Medical clearance shall be provided for approval to the WCSD ES&A prior to the project commencement. Copies of the medical clearance and fit test shall be provided to the District's onsite third-party consultant as well.

Personal Air Monitoring

The contractor is responsible for the collection of personal air samples on workers during all abatement activities for asbestos. If removal activities or methods are expected to disturb any substrates which contain silica, the contractor is also responsible for collection of personal air samples for respirable crystalline silica

exposure. Asbestos and silica personal air samples shall be collected in accordance with OSHA sampling protocols and analyzed by a laboratory with the proper accreditation.

Laboratories to be used for personal air sample analysis must be approved by WCSD ES&A.

Copies of the personal air sampling results, along with laboratory accreditation, shall be submitted to the WCSD ES&A and District's independent third-party consultant.
In addition, the contractor will comply with all requirements regarding personal air monitoring listed in Section 02130, Part 2- - Air Monitoring, 2.02.

Security and Safety

The contractor is responsible for security of all equipment and safety of all employees. Contractor shall provide any storage containers or security needed for tools and equipment if needed.

Contractor is responsible for all worker safety and following all applicable regulations, namely Nevada and Federal OSHA, including for asbestos and respirable crystalline silica exposures.

Occupancy

As noted previously, the project area will be limited to the abatement contractor, WCSD ES&A staff, and District's independent third-party consultant once abatement activities are ready to commence. Once the area has been cleared, other parties may occupy.

Emergency services may also occupy areas in the event of an emergency during the project.

Challenge Testing

All HEPA-filtered equipment to be used on this project shall have been challenge tested (DOP or equivalent) within the previous 30 days prior to use onsite. Copies of the challenge testing results shall be provided to the WCSD ES&A and/or District's independent third-party consultant.

Asbestos Abatement Containment and Abatement Requirements

ALL POLY USED ON PROJECT SHALL BE 6-MIL AND FIRE-RETARDANT UNLESS EXEMPTED IN REQUIREMENTS BELOW.

Vinyl Floor Tile and Mastic Abatement

1. Contractor shall seal all critical barriers (HVAC, windows, doors, etc.) in each containment area with one layer of 6-mil poly. Doors leading outside of the containment area shall remain in place for security.

2. The contractor shall setup a regulated area and abate those areas of tiles that extend below door threshold prior to sealing of doorways as critical barriers as applicable.

3. All walls and any fixed objects that cannot be removed from the containment shall be covered with one layer of 6-mil poly. One additional layer of 4-mil poly may extend up from the floor to a height of 4' to act as a cleaning barrier.

4. A false-ceiling, minimum of 4-mil poly, shall be installed as directed by the owner or if needed to achieve and maintain sufficient negative air pressure differential as noted below. Mastic to be removed by hydro-blasting or grinding will require installation of a 4-mil poly ceiling. See hydro-blasting and grinding sections below.

5. A minimum three-stage decontamination unit with operable shower shall be contiguous with each containment. See "Decontamination Chamber Requirements" in this specification for further requirements.

6. Negative pressure shall be established and a recording manometer shall be attached to each containment. Copies of the manometer recordings shall be provided on 8.5"x11" paper by the Contractor to the District and third-party independent consultant.

7. An air pressure differential of -0.050" WC must be established and maintained throughout all phases of abatement and through receipt of passing air clearance.

8. Workers shall wet all materials prior to, and during, removal using amended water.

9. Baseboard removal shall not take place until containment is established.

10. At the conclusion of abatement, the floor surface shall be HEPA-vacuumed clean and all mastic removed. The criteria for mastic removal shall be no three-dimensional material, including mastic that may have become liquefied and entered slab divots, joints, or any other areas during the removal process.

11. All poly shall be wet-wiped or HEPA-vacuumed clean as part of detail cleaning. The 4-mil poly cleaning barrier may be removed as part of this detail cleaning unless required for maintaining sufficient air pressure differential.

12. All waste shall be placed into two separate waste bags of 6-mil thickness. The outer waste bag shall be sealed in a "gooseneck" fashion to create a leak-tight container.

For the hydro-blasting of the concrete substrate to remove mastic and for areas which must have the top surface of the concrete removed, as directed by the flooring subcontractor(s), the following requirements must be met by the Contractor:

1. For hydro-blasting, a full negative pressure containment must be constructed, including a ceiling of 4-mil poly.

2. All critical barriers must be sealed with one layer of 6-mil poly. Any fixed objects that cannot be moved out of the containment area shall be covered with one layer of 6-mil poly.

3. Contractor shall use a hydro-blasting unit to "power wash" the floors clear of mastic, including any cracks or seams in the concrete slab. This system shall have a man-operated unit that will capture the water with vacuum pressure at the front of the machine as it is operating to prevent the build-up of water in the containment.

4. The hydro-blasting unit shall be set to remove mastic on the substrate surface, cracks, and seams, without damage to the concrete slab. For areas where the top surface layer of the concrete is to be removed, at the direction of the flooring subcontractor(s), the abatement contractor shall set the hydro-blasting unit to remove the surface to a depth specified by the flooring subcontractor(s).

5. The abatement contractor shall anticipate the unit not being able to hydro-blast all areas of the containment (corners, along walls) and shall plan to use alternate methods to remove mastic or the top concrete surface in such areas. Any mechanical means to remove the mastic will need to have HEPA-filtered local exhaust.

6. At the conclusion of the hydro-blasting, the abatement contractor shall clean the floor of the containment using HEPA-vacuums followed by wet-cleaning, and HEPA-vacuuming again to assure that surfaces have been cleaned sufficiently.

7. All poly surfaces, including the ceiling, shall be wet-wiped clean as part of detail cleaning.

8. Contractor shall perform treatment of waste water prior to discharge if water will not be treated as a hazardous waste. Waste water must meet the levels of requirements provided in City of Reno Municipal Code 12.16.565.

9. Contractor shall follow all requirements, including collection of any necessary permits, for the discharge of contaminated water as required by City of Reno Municipal Code 12.16.

10. If abatement contractor will dispose of all water, they shall be responsible for profiling water for disposal. Copies of the waste profile results, along with chain of custody, shall be provided to HMS, Inc. Project Manager prior to disposal.

For the grinding of concrete floor surfaces, the work shall be performed within the same containment erected for floor tile and mastic abatement (as applicable). If areas being ground are not within a contained area (such as non-asbestos floor removal), a negative pressure enclosure shall be constructed as listed in the hydro-blasting section above. In addition to the requirements as noted above, the following engineering controls shall be met by the contractor performing the grinding of floor surfaces.

1. All power equipment to be used for the grinding of concrete floor surfaces shall have an approved shroud system that provides local exhaust.

2. A HEPA-vacuum shall be attached to the shroud system to provide the local exhaust.

3. An airless sprayer or equivalent shall be used to provide water for the suppression of any visible emissions that may be released by the work and to keep surfaces wet prior to cleaning.

4. All slurries or dust remaining within the containment area shall be HEPA-vacuumed cleaned. Additional wet-wiping to assure all dust has been cleaned in the containment area may be required.

Decontamination Requirements

A three stage decon unit including a shower is required for asbestos containments. Each chamber of the decon must have self-closing Z-flaps that seal air tight. A four-inch barrier must exist at the floor of each chamber to prevent the transfer of water and debris from chamber to chamber. This barrier will also provide a seal for the flaps between each chamber. Equipment and bag out chambers do not require a shower, but a washing station must exist and they must be three-stages. The washing station must be constructed in a manner that prevents water from splashing or traveling out of the central decon chamber. Equipment and bag out chambers must also have flaps that seal air tight.

Shower units must be equipped with an overflow pan to catch water which overfills the drain system, or is splashed out of the chamber during employee showers. Showers must be supplied with hot water, soap, shampoo, and towels for the workers. Showers shall be sited in the central decon chamber. Showers and washing station must also be equipped with a filtering system that includes a 0.5 micron filter and heated water. If a filtering system is not available or is not functioning correctly, shower water must be bagged and disposed of as asbestos-containing waste with no extra compensation being given to the Contractor.

All chambers of the decon, including the clean chamber, must be kept clean and dry (except shower) at all times. Abatement work will be stopped if decon is not kept in acceptable condition.

Regulated Area Signage

Asbestos Danger signs shall be posted at all entrances to the containment area, even if the entrance is sealed as a critical barrier. Signs shall also be posted on the flap leading into the shower station of decontamination chambers. Signage will be set once a pre-start visual is passed and work may begin in the containment, but no work will start until all signs are posted.
Signage shall meet the revised requirements set forth in 29 CFR 1926.1101(k)(7).

Air Pressure Differential

Air pressure differential must be established and maintained at -0.05 inches water differential or better before start of abatement and air pressure differential must be maintained through all phases of project, including collection of clearance air samples and receipt of results. A minimum of eight air changes per hour is required for the project. Work will be halted if the air pressure drops below -0.05 inches water differential and can resume when air pressure differential of -0.05 inches is established again.

Air pressure differential must be displayed and recorded on a properly calibrated and fully functioning

manometer. Copies of the manometer recording must be provided by the contractor on 8.5" x 11" paper at completion of project.

All negative air machines must be exhausted to the exterior of the building using wire-reinforced flex duct. All negative air machines must be used inside containment. No machines shall be attached to the exterior of the containment with the intake only inside.

Any exterior barricades need to be constructed of a minimum ½" plywood and lockable for security. Contractor is responsible for providing a lock to any exterior barricades, and keys shall be provided to WCSD site facilities coordinator and District's independent third-party consultant.

Make-Up Air Sources

Available, but may need to be HEPA-filtered. Any make-up holes in critical barriers must be equipped with a challenge/DOP-tested HEPA filter. Placing a pre-filter in the make-up air hole will not be allowed.

Disposal Requirements

All asbestos waste generated on this project will need to be double-bagged in 6-mil poly waste bags. At least one of the waste bags must be sealed in a "gooseneck" fashion. All non-friable debris shall be properly labeled and identified for disposal as an asbestos-containing waste. Materials that have become friable or which removal methods have made friable shall be labeled and identified for disposal as regulated asbestos-containing material (RACM).

The contractor will need to provide a lockable waste bin for all waste created on this project.

Waste bin will need to be labeled with asbestos signage once the waste is loaded into the bin. Waste bins shall be lined with one layer of 6-mil poly prior to waste being loaded.

Waste bins will need to arrive onsite clean of debris or any other waste and in proper functioning order. Waste bins may be rejected by WCSD ES&A staff or District's independent third-party consultant if these conditions are not met, with no extra charge to the District.

Clearance

Upon completion of asbestos abatement activities, a final visual inspection will be performed by either WCSD ES&A staff or District's independent third-party consultant. This inspection will be performed only after the abatement contractor crew supervisor has performed their own final visual clearance. Areas must be free of all three-dimensional material with all surfaces clean of dust and debris and all materials abated within the containment area. Once the containment has been successfully visually inspected and cleared, the Contractor shall apply a lock-down encapsulant to contaminated surfaces in the containment area. The contractor will need to use care to not apply encapsulant to floor surfaces which may prevent adhesion of new flooring materials.

Final clearance shall be through aggressive air sampling conducted by the District's independent third-party

consultant or a District AHERA certified technician. A set of five air samples will be collected inside the containment to be analyzed in accordance with AHERA completion of response action criteria using either phase contrast microscopy (PCM) or transmission electron microscopy (TEM), depending on the quantity of materials abated.

Clearance criteria for PCM sample analysis, in accordance with AHERA, is 0.01 fibers per cubic centimeter (0.01 f/cc) or less for each of the five samples.

Clearance criteria for TEM sample analysis, in accordance with AHERA, is an average of 70 structures per square millimeter (70 s/mm^2) or fewer for the inside-containment set of five samples.

Contractor shall return to the site to remove poly barriers and equipment upon notification of passing clearance air samples. Contractor is also responsible for washing the floor using an approved detergent cleaner and water to provide a clean surface for the new floor installation.

In the event that floor grinding is required to be completed within the same containment area, clearance air samples will be collected at the conclusion of grinding and cleaning of the surfaces within the containment area.

Supplemental Asbestos Abatement Specifications
Washoe County School District
Thermal System Insulation at District Sites

Background

Washoe County School District (WCSD) will be performing the abatement of thermal system insulation (TSI) materials at various District sites. This supplemental spec as well as the District specs will apply to the removal of all asbestos containing Thermal System Insulation. The abatement contractor shall be prepared to abate TSI materials as identified in the site-specific architectural drawings provided for the individual site or information provided prior to bidding.

The contractor will need to note when additional asbestos-containing materials are to be abated within the same containment area and perform that work within the same negative pressure enclosure. The contractor's onsite supervisor, or project estimator during bidding, will need to confer with either WCSD or the District's independent third-party consultant, for the expected containment areas and number of containments at a particular site.

Scope of Work

The contractor awarded the project will be responsible for all costs associated with the abatement of TSI materials.

The project scope shall be determined by the site-specific architectural drawings prepared for the individual site. The Contractor is responsible for reviewing the architectural drawings and the WCSD Regulated Systems and Assessment (ES&A) Material Disturbance Permit to determine which TSI materials in the project area are asbestos-containing and will be required to be abated.

The District has retained an independent third-party abatement consultant to draft these specifications, who may provide oversight during the projects, conduct visual clearance inspections and collect clearance air samples at the conclusion of these abatement projects. All oversight or additional oversight and collection of air samples may be performed by the District's ES&A Department as well at their discretion.

In addition to complying with these supplemental specifications, the Contractor must also comply with all other asbestos abatement requirements listed in these asbestos abatement specifications. If Contractors find any conflicting information in the supplemental specifications, the Contractor must comply with the requirements listed herein that are deemed most stringent by the District or District hired asbestos consultant supervising the abatement.

Project Requirements

Contractor shall be approved by the WCSD ES&A Department to perform asbestos abatement activities within the District. **Approval of firms that have not performed activities impacting asbestos for the District previously, will need to submit all necessary documentation outlined in the WCSD ES&A Technical Specifications for the project at least ten (10) business days prior to work commencing for approval.**

All workers certifications – asbestos training and licensing and medical clearance – shall be submitted to the WCSD ES&A at least five (5) working days prior to project commencement at minimum for approval. Contractor is responsible for reviewing WCSD ES&A worker roster for the company to assure all workers to be used on the project have been approved prior to arrival onsite. Workers not identified on the approved worker list for the contractor will not be allowed to perform any activities onsite, even if documentation is provided onsite at time of the project commencement.

The abatement contractor's onsite supervisor shall have a copy of these Specifications onsite at all times and be familiar with the project requirements prior to arrival onsite at the project. Failure to follow requirements of these Specifications, or lack of knowledge of requirements to be followed during the project, are grounds for replacement of the abatement contractor's onsite supervisor.

Only the abatement contractor will be allowed to occupy the project area once abatement activities are scheduled to start. This applies to all WCSD non-ES&A staff/personnel and site staff/personnel. The area shall only be occupied by the abatement contractor, WCSD ES&A staff, and District's independent third-party abatement consultant. Other personnel will not be allowed to occupy the building during asbestos abatement activities.

Contractor shall adhere to the requirements of these Specifications, WCSD ES&A Technical Specifications, Federal, State, and Local regulations.

Water and Electricity

Water and electricity are available onsite, but long hoses and cords may be necessary. The contractor is responsible for any damage to water or power systems caused by their use of those systems.

Contractor shall provide a GFI at the primary plug-in of all electrical trains used for electrical equipment. Hose washers shall be provided at all hose connections to prevent leakage of water and potential damage to District facilities.

Pre-Cleaning

Pre-cleaning of debris may be required during setup and prior to abatement of TSI.

If required, cleanup will be performed once HVAC is shut down and tagged out by the contractor, with District approval, and critical barriers are sealed with 6-mil poly. Workers performing pre-cleaning will use HEPA-vacuums to vacuum debris and dust from the area. Workers will need to wear half-mask respirator fitted with HEPA (P-100) filters and tyvek quality disposable coveralls with attached hood and boots.

Notifications

Contractor is responsible for timely notifications (including courtesy notifications if applicable) to Nevada Division of Industrial Relations and Washoe County Health Department. Notifications shall be filed in advance of any waiting periods in lieu of the proposed project start date or other requirements for pre-work notification. Any revisions to notifications including project scope, start date, duration of project, or any other changes are

the Contractor's responsibility. Valid notifications shall be posted onsite during the project, and copies shall be provided to the District's onsite third-party consultant and ES&A Department.

Equipment

Contractor is responsible for providing all necessary equipment in sufficient quantities to complete the project in the schedule provided for the project. All equipment must arrive onsite clean and in proper functioning order. Any equipment that arrives onsite dirty or not in proper functioning order shall be removed from the project site for cleaning and/or repairs.

Training

Workers performing asbestos abatement activities as part of this project must have AHERA Worker training with at least one worker trained to the AHERA Contractor-Supervisor level. All workers shall be licensed by the Nevada DIR for asbestos work. The crew lead Contractor-Supervisor may not leave the site anytime asbestos abatement operations are being performed.

As noted previously, all workers certifications must be approved by the WCSD ES&A prior to arrival onsite to start work. Copies of the worker certs shall be provided to the District's onsite third-party consultant as well.

Personal Protection Equipment

A tight-fitting powered air-purifying respirator (PAPR) fitted with HEPA filters shall be worn for respiratory protection when performing TSI abatement.

A full facepiece, supplied-air respirator operated in the pressure-demand mode shall be worn by workers performing Class 1 work if the negative exposure assessment, or air sampling performed by ES&A or the District's third-party consultant, indicates that the exposure level will be above 1 f/cc as an 8-hour TWA.

Workers shall wear Tyvek-level disposable coveralls, hard hats, and work gloves. Street clothes may not be worn under disposable coveralls.

All employees shall have a valid medical clearance and fit test for respirators to be used. Medical clearance shall be provided for approval to the WCSD ES&A prior to the project commencement. Copies of the medical clearance and fit test shall be provided to the District's onsite third-party consultant as well.

Personal Air Monitoring

The contractor is responsible for the collection of personal air samples on workers during all abatement activities for asbestos. These samples shall be collected in accordance with OSHA sampling protocols and analyzed by a laboratory with the proper accreditation.

Laboratories to be used for personal air sample analysis must be approved by WCSD ES&A.

Copies of the personal air sampling results, along with laboratory accreditation, shall be submitted to the WCSD ES&A and District's independent third-party consultant.

In addition, the contractor will comply with all requirements regarding personal air monitoring listed in Section 02130, Part 2- - Air Monitoring, 2.02.

Security and Safety

The contractor is responsible for security of all equipment and safety of all employees. Contractor shall provide any storage containers or security needed for tools and equipment if needed.

Contractor is responsible for any ladder, scaffolding, or any other worker safety measures needed to facilitate the TSI abatement as required by state or Federal regulation.

Contractor is responsible for all worker safety and following all applicable regulations, namely Nevada and Federal OSHA.

Occupancy

As noted previously, the project area will be limited to the abatement contractor, WCSD ES&A staff, and District's independent third-party consultant once abatement activities are ready to commence. Once the area has been cleared, other parties may occupy.
Emergency services may also occupy areas in the event of an emergency during the project.

Challenge Testing

All HEPA-filtered equipment to be used on this project shall have been challenge tested (DOP or equivalent) within the previous 30 days prior to use onsite. Copies of the challenge testing results shall be provided to the WCSD ES&A and/or HMS, Inc.

Asbestos Abatement Containment and Abatement Requirements

ALL POLY USED ON PROJECT SHALL BE 6-MIL AND FIRE-RETARDANT UNLESS EXEMPTED IN REQUIREMENTS BELOW.

1. The Contractor shall develop a regulated area that meets the requirements of OSHA regarding posting and limited access.

2. The Contractor shall follow the procedures recommended by the manufacturer of the glovebags, and the specifications required by OSHA regulations.

3. All critical openings within the regulated area shall be sealed prior to set up of the containment using two layers of 6 mil poly.

4. At least one layer of 6 mil poly must be used to contain the abatement area, including ceiling. Two layers of 6 mil poly shall be placed on the floor of the containment. The bottom layer of floor poly must be black to assist with visual clearance.

5. Stationary objects in the immediate area of the room which cannot be removed from the work area must be covered with at least one layer of 6 mil poly sheeting after being pre-cleaned.

6. A minimum three stage decontamination unit with a shower shall be contiguous with the containment. See “Decontamination Chamber Requirements” in this specification for further requirements.

7. Negative pressure shall be established and a recording manometer shall be attached to the containment. Copies of the manometer recordings shall be provided on 8.5”x11" paper by the Contractor.

8. A HEPA-filtered vacuum shall be in the immediate area for use in conjunction with the bags or in case of a spill.

9. Glovebags may not be used on surfaces where temperatures exceed 150 degrees Fahrenheit.

10. Glovebags will be utilized only used inside of a full negative pressure containment.

11. Glovebags may be used only once, and may not be moved or slid for removal of a second section of TSI.

12. At least two persons shall perform glovebag removal.

13. Before beginning the operation, loose and friable material adjacent to the glovebag operation shall be wrapped and sealed in two layers of 6 mil poly sheeting or otherwise rendered intact using encapsulating cloth.

14. The Contractor shall apply a sufficient volume of amended water to wet all pipewrap removed from the pipes while it is enclosed in the glovebag.

15. Prior to placement in the disposal bag, glovebags shall be collapsed by removing air within them using a HEPA-vacuum.

16. Upon detachment, the glovebag must be immediately placed into a 6 mil thick disposal bag. The disposal bags must be sealed using the "gooseneck" sealing technique. Waste bags shall be properly labeled as a regulated asbestos containing waste.

17. Where pipes enter walls, floors, or ceilings which are not within the scope of the project, the pipewrap shall be removed at least 1" into the structure and the pipewrap end must be sealed with bridging encapsulant and/or wettable cloth.

18. The Contractor shall be responsible for ensuring the piping system remains adequately supported at all times. This may be achieved by readjusting existing hanger brackets as insulation is removed, or by other approved methods, such as inserting wood blocks to replace the thickness of the removed insulation.

Decontamination Requirements

A three stage decon unit including a shower is required for asbestos containments. Each chamber of the decon must have self-closing Z-flaps that seal air tight. A four-inch barrier must exist at the floor of each chamber to prevent the transfer of water and debris from chamber to chamber. This barrier will also provide a seal for the flaps between each chamber. Equipment and bag out chambers do not require a shower, but a washing station must exist and they must be three-stages. The washing station must be constructed in a manner that prevents water from splashing or traveling out of the central decon chamber. Equipment and bag out chambers must also have flaps that seal air tight.

Shower units must be equipped with an overflow pan to catch water which overfills the drain system, or is splashed out of the chamber during employee showers. Showers must be supplied with hot water, soap, shampoo, and towels for the workers. Showers shall be sited in the central decon chamber. Showers and washing station must also be equipped with a filtering system that includes a 0.5 micron filter. If filtering system is not available or is not functioning correctly, shower water must be bagged and disposed of as asbestos-containing waste.

All chambers of the decon, including the clean chamber, must be kept clean and dry (except shower) at all times. Abatement work will be stopped if decon is not kept in acceptable condition.

Regulated Area Signage

Asbestos Danger signs shall be posted at all entrances to the containment area, even if the entrance is sealed as a critical barrier. Signs shall also be posted on the flap leading into the shower station of decontamination chambers. Signage will be set once a pre-start visual is passed and work may begin in the containment, but no work will start until all signs are posted.

Signage shall meet the revised requirements set forth in 29 CFR 1926.1101(k)(7).

Air Pressure Differential

Air pressure differential must be established and maintained at -0.05 inches water differential or better before start of abatement and air pressure differential must be maintained through all phases of project, including collection of clearance air samples and receipt of results. A minimum of eight air changes per hour is required for the project. Work will be halted if the air pressure drops below -0.05 inches water differential and can resume when air pressure differential of -0.05 inches is established again.

Air pressure differential must be displayed and recorded on a properly calibrated and fully functioning manometer. Copies of the manometer recording must be provided by the contractor on 8.5" x 11" paper at completion of project.

All negative air machines must be exhausted to the exterior of the building using wire-reinforced flex duct. All negative air machines must be used inside containment. No machines shall be attached to the exterior of the containment with the intake only inside.

Any exterior barricades need to be constructed of a minimum ½" plywood and lockable for security. Contractor is responsible for providing a lock to any exterior barricades, and keys shall be provided to WCSD site facilities coordinator and HMS, Inc. Project Manager.

Make-Up Air Sources

Available, but may need to be HEPA-filtered. Any make-up holes in critical barriers must be equipped with a challenge/DOP-tested HEPA filter. Placing a pre-filter in the make-up air hole will not be allowed.

Disposal Requirements

All asbestos waste generated on this project will need to be double-bagged in 6-mil poly waste bags, or double-wrapped in 6-mil polyethylene sheeting. All waste bags must be sealed in a "gooseneck" fashion. All waste shall be properly labeled and identified for disposal as a regulated asbestos-containing material (RACM).

The contractor will need to provide a lockable waste bin for all waste created on this project.Waste bin will need to be labeled with asbestos signage once the waste is loaded into the bin. Waste bins shall be lined with one layer of 6-mil poly prior to waste being loaded.

Waste bins will need to arrive onsite clean of debris or any other waste and in proper functioning order. Waste bins may be rejected by WCSD ES&A staff or District's independent third-party consultant if these conditions are not met, with no extra charge to the District.

Clearance

Upon completion of asbestos abatement activities, a final visual inspection will be performed by either WCSD ES&A staff or District's independent third-party consultant. This inspection will be performed only after the abatement contractor crew supervisor has performed their own final visual clearance. Areas must be free of all three-dimensional material with all surfaces clean of dust and debris and all materials abated within the containment area.

Final clearance shall be through aggressive air sampling conducted by the District's independent third-party consultant. A set of five air samples will be collected inside the containment to be analyzed in accordance with AHERA completion of response action criteria using either phase contrast microscopy (PCM) or transmission electron microscopy (TEM), depending on the quantity of TSI abated.

Clearance criteria for PCM sample analysis, in accordance with AHERA, is 0.01 fibers per cubic centimeter (0.01 f/cc) or less for each of the five samples. Clearance criteria for TEM sample analysis, in accordance with AHERA, is an average of 70 structures per square millimeter (70 s/mm^2) or fewer for the inside-containment set of five samples.

Contractor shall return to the site to apply a lock-down encapsulant, remove poly barriers and equipment upon notification of passing clearance air samples.
